FRONTISPIECE To MILLAR's *NEW & Universal* *SYSTEM of GEOGRAPH.*

THIS ELEGANT FRONTISPIECE

Pollard delin.et sculpt.

represents an emblematical Figure of Geography *seated by the Basis of* Britannia *& recording in regular order,* A New Geographical tory & Description *of* Europe, Asia, Africa & America, *who are here introduced on the occasion by* Neptune, *as emblematical representatives of* World, *bringing the various produce & curiosities of their respective Countries.—* New Britannia *is* Mercury, *charged with the delivery of* w Discoveries *in* various parts *of the* Globe, *which point out the assistance the* Author *has had from the late* celebrated Navigators *& ingenious* vellers.—*The other emblems of* Trade & Commerce, *Ships &c all denote the several Departments of this* Entire New & Complete System of Geography.

THE NEW, COMPLETE, AUTHENTIC, AND

UNIVERSAL SYSTEM OF GEOGRAPHY:

BEING A COMPLETE MODERN

HISTORY AND DESCRIPTION

OF THE

WHOLE WORLD.

CONTAINING

A particular, full, accurate, circumſtantial, and entertaining Account, (including the *antient* and *preſent State,)* of all the Various Countries of

EUROPE, ASIA, AFRICA, and AMERICA.

AS DIVIDED INTO

EMPIRES, KINGDOMS, STATES, REPUBLICS, AND COLONIES,

AND AS SUBDIVIDED INTO

CONTINENTS,	ISTHMUSES,	STRAITS,	LAKES,	DISTRICTS,
ISLANDS,	SEAS,	RIVERS,	PROMONTORIES,	GOVERNMENTS,
PROVINCES,	OCEANS,	HARBOURS,	CAPES,	PRINCIPALITIES,
PENINSULAS,	GULPHS,	DESERTS,	BAYS,	&c. &c. &c.

TOGETHER WITH THE PARTICULARS OF

Their Situations, Extent, Boundaries, Limits, Climate, Soil, Natural and Artificial Curioſities and Productions; Laws, Religions, Revolutions, Conqueſts and Treaties, Antiquities, Revenues, Naval and Military Force, &c.

LIKEWISE GEOGRAPHICAL DESCRIPTIONS OF

All the Cities, Capital Towns, Villages, their Diſtance and Bearing, Univerſities, Fortifications, Caſtles, Forts, Sea-ports, Mountains Volcanos, Metals, Aqueducts, Docks, Arſenals, Minerals, Foſſils, Ruins, Palaces, Temples, Churches, Structures, Edifices, Public and Private Buildings, Roads, &c. contained in each Part of the Univerſe.

ALSO

Uſeful and Entertaining Hiſtorical and Deſcriptive Relations of all their Cuſtoms, Manners, Genius, Trade, Commerce, Agriculture, Learning, Policy, Arts, Sciences, Manufactures, Tempers, Diſpoſitions, Amuſements, Habits, Stature, Shape, Colours, Virtues, Vices, Riches or Poverty, Entertainments, Language, and ſingular Ceremonies at Births, Marriages, and Funerals, Titles of Diſtinction, &c. of the different Inhabitants: And a genuine Hiſtory of all Sorts of Birds, Beaſts, Fiſhes, Reptiles, Inſects, Vegetable Productions, Flowers, Herbs, Fruits, Plants, Gums, &c. found in the various Regions.

INCLUDING ALL THE VALUABLE DISCOVERIES MADE IN THE MOST REMARKABLE

VOYAGES AND TRAVELS

To different PARTS of the WORLD from the Earlieſt Period to the Preſent Time.

Particularly all the MODERN DISCOVERIES in the Southern and Northern Hemiſpheres.

Comprising every intereſting CIRCUMSTANCE, and entertaining NARRATIVE, contained in

Captain COOK's VOYAGES ROUND the WORLD.

Together with all other MODERN DISCOVERIES of other CIRCUMNAVIGATORS, viz.

Lord MULGRAVE, WALLIS, CARTERET, BYRON, ANSON, FORREST, CLERKE, BOUGAINVILLE, WILSON, KING, GORE, SOLANDER, &c.

INCLUDING THOSE OF THE

PELEW ISLANDS.

Alſo the laſt Accounts of NEW HOLLAND, and the ENGLISH COLONY of BOTANY BAY; and a particular Deſcription of PORT JACKSON, NORFOLK ISLAND, &c. where the CONVICTS are now ſettled, &c. &c. &c.

LIKEWISE THE SUBSTANCE (SYSTEMATICALLY ARRANGED) OF

BRUCE's TRAVELS

Into ABYSSINIA to diſcover the Source of the River NILE in EGYPT.

The Whole being brought down to the preſent Time, and forming the moſt extenſive and original Production on the Subject ever Publiſhed, wherein a great Variety of Improvements are included, not to be found in any other Work of the Kind.

TO WHICH WILL BE ADDED

A NEW, COMPLETE, and EASY INTRODUCTION TO GEOGRAPHY AND ASTRONOMY; giving an uſeful and entertaining Explanation of the Principles and Terms of both Sciences, the Figure, Motion, &c. of the Earth, Planets, &c. Latitude, Longitude, Uſe of the Globes, Maps, the Compaſs, the Nature of Winds, of Earthquakes, Comets, Thunder, Lightning, Air, and other Important and Authentic Particulars, &c.

By GEORGE HENRY MILLAR, Eſq.

Author of a New Syſtem of NATURAL HISTORY, *now Publiſhing with Univerſal Applauſe.*

Aſſiſted by ſeveral GENTLEMEN, celebrated for their Knowledge in the Science of GEOGRAPHY, particularly

WILLIAM LANGFORD, Eſq. who accompanied Captain COOK in making the New Diſcoveries.

Calculated to convey uſeful and entertaining Knowledge to all Ranks and Degrees of People, for as a celebrated Author juſtly obſerves,

"*There is not a* SON *or a* DAUGHTER *of* ADAM *but has ſome Concern in* GEOGRAPHY."

The Whole embelliſhed with near TWO HUNDRED capital Engravings, being the moſt elegant Set of Copper-Plates ever publiſhed in a Work of this Kind, and conſiſting of beautiful Views, Land and Water Proſpects, Dreſſes of the various Inhabitants of different Countries, their ſingular Ceremonies, Amuſements, Cuſtoms, &c. Alſo neceſſary Maps, Charts, Draughts and Plans, &c. finely Engraved by the moſt eminent Artiſts.

LONDON:

PRINTED FOR ALEX. HOGG, AT THE KING's ARMS, No. 16, PATERNOSTER-ROW.

And ſold by all other Bookſellers and Newſmen in Great Britain, Ireland, &c.

INTRODUCTORY ADDRESS AND PREFACE.

THE Study of GEOGRAPHY has a peculiar Claim to the Attention of *Mankind* in *general*, and cannot be too earneſtly Recommended to all Ranks of People. This pleaſing, uſeful, and delightful SCIENCE, diſplays to our View, in the moſt entertaining and profitable Manner, a general Knowledge of the Whole World. A good Work of this Kind, exhibits to Perſons of every Capacity and Situation in Life, an authentic Account of whatever is worthy of Notice, in the various Countries of the Univerſe. It not only furniſhes a *Deſcription*, but alſo an *Hiſtorical* and *Political Repreſentation* of all the ſeveral *Provinces*, *Diſtricts*, and *Subdiviſions* of every *Country*; together with a clear, natural, and methodical Detail of the *Cuſtoms*, *Manners*, *Dreſſes*, *Ceremonies*, and *preſent State* of the *Inhabitants*; the moſt remarkable *Events* that have tranſpired, from the *earlieſt Period* to the *preſent Time*, and the *Conſequences* that have attended them: Alſo an accurate and impartial *Hiſtory* and *Survey* of their *Laws*, *Government*, *Maxims* of *Policy*, *Forces*, *Revenues*, *Trade* and *Commerce*, and a great *Variety* of other important and intereſting *Particulars*, which are enumerated in our TITLE PAGE.

The PUBLIC in general are ſo thoroughly convinced of the Utility of this Subject, that it might poſſibly be thought impertinent to dwell long on the Recommendation of it.

The *Pleaſure*, as well as *Profit*, attending the *Peruſal* of Books of this Sort, has made them more univerſally read than any other Branch of polite *Literature*; and the Study of *Geography* has now become one of the moſt *faſhionable Purſuits* of the *preſent Age*, for *both Sexes*. In ſhort, this is a Subject in which every man is materially intereſted; for, as a celebrated Author juſtly obſerves, "There is not a SON or a DAUGHTER of ADAM, but has ſome CONCERN in GEOGRAPHY."

However, amidſt the Variety of Publications on this Subject, which have made their Appearance from Time to Time, it has been matter of great Aſtoniſhment to many, that not one has been written on a New, Cheap, and Improved Plan of general Information, containing all the recent *Diſcoveries*, and which may be ſuitable to ſuch as wiſh to gain a perfect Knowledge of *Men* and *Things* in every Part of *Europe*, *Aſia*, *Africa*, and *America*. This has been, moſt certainly, a general Complaint throughout this Country; but, without pointing out the Errors and Abſurdities of other Writers, we now offer to the Public

A NEW, COMPLETE, AUTHENTIC, AND UNIVERSAL SYSTEM OF GEOGRAPHY,

Being a Complete Modern HISTORY and DESCRIPTION of the WHOLE WORLD, upon ſuch an improved and extenſive Plan, as has been long wiſhed for.

Our Readers will have no Reaſon to complain that they have been caught by an inviting Title Page, or that they received leſs than they promiſed themſelves, from the Peruſal of our Propoſals. We acknowledge that we have promiſed much, but we likewiſe confidently aſſert that our Performances will not be found inadequate to our Propoſals.—The moſt ample Fortune of the richeſt Man, and the longeſt Life of the moſt laborious Traveller, attended with all that Succeſs which his moſt ſanguine Expectations could hope for, would be inſufficient to make him acquainted with the twentieth Part of what will be found in this Uſeful and Entertaining Work, which is calculated for general Inſtruction and Amuſement.

The

The Public will at once perceive, that this Work could not poſſibly be completed in leſs than Eighty Numbers, conſidering the neceſſary Copiouſneſs of the Whole; and to have extended it further would have been entirely unneceſſary, and only making a Job for the Printer, and others concerned in the external Execution of it; as, beſides the Conſideration of the extraordinary large and elegant Size in which the Work is printed, we have carefully omitted the tedious Errors of other Writers, particularly long and injudicious poetical Quotations from Authors, who never were allowed by People of any Diſcernment, to have aimed at Authenticity in their fancied local Deſcriptions. So that this work is not only the Cheapeſt of the Kind, but alſo the moſt Complete and Elegant in every reſpect whatever. We ſhall, therefore, ſubmit the Whole to the Patronage and Protection of the unprejudiced and diſcerning Public, who will, no doubt, generouſly give the Preference according to Merit.

That Turn for Reading which now ſo univerſally prevails throughout theſe Kingdoms, is certainly very Laudable, and cannot but be attended with very great Advantages. It is impoſſible that vacant Hours can be better filled up, than in the Peruſal of well-choſen Books; and a very little Reflection will ſhew, that next to the Sacred Scriptures, nothing can have a greater Claim to our particular Notice, than the Work which we now offer to the Public.

We ſhall begin with a New Hiſtory and Deſcription of ASIA, that Quarter of the Globe, which on many Accounts demands our earlieſt Regard.

AFRICA will make the Second Part of our Work; and, attending to the regular Order of Things, we ſhall next come to

The EUROPEAN COUNTRIES, whoſe Inhabitants, becoming more bold in the Spirit of Enterprize, than thoſe of the other two Parts of the Globe, diſcovered the fourth grand Diviſion of the World, namely,

AMERICA; with a more complete Hiſtory and Deſcription (including the preſent, as well as antient State) of which than is to be found in any ſimilar Performance; we ſhall conclude this New Syſtem of Geography—a Work, founded on the moſt reſpectable Authorities, comprizing all the late Diſcoveries made in every Part of the Globe, by the moſt celebrated Navigators, and ingenious Travellers, and arranged with the greateſt Accuracy and Care, being the Reſult of unwearied Aſſiduity and Study, for ſeveral Years.

GEORGE HENRY MILLAR.

*** *It is unneceſſary to remark that (unlike thoſe who abſurdly introduce Accounts in a detatched and heterogeneous way) we ſhall endeavour to be perfectly conſiſtent in obſerving ſyſtematic Order, and give the Hiſtory and Deſcription of* New Holland, Botany Bay, Norfolk Iſland, &c. *where the Convicts are now ſettled, together with all the other New Diſcoveries in the Particular Parts of our Work to which they properly and ſyſtematically belong.*

P. S. The COPPER-PLATES, MAPS, CHARTS, &c. in *other Works* of this Nature having been a *Diſgrace* inſtead of an *Embelliſhment*, we have totally obviated that *Imperfection*, by employing the moſt able and *renowned Artiſts* in the Kingdom; whereby they will juſtly correſpond with the *Dignity* and *Elegance* of the Work they are intended to *embelliſh*. The PUBLISHER therefore flatters himſelf, that the impartial Examiner will, upon a proper Inſpection, juſtly acknowledge this to be the *Beſt* and *moſt Complete* SYSTEM of GEOGRAPHY ever yet offered to the Public.

PUBLISHED ACCORDING TO ACT OF PARLIAMENT

N. B. The New, Complete, and Eaſy INTRODUCTION to GEOGRAPHY and ASTRONOMY; comprehending an uſeful and entertaining Explanation of the Principles and Terms of both Sciences, their Relation to each other, the Figure, Motion, &c. of the Earth, Planets, &c. Latitude, Longitude, Uſe of the Globes, Maps, and Compaſs; the Nature of Heat, Air, Meteors, Wind, &c. conſtant and variable, and other Particulars: Together with a Complete GEOGRAPHICAL INDEX to Places, *will be given at the* CONCLUSION *of the* WORK.

*** A Complete LIST of the SUBSCRIBERS will alſo be printed and delivered gratis with the laſt Number of the Work.

☞ In conſequence of our printing this Work on Types of a particular conſtruction, and unuſual in Publications of the kind hitherto publiſhed, we are enabled to compriſe conſiderably more Matter on the Subject than others give, who have unneceſſarily extended their expenſive performances to 90 or 100 Numbers for ſiniſter Motives—ſo that our Claim to CHEAPNESS, as well as SUPERIORITY in other reſpects, muſt appear evident to every Reader.

THE

A NEW, COMPLETE, AND EASY INTRODUCTION TO GEOGRAPHY AND ASTRONOMY.

THE term GEOGRAPHY, being derived from the Greek, ſignifies a deſcription of the world. By the world we mean the terraqueous globe which we inhabit, and which is uſually termed the terreſtrial globe.

The term Geography is uſed to denote the deſcription of the whole world; Hydrography implies a deſcription of water; Chorography ſignifies the deſcription of a country, or province; and Topography means the deſcription of a particular diſtrict, city, town, village, or place.

GEOGRAPHICAL TERMS.—The principal terms uſed in Geography, reſpecting the deſcription of land and water, are as follow: 1. A Continent; a large portion of earth, comprizing ſeveral countries, which are not ſeparated by the ſea. 2. An Iſland; a portion of earth entirely ſurrounded by water. 3. A Peninſula; a quantity of land, joined to the continent by a ſmall neck, and every where elſe ſurrounded by water. 4. An Iſthmus; that neck which connects the peninſula to the main land. 5. A Promontory or Cape; a high point of land, which ſtretches into the ſea. 6. An Ocean; an immenſe collection of water, ſurrounding a great part of the continent. 7. A Sea; a ſmaller collection of water, or an inferior ocean. 8. A Gulf; a part of the ſea almoſt ſurrounded by land, except at one ſmall part, where it joins the main ſea. 9. A Bay; in general leſs than a gulf, and has a wider entrance. 10. A Creek is leſs than a bay, and may be deemed a ſmall inlet of water, running a little way into the land. 11. A Road is a place on the coaſt where there is a good anchorage. 12. A Streight, or Strait, is a narrow paſſage of water, which joins two ſeas, two gulfs, a ſea and a gulf, &c. 13. A Lake is a collection of waters, ſurrounded by land. 14. A River is a ſtream of water, which derives its ſource from ſome inland ſpring, meanders through the country, and empties itſelf either into the ocean, the ſea, or ſome other river or lake.

Concerning the ARTIFICIAL SPHERE, *or* GLOBE.] The Sphere is an artificial machine, conſiſting of many circles, invented by the ſagacity of mathematicians, to explain the doctrine of the globe, or orrery, and to illuſtrate the motions of the earth, planets, &c. A circle is divided into three hundred and ſixty equal parts, which we call degrees; each degree into ſixty more equal parts, called minutes. The plane of a circle means that ſurface on which it is drawn; and if the ſurface be ſuppoſed of an infinite extent from the centre, it is ſtill called the plane of that circle. But circles are ſaid to be in different planes, when the ſurfaces on which they are made incline to, or interſect each other. The axis is that line which we conceive to paſs through the middle of the earth, and on which the whole maſs turns round, repreſented in the artificial globe by a wire. The two extremities of the axis are called the poles of the equator; and if the axis be imagined to reach the ſtars, one point is called the arctic, and the other the antarctic, or the north and ſouth poles of the world.

The principal great circles are the following, *viz.* 1. The Equator, which is a great circle, going from eaſt to weſt, parting the globe into the north and ſouth hemiſpheres. It is named the Equator or Equinoctial Line, becauſe when the ſun arrives there the nights and days are equal. It is alſo divided into three hundred and ſixty degrees, reckoned eaſtward from the firſt meridian. 2. The Horizon is that great circle which parts the upper hemiſphere from the lower, or the viſible from the inviſible hemiſphere. So much of the earth as we comprehend in our view, in a circular manner when we ſtand on a plain, is called the Senſible Horizon. The Rational Horizon is to ſuppoſe the eye at the centre of the earth, viewing the whole celeſtial hemiſphere upwards, which is repreſented by a broad wooden circle encompaſſing the globe, on which are deſcribed ſeveral other circles. The Meridian is a great circle, dividing the globe into the eaſt and weſt hemiſpheres: it lies directly north and ſouth, paſſing through the poles of the equator. The Meridian is changeable, being properly that part of the heavens where the ſun is at noon; ſo that every place on the earth has a different Meridian, if we move eaſt or weſt; but paſſing north or ſouth, it remains the ſame.

The globe hangs in a braſs circle, on which is placed another ſmall braſs one, called the horary circle; this is divided into twenty-four equal parts, and deſcribes the hours of day and night: which, in turning of the globe, are pointed out by an index fitted to the pole. This is to ſhew the riſing and ſetting of the ſun, moon and ſtars, or the time of the day in all parts of the earth. The degrees of latitude are marked on any Meridian line, but always on the two outermoſt in maps. There are two Meridians, called Colures, the Solſtice Colure, and the Equinox Colure, which being alſo great circles, cut the ſphere into four equal parts. By theſe the ſeaſons are diſtinguiſhed. The Ecliptic is a great oblique circle, cutting the equator at angles of twenty-three degrees twenty-nine minutes. It deſcribes the annual courſe of the earth north and ſouth.

The characters and names of the ſigns are, Aries ♈, Taurus ♉, Gemini ♊, Cancer ♋, Leo ♌, Virgo ♍, Libra ♎, Scorpio ♏, Sagittarius ♐, Capricorn ♑, Aquarius ♒, and Piſces ♓. There are two more great circles, called Verticle, or Azimuth circles. Theſe are perpendicular to the horizon, and paſs through the zenith and nadir.

There are four leſſer circles. The two Tropics are thoſe of Cancer and Capricorn. The two remaining circles are ſtill ſmaller, called the Arctic, or Polar Circles. Theſe circles, like the two Tropics, have double lines.

The Cardinal Points are the four quarters of the world; eaſt, weſt, north and ſouth. The collateral points are the principal diviſions and ſubdiviſions of the four chief; in all thirty-two.

The earth being divided into five parts, by the two Tropics and the two Pole circles, thoſe five parts are named Zones: two Temperate, two Frigid, and the Torrid Zone. The North Temperate Zone includes all the land between the Tropic of Cancer and the North Pole Circle; and the South Temperate Zone includes all between the Tropic of Capricorn and the South Pole Circle. The two Frigid Zones contain all the land from the two Polar Circles to the very Poles. The Torrid Zone includes all the land between the two Tropics, the Equator being in the middle. The whole is thoroughly inhabited. The Temperate Zones contain in latitude each forty-three degrees two minutes, being the ſpace between each Tropic and the Pole Circle. The Frigid Zones contain each forty-three degrees fifty-eight minutes, and the Torrid Zone, in like manner, contains forty-ſix degrees fifty-eight minutes latitude.

SHADOWS.] The antients alſo named the inhabitants of the earth, according to which way the ſhadows of their bodies were caſt by the noon-tide ſun. Periſcii are thoſe beyond the Polar Circles, whoſe bodily ſhadows turn round every twenty-four hours. Heteroſcii are thoſe people in the Temperate Zones, whoſe noon ſhadows ever fall one way; the North Temperate Zone throwing it north, and the South Temperate Zone throwing it ſouth. Amphiſcii are thoſe who live in the Torrid or Middle Zone. Their noon ſhadows fall different ways at different ſeaſons.

SITUATIONS.] 1. The Perieci are thoſe who live in the ſame parallel, have the ſame latitude and ſeaſons, and the ſame pole elevated, but have oppoſite meridians, and conſequently oppoſite days and nights. 2. The Antieci are thoſe people who have the ſame meridian, but oppoſite parallels, equidiſtant from the Equator, though on contrary ſides. 3. Antipodes are ſuch, whoſe parallel and meridian are both oppoſite.

LATITUDE *and* LONGITUDE.] The exact ſituation of cities and places, where the inhabitants of the earth reſide, is more particularly called their Latitude and Longitude. Latitude is the diſtance of any place from each ſide the Equator to either of the Poles; which diſtance being but ninety degrees each, no latitude can exceed that number. Longitude is the diſtance of a place from the firſt, or ſome other meridian. To prevent confuſion, our modern geographers, and delineators of maps, make the metropolis of their own nation the firſt real meridian; and in this caſe longitude is two-fold; being from London either weſt or eaſt, as at ſea it is computed from ſome known port or head-land. The longitude of any place from London being known, the difference in the hour of the day is alſo known. For as the ſun performs his diurnal circuit in twenty-four hours, he gains in each hour fifteen degrees, being a twenty-fourth part of three hundred and ſixty, or one degree in four minutes. So that at any place fifteen degrees eaſt of us, noon is an hour ſooner with them, as it is an hour later with thoſe who live fifteen degrees weſt of us.

Though all degrees of latitude are equal in length, yet degrees of longitude vary in every new parallel of latitude: for all the meridian lines meeting and interſecting each other at the Poles, the degrees of longitude do naturally diminiſh as they proceed either way from the Equator.

Of the SOLAR SYSTEM.] In order to explain the diſpoſition of the ſeveral parts of the univerſe, and to demonſtrate the nature of the heavenly motions with reſpect to each other, and to the earth, it is neceſſary to underſtand the ſyſtem of the world. The only true ſyſtem is called the Solar Syſtem, invented by Copernicus, a Pruſſian.

The Solar Syſtem conſiſts of the ſun in the centre, and the planets and comets moving about it. The planets are vaſt bodies, which to us appear like ſtars; not that they have any light in themſelves, but ſhine merely by reflecting the light of the ſun. The planets are either primary or ſecondary. The primary planets are ſix in number, viz. Mercury, Venus, Earth, Mars, Jupiter and Saturn. Theſe are called Primary Planets, becauſe they move round the ſun; and the other planets are called Secondary, becauſe they move round the Primary Planets. The Secondary Planets are ten in number, and go under the general name of Moons: of theſe one moves round the Earth, four round Jupiter, and five round Saturn.

COMETS.] It is univerſally agreed, that Comets are immenſe ſpherical bodies, revolving about the ſun in elliptical orbits. Their periodical times are equally conſtant, certain and regular, as thoſe of the planets; but the bodies themſelves are abundantly more denſe, as they paſs through greater extremes of heat and cold without any ſenſible diminution.

The SUN.] This immenſe body, ſituated in the centre of the univerſe, is the fountain of light, the ſource of the ſeaſons, the cauſe of the viciſſitudes of day and night, the parent of vegetation, and the friend of man. It is a prodigious maſs of intenſe heat, and amazing illumination; in fine, when we view the ſun, we behold a globe of liquid fire, whoſe diameter is equal to one hundred diameters of the earth, the thickneſs being ſeven hundred ninety-three thouſand miles. Its ſurface is ten thouſand times larger than the earth, and its ſolidity one million greater; that is, the ſurface is the ſquare of the thickneſs, and the ſolidity its cube. The ſun moves round his own axis.

MERCURY.] This planet is about two thirds of the earth's magnitude, being two thouſand ſeven hundred miles in diameter. His diſtance from the earth is eighty-eight millions of miles, and from the ſun thirty-two millions of miles. His revolution round the ſun is made in a little more than eighty-eight days, with the velocity of one hundred thouſand miles in an hour, which is almoſt as ſwift again as the earth travels; for

we only go fifty-six thousand miles in the same space. The heat of the sun in this planet is something more than seven times greater than the heat of the hottest part of the earth in the most sultry summer, which is sufficient to make water boil.

VENUS.] This planet appears to the eye to be the brightest of all the planets, and from its superior lustre it cannot be mistaken for any of them. The distance of Venus from the sun is sixty millions of miles; her revolution round the sun is performed in a little more than two hundred and twenty-four days, and her motion in an hour is seventy thousand miles.

Of the EARTH.] The Earth, which is of a round or spherical form, makes its revolution round the sun in three hundred sixty-five days, five hours and forty-nine minutes, which revolution makes what we term a year. The Earth is near eighty thousand miles in diameter, and distant from the sun about eighty-one millions of miles. The line which this planet describes in its annual motion is called the Ecliptic, through which it proceeds from west to east, according to the signs of the Zodiac; and it is this motion which causes the different seasons of spring, summer, autumn and winter, and of the various lengths of days and nights in those seasons. In passing through the Ecliptic, the earth always keeps its axis in a situation parallel to itself, and equally inclined to the plane of the Ecliptic, which is twenty-three degrees and an half. The rotation of the Earth round its axis makes it day in those parts which are turned towards the sun, and night in those parts which are turned from the sun.

MARS.] This is the least of all the planets, Mercury excepted, has less lustre than any other star, and appears of a dusky red hue. Mars is considerably less than the Earth, its diameter being four thousand four hundred miles. His distance from the sun is one hundred twenty-three millions of miles, and he revolves about that central luminary in six hundred eighty-seven days, proceeding at the rate of forty-five thousand miles in an hour.

JUPITER.] This is the largest of all the planets, but being very remote from the sun, would scarce enjoy any light, had not the great Author of nature provided it with four moons, or satellites, which revolve round it in different orbits. The diameter of Jupiter is upwards of eighty thousand miles, and the mass of matter it contains two hundred twenty times greater than our Earth. The distance from the sun is four hundred twenty-four millions of miles; he revolves round his own axis in nine hours and fifty-six minutes, round the sun in eleven years and ten months, and proceeds at the rate of twenty-four thousand miles an hour.

SATURN.] This is the most distant planet in the whole system, being seven hundred seventy-nine millions of miles from the sun. He is thirty years in performing his revolution, and yet moves at the rate of eighteen thousand miles an hour. He is sixty-one thousand miles in diameter, contains ninety-four times as much matter as the Earth, but his density is not more than a seventh part of the matter which composes our planet. Saturn has five stations, which revolve round him in different orbs. But the most singular circumstance relative to this planet is his ring. This is a vast body of earth, of the thickness of near eight hundred miles, which surrounds Saturn in the form of a circle, at the distance of twenty-one thousand miles from its surface.

SECONDARY PLANETS.] These, as we have already observed, are ten in number, viz. five belonging to Saturn, four to Jupiter, and one to our Earth. The Moon which lights our earth, contains about the fortieth part of the quantity, or mass of matter, which composes the planet we reside upon. It is near two thousand two hundred miles in diameter, two hundred and forty thousand miles distant from us, and its surface is about fourteen millions of square miles. The Moon is the quickest in its motion of all the planets, making its revolution in twenty-seven days, seven hours and three quarters. The light which this planet affords us at night is not the only benefit we receive from it, for it governs the waters, and occasions the tides, which are extremely beneficial to mankind in general.

FIXED STARS.] The difference, with regard to vision, between the fixed stars and planets is, that the latter have a more placid lustre than the former. The fixed stars have the source of light within themselves, being suns; but the planets are composed of opake matter, and have no light but what they receive from the sun, or their own satellites. Hence, though the fixed stars are at an immense distance, their brightness exceeds that of the planets, and they are to be distinguished by their twinkling, though Venus and Mercury both twinkle, but not in so great a degree as the fixed stars. Beyond the atmosphere of our system the heavens are filled with a fluid much more rarified than our air; and here the fixed stars are placed at different, but immense distances from us, and very great distances from each other.

The CLIMATES.] There are twenty-four Climates on each side the equator; and under the equator the longest day is no more than twelve hours; and in proportion as we advance towards the Polar Circles, the days increase in every climate half an hour; and at the Polar Circles, the longest day is twenty-four hours. To know what climate any city, town, or village is in, observe the longest day, from which deduct twelve, and multiply the remainder by two, when the product will be the number of the climate.—Example: The longest day in London is sixteen hours; from this deduct twelve, there will then remain four; multiply the remainder by two; the product is the climate of London, eight.

The COMPASS.] There are four Cardinal points in the Compass, viz. east, west, north, and south. Between these four grand points many intermediate points are formed; but these, for the purposes of Geography and Navigation, are confined to thirty-two. As all these respect the position of places, we find by them how empires, kingdoms, cities, provinces, districts, &c. are situated with regard to each other; that is, whether they lie northerly, southerly, easterly, or westerly, or agreeable to any of the inferior or intermediate points. The invention of the mariner's compass has been, perhaps, of as great and general utility as any discovery that ever benefited mankind, as by its means the wants of one country are accommodated with the superfluities of another; the welfare of individuals, situated at a great distance, becomes interesting to each other; and the inhabitants of the whole universe are linked together in one great society, by a mutual intercourse.

To find the number of miles in a degree of latitude in other nations, in proportion to ours of sixty-nine.] Statute British miles, sixty-nine; Italian miles, each four hundred and seventy-five Rhinland perch, [according to Varenius] sixty; common Turkish miles ditto, sixty; Spanish miles, seventeen; marine leagues of France, [are the same] twenty; German leagues, fifteen; Low Dutch travelling hours, twenty; great leagues of Poland and Denmark, fifteen; Swedish miles, twelve; Hungarian miles, ten; verts of Muscovy, eighty; Persian, Arabian, and Egyptian parasanga, twenty; Chinese lis, two hundred and fifty. The French measure is to ours as fifteen to sixteen. Therefore four thousand nine hundred and fifty Paris feet are equal to five thousand two hundred and eighty British, being our statute mile.

Concerning MAPS.] In all Maps the north is at the top, the south at bottom; the east on the right, and the west on the left: or, if it be otherwise, it is always expressed either by words on each side, or by a mariner's compass, wherein the mark of a fleur-de-lys always denotes the north. Maps are laid down and proportioned to a certain scale, which is always taken from the degrees of latitude, which is always marked on the east and west side of the map. The degrees of longitude are always marked on the north and south side of the map. A degree of latitude is always of the same breadth: wherefore the distance of two places seated directly north and south, is immediately known by knowing the different latitudes. But a degree of longitude is of different extent. The latitude and longitude of a place being known, you may find it immediately in the map, by drawing a line, or thread, cross the map both ways; and the place stands where the two lines cut one another.

As the earth is a globe, a map of the whole earth must necessarily consist of two parts, both sides of the globe not being visible at once. Accordingly, in a universal map, the right hand circle shews the Old World, or Europe, Asia, and Africa; and the left hand circle shews the New World, or America. Upon the general map are marked the circles correspondent to those in the sphere, namely, the equinoctial line, the two tropics, and the two polar circles, all which cross the map from east to west; and the first meridians surrounding the two hemispheres from north to south, the parallels lying from north to south at ten degrees distance; and the meridians at the same distance from west to east, are also marked upon general maps. Particular maps, being parts of this, retain the meridians and parallels belonging to that particular mark; which are made smaller or larger, as the paper on which it is drawn will admit; and the distance of places mentioned in it are always exactly proportioned to the breadth of the parallels. So that let a map be ever so small, the distance of places is exactly shewn, if measured according to the degrees of latitude in that particular map. In both general and particular maps, the thick shadowing denotes the sea-coast. Rivers are marked by large shadowed serpentine lines; roads by double lines; divisions of countries by dotted lines; larger for provinces, and smaller for subdivisions; and divisions of nations are often shewn by chain lines. Forests are represented by trees; mountains by rising shadows; sands by dotted beds; marshes by shadowed beds; lakes by shadowed coasts.

The names of provinces are written in larger capitals; and smaller divisions, in smaller capitals; great cities in round Roman characters; smaller towns in Italic. The exact situation of a town is shewn by a little round o, but larger places have the addition of a church for a market-town, if the size of a map will admit. A city is noted by a church with houses about it, as much as the scale will allow. Particular qualifications of cities are distinguished by marks, as a bishopric has a cross, or sometimes a mitre over it.—An archbishopric has a double cross over it.—A university has a flag, or sometimes a Caduceus.—An abbey is shewn by a crook, or pastoral staff.—A fortress by angles like bastions.—A castle, by a little flag.—A gentleman's seat, by a house only.—Other marks are affected by particular engravers, which they explain in the margin of the map.

A distinct view of the EARTH.] The Earth, properly so called, is a heap of various bodies; for therein are discovered sand, clay, mould of various colours, several sorts of stones, many salts, sulphur, bitumen, minerals, and metals, without number.

Independent of the perpetual variety of the seasons, heat and cold, rain and wind, we may observe, that earthquakes and running waters are always making a wonderful change in that part of the earth which is next the surface: and if we take in the daily mutations of innumerable animals and plants, which are fed by the fruits and moisture of the earth, and after a short time putrify, and return to earth again, we shall have reason to believe, that this surface on which we tread, especially in countries that have been long inhabited, is, for the most part, composed of the bodies of men and beasts, or rather of a matter which is every day putting on new forms. And by such perpetual variations of matter, there must needs happen an increase of dry earth, and a decay of moisture; for it does not appear, that the parts of fluid bodies, which have been once blended with solids, and have been so impregnated with salts as to lose their fluidity, do ever retrieve it again. This is evident in plants and animals, which grow bigger so long as they receive spirit and nourishment from liquors, but afterwards turn to corruption. Moreover, there must needs be a vast change made in the earth by means of the many fires which prey upon it within, and sometimes burst forth, and desolate the circumjacent countries.

GEOGRAPHICAL PROBLEMS.

PROB. 1. *The latitude of any place being given, to rectify the Globe for that place.*] Let it be required to rectify the globe for the latitude of London, fifty-one degrees thirty-two minutes north; and Madrid forty degrees ten minutes north, proceed thus: Turn the pole on which the dial plate is fixed towards the verge of the horizon, slipping or moving the globe backwards or forwards in the notches of the horizon, till the horizon cuts the brazen meridian in fifty-two degrees thirty-two minutes, (viz. a little more than fifty-one and a half); so is the globe rectified for the latitude of London; that is, the north pole will then be elevated fifty-one degrees thirty-two minutes above the horizon; and London

being brought to the meridian itself, will then be the zenith, or right up, and at equal distance from all parts of the horizon. Depress the pole till the horizon cuts the brazen meridian at forty degrees ten minutes, and you have then the position of the inhabitants at Madrid; and turning the globe till Madrid comes to the meridian, you will find it in the zenith, or top of the globe, under forty degrees ten minutes. Note, If it were required to rectify the globe for south latitude, then you must elevate the south pole to the given latitude, instead of the north pole; but the next problem will better explain this.

PROB. 2. *The latitude and longitude of any place given, to find the same.*] You are first to observe whether the longitude be reckoned from London, or from the first meridian; for on some globes the first meridian begins twenty-three degrees, on others twenty degrees, and on Senex's globes eighteen degrees west of London; but if once you know where the first Meridian is on the globe, it is very easy to know the difference from the meridian of London.

PROB. 3. *The latitude of any place given, to tell all those places that have the same latitude.*] DEFINITION: All those places that have the same latitude have the days and nights of the same length, at the same length, at the same time of the year. *Rule.* Bring the given place, or places, to the meridian (suppose London fifty-one degrees thirty-two minutes, and Madrid forty degrees ten minutes north); then turn the globe, and all those places that pass under forty degrees ten minutes have the same latitude as Madrid, which you will find to be Pekin nearly for one, and many other places.

PROB. 4. *To tell the difference of the latitude of places.*] Here are two variations, or rules:—First, If the latitudes be both north or both south, then subtract the less from the greater latitude, and the remainder is the difference or answer. Thus between London and Madrid is twelve degrees thirty-two minutes, the first being fifty degrees thirty-two minutes, and the other forty degrees. And between Candy and Stockholm is fifty-two degrees thirty minutes, for Stockholm is about fifty-nine degrees thirty minutes north, and Candy seven degrees thirty minutes north. Secondly, If one lies on the north, and the other on the south-side of the equator, (that is to say, if one be north and the other south latitude) then add them all together, and their sum is the difference of the latitude required.—Thus, Copenhagen is fifty-five degrees forty minutes north, and the island of Madagascar is nineteen degrees thirty minutes south: these added together make seventy-five degrees ten minutes, the difference of longitude required in the problem.

PROB. 5. *The longitude of any place given from any meridian, to tell those places, having the same longitude.*] This is done after the same manner as the other; only here the answer will be on the equator, as others were on the meridian. I would know what places have the same longitude as London, and the same longitude as Moscow? The rule is, bring London to the meridian, then all those places on the globe (from the north pole to the south part of the horizon) that lie under the edge of the meridian, have the same longitude as London: thus Fort Nassau, and Fort Mina, in Guiney, have the same, or very nearly the same longitude as London. And Muscow, in Moscovia, has very nearly the same longitude as Aleppo, in Syria: also Scandaroon, Antioch, and Tripoli, in Syria, have the same longitude, viz. thirty-seven degrees thirty minutes from London.

PROB. 6. *To tell the difference of longitude of places.*] Rule. Here are two variations. First, if the places lie both east, or both west, of the first meridian, or where you reckon the longitude from, viz. if they both be east, or both be west longitude, then subtract one from the other, you have the difference. Thus I find Jerusalem has thirty-six degrees fifteen minutes east longitude from London, and Pekin one hundred and ten degrees fifty-two minutes east longitude; therefore subtract thirty-six degrees fifteen minutes from one hundred and ten degrees fifty-two minutes, and there remains seventy-four degrees thirty-seven minutes difference of longitude east or west; that is, Pekin is seventy-four degrees, thirty-seven minutes east longitude of Jerusalem, or Jerusalem is seventy-four degrees thirty-seven minutes west longitude of Pekin. Secondly, If one place be east, and the other west longitude of the first meridian, (suppose London, or any other meridian) then add their longitudes together, and the sum is the difference of longitude required.

PROB. 7. *The day of the month given to find the sun's place in the ecliptic.*] Rule. The day of the month being given, look on the inner calendar on the new globes, and you have the sign, and the degree of that sign that the sun is in for that day, according to the new style. If it be upon old globes, look on the outer calendar, you have the sign, and degree of the sign. N. B. You may further observe, that the calendar used throughout Europe is the calendar for new style, viz. new style is always known from the other, because it has the saints days, and several other things inscribed on the horizon.

PROB. 8. *The sun's place given to find the day of the month.*] This is only the reverse of the former problem; for having the sun's place given, seek it in the circle among the signs, then against that degree in the calendar, new style; you have the day of the month required. Example. I would know what time of the year the sun is in one degree of Gemini; as also when he enters Aries, Cancer, Libra, and Capricorn. Proceed according to the rule, and you will find the day to be May 21, June 21, September 22, and December 21, as in the last.

PROB. 9. *The latitude and day of the month given, to find the sun's place in the ecliptic, and rectify the globes for use.*] Rule. Find the sun's place on the horizon by problem the seventh; and having noted what degree he is in, look upon the ecliptic on the globe, and find the same sign and degree as you did on the horizon; then bring this degree of the ecliptic very carefully to the graduate edge of the brazen meridian, and holding the globe steady, turn the index exactly to the upper twelve (which represents twelve at noon) and thus is the globe rectified for that day, and the degree of the ecliptic that lies under the equator represents the sun's place at noon, or twelve o'clock that day. Note, The astronomer's day is reckoned from, or begins at, twelve o'clock; and if you fix the quadrant of altitude to the latitude in the zenith, the globe will be completely rectified.

PROB. 10. *To tell the declination of the sun on any day of the year.*] Rule. Having found the sun's place in the ecliptic for the given day, bring it to the brazen meridian, and observe what degree of the meridian it lies under, and whether it be on the north or on the south side of the equator, for that is the declination accordingly. Thus, on April 21, the sun has eleven degrees thirty minutes north declination, and on May 21, he has twenty degrees thirty minutes declination, but on October 27, he has twelve degrees thirty minutes south declination.

PROB. 11. *The latitude and day of the month given, to tell the sun's meridian altitude, viz. his height at noon.*] Rule. Bring the sun's place to the meridian, and observe what degree of the meridian the sun's place is under: for those degrees on the meridian that are intercepted, or lie between the south verge of the horizon and the degree, which is over the sun's place on the meridian, (counted on the meridian) is the sun's meridian altitude required. Thus I find his meridian altitude at London, May the 21st, to be fifty-nine degrees, but on November the fifth, he has but twenty-three degrees thirty minutes altitude.

PROB. 12. *The latitude and day of the month given, to tell the sun's altitude at any time.*] Example. On May the 21st, at nine in the morning, and at five in the afternoon, at London, I would know the sun's altitude, or height? Rule. Rectify the globe for the latitude, and bring the sun's place (one degree gemini) to the meridian, and the index to the upper twelve on the dial-plate; then screw the quadrant of altitude on the zenith, viz. the left edge of the nut must be fixed on the meridian, at fifty-one degrees thirty minutes, then turn the globe till the index points to the hour, viz. nine in the morning: this done, fix the globe by thrusting a quill between it and the horizon: lastly, turn the quadrant about till the graduated or figured edge touch the sun's place, (viz. one degree gemini) and the degrees on the quadrant, counted from the horizon upwards on the quadrant, is his height at that time, viz. forty-three degrees thirty minutes. Then turn the globe till the index points at five in the afternoon; and also turn the quadrant on the west side (without unscrewing it) till it touches the sun's place, and you have about twenty-four degrees on the quadrant, his altitude at that time. N. B. At North cape, (north latitude, seventy-two degrees at nine in the morning) May the 21st, he will not be but about thirty-two degrees high.

PROB. 13. *The latitude given, to tell the rising and setting of the sun, and length of the day and night, at any time of the year in any place.*] Rule. Rectify the globe, (viz. elevate it for the latitude; bring the sun's place to the meridian, and index to the upper twelve): then turn it till the sun's place comes even with, or lies right against the inner verge, on the east side of the horizon, then the index will shew you the time of the sun's rising; turn it to the west-side, or verge of the horizon, and the index will shew you the setting. Or thus: having got the hour the sun rises, count how many it wants of twelve, for so many hours will it set after. Thus, if the index points to four in the morning at rising, it will of course be at eight at night, &c. Proceed thus, and you will find the sun, on May the 26th, at London, to rise about four in the morning, and sets at eight at night. Now double what he wants of twelve at rising, viz. eight hours, and it gives the length of that day at London, viz. 16 hours.

PROB. 14. *To tell the sun's right ascension.*] Bring the sun's place to the brazen meridian, and note what degree of the equator is cut by the meridian, for that is his right ascension required. I would know the sun's right ascension on March the 21st, June the 21st, September the 22d, and December the 21st? I find the sun's place for these different days, and bring it to the meridian; I find the meridian cuts the equator in (0), in (90), in (180), and in (270 degrees) his right ascension requires. Note. When the sun enters Aries, March the 21st, he has no right ascension, because it is counted from, or begins at Aries; therefore, on March the 20th, he must have his greatest right ascension, viz. three hundred and fifty-nine degrees.

PROB. 15. *To find the sun's oblique ascension and descension at the time, and in any latitude.*] Rule. Rectify the globe for the latitude, and bring the sun's place down to the eastern verge of the horizon; then observe what degree the horizon cuts the equator in, for that is the oblique ascension required. Thus on March the 21st, June the 21st, September the 22d, and December the 21st, viz. when the sun enters Aries, Cancer, Libra, and Capricorn, you will find his oblique ascension at London to be (0), (56), (180), and (304). And on the same days his oblique descension will be (0), (123,) (180), and (237) and a half.

PROB. 16. *The latitude and day of the month given, to tell the sun's ascensional difference, viz. how much he rises, or sets, before and after six; and consequently to tell the length of the days, suppose there were no index to the globe.*] Rule. By the last problem find the sun's right, and oblique ascension; then subtract the oblique from the right ascension, or the contrary, and the remainder is the ascensional difference required; which divide by fifteen, the degrees of the equator that pass through the meridian of one hour, (or seven and a half for half an hour) gives the answer in time, that the sun rises and sets before and after six. Thus, on May 26, I find the sun six degrees of Gemini, and his right ascension is sixty-four degrees, and on the same day his oblique ascension is thirty-four degrees; now thirty-four degrees from sixty-four degrees there remains thirty degrees, his ascensional difference; which divide by fifteen gives two hours, the time that he rises before, or sets after six.

PROB. 17. *The latitude and day of the month given, to tell the sun's Amplitude, viz. his distance from the east and west points of the compass he rises and sets upon.*] Rule. The globe being rectified, bring the sun's place to the eastern verge of the horizon, (which shews his rising) then the degree upon the innermost circle of the horizon, counted from the true east point to the place where the sun's place lies against on the horizon, shews you the sun's amplitude. Proceed according to the rule, you will find the sun's amplitude at London, (May 21,) at rising, to be about thirty-four degrees from the east to the north, and at setting thirty-four degrees from the west to the north; and the point he rises upon is north-east

by

by east, and he sets north-west by west; but on November the 5th he has about twenty-five degrees and a half amplitude from the east to the south; and at setting twenty-five degrees and a half from the west to the south. The point he rises upon is east-south-east, and the point he sets upon is west-south-west.

PROB. 18. *The latitude and day given, to tell the sun's azimuth, viz. his distance from the east and west, or from the north and south points, at any time.*] Rule. Rectify the globe in general, then turn the globe till the index points to the given hour: this being done, turn the quadrant till it touches the sun's place for the given day; and then the quadrant will cut the horizon in the Azimuth required, from the east or west points, or from the north or south points; for you may reckon from either; only then name it properly, and accordingly. Thus, on August the 17th, at nine in the morning, the sun will have about thirty degrees azimuth from the east to the south, or which is the same, sixty degrees from south to the east; for sixty degrees and thirty degrees make ninety degrees, the whole quarter from east to south.

PROB. 19. *The latitude, day, and hour given, to tell the sun's almicanter.*] Definition; Almicanters are circles of altitude, that run parallel to the horizon, whose poles are the zenith and nadir; so that you may imagine as many circles of altitude, viz. almicanters, as you please. Rule. The almicanter is found the same as the altitude of the sun at any time, therefore I refer you back to Prob. 13.

PROB. 20. *The latitude and length of the day given to tell what other day of the year will be of the same length.*] Rule. Having found the sun's place for the given day, bring it to the meridian, and observe well its declination, then turn the globe till some other degree of the ecliptic comes under the same degree of declination under the meridian; this being done, see what day of the month answers to the sun's place then under the meridian, for that is the day required, which you may easily prove. Thus you will find July 13 and August 20 of the same length as May 26 and April 27.

PROB. 21. *The latitude and day given to tell the beginning, ending, and consequently the length, or continuance of twilight.*] Definition. Twilight is that faint light which begins immediately after the sun sets in the evening, till he is eighteen degrees below the horizon, and it begins in the morning, when the sun comes within eighteen degrees of the horizon on the east side, and ends when he rises: therefore it is plain that twilight is not only longer when days increase in length, but it is also much stronger.

PROB. 22. *The hour given where you are to tell what hour it is in any other part of the world.*] Rule. Bring the given place to the meridian, and set the index at the given hour, then turn the globe till the other place, or places, come under the meridian, and the index will point to the real time required. Example. When it is two o'clock in the afternoon at London, I would know the time at Jerusalem, and at Port Royal in Jamaica. Proceed according to the rule, and you will find that when it is two in the afternoon at London, it is twenty-five minutes past four at Jerusalem, and but fifty-two minutes past eight in the morning at Port Royal.

PROB. 23. *The day of the month given to tell those inhabitants that will have the sun in their zenith, or over their heads, on that day.*] This cannot happen to any other inhabitants but those in the torrid Zone; that is, to all such as have not twenty-three degrees and an half of latitude either north or south. Rule. Bring the sun's place to the meridian, and observe exactly his declination for that day, then turn the globe any way, and observe what places pass under that degree of declination on the meridian; for all such will have the sun right over their heads some time or other on that day.

PROB. 24. *The day and hour given in any place to tell those inhabitants, or that place, to which the sun is then vertical, viz. in the zenith.*] Rule. Bring the given place to the brazen meridian, and turn the index to the given hour; this done, turn the globe till the index points to the upper twelve, or noon; then look under the degree of declination on the globe of that day, for that is the very spot, or place to which the sun is then vertical. Example. On May 13, at eight minutes past five in the afternoon at London, I would know what place has the sun in their zenith. Answer, Port Royal in Jamaica. Thus also you will find, when it is thirty-three minutes past six in the morning at London, on April 12 and August 28, the inhabitants of Candy, in the island of Ceylon, will have the sun nearly in their zenith.

Concerning the MAGNET *or* LOADSTONE.] The Loadstone is found in iron mines, and is much of a colour and weight with iron. However, it is not to be melted and hammered out like iron, but flies to pieces under the hammer, and turns to a calx in the fire, which shews, that its parts exceed those of iron for hardness, rigidness, and an intricate combination one with another. Its known properties are these: first, when it moves freely and without any obstacle, it points north and south, so as that part of it that stands to one pole never turns to the other. The way to give it a free motion, is to swim it in the water upon a piece of wood. Philosophers have observed, that the loadstone does not always point full north and south, but sometimes inclines to the east or west without any rule. Though a loadstone has generally two poles pointing north and south, as we said before, yet there are some irregular ones, which seem to have more poles. As one loadstone holds up another, so it does iron of greater or less weight than itself. If iron dust be strewed upon a loadstone, the particles will dispose themselves directly between the poles, and then by degrees incline to an orbicular figure, so as to lie parallel with the axis of the loadstone, unless it be one of the irregular sorts before taken notice of. The loadstone imparts its virtue to iron so effectually, that iron, touched with a loadstone, appears to have all the properties aforesaid, though not in an equal degree. The great use of this communication is experienced in the mariner's needle, by the help whereof they readily find the north and south, and all other parts of the world.

Concerning the SEA.] The Sea is that vast quantity of salt water extending from north to south, and from west to east, surrounding the dry land on every side, into which all streams discharge themselves, and out of which mighty gulfs and bays are formed, the greatest of which is the Mediterranean. The whole is called the ocean, but variously distinguished and named from the several countries by whose coasts it runs. The saltness of the sea water seems to proceed from the same cause as that of several fountains, by the boiling of which water salt is produced; for since the bottom of the sea is of such vast extent, it is reasonable to suppose that there are large mines of salt in many parts of it, which being diluted, spread throughout the sea. In order to find out the reason why the water of the sea is not augmented, let us see whether there be not a way for its daily diminution as well as increase.

Concerning WINDS.] The winds may be divided into constant and variable: the former are always, at certain times of the year, and in certain parts of the world; but the latter vary so much, that they cannot be reduced to any rule. Now since it is easier to find out the cause of one regular effect, than of many irregular, let us, in the first place, treat of constant winds. And here we must take notice, that the winds are constant and periodical only in the open seas. Now the universal ocean may most properly be divided into three parts. 1. The Atlantic and Ethiopic ocean. 2. The Indian ocean. 3. The great South Sea, or pacific ocean; and though these seas do all communicate by the south, yet as to our present purpose of the periodical winds, they are sufficiently separated by the interposition of great tracts of land; the first lying between Africa and America, the second between Africa and India, and the last between China, Japan, and the coast of America. There is in the Atlantic and Ethiopic seas between the Tropics a general easterly wind all the year, excepting that it is subject to vary and deflect some few points towards the north or south, according to the position of the place. The winds in the Indian ocean are partly general, and in the Ethiopic ocean partly periodical; that is, half the year they blow one way, and the other half near upon the opposite points; and these points, and times of shifting, are different in different parts of this ocean; the limits of each tract of sea, subject to the same change, or monsoon, as the natives call it, are certainly very hard to determine.

The variable winds are felt most by land, and in such parts of the sea as are without the limits of the constant winds to the north and south; that is, in the colder parts of the ocean, and all over its outmost bays, the principal of which are the Mediterranean and Baltic: some are common to all countries, others are more peculiar to some particular parts. Of this latter sort the most famous are the hurricanes, which chiefly infest the Caribbees, but are not anniversary, nor equally frequent. Their fury is so great, that they throw down all before them, tear up trees, overturn houses, toss ships prodigiously, and blow about things of vast weight. They are not even, but blow in gusts, which suddenly come and go; neither do they extend very wide, but are sometimes confined to a narrow compass, and at other times take a larger scope. As for their duration, it is but for a few days, and sometimes only a few hours. They are more common in America than any where, though Europe and Asia are not altogether without them.

Wind is most properly defined to be the stream, or current of the air; and where such a current is perpetual, and fixed in its course, it is necessary that it proceeds from a permanent, unintermitting cause, which we conceive to be the action of the sun beams upon the air and water, as he passes every day over the oceans, considered together with the nature of the soil, and situation of the adjoining continents: therefore, first, according to the laws of statics, the air, which is less rarefied or expanded by heat, and consequently more ponderous, must have a motion towards those parts thereof, which are more rarefied and less ponderous, to bring it to an equilibrium; and, secondly, the presence of the sun continually shifting to the westward, that part towards which the air tends, by reason of the rarefaction made by his great meridian heat, is with him carried westward, and consequently the tendency of the whole body of the lower air is that way. Thus a general easterly wind is formed, which being impressed upon all the air of a vast ocean, the parts impel one another, and so keep moving till the next return of the sun, whereby so much of the motion as was lost is again restored, and thus the westerly wind is made perpetual.

With respect to the common phænomena of winds, the dry ones are such as carry few vapours along with them, and therefore draw off the moist particles from bodies over which they pass. Thus in Holland the north and east winds, with the intermediate points, are drying, because the cold northern sea yields but few vapours, in comparison of those which come from warmer parts of the ocean; and from thence towards the east are vast tracts of land, where the heat at Midsummer is but very small. But the other winds, especially the westerly, are moist, because they issue from warm and vaporous parts. The Western Ocean seldom fails to send us rainy winds; however, this property varies according to the various situation of countries. Such winds gather clouds as blow from the quarters where the vapours arise, which, in conjunction with the vapours of our own region, fill the air. On the other side, those winds make fair weather, which bring little vapour along with them, and bear away that which hangs over us.

When the air gets loose from those broken bubbles in which it was before imprisoned, that which happens to be pent in betwixt the clouds is necessarily very much dilated by the inflammable substances, and therefore being hemmed in on every side by thick clouds, which contrary winds heap together round it, or by the falling in of one cloud upon another, does, by its expansive force, burst its passage through them with a violent explosion, and causes that crack or rumbling which we call thunder. The clap seems continued or reiterated by reason of the sound being reflected from the surface of different clouds, which causes so many repetitions or echoes.—When a flash is projected through a large extent of air, or sets fire to a train of other inflammable matter within the sphere of its action, it is what we call lightning.—If the quantity of fiery particles issuing from the bubbles of water, upon the collision of two clouds be very small, forming only a little globe of fire, which shoots out into a little train of light in the air, and strait-way disappears, this is what the common people call a falling star.

ASIA.

OBSERVATIONS CONCERNING ASIA IN GENERAL.

THOUGH it is natural for the inhabitants of that quarter of the globe in which we live, from an innate fondneſs, to give the preference to Europe, nevertheleſs Aſia is eſteemed to be, in all reſpects, the moſt conſiderable part of the world, and is entitled to the firſt rank, on account of its many ſingular advantages above the reſt. We ſhall inſtance a few particulars; in Aſia, the Creator of the Univerſe planted the delightful garden of Eden, wherein he placed the firſt parents of mankind, from whom the whole race of human beings deſcended. Aſia, whoſe countries are firſt enlightened by the riſing ſun, became the nurſery of the world after the general deluge, and from thence the deſcendants of Noah diſperſed their various colonies into all other parts of the habitable globe. In Aſia, God made choice of that fertile ſpot Canaan, wherein he placed his favourite and antient people the Jews. Here, alſo, the great and ſtupendous work of our redemption, was accompliſhed by his divine Son: and from hence his diſciples and followers diffuſed the light of his glorious goſpel amongſt the ſurrounding nations. Here, likewiſe, were founded the firſt chriſtian churches; the firſt councils were held; the firſt biſhopricks erected, and the chriſtian faith miraculouſly founded, promulgated, and watered with the blood of a glorious army of martyrs. In ſhort, in Aſia the firſt edifices were reared, the firſt cities built, and the firſt kingdoms and monarchies founded, at a time when the other parts of the world were the haunts of wild beaſts, or but very thinly, if at all inhabited.

Beſides the above-mentioned advantages, Aſia ſurpaſſes the other parts of the world in the extent of its territory, the richneſs of its ſoil, the ſerenity of its air, the delicious flavour of its fruits, the ſalutary quality of its drugs, and the fragrancy and balſamic nature of its plants, ſpices, gums, &c. the value, beauty, variety, and quantity of its gems; fineneſs of its ſilks, cottons, &c. the richneſs of its metals, beſides various other excellencies: all which peculiar advantages, rendered it ſo charming and delightful an abode, that it was for a long ſeries of years the reſidence and ſeat of the greateſt monarchies in the world. But ſince the Turks, who are enemies to all politeneſs and the fine arts, have poſſeſſed a conſiderable part of it, much of its ancient ſplendor has been entirely loſt; the moſt fruitful and delightful ſpot in all Aſia, reſembles a wild, uncultivated deſart, and ſince that time, is only remarkable for the rich commodities it affords, but is ſtill viſited and reſorted to by merchants of other nations, on that account. Such parts of this country as have eſcaped the barbariſm of the Turks, are ſtill in a flouriſhing ſtate, notwithſtanding the inhabitants are juſtly cenſured for their indolence, effeminacy, and luxury: ſo that this advantage may be rather aſcribed to the richneſs of the ſoil, than to the induſtry of the inhabitants.

Hiſtorians, in general, impute the effeminacy of the natives of this country, chiefly to the warmth of the climate, heightened by cuſtom and education; conſequently it is leſs prevalent, the nearer they are ſituated to the north; hence the ſouthern countries do not produce ſuch robuſt natives as the northern ones; from whence it is inferred, that thoſe Aſiatics who live nearly in our latitude, are, in this reſpect, not much inferior to us; and that the northern Turks and Tartars, particularly, are very ſtrong and courageous. We muſt, however, obſerve, that they who live in the more ſouthern regions of Aſia, experience the deficiency of robuſtneſs in their bodies, to be in a great meaſure ſupplied to them by the vivacity of their mind, and their ingenuity in various kinds of workmanſhip, which our moſt expert mechanics have in vain endeavoured to imitate.

We will not pretend to determine, whether the reflection which is commonly caſt on all the Aſiatic nations, that they are naturally ſordid admirers of monarchy, be altogether juſt; ſince their princes have always kept them in ſuch abject ſlavery and ſubjection, that they never had the leaſt opportunity of diſplaying their love of liberty, which we may ſuppoſe to be as congenial with them, as with the reſt of mankind. It muſt, however, be confeſſed, that many of thoſe people, when the Dutch firſt came among them, could not conceive how it was poſſible for any nation to live under any other than a deſpotic government (which is the only one eſtabliſhed throughout that vaſt country) or how that people could ſubſiſt under a republican one.

A ſtupid kind of religion now prevails in Aſia, a great part of it being over-run with Mahometaniſm, particularly Turky, Arabia, part of India, and Tartary; they profeſs the ſame in Perſia, and the empire of the great Mogul, but are of the ſect of Hali, which, in ſome reſpects, differs from that of the Turks, though both of them acknowledge Mahomet for their lawgiver, and the alcoran for their divine rule of faith and practice. In China, Japan, Siam, &c. they are, for the moſt part, heathens and idolaters; have ſtrange notions of the Deity, or rather of their deities, and uſe the moſt extravagant rites in their worſhip of them, as we ſhall have occaſion to ſhew hereafter; but muſt obſerve here, that their multiplicity of idols, and ſuperſtitious ceremonies attending the

worſhip of them, are only regarded by the populace, for whom they are chiefly calculated by the prieſts, who are thereby conſiderable gainers; and whatever countenance men of ſuperior talents and wiſdom may ſeem to give them in outward appearance, they are of too philoſophic a turn of mind not to deſpiſe them in their hearts. There are, beſides, ſeveral ſects of the antient Perſees, or followers of the great Zoroaſter, diſperſed all over India and Aſia, who acknowledge but one ſupreme Deity, and are ſtiled Fire-worſhippers, becauſe they pay their addreſſes to it under the ſymbol of that element. Theſe are avowed enemies to every ſpecies of idolatry, imagery, temples, &c. which they conſider as unworthy the ſupreme Being, who, they affirm, neither can, nor ought to be repreſented by images, nor confined in temples. Theſe ſects, among whom are included the brahmans or brachmins, are reckoned the moſt conſiderable, and are alſo very humane and benevolent, lead a contemplative life, feed only upon vegetables, and are ſo far from killing any living creatures for their uſe, or even noxious ones in their own defence, that they even provide hoſpitals for ſuch as are decayed through age, accident, or any other infirmity; and beſtow a peculiar degree of attention and care on domeſtic animals.

Aſia, as we before obſerved, was celebrated for being the favoured quarter of the world, where the chriſtian religion was firſt planted, from whence it ſpread with ſuch amazing rapidity and ſucceſs, that even in the apoſtolic age it had reached as far as India, if not beyond, and was almoſt univerſally received and profeſſed. But as the degeneracy of thoſe converts produced that denunciation recorded by St. John, *Rev.* ii. 5. the churches of Aſia Minor were abandoned to perſecution, and at length almoſt utterly deſtroyed by the irruption of the northern barbarians, Saracens, Tartars, and Turks; and although the pure light of the goſpel could never be totally extinguiſhed by them, but great numbers of chriſtians in different parts of Aſia continued to adhere to it; yet they have always been kept under ſuch abject ſubjection by the tyranny of the ruling powers, and are ſo to this day, that their preſent ſituation, as they have neither compaſſion nor toleration granted them, may juſtly be deemed a ſtate of miſery and oppreſſion.

The continent of Aſia is ſituated between twenty-five and one hundred and forty-eight degrees of eaſt longitude from London, and between the equator and ſeventy-two degrees north latitude, excluſive of the iſlands which lie to the ſouth. It is about four thouſand ſeven hundred and forty miles in length, from the Dardanelles on the weſt, to the eaſtern ſhore of Tartary; and about four thouſand three hundred and eighty miles in breadth, from the moſt ſouthern part of Malacca, to the moſt northern cape of Nova Zembla. It is bounded by the frozen ocean on the north; and is ſeparated from Africa on the weſt, by the Red Sea; and from Europe by the Levant, the Archipelago, the Helleſpont, Propontis, Boſphorus, the Black Sea, the river Don, and a line drawn from it to the river Tobal, and from thence to the Oby, which falls into the Frozen Ocean; on the eaſt, it is bounded by the Pacific Ocean, and on the north by the Indian Ocean.

The moſt conſiderable monarchies or ſovereignties of Aſia, at preſent known to us, amount to forty-two; four of theſe are ſtiled entire empires; namely, Perſia, Great Mogul, China, and Japan; alſo Turky and Muſcovy, which are part of two more, whoſe moſt conſiderable ſhares are in Europe.

Aſia comprehends thirty-three kingdoms, twenty-ſix of which are on Terra Firma, and the other ſeven are inſular ones. Of the former ſort are, 1. Yemen; 2. Sartach, in Arabia; 3. Nizapor; 4. Golconda; 5. Biſnagar; 6. Calicut; 7. Cochin, in the peninſula of India, on this ſide of the Ganges; 8. Siam; 9. Camboya; 10. Ava, alias Pegu; 11. Acham; 12. Aracham; 13. Tonquin; 14. Cochinchina; 15. Jaos in the peninſula, on the other ſide the Ganges; 16. Barantola, alias Laſſa; 17. Neckbat; 18. Cogua, alias Great Thibet; 19. Nanyu; 20. Little Thibet; 21. Kalghar; 22. Corea; 23. Samareand; 24. Becha, in Great Tartary; 25. Mingrelia; 26. Imeretia, in Georgia.—The ſeven inſular ones are, 1. In the Maldivia Iſles; 2. Candi, in the iſle of Ceylon; 3. Achem; 4. Materan; 5. Borneo, in the iſlands of thoſe names in the Sound; 6. Macaſſer; and 7. Ternate, in the Molucca iſlands.

In addition to the above-mentioned ſovereignties, we may reckon three eſtabliſhed here by the Europeans, as follow; 1. Of the Spaniards, in the Philippine iſlands; 2. Of the Portugueſe, in Goa, and other coaſts of India; 3. Of the Dutch, in Batavia, Java, Ceylon, and other iſles and coaſts. Alſo the Engliſh ſettlements at Bombay, Fort St. George, &c. and the Daniſh at Malabar, the coaſts of Coromandel, &c. There are alſo ſome independent, or vagrant nations, who have no ſettled abode; the moſt conſiderable of theſe (who live in hords, independent of each other) are the tribes called Bengebres, Bedwins, and ſome others in Arabia, and the Calmuc or Kalmac in Tartary; theſe move their tents from place to place as occaſion offers, or fancy prompts them.

Notwithſtanding the great number of different tongues and dialects ſpoken in this vaſt extent and variety of nations, we can with truth affirm, that Aſia has, by far, the feweſt of any other part of the world; this is chiefly owing to the very extenſive empires compriſed in it, each of which ſtrives to introduce an uniformity of language among the ſubjects of it. The principal ones are, the Perſian, Arabic, Tartarian, Chineſe, Japaneſe, Malayan, and Malabarian. The European languages, viz. the Portugueſe, Spaniſh, Engliſh, and Dutch; the Greek and Latin among the Chriſtians, and the Hebrew among the Jews, are only uſed by thoſe foreigners who have introduced them for their own convenience, and are little known to the natives.

As Aſia extends itſelf quite from the equator to the polar circle, and even beyond, conſequently the climates muſt be ſo various that a minute detail of them, and their peculiar products, would, in this place, be tedious, and lead us into too great a length, ſince the ſoils muſt naturally vary, according to their different ſituations. We ſhall, therefore, only ſay at preſent, till we come to deſcribe each part in a more particular manner, that Aſia comprehends all the temperate, the larger half of the torrid, and great part of the frigid zone; ſo that it enjoys no leſs than twenty-four climates; yet, upon the whole, the country is rich and fruitful, and ſome parts of it exceedingly ſo, if we except ſome parts of Arabia and Tartary, and ſome of the more northern tracts.

In order to avoid as much as poſſible the ſcrupulous niceties, and, in ſome caſes, the miſtakes and errors of other geographers, we ſhall, in our diviſion of this great part of the world, conſider it with reſpect to the different dominions it is at preſent ſubject to; namely,

I. PERSIA.

II. CHINA, which is divided into north and ſouth.

III. INDIA, comprehending, 1. The peninſula of India beyond the Ganges, containing Cochinchina, Tonquin, Pegu, and Siam, the laſt of which is ſubdivided into Martaban, Siam, and Malacca. 2. The peninſula on this ſide the Ganges, containing the Decan, Golconda, Biſnagar, and Malabar.

IV. HINDOSTAN, or the empire of the Great Mogul, as it is generally, though improperly, called in Europe, the title not being aſſumed by the emperor there. In this great empire are many petty kingdoms, lately erected into free ſtates, or fallen under the juriſdiction of the Engliſh Eaſt India company.

V. GREAT TARTARY, SIBERIA, SAMOJEDIA, and ASIATIC RUSSIA.

VI. TURKY in ASIA, which is divided into eaſtern and weſtern. The eaſtern contains Diarbeck, Turcomania, and Georgia; the weſtern comprehends Arabia, Paleſtine, Syria, and Anatolia.

VII. The ASIATIC iſlands are divided into four claſſes; 1. The iſland, or empire of Japan; 2. The iſlands of the eaſtern ocean; viz. the Marian or Ladrone iſlands, Formoſa, and the Philippine iſlands; 3. Thoſe in the Indian ocean, which are the Moluccas, namely, Tydore, &c. and the Spice iſlands; viz. Banda, Amboyna, Ceram, Ternate, Timor, Gilolo, &c. Celebes, Borneo, Java, Sumatra, Ceylon, the Maldivia iſlands, &c. 4. On the coaſts of Aſia, and in the Mediterranean, as Cyprus, Rhodes, Leſbos, or Mytelene, Chios or Scio, Samos, Coos, and ſome others of leſs note, with the *New Diſcoveries*.

Theſe laſt diviſions not coming into any of the former claſſes, muſt be ſpoken of in ſeparate articles.

It is not unlikely that ſome may object here, that Tartary is not under one government; that India, beyond the Ganges, is independent of the Great Mogul, as Arabia is of the Turks; and that Georgia, Mingrelia, &c. are ſubject partly to the Turks, and partly to the Perſians, and conſequently that each of theſe ſhould be divided into its reſpective parts. But, in this introductory part of our work, we think it more eligible to avoid clogging our readers' memory with too many diſtinctions, which will be more properly introduced, when we treat of each particular part. However, a clear idea of the continent, iſlands, &c. of this quarter of the globe may be obtained from the ſeveral following tables:

ASIATIC

ASIATIC TABLE.

A NEW, COMPLETE, and GENERAL TABLE of the CONTINENT of ASIA.

Asia is considered under Six Grand Divisions, viz.

	Nations.	Length.	Breadth.	Principal Cities.	Distance and Bearing from London.		Religions.
	Persia	1300	1100	Ispahan	2460	S. E.	Mahometans
	China	1440	1260	Pekin	4320	S. E.	Pagans
	India	2000	1000	Siam	5040	S. E.	Pagans
	Mogul Empire	2042	1400	Dehli	3720	S. E.	Mah. & Pagans
Great Tartary.	Russian	Limits not to be ascertained, being frequently changing by continual wars.		Tobolski	2160	N. E.	Christ. & Pag.
Great Tartary.	Chinese			Chynian	4480	N. E.	Pagans
Great Tartary.	Mogulean			Tibet	3780	E.	Pagans
Great Tartary.	Independant			Samarcand	2800	E.	Pagans
Turkey in Asia.	Arabia	1300	1200	Mecca	2640	S. E.	Mahometans
Turkey in Asia.	Syria	400	200	Aleppo	1860	S. E.	Christ. & Mah.
Turkey in Asia.	Holy Land	200	180	Jerusalem	1920	S. E.	Christ. & Mah.
Turkey in Asia.	Natolia	600	320	Smyrna	1440	S. E.	Mahometans
Turkey in Asia.	Mesopotamia	600	300	Bagdat	2160	S. E.	Mahometans, with some Christians.

A NEW and COMPLETE TABLE of the ISLANDS, &c. in ASIA.

In the PACIFIC and INDIAN OCEANS.

Names.		Chief Towns.	Belonging to, or trade with
Japanese	Islands.	Jeddo	Dutch
Ladrone	Islands.	Guam	Spain
Formosa	Islands.	Tai-ouan-fou	China
Philippines	Islands.	Manilla	Spain
Banda	The Molucca or Spice Islands.	Lautor	Dutch
Amboyna	The Molucca or Spice Islands.	Amboyna	Ditto
Celebes	The Molucca or Spice Islands.	Macassar	Ditto
Gilolo	The Molucca or Spice Islands.	Gilolo	Ditto
Machian	The Molucca or Spice Islands.		
Motyer	The Molucca or Spice Islands.		
Ternate	The Molucca or Spice Islands.		
Tydore	The Molucca or Spice Islands.		
Borneo	Sunda Islands	Borneo, Achen, Bencoolen, Batavia, and Bantam.	Various nations; particularly the English and Dutch
Sumatra	Sunda Islands		
Java	Sunda Islands		
Andaman	Islands	Andaman	Various nations
Nicobar	Islands	Nicobar	Ditto
Ceylon	Islands	Candy	Dutch
Maldives	Islands	Caridon	Various nations
Bombay	Islands	Bombay	English
Kurile, or Kamtschatka	Islands	Nothing worthy the name of a town.	Russians
New Holland	Islands	Botany Bay	English
New Guinea & Papua	Uncolonized.	With a Variety of otherfmaller and more scattered Islands, inhabited by different Nations of the Indians, which have been lately visited by European Navigators, and will be particularly described in this Work.	
New Britain	Uncolonized.		
New Ireland	Uncolonized.		
New Hebrides	Uncolonized.		
New Caledonia	Uncolonized.		
New Zealand	Uncolonized.		
The Friendly and Society isles	Lately discovered.		

In the Levant, belonging to the TURKS.

Cyprus	Nicolia	Merchants of all nations are allowed to trade hither under the particular restrictions of the Turks.
Rhodes	Rhodes	
Lesbos or Mytelene	Castro	
Scio	Scio	
Samos	Cora	
Nicaria	No town worth naming	
Stanchio	Stanchio	

The greatest Number of these Islands lying in Clusters, we cannot in the Limits of this Table give the Length and Breadth; therefore we refer our Readers to our particular Description of each Island.

A GENERAL TABLE of SEAS, LAKES, RIVERS, &c. IN ASIA.

Seas and Lakes.	Rivers.	Mountains.	Religions.		Language.
Caspian	Euphrates	Caucasus	Antilibanus	Idolaters — Who follow the opinions of: Foe, Confucius and Brama	Arabic
Dead Sea	Tigris	Taurus	Carmel		Persian
El-Catif	Jordan	Corax	Sinai		Tartarian
Sea of Galilee	Indus	Imaus	Horeb		Chinese
Samochonites	Ganges	Coronus	Olympus		Japanese
Gennesareth, &c.	Oby	Orminius	Gilead	Mahometans — Who follow the opinions of: Mahomet Ali	Malayan
	Orchardus	Cadmus	Masias		Malabarian and Portuguese corrupted, &c. &c.
	Volga, Chefel	Ida	Singarus		
	Oxus, Arbis	Siphylus	Casius	Fire Worshippers — Who follow the opinions of: Zoroaster	
	Samadaces	Timolus	Pieria, &c.		
	Cyrus	Mesagys		Jews — Who practise the Laws of Moses.	
	Cambyses	Mimu			
	Amardus	Larmus		Christians — Who profess the Doctrines of Christ.	
	Strato	Mycale			
	Corindas	Phœnix			
	Caritas, &c.	Libanus			

Having thus preſented to the view of our readers, a ſketch of the plan we mean to purſue, in the deſcription we are about to give of the Aſiatic dominions (in doing which, we ſhall endeavour to be ſo clear and comprehenſive, that nothing material ſhall be omitted) we ſhall now proceed to give a full and complete hiſtory and deſcription of the kingdom of Perſia, a kingdom of very conſiderable importance; on which account, as well as that we may not be thought mere copyiſts, like former writers on this ſubject, we give theſe extenſive and celebrated provinces, the lead in the Aſiatic part of the work.

CHAP. I.

THE NEW HISTORY AND DESCRIPTION OF

PERSIA.

SECT. I.

Containing a Deſcription of the Name, Boundaries and Extent, Situation, Provinces, Air, Climate, &c. Seas, Rivers, celebrated Iſlands, and their Produce, of the Empire of PERSIA, both with Reſpect to its antient and preſent State.

IT is highly probable that Perſia derives its name either from the province of Perſis, now called Fars, or from Perſepolis, which was antiently the capital city of this province, and the ſeat of its monarchs, when Alexander the Great conquered Darius, and ſubdued the whole country. Some claſſic writers deduce its name from Perſeus, the ſon of Jupiter and Danae; while others take it from Paras, a horſeman, becauſe the Perſian troops ſerved on horſeback, and were famous for their ſkill in horſemanſhip.

Though the boundaries of this empire will be better underſtood from the deſcription of its reſpective provinces, yet ſome geographers affirm them to be as follows; viz. India, or the dominions of the Mogul, towards the eaſt; the ocean, or Perſian gulf, or Boſſora, towards the ſouth; the Turkiſh empire towards the weſt; and Circaſſia, the Caſpian ſea, and the river Oxus (which divides it from the country of the Uſbeck Tartars) towards the north. We muſt allow that this deſcription would be tolerably juſt, were the bounds of the Mogul's dominions on the eaſt, and thoſe of the Turkiſh empire on the weſt, once ſettled. As ſeveral provinces of India lie to the weſtward of Indus, and ſome of the Turkiſh provinces extend to the eaſtward of the river Tigris; conſequently thoſe writers muſt err, who make the river Indus the eaſtern boundary, and the Tigris the weſtern; to which we may alſo ſubjoin, that part of the Arabian coaſt, on the ſouth of the gulf of Boſſora, is ſubject to the king of Perſia.

The moſt ſouthern part of Perſia lying in twenty-five degrees north latitude, and the moſt northern part in forty-five degrees, it may be juſtly reckoned to be twelve hundred miles in extent, from north to ſouth; and as the weſtern part of it lies in forty-five degrees of longitude, calculating from the meridian of London, and the moſt eaſtern part in ſixty-ſeven, the length and breadth is nearly equal; and the form of the country would be almoſt ſquare, were it not for the Caſpian ſea, which divides the north-eaſt parts of Perſia from the north-weſt. They are certainly egregiouſly miſtaken, who extend it thirteen degrees beyond our moſt accurate accounts; for by that means, they make it to contain thirty-five degrees of longitude, and the length greatly to exceed the breadth.

The Perſian provinces may all be comprehended in twelve diſtricts, in the following order; Choraſan, Sableuſtan, Sigiſtan, Makeran, Kerman, Fars, Chuſiſtan, Curdeſtan, Irac-Agem, Ghilan, Adarbeitzen, and Shirvan. We ſhall ſhew the different names by which they were antiently, and are now called; and that the reader may not remain in any doubt concerning them, we ſhall take care (where other writers name two or more, in the bounds of one of theſe diſtricts) generally to mention them both.

We ſhall deſcribe the whole of this extenſive empire, in the moſt circumſtantial manner, and arrange the ſeveral provinces as follow:

I. Choraſan (in which Eſterabad or Kheman may be included, though ſome reckon them diſtinct provinces) is bounded, towards the eaſt, by part of India; on the north-weſt, by the river Oxus, which divides it from Uſbeck Tartary; on the ſouth by the province of Sableuſtan; on the weſt, by Ghilan and Irac-Agem; and by the Caſpian ſea on the north-weſt. The chief towns are Herad, Meſchid or Thus, Nizabour, Eſterabad, Aria, Maron, Indion, and Zarchas. This province contains part of the antient Bactria.

II. Sableuſtan, (in which Gaur and Candahor may be comprehended) is bounded, towards the north, by Choraſan; towards the eaſt, by the province of Cabul, in India; towards the ſouth, by the province of Sigiſtan; and, towards the weſt, by the province of Irac-Agem. Gazna, Buſt, Beckſabath, and Candahor, are the chief towns.

III. Sigiſtan; which is bounded, on the north, by Sableuſtan; towards the eaſt, by the province of Multan, in India; on the ſouth, by the province of Makeran; and, towards the weſt, by part of the province of Kerman. Sigiſtan, Kobin, and Maſtich, are the chief towns. This province is ſaid to be the antient Drangiana.

IV. Makeran; which is bounded on the north, by Sigiſtan; towards the eaſt, by the provinces of Buckor and Tata, in India; towards the ſouth, by the ocean; and towards the weſt, by the province of Kerman. Makeran, Paſſir, and Geſt, are its chief towns. This province is ſuppoſed to be the antient Gedroſſia.

V. Kerman; which is bounded, towards the eaſt, by the provinces of Sigiſtan and Makeran; towards the ſouth, by the ocean; towards the weſt, by the province of Fars; and, towards the north, by a deſart in the province of Irac-Agem. The chief towns are Kerman, Chabis, Salem, Tubaran, Jaſques, and Darabegerd, which was the antient Paſſagardi.

VI. Fars, or Farſiſtan; which is bounded, towards the eaſt, by Kerman; towards the ſouth, by the gulf of Perſia, called Boſſora; towards the weſt, by the province of Chuſiſtan; and towards the north, by the province of Irac-Agem. The chief towns are the following; 1. Schiras, which lies in the latitude of twenty-nine degrees, fifty minutes, about thirty miles ſouth-weſt from Perſepolis, whoſe magnificent ruins excite the admiration of travellers; but of this we ſhall have occaſion to ſpeak hereafter. 2. Lar; about a hundred miles ſouthward of Schiras, Gombron, or Bander Abaſſi, in twenty-ſeven degrees thirty minutes north. 3. Ormus; which ſtands on a ſmall iſland of the ſame name, in the gulf of Perſia, oppoſite to Gombron, and about ſix miles from it. 4. Bander Congo; which alſo ſtands on the Perſian gulf, about thirty miles weſt of Gombron. It may not be improper to take notice here of a ſmall territory belonging to the kingdom of Perſia, which lies on the Arabian ſhore, on the other ſide of the gulf; the chief towns of it are Catena and Elcatif, from whence this ſea ſometimes takes the name. In the province of Fars, may be comprehended the diſtricts of Lar and Ormes.

VII. Chuſiſtan; which is bounded, on the eaſt, by the provinces of Fars and Irac-Agem; on the ſouth, by the gulf of Perſia; on the weſt, by the territory of Boſſora;

and, on the north, by the province of Curdeſtan. The chief towns are, 1. Suffer, or Schourter, ſuppoſed to be the famous Shuſhan, where Ahaſuerus made that magnificent feſtival, mentioned in ſcripture, on his marriage with Eſther. 2. Elmais; and 3. Banderick, now a ſmall town on the ſea coaſt. This province was called Suſiana by the antients.

VIII. Curdeſtan; which is bounded, on the eaſt, by Irac-Agem; on the ſouth, by Chuſiſtan; on the weſt, by Turkiſh Curdeſtan; and, on the north, by Aderbeitzen. Arnova and Courmebud are the chief towns in it. This province was the Aſſyria of the antients; the weſtern part of it belongs to Turky, and the caſtern to Perſia.

IX. Irac, or Erack-Agem; which is bounded, on the north, by Aderbeitzen and Ghilan (antiently called Hyrcania) on the eaſt, by the province of Choraſan; on the ſouth, by Chuſiſtan and Farſiſtan; and, on the weſt, by Curdeſtan. The chief towns in this province are, 1. Iſpahan, the metropolis of the kingdom, in thirty-two degrees forty minutes north latitude, and the fiftieth degree of longitude, reckoning from the meridian of London. 2. Caſbin, or Caſwin (where the antient Arſatia ſtood) in thirty-ſix degrees odd minutes. 3. Com, ſituate in thirty-four degrees thirty minutes. 4. Sava, almoſt exactly between Caſbin and Com. 5. Hamadan, about a hundred miles north-weſt of Com. 6. Caſham, about ſeventy miles north of Iſpahan. 7. Yeſd, about one hundred and five miles to the eaſtward of Iſpahan. Irac-Agem, was the antient Parthia, and is now reckoned the principal province of the empire, being very extenſive, almoſt in the centre of the Perſian dominions, and the province where the capital city ſtands.

X. Ghilan, or Kylan, (in which Mazanderan, or Tabriſtan, may be comprehended) which is bounded, on the north, by the Hyrcanian or Caſpian ſea; on the eaſt, by the province of Choraſan, or Bactria; on the ſouth, by the province of Irac-Agem, or Parthia; and, on the weſt, by Aderbeitzen. Its chief towns are, 1. Reſcod. 2. Ghilan, ſituate in thirty-eight degrees north latitude, and two hundred miles eaſt of Tauris. 3. Mazanderan, one hundred miles further eaſt. 4. Aſherol, within two miles of the Caſpian ſea. 5. Tabriſtan; and, 6. Ferabat. This province (as we hinted above) was antiently called Hyrcania.

XI. Aderbeitzen, or Adirbajon; which is bounded, on the north, by the province of Shirvan; on the eaſt, by Ghilan and part of the Caſpian ſea; on the ſouth, by Irac-Agem and Curdeſtan; and, on the weſt, by the river Aras, or Araxis, which ſeparates it from part of Georgia. The following are its chief towns. 1. Tauris, or Tabris, ſuppoſed to be the antient Ecbatana, formerly the royal reſidence of the Median and Perſian monarchs, and eſteemed little inferior to Babylon, either for its antiquity or magnificence; it lies in thirty-eight degrees odd minutes of north latitude, and is about four hundred miles north-weſt of Iſpahan. 2. Ardevil, or Ardebil, ſtands about thirty miles eaſt of Tauris. 3. Sultania, which is ſix days journey to the ſouth-eaſt of Tauris, in thirty-ſix degrees thirty minutes north latitude. This province is the ſouthern part of the antient Media.

XII. Shirvan, or Schirwan; which is bounded, on the north, by Circaſſia, and the Muſcovite dominions; on the eaſt, by the Caſpian ſea; towards the ſouth, by Aderbeitzen; and towards the weſt, by Turkiſh Armenia and Georgia. The chief towns in this province, are, 1. Derbent, or Debircan, which ſignifies an iron gate; it is a very ſtrong paſs between the mountains and the Caſpian ſea, in forty-two degrees north latitude. 2. Schamachie, which is ſituate about fifty miles to the ſouth of Derbent. 3. Baku; this town ſometimes gives name to the Caſpian ſea, and ſtands a little to the ſouthward of Schamachie. 5. Tafflis, or Cala, the capital of eaſtern Georgia; it ſtands in forty-four degrees of north latitude, and forty-eight degrees of longitude, reckoning from the meridian of London. 5. Erivan, or Irvan, lies in forty degrees odd minutes, upon the river Sargi, near the borders of Armenia. 6. Gangea lies between Erivan and Schamachie. 7. Nackſivan, or Naziwan, is ſituate twenty-one leagues ſouth of Erivan. This was antiently the capital of an Armenian province, and the natives affirm, from an antient tradition, that Noah built the city, when he firſt came out of the ark: the word "Nackſivan" ſignifying a ſtation for ſhips. 8. Tarku, which is the capital of Dagiſtan. 9. Old Julpha, which is, at preſent, a heap of ruins; the Armenian inhabitants having been tranſplanted to Iſpahan, near which city they have a conſiderable town, and are become the greateſt merchants in the Perſian dominions; and as they have their agents and factors in almoſt every place throughout Europe and Aſia, they may with propriety be eſteemed the greateſt traders in the whole world.

As the kingdom of Perſia reaches from the twenty-fifth to the forty-fifth degree of latitude, the longeſt day in the ſouth is thirteen hours and an half; and, in the north, above fifteen hours; ſo that it is very natural to ſuppoſe that, in ſuch a vaſt extent of country, the air and ſeaſons greatly differ, which we find they really do. Their winter, in the middle of the kingdom, begins in November, and continues till March, with ſevere froſts and ſnow, the latter of which falls in great quantities on their mountains, but not ſo much in the plains. From March till May, the wind is commonly high; and from that time till September, they enjoy a calm ſerene atmoſphere, without ſo much as a cloud in the heavens; and though it be pretty hot in the day time, the refreſhing breezes, which blow conſtantly in the morning and evening, and at night, make the ſummer tolerably pleaſant, eſpecially as the nights are nearly ten hours long. The air is very pure; and the ſtars ſhine with ſuch luſtre, that one perſon may know another very well by their light; and people in general, find it much more convenient and agreeable to travel in the night, than in the day time.

There are ſeldom any hurricanes or tempeſts in the middle of Perſia, and very little thunder or lightning; nor have they many earthquakes, and the air is ſo extremely dry in the fine ſeaſon, that there is not the leaſt moiſture found on any thing that is laid abroad all night, or even on the graſs; and they have very little rain in the winter ſeaſon. It is a common obſervation among foreigners, who have travelled to the heart of Perſia, that thoſe who are healthful on their arrival thither, continue ſo; and that thoſe who are ſick, ſeldom recover; which is a manifeſt indication of the ſalubrity of the air and climate, and further appears from the hale complexion of the natives, who are ſtrong and robuſt, and generally enjoy a conſtant ſeries of health.

In the ſouthern part of Perſia, the air is very unhealthful in the ſpring and fall, particularly about Gombron; the European factors never paſs a year without a dangerous fit of illneſs, which frequently proves fatal to them. As this event is always expected to happen, two of them commonly agree, that if one die, the fortune of the deceaſed ſhall devolve to the ſurvivor. This is no great prejudice to the relations; for if a man leaves private truſtees, or makes the company his executors, the heir of the deceaſed will, in either of thoſe caſes, meet with great difficulties in recovering the effects of the teſtator. The months of June, July, and Auguſt, are pretty healthy, but ſo very hot, that both natives and foreigners get upon the mountains at that time. The hot winds, which come from the eaſtward over a long tract of ſandy deſerts, well nigh ſuffocate them; and ſometimes a peſtilential blaſt ſtrikes the traveller dead in an inſtant. It ſeldom rains here in any part of the year; and the water they ſave when it does, is very unwholſome. It has been commonly remarked, that the countries near the tropics are much hotter than thoſe under the line; which is accounted for, from the ſun's remaining longer near the tropics, than the equator; and the days being of a greater length in ſummer near the tropics, than under the line; which are certainly very ſubſtantial reaſons. But a great deal muſt be attributed to the nature of the ſoil, and the ſituation of the country, where the winds blow over large, ſandy, and ſcorching deſerts; and eſpecially between the mountains, which reflect the heat from one ſide to the other; and there are no refreſhing breezes or ſhowers to cool the air, as there generally are near the line; ſo that it is no wonder that thoſe countries are much hotter than any that are under the equator, as thoſe near the Perſian gulf certainly are. The moſt probable reaſon, therefore, that the antients never diſcovered any country in the ſouthern latitude, is, they found it ſo exceſſively hot about the tropics, that they imagined, if they ſhould proceed much farther ſouth, the heat would have been intolerable; and it ſeems to have been a received opinion among them, that part of the torrid zone was not habitable. But we find on the contrary, that in many countries, which the antients were acquainted with, the heats were greater than thoſe under the line.

It ſeems very incredible that all countries in the ſouthern latitude were uninhabited till within ſome hundred years paſt, eſpecially in Africa, where no ſeas intervened to prevent diſcoveries; but it appears no leſs ſtrange, on the other hand, if people had travelled into the ſouthern parts of Africa, that none ſhould ever return from thoſe parts, to give the antients an account of theſe countries, and inform

them, at leaſt, that they were capable of being inhabited.

It is a received opinion among philoſophers, that the wind is nothing elſe but the air put in motion, and the air muſt receive a great addition of heat from the reflection of the burning ſands; this, therefore, being the caſe, it is not more ſurpriſing that the wind ſhould blow warm at noon day, when it has paſſed over a parched country for ſeveral hundred miles, than that thoſe which come from the ſea, or from ſome frozen climate, ſhould prove cool. We ſhall not diſpute that ſome people may have been ſuffocated by theſe hot winds, as travellers inform us; but do not remember to have heard one inſtance of it from thoſe perſons who have been ſeveral years in India, where the hot winds likewiſe blow annually in May and June. It is certain that the chilling cold winds that happen in the night, ſometimes after an exceſſive hot day, have been very fatal to Europeans, who have imprudently lain expoſed in the open air. There have been alſo inſtances of people loſing the uſe of their limbs, and ſome of them their lives, by a ſudden peſtilential blaſt, as well at ſea, as on ſhore.

About forty years ago a gentleman, who held a conſiderable poſt in India, under the Eaſt India Company, had the uſe of his limbs taken away in the following manner: a company of ſix or ſeven perſons, of which number he was one, were drinking a glaſs of wine on board, when two of them were ſuddenly ſtruck dead, and the others ſeized with a kind of dead palſy; and, for his part, he had not the leaſt feeling in his limbs; but when he was carried on ſhore, the Indian phyſician ordered him to be ſtretched out in the ſcorching ſand at noon, for ſeveral days ſucceſſively, placing an umbrella over his head only, and two or three ſervants were ordered to rub and pinch his fleſh in every part, for ſome hours; and though he was ſo very bad, that when one of them ſtood upon his breaſt, he did not feel him at firſt, yet, by chafing and rubbing him with oils in the ſun, and bathing and pinching him in this manner, for ſeveral days, his feeling at length returned, and the uſe of his limbs, except one hand, the uſe of which he was in a great meaſure deprived of.

With reſpect to the temperature of the air in the north part of the Perſian dominions, we ſhall here remark, that the provinces of Georgia, Shirvan, and Aderbeitzen, are very warm and dry in ſummer; but in winter they are ſubject to violent tempeſts, and to as ſevere froſts for ſix months, as any country on the continent, in the ſame latitude: but as this part of Perſia is very mountainous, there is frequently a great difference between the air on the north and ſouth ſide of the mountains; and, after travelling a few miles, people imagine themſelves to be in a different climate; but how cold ſoever the mountains on the north may be, they are extremely healthful. The inhabitants of the flat country of Ghilan and Mazanderan (which lies upon the Caſpian ſea, and was the antient Hyrcania), in the ſummer retire into the mountains, all the water they have being foul and corrupted in the hot ſeaſon; and it is ſaid that here, and in Choraſan, earthquakes are very common. This part of the country is alſo very damp, full of ſtinking moraſſes, and unhealthful.

Though Perſia exceeds moſt other countries in the world in extent, yet there are very few navigable rivers in it, there not being one in the heart of the country, that will carry a boat of any burden; and, in ſome parts, people may travel ſeveral days journey together, without meeting with any water. The river Oxus, it is true, which divides Perſia from Uſbeck Tartary, is a large ſtream; but as none of the branches of it ariſe in the Perſian dominions, it is of little uſe to them. There are, however, ſeveral ſmall rivulets which fall from the mountains, and are conveyed by ſubterraneous channels, or otherwiſe, to their principal cities. The rivers Kur and Aras, antiently called Cyrus and Araxes, which riſe in the mountains of Ararat, run through Georgia, Shirvan, and Aderbeitzen, and having joined their ſtreams, fall into the Caſpian ſea, are much the moſt conſiderable rivers in the Perſian dominions.

As the government in Perſia have the care of the conveyance and diſtribution of the waters, they have appointed a great officer in every province, who has the charge of it. And as there is a great ſcarcity of this uſeful article in this country, ſo there is no place where they are more careful of it, or have more ingenious contrivances to convey it to their cities, and into their corn fields and gardens. For the more copious and general ſupply of water, the Perſians alſo turn their little rivulets and ſprings to ſuch parts of the country where it is moſt wanted; and they dig very broad and deep wells, out of which they draw the water with oxen, in great leathern buckets, which they afterwards empty into ciſterns, and let it out for the ſervice of the country, as there is occaſion. Subterraneous aqueducts are alſo provided, through which the water is conveyed to the diſtance of near thirty leagues. Theſe are arched with brick, and are two fathoms high; at the diſtance of every twenty paces, there are large holes like wells, made for the conveyance of carrying on the arch, without working underground too far, and for the more eaſy repairing them. The river and ſpring water is diſtributed to different quarters of the town alternately, as occaſion requires, when every perſon opens the canal or reſervoir in his garden to receive it; and for this benefit every garden pays a yearly ſum to the government, particularly about Iſpahan; and as it is very eaſy for any perſon to turn his neighbour's water into his own channel, that fraud is very ſeverely puniſhed. As the ſpring water is not found ſo proper for the grounds, they therefore pay a higher rate for river water.

Two ſeas, beſides the ocean, belong to Perſia; namely, the Caſpian ſea, and the gulf of Boſſora, or Perſia, one on the north, and the other on the ſouth-weſt. The Caſpian ſea is about a hundred leagues in length, from north to ſouth, and ninety leagues in breadth, and has near a hundred rivers running into it, of which the chief is the Wolga, at the mouth of which ſtands Aſtracan, but this ſea has no communication with any other; and though ſo many rivers fall into it, the way by which it diſcharges its redundance of waters is not known, for they neither ebb nor flow, but are always of the ſame height. It is navigated chiefly by the Muſcovites, who live on the north ſide of it; and the late Czar was cutting a channel between the Wolga and the Don, or Tanais, whereby that monarch propoſed to open a communication between the Euxine and Caſpian ſeas; but this project is ſaid to be at preſent ſuſpended. As to the Perſians, they ſeldom apply themſelves to navigation, and have few veſſels upon this ſea; but they are not altogether ſo negligent of the gulf of Boſſora, upon account of the pearl fiſhery there, which, being reckoned the beſt in the world, they are very jealous of. The pearl fiſhery lies near the iſland of Baharem.

Ormus is the moſt famous of the reſt of the iſlands in the bay; it is ſituate at the entrance of the gulf of Boſſora, and is about thirty miles in circumference. While the Portugueſe were poſſeſſed of this iſland, they commanded the pearl fiſhery, and all the trade of Perſia, and had built one of the moſt elegant cities in Aſia upon it. There is now only an indifferent caſtle upon the iſland, which the Perſians keep poſſeſſion of, in order to prevent other nations from inſulting them as the Portugueſe did formerly, the trade being removed to Gombron, from which it is about two leagues diſtant. The iſland itſelf never produced any thing but ſalt, which grows in a ſolid cruſt, two inches deep upon the ſurface of the ground; and the hills, at a diſtance, appear as if they were covered with ſnow. The Portugueſe fetched moſt of the water they uſed from the continent; for there is not a drop of water upon the iſland but what is preſerved in ciſterns.

The king of Perſia, by the aſſiſtance of the ſhips belonging to the Engliſh Eaſt India company, reduced this iſland, about one hundred years ago, to his obedience, and expelled the Portugueſe; for which ſervice the Perſians allowed the company great advantages in trade, and half the cuſtoms of Gombron, for fifty years ſucceſſively, amounting, it is ſaid, to forty thouſand pounds per annum; but theſe cuſtoms were afterwards taken from the company, who were allowed three or four thouſand pounds a year, as an acknowledgment of their ſervice at Ormus. The Engliſh were deprived of their ſhare of the cuſtoms, under pretence that they did not afterwards protect the Perſian trade againſt the Portugueſe and Arabs, as they had ſtipulated to do; but the ſum of three thouſand pounds and upwards per annum, was paid till the civil war commenced. Several iſlands are diſperſed over this ſea: but none of them are of any note except two ſmall ones, the one called Kiſmiſh, and the other Lareca; the former of which is ſaid to yield abundance of wheat, and to be as fruitful as Ormus is barren.

SECT. II.

Containing a circumſtantial Account of the Public and Private Buildings, Chief Places, Houſes and Furniture, Streets, Bridges, Squares, Palaces; alſo the Stature, Complexion, Dreſs, Food, &c. of the PERSIANS.

PERSONS of quality in Perſia generally erect their houſes in the middle of a garden elegantly laid out, ſo that they make little or no appearance in the ſtreet, nothing

thing being ſeen but a dead wall with a great gate in the middle, and perhaps a ſkreen or ſlight erection within the gate, to prevent their being overlooked. By their fondneſs for privacy and retirement, they differ greatly from the Europeans, who generally expoſe their ſeats as much as poſſible to the view of the public, and ſeem to intimate, that they can enjoy no pleaſure in the fineſt palaces, but what reſults from the admiration of the ſpectators that paſs by the gates. The Perſians alſo differ from us, in that they have ſeldom more than one floor, which is diſpoſed in this manner: In the front of the houſe ſtands the virando, being a large piazza or cloiſter, open before, where they ſit and conduct their ordinary affairs. Beyond this is a large hall eighteen or twenty feet high, which is uſed at great entertainments or on any ſolemn occaſions. On the farther ſide of the houſe is another virando, or piazza, with a baſon or fountain of water before it; beyond which runs a walk of fine-trees, as there likewiſe does from the front of the ſtreet to the houſe. At each corner of the hall is a parlour or lodging-room, ſerving indifferently for both thoſe purpoſes: between theſe parlours, on the ſides, there are doors out of an hall into an open ſquare place as large as the rooms at the corners; there are alſo ſeveral doors out of the hall into the virando or piazza, before and behind the houſe; ſo that in the hot ſeaſon they can ſet open in the great hall nine or ten doors at once; and they will have the benefit of the air, if there be any ſtirring. There is a handſome baſon in ſome palaces, and a fountain playing in the middle of the hall, which adds ſtill more to the coolneſs of the place. The walls of the houſes are of a conſiderable thickneſs, and ſometimes built of burnt bricks, but more commonly of bricks dried in the ſun. The roof of the great hall is arched, and five or ſix feet higher than the other rooms about it. The roofs of the buildings on each ſide of the hall are flat; and there is a pair of ſtairs up to the top, where the Perſians walk in the cool of the day: they ſometimes lie there all night on a mattraſs, as there is a wall or baluſtrades all round the top of the building. The kitchens and other offices are at a diſtance on the right or left; and it is obſervable, that all their rooms, except the hall, ſtand ſeparate, and there is no paſſage out of one into another, except from the hall. Inſtead of a chimney, they uſually have a round hole about four or five feet broad, and a foot and a half deep in the middle of the room, in which a charcoal fire is made, and the place covered with a thick board, or table, about a foot high, ſo cloſe that no ſmoke can get out. Over that table a large carpet is thrown, under which they put their legs in cold weather, and ſit round, there being a paſſage for the ſmoke by pipes which are laid under the floor. The doors of the houſe are narrow, and ſeldom turn upon hinges as ours do; but at the top and bottom of the door there is a round piece left, which is let into the frame above and below, on which they turn; and the very bolts are frequently made of wood.

Their furniture conſiſts only in carpets ſpread on the floor, with cuſhions and pillows to lean on; and at night there is a mattraſs brought to ſleep on, and a quilt or two to cover them, but ſheets are ſeldom uſed. Their ſervants lie about in any paſſage on mats, and take up very little room.

The floors of the rooms are either paved or made of a hard cement, on which they lay a coarſe cloth, and a carpet over it. The ſides of ſome of their rooms are lined with fine tiles, not unlike the Dutch tiles, about a yard high, and the reſt of the wall painted or hung with pictures. From the above deſcription, the reader may form a tolerable idea of a Perſian houſe. Thoſe of the inferior claſs of people cannot be expected to be like thoſe already deſcribed in every particular; but they endeavour to imitate their ſuperiors as nearly as they can. The palaces of the princes ſeem to be built much after the ſame manner, only they are more lofty and magnificent.

We proceed now to deſcribe ſome of their principal towns, the firſt of which is Iſpahan, or, as is commonly pronounced, Spahawn. It is ſituated in thirty-two degrees forty minutes north latitude, and the fiftieth degree of longitude, reckoning from the meridian of London. It ſtands in a fine plain, almoſt ſurrounded with mountains, which lie about two or three leagues from it; and the form is pretty nearly oval. The river Senderhout runs by it at about a mile diſtance; but there are ſeveral channels and pipes above the town, which convey the water from it into canals and baſons, for the ſervice of the court and city. The town is without walls, and about ten or twelve miles in circumference. Thoſe who extend it ten leagues, take in the town of Julpha, and ſeveral others, for which we ſee no manner of reaſon; for Julpha lies a mile from Iſpahan, and on the other ſide the river, and can no more be reckoned a part of the city, than Chelſea may a part of Weſtminſter. Were we to take in all the villages within the weekly bills, the circumference of all London would very probably be little leſs than ſome travellers reckon Iſpahan. There were formerly twelve gates to the town, but four of them are now cloſed up, the others are always open. With reſpect to the walls mentioned by ſome gentlemen, it is probable there was formerly a mud-wall; but a merchant who came not many years ago from thence affirms, that there is no part of it viſible at preſent. There is indeed an old caſtle without artillery, run to ruin, which is no better fortified than the town.

Moſt of the ſtreets of Iſpahan are narrow and crooked, and as few of them are paved, they are either exceeding dirty or duſty; and the paſſage is rendered very unpleaſant by the number of people of faſhion who ride through them with great trains of ſervants, notwithſtanding there are no coaches or carts. There are, however, ſeveral very fine ſquares in the town, particularly Meydan, or the royal ſquare, of which we ſhall now give ſome deſcription.

Two of the palace gates open into this ſquare, which is one third of a mile in length, and above half as much in breadth. On the ſide of it are buildings reſembling the Exchange in the Strand at London, with ſhops on both ſides; where every trade has a diſtinct quarter aſſigned; there is alſo a ſecond ſtory, where the mechanics have their working ſhops. There ſeems to be little difference between theſe exchanges and ours; except that thoſe at Iſpahan have no windows, but great openings at proper diſtances to admit the light, and people ride through them as along the ſtreets. There is a market for horſes and cattle in the middle of the ſquare, and all manner of goods and eatables are expoſed to ſale; though the great Shah Abbas, who built this ſquare, deſigned it for manly exerciſes, particularly thoſe of horſemanſhip, and handling the bow and lance, at which no people are more ſkilful than the Perſians. There is a fine row of trees planted, and a handſome baſon of water, on that ſide of the ſquare next the palace; and ſome great braſs gates, which were taken from the Portugueſe, ſerve to make a fine ſhew. A great moſque ſtands at the ſouth end of the ſquare, and another on the eaſt ſide, over-againſt the great gate of the palace.

Several ſtreets in Iſpahan are covered and arched over, which makes them pretty dark, and this ſeems to be peculiar to the Perſian towns. In the Indies, it is true, the tradeſmen have little piazzas before their houſes, where they expoſe their goods to ſale, but then there are wide ſtreets before them; though in ſome places there is no other ſtreet than theſe covered ways through which people ride. Another peculiarity among them is, that their houſes and ſhops are never in the ſame place, ſo that it is very common for a tradeſman to go half a mile in the morning to the hazar or market-place, where his ſhop is; and at night they lock up their valuable goods in cheſts and counters, and the meaner ſort they leave packed up, ſometimes in the open ſquare; for it ſeldom happens that any thing is loſt, ſo careful are the watch appointed to guard their market places, or ſo very little given to thieving are the people in this part of the world; and no doubt the ſpeedy and exemplary puniſhments inflicted upon pilferers, is one great means to deter them from it.

Foreign merchants lodge their goods in the public caravanſeras about the city: which ſerve them alſo inſtead of inns, for lodging and diet; but there is this difference between an inn and caravanſera, that people find their own bedding and cookery in the caravanſera, whereas we have not that trouble in our inns. Two things, however, render a caravanſera preferable to an inn; one is, that a perſon is not ſubject to the extortions of an inn-keeper, but buys his proviſion at the beſt hand; and the other is, that let the merchant occupy never ſo many rooms, he ſhall not be diſturbed in them; pays only a ſmall ſum for his warehouſe or lodgings, and pays nothing upon the road. In Iſpahan there are one thouſand five hundred public caravanſeras, which have been built by charitable people, for the uſe of ſtrangers; moſt of them are built after one model, and differ only in the dimenſions. There is a handſome portal at the entrance, on each ſide of which are ſhops, from whence you enter into a ſquare, about which there is a cloiſter, or piazza, and within are lodging rooms, and warehouſes for goods; there are alſo conveniencies and ſtabling for horſes, and other beaſts, on the outſide, or they may be brought into the ſquare, and faſtened there, as is frequently done on the road, where there is no danger of robbers.

There

There are no taverns at Iſpahan, wine being prohibited by the Mahometan religion; nevertheleſs ſome of the Perſians drink pretty plentifully of it in private. There are, however, very handſome coffee-houſes in the principal parts of the town, where people meet and converſe of politics, though they have no printed papers in them. In theſe are to be met with ſome amuſements peculiar to the country, as the harangues of their poets, hiſtorians, and prieſts, who frequently, by their orations, collect a great number of people about them, and expect, for their inſtructions, ſome gratuity from their audience.

The palace, with the buildings and gardens belonging to it, occupy above a league in circumference. One of the gates which comes up to the royal meydan or ſquare, is called Alicapi, and the other Doulet Cuna; over one of them is a gallery, where the Sophi uſed to ſit and ſee martial exerciſe performed on horſeback. No part of the palace where the court reſides, comes up to the royal ſquare; but within the principal gate there is a hall, or court, on the left hand, where the Vizir and other judges, adminiſter juſtice on certain days; and on the right hand are rooms where offenders are allowed to take ſanctuary. From hence to the hall, where the king uſually gives audience, is a handſome walk: it is a long room, well painted and gilded, and ſupported by forty pillars; it is divided into three parts, one a ſtep higher than the other, on which the great officers ſtand, according to their rank. There are no hereditary nobility in Perſia. On the third aſcent is the royal throne, raiſed about a foot and an half above the floor, and about eight feet ſquare, on which is ſpread a rich carpet; the King ſits croſs-legged here upon ſolemn occaſions, having a brocade cuſhion under him, and another at his back. No perſon is permitted to enter the other apartments of the palace, particularly the haram, or women's apartment, none but eunuchs entering them: ſo that they cannot be exactly deſcribed; but we underſtand in general, that they are compoſed of ſeveral pleaſure-houſes diſperſed about the gardens, nearly reſembling the houſes firſt deſcribed; their great beauty conſiſts in the fine walks, fountains, and caſcades about them. The ladies hunt and take their pleaſure with the Prince, in a large park walled in, which is beyond the above-mentioned gardens.

There are upwards of an hundred and fifty Mahometan moſques, or temples, in this city which are covered with domes or cupolas, and, appearing through the trees that are planted almoſt all over the town in the ſtreets and gardens, afford a noble proſpect; but the common buildings are ſo low, that they are hardly diſcerned by a perſon who views the town on the outſide. Chriſtians are prohibited from entering their moſques, or even coming within their courts under ſevere penalties, ſo that our readers cannot expect a minute deſcription of them.

The great moſque in Iſpahan, called by way of eminence the King's, or becauſe it was built by one of their kings, has been viewed by travellers in diſguiſe, who inform us, that there is a gate which leads to this moſque, covered with ſilver plates; through this you proceed to a court with a piazza or cloiſter on each ſide of it, where the prieſts lodge who belong to the moſque. Oppoſite to the great gate are three large doors, which open into it: the five iſles, of which the moſque is compoſed, are beautified with gold and azure: in the middle is the cupola, ſupported by four great ſquare pillars: the iſles on the ſide are lower than that in the middle, and borne up by thick columns of free-ſtone; two great windows towards the top of the middle iſle give light to the whole moſque: on the left hand, towards the middle, ſtands a kind of pulpit, with a flight of ſtone ſteps to go up to it: there are no ſeats, or pews, as in Chriſtian places of worſhip, nor any kind of imagery or pictures. The bricks and tiles on the outſide of the building are painted with various colours after the Perſian manner, and the floor of the moſque is covered with carpets, all perſons putting off their ſhoes as they enter it.

The outſide of the moſque at the ſouth ſide of the royal meydan is ſtone, and the form round, it is divided into iſles: the walls are lined fifteen feet high with white poliſhed marble, and in the middle of the ſquare before the moſque is a large baſon where they waſh themſelves before they enter the temple. The moſques have moſt of them cupolas with ſteeples or towers, whither the Mollas go up to ſummon the people to their devotions, but make no uſe of bells for that purpoſe.

Another ſubject of the traveller's admiration, is, the numerous bagnios, called hummums, in this city. Some of theſe are ſquare buildings, but moſt of them globular: the tops are covered with tiles painted blue; and the ſtone of which they are built is uſually white, and well poliſhed. The inſides are divided in many cells, or chambers, ſome for pleaſure, and others for ſweating: the floors are laid with black and white marble. As the Perſians eſteem bathing to be extremely healthful, and an effectual remedy for colds or aches, and many other diſtempers, they therefore repeat it almoſt every day.

The Charbag, which is a walk above a hundred yards wide, near Iſpahan, is greatly admired by foreigners; it extends a mile in length, from the city to the river Zenderhoud; double rows of trees are planted on each ſide of it, and in the middle runs a canal, not continued upon a level, but at every furlong diſtance the water falls into a large baſon, and forms a caſcade; the ſides of the canal and baſon are lined with hewn ſtone, broad enough for ſeveral men to walk a-breaſt upon them. On each ſide of this walk are the royal gardens, and thoſe of the grandees, with pleaſure-houſes at ſmall diſtances. Theſe, when viewed together, afford a very agreeable proſpect to the ſpectator. At the end of this walk is a bridge, over the river Zenderhoud, which leads to the town of Julpha; there are alſo two other bridges, one on the right, and the other to the left, by which the neighbouring villages have a communication with the city, though they are diſtant about a mile from it.

The architecture of theſe bridges is extremely remarkable, for on both ſides, both above and below, are arched paſſages, through which people ride and walk, from one end of the bridge to the other; as in the covered ſtreets of the city, and at little diſtances, there are openings to receive the light. The arches of theſe bridges are not very high, there being no veſſels to paſs under them; for this river is not navigable, any more than the reſt in Perſia. At the latter end of the ſummer the channel is exceeding narrow and ſhallow, inſomuch that there is not water enough for the gardens belonging to the city; to ſupply the want of it, they have abundance of wells about Iſpahan, which contain very good water for all uſes. But in the ſpring, on the melting of the ſnow on the mountains, it makes a pretty good appearance, being almoſt as broad as the Thames at London.

The town of Julpha ſtands on the ſouth ſide of the river Zenderhoud: it is inhabited by a colony of Armenians, which were tranſplanted hither by the great Shah Abbas. This town is about two miles in length, and not much leſs in breadth, being for the moſt part better built, and the ſtreets wider than thoſe of Iſpahan, but the trees that are planted in the ſtreets, and the large gardens they have near their houſes, give it more the appearance of a country village than a town. Georgians, and ſeveral other Chriſtians, inhabit here, as well as Armenians; and there are ſome convents of Europeans, but no Mahometans. This colony has flouriſhed prodigiouſly ſince its firſt ſettlement here by Shah Abbas; they being now the moſt conſiderable merchants in the world; and we meet with them in almoſt all countries of Aſia and Europe. The king at firſt provided them with ſtocks to trade with, and partook of their profits, ſo that they were little better than the king's factors; but they now only pay a yearly tax to the government. They enjoy a privilege above all other Chriſtians, being allowed to purchaſe eſtates.

The factors belonging to the Eaſt India company have a handſome houſe in Iſpahan, the model of which is the ſame with the houſe firſt decribed; but ſince the civil wars broke out, the uſurpers have ſo harraſſed and oppreſſed them, that the company have ordered their ſervants to retire from thence; they have alſo withdrawn moſt of their ſervants from Gombron, and made Boſſora (at the bottom of the gulf of the ſame name) their principal factory on that ſide. The city of Boſſora ſtands on the Tigris, two days journey below Bagdat, and the territory is governed by its own prince, but tributary to the Grand Seignior.

Schiras, or Sheraz, according to the modern pronunciation, lies about two hundred miles to the ſouthward of Iſpahan: it is ſituate in twenty-nine degrees fifty minutes of north latitude, and is uſually reckoned the ſecond city of the kingdom, and is the capital of the province of Fars, or the antient Perſia: ſome deduce the name from Cyrus the Great, there being a tradition that he was buried there; others ſay it is derived from "ſherab," which in the Perſian tongue ſignifies a grape, becauſe that fruit abounds in this place; and others from the word "ſheer," which ſignifies milk. The town is ſeated in a pleaſant fertile valley, about twenty miles in length, and ſix in breadth: it has a rivulet running through it, which in the ſpring appears like a large river, and ſometimes increaſes to ſuch a torrent,

as

as to bear down the houſes in its courſe; but in the ſummer it is almoſt dry. There are no walls about this place, which contains only about four thouſand houſes: the compaſs of it is reckoned to be about ſeven miles, but much the greateſt part of this ſpace is gardens. It is obſervable, that the Perſians let moſt of their buildings run to ruin: every generation chooſing to build new houſes, rather than occupy thoſe of their anceſtors. There is no place where the Mahometan ſuperſtition prevails more than here, there being a moſque or temple almoſt to every twenty houſes; the domes of which, being covered with blue varniſhed tiles, make a pretty appearance among the trees: here is alſo a college, where the liberal arts are ſtudied.

Schiras is moſt remarkable for the fine gardens and vineyards about it. The ſtreets are for the moſt part narrow and duſty; but there are ſome broad ones with canals, and baſons faced with ſtone. The cypreſs-trees with which their walks are chiefly compoſed, are the talleſt and largeſt of any whatever, and grow in a pyramidal form; intermixed with theſe are ſeveral broad ſpreading trees, and all manner of fruits, as pomegranates, oranges, lemons, cherries, pears, apricots, dates, &c. Theſe are not planted againſt walls, as with us, but ſtand in the alleys, and ſometimes are diſpoſed irregularly, as in a wilderneſs. They have alſo abundance of ſweet flowers of various colours, but not planted in that regular order as in the gardens of Europe. Their vineyards and wines are preferable to any in Perſia: and the canals, caſcades, fountains, and pleaſure-houſes in their gardens, are not at all inferior to thoſe of Iſpahan. The king's garden here is no leſs than two thouſand paces ſquare, and ſurrounded with a wall fourteen feet high; but the gardens as well as the buildings of Schiras have been much neglected of late years.

The nobleſt ruins of an antient palace, or temple, that any country can boaſt of, are now to be ſeen thirty miles to the north-eaſt of Schiras; even Rome itſelf, it is ſaid, has nothing comparable to theſe venerable remains of antiquity. The place is at preſent called Chilmanar, or Forty Pillars. According to ſome, it was built upon a mountain of dark-coloured marble, and the ſteps hewn out of the ſolid rock; but others, who have viewed it more narrowly ſince, obſerve that the ſteps are compoſed of large ſtones, fifteen or ſixteen feet in length, and of ſuch a thickneſs, that ſix or ſeven ſteps are cut out of one ſtone: the whole being ſo ſkilfully joined by art, that they appear to be but one piece.

The ruins of this once magnificent palace or temple are ſeated at the north-eaſt end of that ſpacious plain where PERSEPOLIS once ſtood, and are generally held to be part of the palace of Darius, who was conquered by Alexander the Macedonian monarch. The front of this palace ſtood towards the weſt, and was about five hundred paces in length, the whole occupying near threeſcore acres of ground. The aſcent to it is by ninety-five ſteps, thirty feet in length, and twenty inches broad, but not above three inches deep, ſo that a horſe may eaſily go up or down them. The ſtair-caſe divides as you aſcend; one branch winds to the right, and the other to the left, each having a well on one ſide, and a marble balluſter on the other: both of the branches afterwards turn again, and end at a ſquare landing-place, from whence is an entrance into a portico of white marble twenty feet wide: on which are carved in baſs-relieve two beaſts as large as elephants; but their bodies reſemble thoſe of horſes, and they have the feet and tails of oxen. Ten feet farther ſtand two fluted columns of whitiſh ſtone, about ſixty feet high, beſides their capitals and baſes, and as thick as three men can fathom: a little farther ſtand two other pilaſters, carved like the firſt, except that the beaſts on theſe latter have wings, and men's heads. Beyond this portal, or hall, is another ſuch double ſtair-caſe, leading to the upper rooms, twenty-five feet broad, but incomparably more beautiful than the former; for on the walls of it a kind of triumph is carved in baſs-relieve, conſiſting of a numerous train of people in diſtinct companies, ſome of them carrying banners, and others offerings, and after all comes a chariot drawn by ſeveral horſes, with a little altar upon it, from whence the fire ſeems to aſcend. On the other ſide are carved wild beaſts fighting, and, among others a lion and a bull are cut with great exactneſs, the ſtone of which is ſo hard, that the niceſt and moſt curious part of the workmanſhip is ſtill in fine preſervation.

There is a ſquare place on the top of the ſecond ſtair-caſe, which has been ſurrounded with columns, ſeventeen of which only are now ſtanding, but there are an hundred pedeſtals: ſome of thoſe that are left are ſixty, and others ſeventy feet high, and twelve of them near three fathom in compaſs; they are of red and white marble fluted. Antiquaries ſuppoſe that theſe ſupported the temple of the ſun. Near thoſe columns, on the ſame floor, is a place fifty feet ſquare, incloſed with walls ſix or ſeven feet thick, of a much finer marble than any hitherto mentioned, and ſo wonderfully carved, that it would take up ſeveral days to view all the figures: which way ſo ever a man turns himſelf in this ſecond floor, there appear figures cut in baſs and half-relieve. In one place, are men fighting with lions; in another, a man holding a unicorn by the horn; in a third, are the figures of giants; and in a fourth, a prince is repreſented giving audience to his people or to ambaſſadors; beſides a multitude of other ſcenes. Here are likewiſe abundance of inſcriptions, in laſting characters, many of which have been tranſcribed, and brought into Europe, but ſcarcely any of them are underſtood at this day by the learned, any more than they are by the people of the country.

Gombron is a town and port the moſt reſorted to of any in the Perſian dominions. The Engliſh Eaſt India company have had a factory here for upwards of three hundred years: they have a juſt claim to half the cuſtoms of this place, by virtue of the before-mentioned treaty, in conſideration of their having aſſiſted Shah Abbas in the reduction of Ormus; but of late years they have received the annual ſum of one thouſand tomans, or three thouſand three hundred and thirty-three pounds, ſix ſhillings and eight pence in lieu of it. After the conqueſt of that iſland, Gombron received the name of Bandar-Abaſſi, or the port of Abbas (Bandar ſignifying a port) that prince having transferred the trade hither. Gombron is ſituate in twenty ſeven degrees thirty minutes north latitude, and diſtant about three hundred miles from Schiras. It is about three miles in compaſs; and ſtands on a level ground cloſe to the ſea; the country almoſt every way riſing inſenſibly for ſome miles, without any conſiderable hill, except towards the north: near this town is the narroweſt part of the Perſian gulf, or Boſſora. The coaſt of Arabia lies oppoſite to it, at about ten leagues diſtance, but does not ſeem to be farther acroſs than from Dover to Calais. Beſides the natives, it is inhabited by Engliſh, Dutch, Portugueſe, Arabs, Jews, Armenians, Banians, and ſeveral other nations, of which the two laſt mentioned are much the greateſt merchants. Towards the land it has a wall, which is in a ruinous condition; and towards the ſea there are three ſmall forts, mounting five guns each, and a platform of eight. There is a caſtle mounted with thirty-five guns, for the ſecurity of the road. The people here have the ſame humour as in other parts of Perſia, in letting the houſes of their anceſtors drop, and erecting new ones for themſelves; for they have adopted the ſuperſtitious opinion, that if the perſon who inhabited the houſe before was deemed unhappy, they are apprehenſive that the like ill fortune will attend the perſon who next occupies it; ſo that the houſes in many of the ſtreets are tumbling down, and others going to decay. Their beſt houſes are built of ſtone brought from the iſlands of Kiſhmee, or Larrak, but they are for the moſt part built of bricks hardened in the ſun. They conſiſt ſometimes of two ſtories, and have a wooden contrivance on the top of the houſe, to force the wind down into the lower rooms. Theſe machines are about ten feet high, and at a diſtance look like towers. The houſes belonging to the Engliſh and Dutch Eaſt India companies are as well built as moſt in the town.

Tauris is the next town of note. It is called by the Turks and Perſians Tabriz, and was the metropolis of Media. It is ſituate in thirty-eight degrees odd minutes, north latitude, and is ſuppoſed to be the antient Ecbatana. Some of the antients were of opinion that it was founded by Semiramis, who with incredible labour brought the water thither from the mountain Orontes, a branch of Taurus; but a celebrated Jewiſh writer aſſures us, that it was built, or at leaſt a royal palace in it, by the prophet Daniel. It was beſt known formerly by the name of Ecbatana, and was then in its greateſt ſplendor. The antients obſerve, that it was fifteen miles in circumference, and had walls ſeventy cubits high and fifty broad, with many noble palaces; but there is now little or nothing remaining either of the walls or palaces. However, Tauris is ſtill a conſiderable town, being about five miles in circuit, populous, and a place of very great trade; but it is not near ſo well peopled as ſome late accounts have made it. The inhabitants, including men, women, and children, do not exceed fourſcore thouſand, though their number has been exaggerated beyond all credibility; for during the late civil war neither the prince or uſurper have been

able to levy an army of forty thouſand men, notwithſtanding the news-writers have lately found in this city two hundred thouſand men capable of bearing arms. Here are ſeveral noble meydans, or ſquares, one of them almoſt equal to the royal meydan of Iſpahan: they have alſo their covered ſtreets, or exchanges, where abundance of rich merchandiſe is expoſed to ſale; and their moſques and bagnios reſemble thoſe in other cities, of which we have made mention before.

The city of Tauris, like moſt others in Perſia, ſtands in a plain ſurrounded by mountains, from whence there falls a ſmall ſtream, which runs through the middle of it; but, on the melting of the ſnows, it is increaſed to a mighty torrent. This city has often changed its maſter, having been ſometimes poſſeſſed by the Turk, and at others by the Perſian: but as the citizens ſeem chiefly inclined to the Perſians, the Turks have ſeveral times burnt and plundered it without mercy, but the great Shah Abbas, upwards of a hundred years ago, drove the Turks out of this part of Perſia, from which time Tauris remained in the peaceable poſſeſſion of the Perſians till a few years ago, when the Turks again ſurpriſed it, exerciſing their uſual cruelties on the miſerable inhabitants. The caravans uſually travel in four and twenty days to and from Iſpahan and Tauris, which lies about four hundred miles to the northward of the other.

We have already obſerved that Tafflis is the capital city of Georgia, but ſubject to the Perſians, and inhabited chiefly by Chriſtians; inſomuch that there is not one Mahometan moſque in the place, except that of the caſtle, though there are no leſs than fourteen Chriſtian churches. It is ſituate in fourteen degrees of north latitude, on the river Kur, or Cyrus, at the foot of a mountain; it is not of very large extent, but elegantly built. On the ſouth ſide, on the declivity of the mountain, ſtands the caſtle, which was once a place of ſtrength, but is hardly tenable at preſent, and therefore liable to be ſeized by the next invader, whether Turk or Muſcovite, if they are not already poſſeſſed of it. It is a biſhop's ſee, and has a handſome cathedral, built in form of a croſs. The other churches belong partly to the Georgians, and partly to the Armenians. Theſe, as well as the other public ſtructures, are built of ſtone, ſuch as their bazars, caravanſeras, bagnios, &c.

SECT. III.

Containing a further Account of the PERSIANS, with reſpect to their Diſpoſition and Mental Qualities, Dreſs, Stature, Shape, and Complexion; together with their Diet, Liquors, Public and Private Diverſions, Rural Sports, and Ceremonies, Salutations, Gaming, &c. alſo of their Travelling, Carriages, Roads, and Retinue.

IT is univerſally allowed, that the Perſians are in general endowed with bright parts, have abundance of vivacity, are fond of glory, and ſurpaſs their neighbours of India in point of courage, inſomuch that the great Mogul prefers them to the greateſt poſts both in his court and army; and as they were obſerved to be of all men the moſt civil and obliging, they retain the ſame diſpoſition to this day; eſpecially towards foreigners, who cannot but admire their hoſpitality and benevolence. They are far from being guilty of that brutiſh behaviour which is ſo common among the Turks; they are, however, moſt juſtly and univerſally charged with vanity and profuſeneſs in their apparel, equipages, and number of ſervants. Voluptuouſneſs in eating and drinking does not appear to be their diſtinguiſhing vice, at leaſt the Europeans are much more addicted to it; for the greateſt part of their food is rice, fruit and garden-ſtuff: they have not any great variety of fleſh, neither have they many ways of dreſſing it: pilo ſeems to be the ſtanding diſh, even among thoſe of the beſt quality. And as for ſtrong liquors, though they drink them now and then by ſtealth, yet drunkenneſs is very far from being common among them; every man may retire from an entertainment without ceremony, when he thinks proper, without a breach of good manners; no perſon being urged to take more liquor than he finds convenient and agreeable to himſelf.

It is univerſally allowed that the Perſians have a genius well adapted to poetry, inſomuch that a poet is introduced at every feſtival or entertainment; and is deſired to oblige the company with his compoſitions; and theſe perſons are frequently found with a crowd about them in coffee-houſes, and other places of public reſort. Though the Perſians are by ſome people charged with being very covetous, this muſt certainly be underſtood with reſpect to the acquiſition of riches; for as to keeping and hoarding up money, they are generally abſolved from it. They only get that they may ſpend; and when they have furniſhed themſelves with an equipage, houſe and gardens, ſuitable to their mind, they chuſe rather to lay out their money in building caravanſeras, moſques, and on other public occaſions, than let it lie by them; ſo that ſome travellers obſerve, that no people in the world take leſs thought for to-morrow. A man, for inſtance, who has lately come to the poſſeſſion of eight or ten thouſand pounds, will in a few weeks lay it out in purchaſing wives and ſlaves, clothing and furniture, without conſidering where he ſhall meet with a ſupply in future, and in two or three months afterwards he will diſpoſe of them again for ſubſiſtence.

The Perſians have a great command of their paſſions: they are not eaſily provoked to anger or reſentment: and when they are, it never proceeds to a duel, and very ſeldom to blows. When angry, they generally call each other Jews or Chriſtians, and their quarrels commonly terminate in ill language, which is ſometimes intermixed with hearty curſes. Few European nations are in general more polite, they being of a very engaging addreſs and moſt obliging behaviour: they are alſo meek, peaceable, modeſt, grateful, generous, enemies to fraud, and courteous and affable to Chriſtians as well as others; they are moreover fair and punctual in their bargains, and treat foreigners with great humanity.

The ſtature, ſhape, limbs, and features of the Perſians are agreeable and well proportioned. In Georgia, and the northern provinces, they have an admirable complexion; towards the ſouth, they incline to the olive: but the great men having had their wives and concubines chiefly from Georgia and Circaſſia for an hundred years paſt, the breed is very much mended in the ſouthern provinces. Their eyes and hair are generally black, and they wear only one lock on the crown of their heads, like other Mahometans, by which they expect Mahomet will lift them up to paradiſe. The king, great officers of ſtate, and ſoldiery, wear only long whiſkers on the upper lip, which, joined to a tuft of hair on the upper part of their cheeks, grow to a very enormous ſize, inſomuch that ſome of them, it is ſaid, are near half a foot long. The common people clip their beards pretty ſhort; but none of the Perſians ſuffer any hair to grow upon their bodies. Their mollahs and religious people wear their beards long, only clipping them into form.

The large turbants, which the Perſians wear over their heads, are ſome of them white, and others ſtriped with red or other colours, and the great men have flowers of gold and ſilver woven or worked in the cloth. They have alſo a ſcull cap under their turbant, and altogether does not weigh leſs than ſeven or eight pounds, ſometimes a great deal more. They wear a kind of ſhirt of coloured ſilk or callico, generally blue, next to their ſkins, which they ſeldom waſh white while it is fit to wear; this ſhirt has an open boſom, but neither neck nor wriſtbands, and is made cloſe to the arm: they have alſo a pair of breeches, or rather drawers, cloſe before, reaching half down their legs. Their ſtockings are made of woollen cloth, but not at all ſhaped to the leg: over the ſhirt they wear a waiſtcoat, and upon theſe a coat with ſleeves, and buttons and loops before, tied with a ſaſh; this is wide at bottom, and hangs like a bell a little below their knees. Beſides this, they put on another coat frequently without ſleeves, the uppermoſt coat being ſhorteſt; over all theſe they have another looſe coat, lined with furs. Inſtead of ſhoes, they have peeked ſlippers turned up at the toes, and made of Turkey leather, which are neither tied nor buckled; and when they ride, they have boots of yellow leather: their bridles, ſaddles, and houſings are immoderately fine; and almoſt covered with gold: the houſing is ſo large, that it almoſt hides the hinder part of the horſe; and whether on foot or on horſeback, they wear a broad ſword and crice or poniard; the latter of which, it is ſaid, the ladies alſo wear.

The dreſs of the women nearly reſembles the men's, except that they neither wear turbants on their heads, nor ſaſhes about their waiſts; and their coats, or veſts, reach almoſt to their heels. When they go into the ſtreets (which women of quality ſeldom do) they are covered from head to foot with a white vail. The girls wear a ſtiffened cap upon their heads, turned up like a hunting cap, with a heron's feather in it, their hair being made up in treſſes, and falling down their backs to a very great length; the quality have pearls and jewels interwoven with their hair. The married women comb their hair back, and, having bound it about with a broad ribbon, or rich tiara ſet with jewels,

HABITS and CHARACTER of the PEOPLE in PERSIA, with the manner of SMOKING, &c as practised in that COUNTRY.

Bannerman & Smith sculp.

jewels, which looks like a coronet, let the reſt of their hair fall gracefully down their ſhoulders; which is a very becoming dreſs. Both men and women have a great many rings and bracelets on their arms and fingers; but neither of them wear gloves.

Black hair is in greateſt eſteem, being the moſt common, and the thickeſt and broadeſt eye-brows are thought the fineſt; the women will dye their eye-brows, if they are not black, and it is very cuſtomary with them to paint their faces; they alſo rub their hands and feet with an orange-coloured pomatum. Some have feathers ſet upright in their tiara; and others have a ſtring of pearls, or precious ſtones faſtened to it, which hangs down between their eye-brows: they likewiſe wear jewels in their ears, and rows of pearls fall down their temples as low as the neck; and in ſome provinces, which are on the confines of India, they wear jewels in their noſtrils, which have a very diſagreeable appearance to Europeans; for as they hang down to the mouth, it makes them look as if they had hare lips; but the ladies of Iſpahan never wear noſe-jewels. Their necklaces fall upon the boſom, and have always a little golden box hanging to them, which is filled with fragrant and reviving perfumes: theſe necklaces are either gold or pearls.

Dreſs is no inconſiderable article in Perſia: for the clothes of both men and women conſiſt of the richeſt flowered and brocaded ſilks; and people of mean fortunes endeavour to vie with the quality, and will have fine clothes; though they want food. The purchaſe of an ordinary turbant, it is ſaid, amounts to ten pounds, and they frequently coſt twice as much; and they muſt alſo have a variety of them, leſt, as the proverb is, they ſhould be known by their clothes. Their ſaſhes are alſo brocaded, and coſt from twenty to an hundred crowns; and over this they have frequently another of camel's hair, which coſts nearly the ſame ſum, on account of its curious workmanſhip. Thoſe who wear ſables, which they are very eager to obtain, ſeldom pay leſs than a hundred pounds for a cloſe-bodied coat; all this, with the rich furniture and equipage they have when they ride out (which they do almoſt every day, if they go but a very little way) muſt amount to a very large ſum; and it is juſtly obſerved, that this keeps them exceedingly poor. However, as there are in no country more handſome and comely men, finer horſes, or richer equipages to be ſeen, the Perſians are allowed to make as ſplendid a figure as any people in the world: though poverty may prey upon them at home, they are generally loaded with gold and jewels when they go abroad: as they enjoy almoſt continually a clear ſun-ſhine, and a bright element, a more than ordinary luſtre is caſt on their perſons, and their elegant dreſs appears to the greateſt advantage. Our European merchants, in order to preſerve their credit, and conduct their affairs ſucceſsfully, are under a neceſſity of conforming to theſe expenſive cuſtoms at Iſpahan; and the accuſtoming themſelves to ſo much expenſive gaiety might prove of ill conſequence to them when they return to Europe, were it not that they uſually acquire fortunes in this country ſufficient to ſupport an equipage in their own.

We now proceed to give an account of the food and liquors of the Perſians. They commonly drink a diſh of coffee early in the morning; and go to dinner about eleven o'clock, when they eat melons, fruit, ſweetmeats, cheeſe-curd, or milk; but their principal meal is in the evening, when a diſh of pilo is always ſerved up; this conſiſts of boiled rice well buttered and ſeaſoned, with a fowl, a piece of mutton, or kid, accompanying it: they have an excellent way of boiling their rice all over the coaſt: the water is quite dried away by the time the rice is enough; after which, they ſeaſon it with ſpices, and mix ſaffron or turmerick with it, giving it a yellow, or what other colour they pleaſe; but, as we have already obſerved, there is very little variety either in their food, or the manner of dreſſing it. If they have a large joint, it is baked, inſtead of being roaſted, but their uſual way is, to cut their fleſh into ſmall ſlices, and ſpitting, or ſkewering them together, roaſt them over a charcoal fire: and, whether they boil or roaſt, it is always done to rags, as the phraſe is, or it would be impoſſible to pull the meat to pieces with their hands, as they do; uſing neither knives nor forks. Pork is never eaten here, nor veal; neither do they eat hares, or other animals prohibited to the Jews; and beef is eaten but ſeldom: they do not deal much in veniſon, fiſh, or wild fowl: they dreſs only plain diſhes, being ſtrangers to haſhes, ragouts, and other compounds; and ſeldom have any other ſauce than a ſlice of lemon, or ſome pickles. They eat their bread, which is made in thin cakes, the moment it is baked; but eat much more rice. They uſe no beaten pepper, only the whole ſort; and not much ſalt in their ſeaſoning, nor is there any brought to table; their meat is never ſalted before it is dreſſed, as with us. They generally kill their meat and fowls the ſame day they uſe them; and ſet by nothing till the next, to be eaten cold; and if any meat is left, they give it to the poor. They ſit down croſs-legged at their meals, having a cloth ſpread upon the carpet: then ſome perſon, who has the proviſion before him, diſtributes rice and fleſh to the company. They uſe no ſpoons, except for ſoups and liquids; but take up their rice by handfuls, like the people in India. They ſeldom ſit above half an hour at their meals: before which they waſh, making uſe of their handkerchiefs to wipe on, inſtead of a towel.

The common people of Iſpahan ſeldom dreſs their food at home, but when they have ſhut up their ſhops in the evening, go away to the cooks, of which there are great numbers in that city, and buy pilo for their families. The cooks have kettles, or coppers fixed in brick-work in their ſhops and ſtoves, over which they dreſs moſt of their meat, ſeldom making uſe of chimnies.

To the commendation of the Perſians, we may obſerve, that they are ſo far from ſhutting their doors at their meals, that they invite every one to eat with them, who happens to come to their houſes at that time: they remember to this day, and imitate, the hoſpitality of Abraham; obſerving, that if he had not been of that communicative diſpoſition, he had probably miſſed the honour of entertaining three angels.

When any of the Perſians are diſpoſed to make an entertainment, it is generally in the evening; and though a ſupper, the gueſts uſually come at nine or ten in the morning, and ſpend the whole day at the place to which they are invited. They diſcourſe, ſmoke, eat ſweetmeats, and paſs away the time with a variety of amuſements; ſometimes they are entertained with heroic poems, repeated in honour of their prince; ſometimes ſinging women are introduced, who ſing, dance and play, and exhibit a thouſand antic tricks to divert the company, and if any of the gueſts are diſpoſed to withdraw with any of thoſe dancing girls, they are ſhewn into a private room; and when they return not the leaſt notice is taken of it. When ſupper is ſerved up, the ſon, or ſome relation of the maſter of the houſe takes the management of the feaſt upon him, and helps the gueſts to their meat: they generally provide a variety of ſherbet on theſe occaſions. It is the employment of great numbers of people of Iſpahan, to collect vaſt quantities of ice together in the winter ſeaſon, and keep it in repoſitories under ground all the ſummer, when they ſell it to great advantage; for the uſual drink of the Perſians is nothing but fair water, which they drink with ice.

We have already obſerved, that wine is made in ſeveral provinces in Perſia; but it is chiefly uſed by the Armenians and other Chriſtians. The officers of the army will indeed ſometimes indulge themſelves with this liquor, and other people drink it as they pretend for their health; but that is ſeldom done: the greateſt part of it is ſent to the neighbouring countries, or drank by thoſe Chriſtians who are diſperſed throughout the Perſian dominions. Thoſe who abſtain from wine for conſcience ſake, becauſe it is prohibited by law, exhilarate their ſpirits with opium, bang, poppy-ſeed, and other intoxicating ingredients; it being almoſt univerſally allowed, that they cannot ſuſtain the cares and inquietudes of life, without an expedient of this nature.

The Perſians, like other eaſtern nations, take pills of opium, which ſome of them gradually increaſe to ſuch a doſe, as would deſtroy half a dozen Europeans. In an hour after they have taken the pill, it begins to operate, and a multitude of romantic ſcenes preſent themſelves to their imagination; they laugh and ſing, and repeat abundance of humorous expreſſions, like men intoxicated with wine; but after the effect of it is gone off, they find their ſpirits exhauſted, and grow penſive and melancholy till they renew the doſe; ſome, we are told, have made it ſo neceſſary to them, that they cannot live without it. A decoction of poppy-ſeeds is ſold in moſt cities of Perſia; and in theſe houſes you will ſee people acting and talking as ridiculouſly as men uſually do when they are drunk. Surely, if there was any reaſon for prohibiting the uſe of wine, it muſt have been, in order to prevent people's playing the fool, and deſtroying their healths, which we perceive can be as effectually done by an opiate: but as long as they keep to the letter of the law, and abſtain from wine, it matters not how much they diſorder themſelves, ſince they think they never ſhall be accountable for that.

The

The young gentlemen of Perſia in general, as well as that province inhabited by the deſcendants of the antient Parthians, endeavour with great diligence to accompliſh themſelves in the uſe of the bow and horſemanſhip; which are exerciſes that the Perſians are extremely fond of at this day. Their greateſt kings have condeſcended to come into the meydan, before the palace, at certain times in every week, to be witneſſes of the addreſs and activity of their ſubjects, and frequently themſelves contended for the prize. They begin with teaching the young pupil to bend the bow, firſt a weaker, and then a ſtronger: he is afterwards taught to ſhoot forwards, backwards, ſideways, and almoſt in every poſture: they are exerciſed for ſome time in ſhooting upwards into the air, to try which of them can ſhoot higheſt; after this, they are inſtructed to ſhoot at a mark, and to deliver their arrows ſteadily without ſhaking. The arrows for theſe exerciſes have blunt iron heads; but thoſe for ſervice are ſhaped like the point of a ſpear. They next teach the pupil to mount a horſe with dexterity, to have a good ſeat, gallop with a looſe rein, ſtop ſhort, and turn ſwiftly to the right or left, upon the leaſt ſignal, without being diſordered in their ſaddle. They are alſo taught to play at a game almoſt like bandy on horſeback: every gentleman has a ſhort bat in his hand; and a ball being thrown amongſt them, they ride after it, and ſtooping almoſt to the ground, ſtrike it in a full career; and he who ſtrikes it ofteneſt before it comes to the end of the mall, wins the prize. They are likewiſe taught to manage the ſabre, or back-ſword, and to throw the lance: the ſtaff they throw by way of exerciſe is without iron, and about five feet long, and with theſe they engage on horſeback; and though there be no ſpear at the end, they frequently give one another very dangerous wounds.

When they have gone through their exerciſes, they are permitted to ſhoot for the prize in the royal meydan, before the king and court. In this ſquare is erected a high pole, like the maſt of a ſhip, and upon it is ſet a cup, ſometimes of maſſy gold, eſpecially if the king and great officers deſign to ſhoot at it, as they frequently did, till of late. Thoſe who contend for the prize, ride full gallop with their bows and arrows in their hands; and when they are got a little beyond the pole, without ſtopping or turning their horſes, they bend themſelves backward either to the right or left, and let fly their arrows at the cup, and he who brings it down gains abundance of honour. As the Perſian troops are thus conſtantly practiſed in ſhooting backwards, they may poſſibly take their aim better this way than any other: it is therefore no wonder that the Perſian troops have been as much dreaded when they retreat as when they charge.

The rural ſports and manner of hunting, or rather courſing, of the Perſians, ſeems as remarkable as their martial exerciſes. Their grey hounds very much reſemble thoſe of the Iriſh; but the ſtags and antelopes they hunt, are ſo very fleet, that the dogs cannot come up with them without the aſſiſtance of their hawks: of theſe they have various kinds brought from Circaſſia, Muſcovy, and the northern parts of the empire: theſe hawks are taught not only to fly at partridges, quails, rabbits, hares, &c. but even at deer and wild beaſts; and in order to train them up to it, they take the ſkin of one of theſe beaſts, and having ſtuffed it, faſten a piece of fleſh on the head of it, with which they feed the hawk, drawing the ſtuffed ſkin along upon wheels at the ſame time, to uſe them to fix themſelves on the head while it moves. When they have uſed the young hawk to this for ſome time, they carry him to the ſport with an old ſtaunch hawk that is uſed to the game: the dogs being let go, the hawks are ſoon after thrown off, who faſten upon the noſe of the deer, and ſtriking their talons into his fleſh, keep beating their wings about his head, ſo that he cannot ſee his way: which gives the dogs an opportunity to come up and ſeize him: the gentlemen uſually carry a little kettle-drum at their ſaddle bow to call off their hawks; ſome of them, it is ſaid, have formerly been taught to fly at men. The governor of Tauris uſed to divert himſelf with this ſport, not ſparing his friends ſometimes: and one day letting his hawks fly at a gentleman, they tore his face and eyes in ſuch a manner that he died of it; but the king being informed of it, reſented it ſo far, that he was turned out of his office.

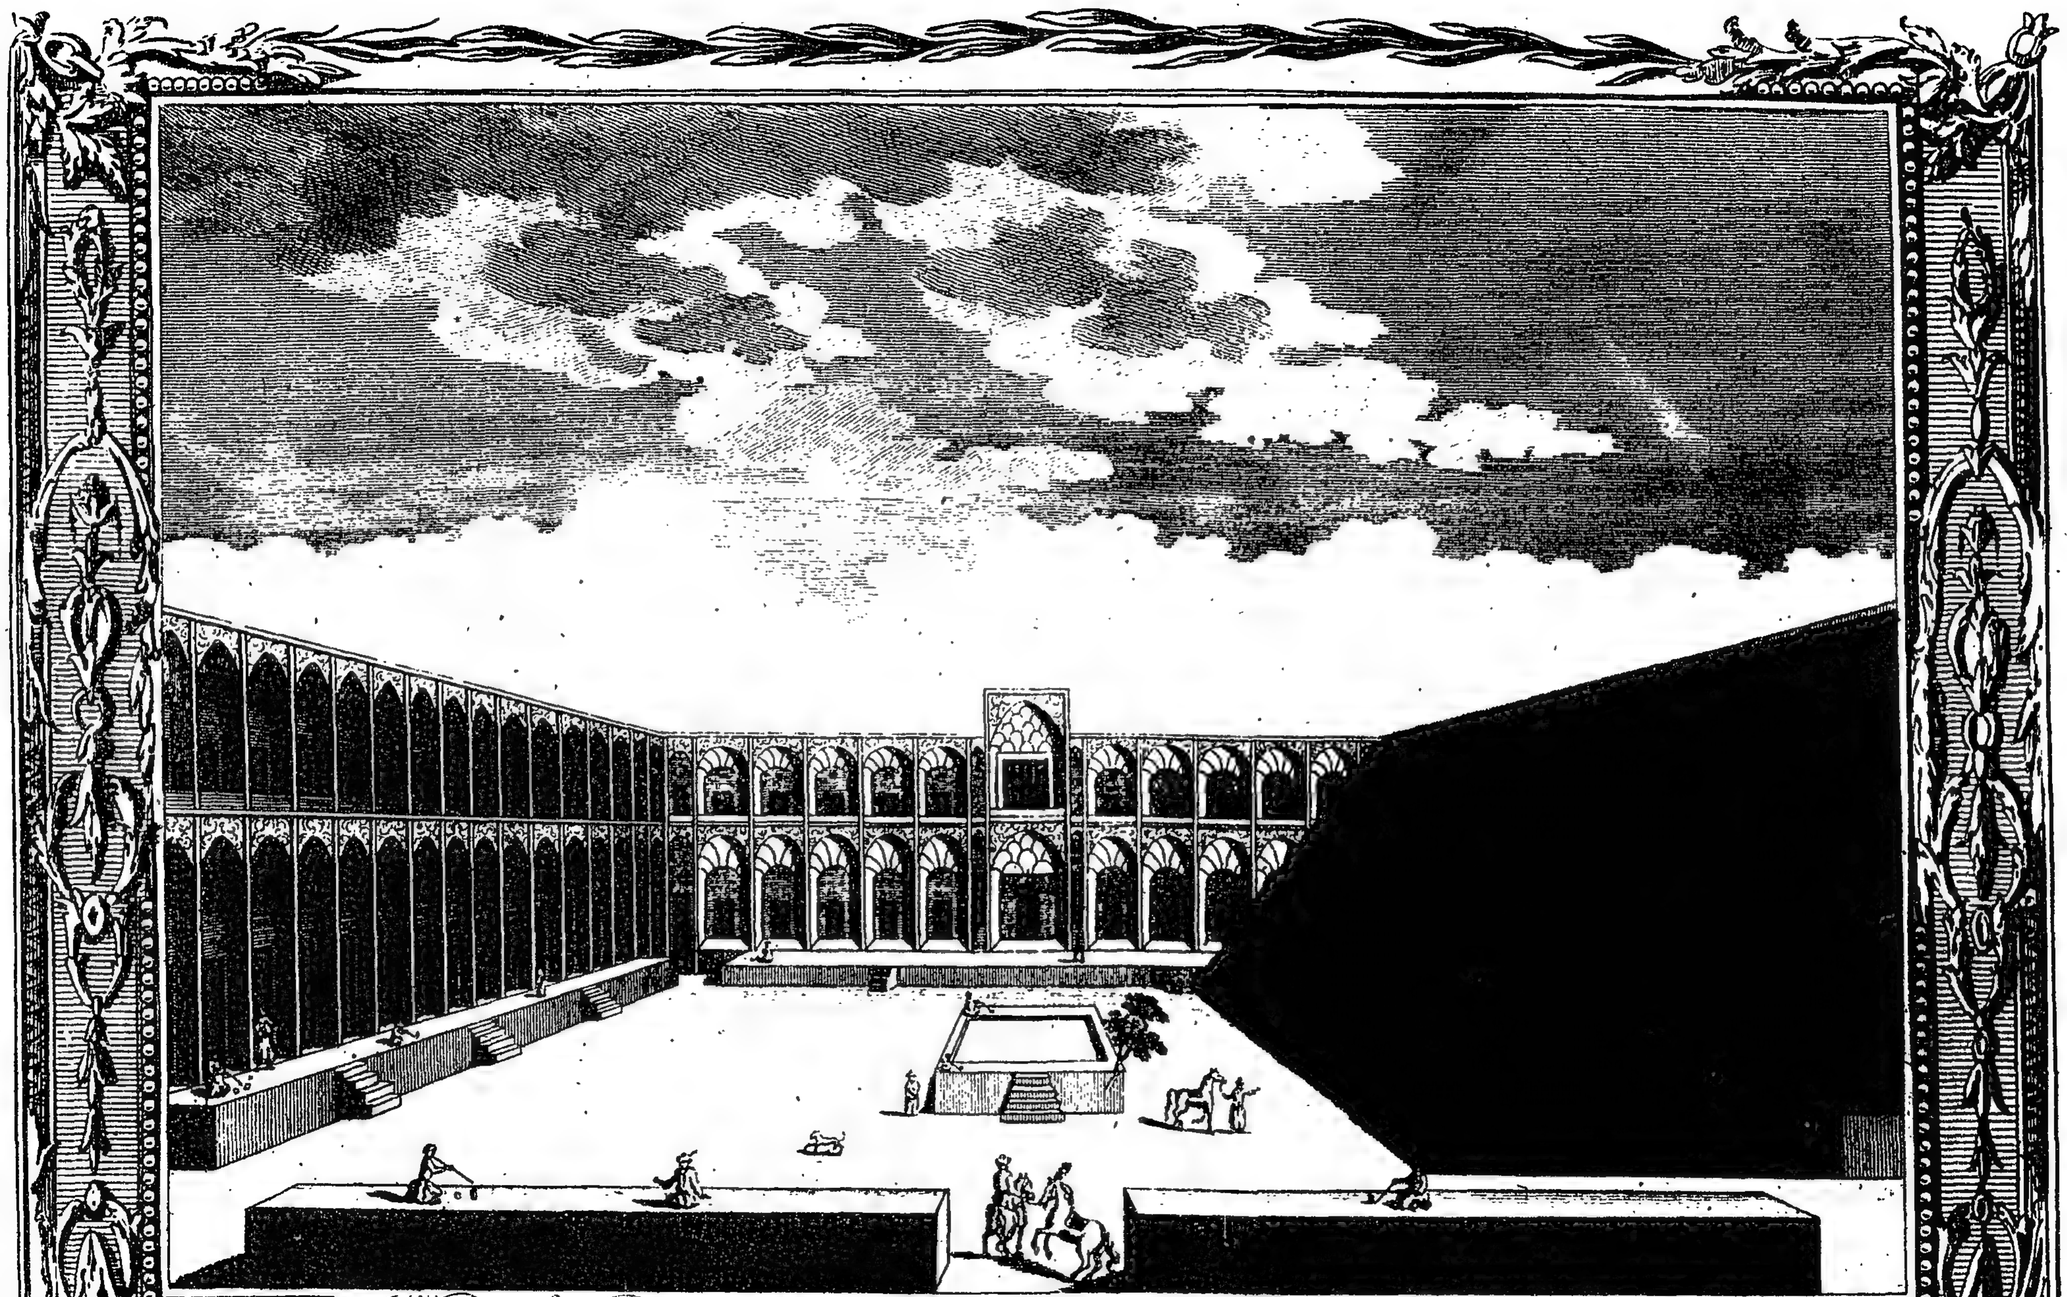
When a grand hunt is ordered by the king, at which the great omrahs are preſent, the country-people for ten or fifteen miles round, are ordered to drive all the wild beaſts and game into a certain place, which is ſurrounded with ſtrong nets and fences; and when they have thus incloſed them, every one of the company ſhoots at which he pleaſes, and they make a terrible ſlaughter of them; there are often ſeveral hundreds killed at one of theſe hunting matches; but they uſually ſtay till the man of the beſt quality in the field comes up and diſcharges an arrow, after which every one diſcharges as faſt as he can, there being generally a ſtrange variety of deers, antelopes, wild hogs, wolves, foxes, hares, &c. all driven together in a crowd. They frequently bring up the leopards and panthers to hunt the game, or rather ſurpriſe it; for they creep from one cover to another, till they can jump upon their prey, as a cat does upon a mouſe, but never run after it in a continued courſe. As for hounds, and hunting by the ſcent, they know nothing of it; and indeed their country ſeems to be too dry for this kind of ſport, if they had dogs which were fit for it.

The Perſians are not much addicted to gaming; and ſome of the moſt ſcrupulous look upon the games of chance to be unlawful: however, ſome of them play at cards, dice, tables, cheſs, and other games not in uſe among us. The king and people of quality alſo ſometimes divert themſelves with the fights of wild beaſts, as is practiſed in India. The common people alſo amuſe themſelves with jugglers, tumblers, and rope-dancers; but as their tricks nearly reſemble thoſe practiſed in Europe, it is needleſs to take up our readers time with a rehearſal of them.

In Perſia, they uſually ſalute each other by bowing the body a little, and clapping the right hand to their breaſt; but they never ſtir their cap or turbant; they bow their faces three times to the ground when they approach the king, the viceroys of provinces, and other great men. They expect from Europeans, the ſame reverence they ſhew to men of quality in their own country; and if they are not cloathed in the Perſian dreſs, they look for the motion of their hats as a token of reſpect.

The Perſians do not fail to viſit each other, and people of condition always expect the compliments of their dependents, on occaſions of mourning or rejoicing. They are introduced into a large hall, where coffee and tobacco are ſet before them, with which they amuſe themſelves till the great man appears; as ſoon as they ſee him, every man riſes up, and ſtands in his place; he bows to them, and every one bows much lower to him again as he paſſes by: and after he has taken his ſeat, he makes a ſign to the company to ſit. If the maſter of the houſe be already in his hall, the viſitor comes in ſoftly, and, ſtepping to the next vacant place, ſtands gravely with his feet cloſe together, and his hands acroſs, till the maſter of the houſe beckons to him to ſit down. But if a perſon receives a viſit from his ſuperior, he riſes as ſoon as he ſees him, and meets him half way; and ſometimes receives him at the gate, if he has notice of his coming; and, in ſhort, the reſpect ſhewn is generally proportionable to the quality of the perſon, as it is with us; but they differ in this, that they place thoſe on the left hand for whom they have the greateſt reſpect. They have frequently ſtools brought for Europeans, who viſit them, to ſit upon, but the Perſians themſelves ſit croſs-legged.

The people in this country travel upon camels, horſes, mules, or aſſes, as they have no wheel-carriages. The women, who are always concealed as much as poſſible, are put into a ſquare wooden machine, one of which they hang on each ſide of a camel; they are about three feet deep, and juſt large enough for one to ſit down in; and over-head are three or four hoops, like thoſe which ſupport the tilt of a waggon, with a cloth thrown over them. Their aſſes, it ſeems, are much larger and nimbler than ours, and will trot ten miles at a pretty good rate; but they are very obſtinate and unruly, and frequently throw their riders.



A common method of travelling in Perſia, is with the caravan, conſiſting of four or five hundred camels, beſides other beaſts; and there is no place where they travel with greater ſecurity, and leſs expence, there being caravanſeras at proper diſtances, where they have their lodging gratis, and purchaſe proviſion at the beſt hand; and though the roads are frequently ſteep and mountainous, yet ſuch care is taken in laying bridges and cauſeways, and to level and enlarge the ways, that a traveller ſeldom meets with any difficulties but what are eaſily ſurmounted.

Here are no general poſts; but if a perſon has letters to ſend, he diſpatches a ſhatir or footman with them on purpoſe, who will travel a thouſand miles in eighteen or twenty days: ſome families make this their only employment; and breed their children up to it, practiſing them to run from their infancy. Theſe perſons carry with them a bottle of water, and a little bag of proviſions, which ſerves them thirty or forty hours; they generally leave

Page sculp.

leave the high road, and croſs over the country the neareſt way. Each of them charges no more than twenty-pence or two ſhillings a day for his trouble. The king and all the great men have ſeveral of theſe ſhatirs or footmen in their retinue.

Before a man can be admitted one of the king's footmen, he muſt give a very extraordinary proof that he neither wants heels nor breath; for he muſt run from the great gate of the palace, called Aly Capi, to a place a league and a half from the city, twelve times in one day, and every time bring an arrow along with him, which is delivered to him by thoſe who ſtand at the end of the race, to ſhew he has run the whole courſe; and this he performs between ſun riſe and ſun ſet, in thirteen or fourteen hours at moſt, being no leſs than one hundred and eight miles. This honour is always beſtowed upon ſome favourite ſervant of the king.

On the day of trial, the elephants and horſemen are drawn up in the royal ſquare, with the muſic, drums and trumpets ſounding, as if it was ſome feſtival; all the great men make preſents to the ſhatir (ſome of whom have obtained above a thouſand pounds on ſuch an occaſion) and ſeveral of them ride the courſe with him, to ingratiate themſelves with the prince; and the populace attend him, every time he returns, with their ſhouts and acclamations. The chams and viceroys, who admit of a ſhatir into their ſervice, make him run the ſame number of miles, and they are careſſed, and preſented by all their dependents in the ſame manner as the king's ſhatirs are, though, we may well ſuppoſe, not to the ſame amount.

SECT. IV.

Containing a Relation of the Civil War in PERSIA, which terminated in the depoſing of SULTAN HOSSEIN by MAHMOOD, who uſurped the Sovereignty.

SHAH Sultan Hoſſein, the late Sophi, ſucceeded his father Sultan Solyman. This prince choſe to paſs his time in an indolent and inactive manner among his women in the haram, leaving the adminiſtration of the government intirely to his miniſters, who promoted and diſplaced whom they thought fit; oppreſſing the ſubjects with taxes and impoſitions, though in a time of profound peace, and ſetting every thing to ſale; ſo that a general corruption ſpread itſelf through the whole magiſtracy, and juſtice was as often bought and ſold as any other commodity; the public buildings were neglected; and even the ordinary exerciſes of the young nobility and gentry, which uſed to be performed in the royal preſence, were diſuſed; hunting and all rural ſports were laid aſide; and ſo univerſal was the degeneracy, that while one part of the people, following the example of their prince, ſpent their whole time in the harams with their women, others were employed in devouring and preying upon their fellow-ſubjects.

The famous Mereweys was one of the perſons, among others, who were diſcarded for not offering a bribe, or preſent, as it is called in Perſia, ſuitable to the expectation of the miniſtry. This gentleman was a Tartar by deſcent, or at leaſt commanded four or five hundred men on the utmoſt bounds of the Perſian empire towards Uſbeck Tartary, where the Perſians live in hords, or clans, as the Tartars do on the other ſide of the river Oxus, moving from place to place with their tents, as they can find proviſion for their cattle. Mereweys, underſtanding that he was removed only to make room for another who had procured to himſelf a preference by preſents, applied to all his friends; and raiſed ſuch a ſum, as in a ſhort time cauſed him to be reinſtated in his command. He was however, ſo impoveriſhed by this laſt preſent, that he found himſelf in very uneaſy circumſtances; and taking advantage of the ſupineneſs of the government, and his diſtance from the court, he determined to ſeize on the neighbouring province of Candahor, and ſet up for himſelf. Accordingly, he communicated his deſign to his friends the Tartars, who promiſed to aſſemble their troops, and aſſiſt in the enterprize; but the city of Candahor being a frontier towards India, and a conſiderable body of troops quartered thereabouts, he was in doubt whether he ſhould be able to carry the place by force; whereupon he had recourſe to the following ſtratagem: When he received his firman or commiſſion for reinſtating him in his command, he pretended alſo that he had received a commiſſion to ſucceed the governor of Candahor in that province, and accordingly marched that way with his troops. When he came within a mile or two of the town, he ſent to the governor, to appriſe him of his pretended commiſſion: well knowing that the governor, as was uſual in ſuch caſes, would come out to meet him; which he accordingly did. After ſome compliments between them, Mereweys, who had poſted his men ſo as to prevent the governor's retreating into the town, fell upon his guards, and cut them to pieces; after which, before the city could be informed of what had happened, he marched forward to Candahor, and had the gates immediately opened to him.

Mereweys had no farther views at this time, than the erecting the province of Candahor, which had formerly belonged to India, into an independent ſtate; but this he could not expect to accompliſh, without forming ſome powerful alliances: in order, therefore, to protect himſelf againſt the forces of the Perſians, which he had reaſon to expect would be ſuddenly brought down againſt him, he diſpatched an omrah to the Mogul's court, to give advice of his ſucceſs, and to propoſe an alliance againſt Perſia, the antient enemy of India. This intelligence was joyfully received by the Mogul, who began now to entertain hopes of recovering the province of Candahor, and reſtoring it to his dominions, which would be no hard matter to effect, if he could make Mereweys dependent on him. He therefore offered him what number of troops he thought fit to demand for his ſupport, giving him the title of Prince of Candahor, which he then aſpired to; and moreover ſent him all imaginable aſſurances of his affection and eſteem.

Advice being received at the Perſian court of the ſurpriſe of Candahor by Mereweys, the miniſtry detached a body of four or five thouſand horſe to endeavour to reduce him; but Mereweys (being joined by the Uſbeck Tartars, and ſome others, who daily flocked to him in hopes of meeting with abundance of rich plunder in Perſia) did not ſhut himſelf up in Candahor, but attacked the Perſians in their march, and defeated them. This ſucceſs induced him to extend his views, and he ſeemed now to aim at a revolution: to this end he diſpatched his emiſſaries into all the provinces, and even to Iſpahan itſelf, who complained loudly of the perſonal vices and indolence of the Sophi, who, he inſinuated, was unworthy to govern the true believers, and remonſtrated againſt the male-adminiſtration of public affairs, through the corruptions and oppreſſive conduct of the miniſters.

The late tranſactions threw the miniſtry into the utmoſt conſternation: but they had, by their paſt behaviour rendered themſelves ſo obnoxious to the reſentment of the chams and omrahs, that they knew not whom to confide in. Should they order them, with their troops, to aſſemble and make head againſt this formidable rebel, they were under apprehenſions he would receive additional ſtrength by their joining him: or that they would at leaſt expoſe their adminiſtration, if not demand their heads as an atonement for their crimes. If on the other hand they ſuffered him to march forward without oppoſition, they knew the conſequence would prove no leſs fatal. They therefore diſpatched another general, whoſe fidelity, and ſkill in military affairs, they had a great opinion of, to watch the motions of Mereweys, and awe the country at leaſt, that they ſhould not go over to him, or ſupply him with proviſions: but this detachment ſucceeded no better than the former, being ſurpriſed by Mereweys, and moſt of them cut to pieces.

In conſequence of theſe two engagements, Mereweys furniſhed his followers with arms and accoutrements, who were at firſt little better than a defenceleſs rabble. He began alſo now to talk of advancing to the capital of Iſpahan; but as there was a vaſt extent of country between Candahor and Iſpahan, and his troops did not yet amount to more than eight or ten thouſand horſe, he thought proper, firſt of all, to ſtrengthen himſelf with an alliance with the Grand Seignior, and put the city of Candahor into a condition to reſiſt any attempt that might be made upon it in his abſence. His negotiations at the Porte ſucceeded to his heart's deſire; and the Baſſa of Bagdat was immediately ordered to aſſemble an army, and march to the frontiers of Perſia. Mereweys now began to throw off all diſguiſes, and ſtile himſelf Protector of the kingdom of Perſia, and to prepare for his march to Iſpahan; but in the midſt of all his projects, and while he was graſping at the whole world in his imagination, death put a period to his views. This event had probably diſcouraged his adherents, and proved fatal to the cauſe, had he not left a ſon behind him equal, if not ſuperior to himſelf, in every reſpect.

Mahamood, the ſon and ſucceſſor of Mereweys, being conſcious of the great reputation his father had gained by the ſurpriſe of Candahor, and the victories he had obtained, thought fit to conceal his death, and to tranſact all affairs in his father's name, till his own reputation ſhould be

eſtabliſhed. Accordingly, all things went on as if Mereways had been ſtill alive: the preparations for marching to Iſpahan were continued, new alliances were cultivated, and new forces raiſed. Nor did the Turks and Muſcovites neglect to improve theſe diſtractions in Perſia to their own advantage. The Muſcovites ſurpriſed Derbent and Tarku, which lay next to them on the weſt ſide of the Caſpian ſea; and afterwards extended their arms into Ghilan, all along the ſouth coaſt of the ſame ſea. The Turk, on the other hand, took poſſeſſion of Hamadan, and ſeveral other frontier places, finding little or no oppoſition.

The Perſian miniſtry were now terribly alarmed, not knowing what meaſures to purſue; and, to add to their misfortunes, the treaſury was entirely exhauſted. They came, however, at length to the reſolution, to let the frontiers ſhift for themſelves, and to aſſemble an army of eight or ten thouſand horſe in the neighbourhood of Iſpahan, to oppoſe the uſurper, of whom they received repeated advices, that he was in full march for that capital.

The king, when he underſtood that the uſurper's army, under the command of Mahamood, was approaching his capital city, and that the people were in general diſcontented with the adminiſtration, propoſed to his omrahs to reſign his crown, and ſet his eldeſt ſon upon the throne. This was generally approved of; but the poor young gentleman, who had never been out of the ſeraglio, and was ſufficiently terrified with the repreſentation the eunuchs made of the ſtrength and power of the uſurper, declined the offer, being apprehenſive that he was only ſet up to be made a ſacrifice to the rage of a powerful enemy.

Sultan Thamas, or Thomas, the King's ſecond ſon, was not altogether of ſo puſillanimous a ſpirit; but was contented to ſucceed his father in the throne, and put himſelf at the head of the army, which encamped in that fine walk called the Char Bag, between Iſpahan and Julpha or Zulpha. Here the army continued ſome time, and an engagement between the royal troops and the uſurper was daily expected. Shah Thomas, in the mean time, endeavoured to diſcover how the great men and officers ſtood affected to his cauſe: and, among others, he ſent to the Engliſh factory, reminding them of the previleges they had enjoyed in Perſia under his anceſtors, and let them know, that he expected all the aſſiſtance they could give; and, in ſhort, things bore ſo favourable an aſpect, that it was expected he would have driven the uſurper from the neighbourhood of Iſpahan; when news was brought one morning, that Shah Thomas, with ſome few of his friends, had left the army the night before, and had fled, nobody knew whither; whereupon the officers of the royal army, as well as the citizens, thought of nothing elſe but making their peace with the uſurper, and inviting him into the town, which he ſoon after took poſſeſſion of, making the old king and the whole court his priſoners. This Mahamood effected with ſo ſmall a force as ſix or ſeven thouſand horſe.

Mahamood, finding an empty treaſury, and being under a neceſſity of raiſing more forces for the ſupport of his uſurpation, confiſcated the goods of all thoſe who were not in his intereſt; he alſo cut off the heads of the prime miniſter and his adherents, who for ſeveral years had been fleecing the people, whereby he repleniſhed his coffers, at the ſame time that he gained the applauſe of the people, who ſeldom conſider the juſtice of the cauſe on theſe occaſions, but never fail to rejoice when they ſee their oppreſſors puniſhed. The uſurper, having ſent the king under a guard to Candahor, took poſſeſſion of the royal palace; money was extorted from the foreign merchants, eſpecially the Engliſh, inſomuch that the factory was in a manner ruined.

Sultan Thomas, with his few friends, having quitted Iſpahan, took the road of Tauris, where he aſſembled a body of horſe, and made a ſhew of oppoſing the Turks, which drew over many of the Perſians to his intereſt; but the Turks were ſo much ſuperior to him, that he could do little towards ſtopping the progreſs of their arms; and the towns being for the moſt part without walls or garriſons, became an eaſy prey to the grand ſeignior's forces, who ſoon afterwards took Tauris, and put the inhabitants to the ſword.

SECT. V.

Of the PERSIAN Home Trade, Mechanic Arts, and Manufactures; alſo of their Foreign Trade, Navigation, Pearl-Fiſheries, ENGLISH Trade in PERSIA, Freight of Goods from GOMBRON to SURAT, Price of Goods at GOMBRON, Port Duties, Weights, and Coins.

A HEAD or warden is appointed by the Government to preſide over every trade, who is to ſee that the rules and orders relating to the profeſſion are duly obſerved. When any perſon intends to ſet up a trade, he goes to the warden, and regiſters his name and place of abode; and no enquiry is made who was his maſter, or whether he underſtands the buſineſs, or not; nor is there any reſtraint laid upon them, that they ſhall not encroach upon any other profeſſion; thus, for inſtance, the braziers are at liberty to make ſilver veſſels, as they frequently do, without being in danger of a proſecution from the ſilver-ſmiths. Every trade almoſt is bound to work for the king, whenever he requires it; and thoſe who are exempted, pay an annual tax to the government. Tradeſmen do not take apprentices for a term of years; but hire their ſervants, and allow them wages from the firſt day they entertain them.

It is obſerved, that their carpenters are but very indifferent artiſts: and the reaſon thereof may be, that there is not much timber in Perſia, and but very little is uſed in their buildings. Joiners and turners are more expert in their profeſſion, and they lay on their lacker very nicely. The braziers and tin-men work well with their hammers, files, and turning inſtruments. They have neither iron, braſs, nor pewter in their kitchen furniture; moſt of the veſſels and implements uſed in their kitchens being made of copper tinned.

The broad-ſword blades, made by their armourers, are very good, and they damaſk them as well as any European. The barrels of their fire-arms are not amiſs; they make them very ſtrong, and as thick at the muzzle as the breech. Their ſtocks are but ill-contrived, being thin and light at the butt end, and not fit to clap to a man's ſhoulder; as for locks to their guns, or any locks that have ſprings, they do not pretend to make them, any more than they do watches or clocks, which they either purchaſe abroad, or employ European workmen to make for them. Knives, raſors, ſciſſars, and ſome other cutlery ware, they make very well; and little ſteel mirrors, which they uſe inſtead of looking-glaſſes: theſe are almoſt all convex; and the air is ſo perfectly dry, that they ſeldom ruſt, or grow dull. They do not underſtand the art of making looking-glaſſes, but have them from Europe; they have, however, a manufacture of glaſs, which ſerves for windows and bottles. The uſe of the bow being what the Perſians greatly value themſelves upon, there are no where better bows made than among them: the chief materials are wood and horn, with ſinews bound about them: their quivers are of leather, embroidered or worked with ſilk. The bow-ſtring is of twiſted ſilk, of the bigneſs of a gooſe-quill. Their bows are painted and varniſhed, and made as fine as poſſible.

The Perſians are as well verſed in embroidery as in any art whatever, eſpecially the gold and ſilver embroidery, either on cloth, ſilk, or leather: they cover their ſaddles and houſings almoſt with embroidery, and the ſtitching of the leather by far exceeds any thing done in Europe. Their ſaddles are made after the Morocco model, the ſtirrups of which are very ſhort; they have a kind of breaſt-plate to them. Perſons of quality have gold about their furniture where we uſe braſs.

What is called in Europe Turkey leather, from its coming through that country, is uſually made in Perſia. The ſhagreen alſo comes from thence, which we are told is made of the ſkin of an aſs's rump. Tanners uſe ſalt and galls inſtead of bark, and dreſs their coarſe ſkins with lime.

Earthen-ware is another manufacture the Perſians excel in; it is much beyond any thing of this kind made by the Dutch; ſome affirm, that it is almoſt equal to china-ware. It is chiefly made at Schiras, Metzed, Yeſd, and Kerman. Mending of glaſs and earthen-ware is a particular trade in Perſia: they will drill holes through them, and faſten the pieces together ſo, that a broken bowl or plate will hold liquids as well as before it was broke.

Gold wire-drawers and thread-twiſters, may alſo be ranked among their moſt ingenious artiſts. They will draw a piece, weighing a dram, to the length of three hundred Perſian ells (five and thirty inches making an ell).

Their lapidaries, we are aſſured by a perſon who was a jeweller, underſtand the grinding of ſoft ſtones, and can cut them pretty well.

Their dying is preferred to any thing of that kind in Europe. This is rather aſcribed to the dryneſs and clearneſs of the air (which gives a livelineſs to the colours, and fixes them) than to the ſkill of the artiſt.

Taylors work is done very neatly by the Perſians; the men's cloaths, which are made of the richeſt flowered and brocaded ſilks, are fitted exactly to their bodies without the leaſt wrinkle; and their ſewing is incomparably beyond that of our workmen; as the fine materials they work on require it ſhould. They work flowers alſo upon their carpets,

pets, cushions, and window-curtains, so very nicely, that they look as if they were painted. Their barbers are no less excellent in their way: for they will shave the head almost at half a dozen strokes, and have so light a hand that a person can scarce feel them. They use only cold water, and hold no bason under your chin, as with us; but have their water in a cup about the bigness of a little china dish. After they have shaved a man, they cut the nails of his feet and hands with a little iron instrument like a bodkin, sharp at the end; then they stretch his arms, and rub and chafe his flesh; which, in these hot countries, is an operation very pleasing as well to the Europeans as the natives.

Their goldsmiths are in general very unskilful and awkward workmen; what they perform best, is in the filligree way: they also make stone rings, and engrave pretty well, but do not understand enamelling. Any work which requires springs, such as watches, &c. they are totally unacquainted with.

The principal manufactures of the country are silks; such as taffaties, tabbies, sattins, and silk mixed with cotton or camel or goat's hair, brocades, and gold tissue. There are an hundred sorts of the single brocade: the double are called duroy, or two faces, because both sides are equally good; they are the richest that are to be met with any where. The gold velvet, which is wrought in Persia, is admirable. All their rich stuffs have this good property, that they are very durable; the gold or silver does not wear off or tarnish, while the work lasts, but keeps its colour and brightness. The finest looms for these stuffs are at Ispahan, Cashan, and Yesd: those for carpets are chiefly made in the province of Kerman. What are usually called Turkey carpets, are indeed Persian; but obtained that name from being brought to us by way of Turkey. The camel-hair stuffs are made in Carmania: it is exceeding soft and smooth: but the stuffs they make with it are not strong. Camlets and silk and worsted druggets are made in the same province. Goats-hair stuffs are made in Hyrcania, and near the gulf of Bossora. There is some callico cloth made in Persia, and they know how to paint and stain it; but the Indian callicoes are far preferable.

In Persia, the profession of a merchant is reckoned very honourable; and the rather, as there is no hereditary nobility, which devolves from father to son. With respect to those in great posts, their honours and profits terminate with the office: and their lives and fortunes are in perpetual hazard, especially under a weak or cruel prince. The trader seems more independent than any other subject; and notwithstanding the government is despotic, they are usually encouraged, because they bring in a considerable revenue to the crown; and we may add, the greatest ministers do not think the business of a merchant degrading to them: even the king himself has had his factors and agents in the neighbouring kingdoms, and exported silks, brocades, carpets, and other rich goods; and his agents at the Mogul's court, and elsewhere, when their business was chiefly traffick, have frequently had the character of ambassadors conferred upon them.

Brokers and stock-jobbers, who are a very cunning and subtle class of people, generally carry on the trade in Persia. After they have talked over and settled the matter at the seller's house (for there is no exchange for the rendezvous of merchants) they agree about the price upon their fingers, putting their hands under a cloth; the fingers end, it seems, stands for one; the bent finger for five, and the strait for ten; the open hand for a hundred, and, if shut, a thousand; and it is impossible for a by-stander to gather any thing from the circumstances, because they retain so even a countenance all the while they are transacting the affair.

The Armenian Christians, and Banians of India, have by far the greatest share of the trade, notwithstanding the Mahometans are the governing part of the country. The Mahometan Persians trade from one province of their own country to another, and to India not a little; but the Armenians manage the whole European trade; one reason whereof is, that the Mahometans do not care to go into Christian countries, because they cannot there observe the customs their religion prescribes; for their law, it seems, forbids them to eat flesh killed or dressed by a man of a different religion, or to drink out of the same cup with him; and even prohibits the touching of persons in some circumstances, whom they look upon to be polluted. Another thing, which is a disadvantage to their trade, is, that the taking up money at interest is unlawful, though they are at liberty to make what advantages they can in buying and selling. But the business of trade never entered into the thoughts of their law-giver, he lived in a part of the country, where they dealt chiefly in herds of cattle, and he did not foresee the advantages his disciples might make by foreign trade and merchandize. The government, therefore, find themselves under a necessity of protecting and encouraging their Christian subjects, as they value their foreign trade, and the revenue it brings in; and Christians, it is observed, live much easier and happier under the Persian government, than in many Christian countries, where the people are of different sects and persuasions; and, as a consequence of this, the Christians of Persia, especially towards Georgia, are a very considerable body; the Christians also are the only sort of people who inhabit the great town of Julpha near Ispahan.

Silk, both raw and wrought, is the staple commodity of Persia; great quantities of this are exported to India, Turky, and Muscovy; and the English and Dutch formerly took a great deal off their hands, but little or none at present. They supply India with abundance of fine horses, at a very great rate, forty or fifty pounds being but an ordinary price for an horse there. They export also camels hair, goats wool, leather, wines, distilled waters, dried and preserved fruits, pistachio nuts, dates, &c.

We cannot learn that there is any considerable quantity of pearls to be met with in Persia at present, though the country was once famous for them. There was, it is true, one of the finest pearl fisheries in the world in the gulph of Persia some few years ago; but the Persians have lost the dominion of that sea, and of all the islands in it, except Ormus, and that was vigorously attacked by the Arabs, who conquered the rest.

About the year 1718, the Persians made an attempt to recover these islands, and, in order thereto, procured the viceroy of Goa to assist them with four men of war, but the Persian general, it seems, was bribed by the Arabs, and had nearly betrayed the Portuguese ships into their hands; and though he failed in that, yet never providing any land-forces to assist in that expedition, the Arabs remain in possession of those places, and, with them, of the pearl-fisheries. The Portuguese squadron, however, came to an engagement with the Arabian fleet, and it proved one of the most obstinate encounters that had been seen in that part of the world: one of the Arabian ships was sunk; and those of the Portuguese were so shattered, that they were glad to retire to their ports, and appeared no more in that sea. Some of the Arabian men of war are very large, carrying no less than fourscore guns; and they are said to have ships of the greatest force of any nation on the other side the Cape of Good-Hope.

The English East India Company trading to Persia had before the civil war, two considerable factories in that kingdom, one at Ispahan, and the other at Gombron in the mouth of the gulf of Persia or Bossora; the head of each factory was called their agent, and lived in as great state as a nobleman. The agent at Ispahan had with him at that time three or four English factors, and a retinue of no less than thirty or forty servants natives of the country: their house was elegantly built, after the model of the Persian palaces, and stood in the middle of a garden. Their horses, servants, and equipage, when they went abroad, were equal to an omrah's: their furniture shone with gold, or rather was covered with it. The state of the Gombron agent was not altogether so grand; but his advantages were equal, as will appear hereafter; but before we give an account of the privileges of the servants of the English company, it will be necessary to treat of their trade which has very much dwindled of late years.

English cloth is almost the only commodity the company carry to Persia, nor does this turn to any great account, the Turky company being able to supply that part of the country, where it is chiefly vended, at a much cheaper rate. In return for cloth the company bring back wool, as it is commonly called, which is the soft down that grows under the hair next the skin, and is chiefly used by hatters: the company bring away every year about a thousand bags of this, each bag weighing a hundred weight; and if they do not meet with a sufficient return in this, they take the balance in abasses and chequeens, or else in gold bars, of which great advantage is to be made; and as they have not sufficient freight of their own, they take in freight of the Armenians, Banians, and Moors, and other private traders, when they return to Surat, and generally a great number of passengers for that country.

The Persians have not a ship in the gulf, or indeed any where else, but freight all their goods for India in English or Dutch vessels, and the captains and officers were formerly guilty of great extortions: for they would make a merchant pay a considerable sum for a place on the deck to sleep on; the room between two guns they let out at

thirty or forty rupees (valued at two ſhillings and ſix-pence each), and the mates would have two or three hundred rupees each for their cabbin, which are but juſt big enough for two or three people to ſit in: but the company have taken that matter under their conſideration, and regulated the price to the ſatisfaction of the merchants, and, in purſuance to their directions, the chief and council always agree with the commanders before-hand, for ſuch conveniences as the merchant requires. The great cabbin, in a ſhip of four hundred tons, is uſually let for a thouſand rupees, which, being occupied by twenty or thirty merchants, is not thought much, and is indeed a trifle compared to what uſed to be extorted from them; even the long boat itſelf uſed to be farmed out formerly. The ſearching the paſſengers little parcels on their going aſhore, was another thing that uſed to diſoblige them highly; and which the Dutch, who were conſiderable gainers by tranſporting theſe merchants and their effects, never concerned themſelves about; which made them better affected to the Dutch than the Engliſh.

We cannot forbear reflecting here on the inſolence of ſome of our ſea-officers, even towards gentlemen of their own nation, who happen to be paſſengers on board them; and as for a Moor or Banian merchant they reſpect them no more than dogs.

Nothing ſurely can be more barbarous than the uſage of theſe people to the poor laſcars, or Indian ſailors, who aſſiſt in bringing their ſhips home, when they have loſt their Engliſh ſailors by ſickneſs or deſertion. One of the captains beat and abuſed the laſcars unmercifully; and when they repreſented to him, that this treatment would not paſs unpuniſhed in the next world, however it might in this, he would laugh at them; and by way of jeſt, when one of theſe poor fellows died, ordered a letter to be written, and put into his mouth, directed to ſome of his friends, who had gone before him, wherein he endeavoured to ſhew his wit, but in ſuch a ſtrain, as made all men abhor him. Another great hardſhip theſe laſcars are liable to, is, that when they have brought an Indian ſhip to England, care is not always taken to ſend them back again to their own country; but they are ſeen, through extreme neceſſity, begging about the ſtreets: and as they come from a hot climate, many of them probably periſh in the winter ſeaſon. Such practices as theſe are diſgraceful to any nation, and give more cauſe to Indians to brand us with the epithet of ſavages, than we can have to give them that appellation.

The gains made by the Engliſh Eaſt India company in carrying the effects of the Armenians, Moors, Banians, &c. from Gombron in the gulph of Perſia to Surat in India, is one great branch of the company's profit; and they rarely ſend a ſhip from Gombron to Surat, but ſhe is as deeply laden as ſhe can ſwim full of paſſengers, and ſhe has a vaſt quantity of treaſure on board, ſometimes to the value of two or three hundred thouſand pounds, inſomuch that the Engliſh ſhips going from Perſia to India in October and November annually, are ſuppoſed to be the richeſt veſſels in that part of the world.

The orders and regulations of the Eaſt India company made, in relation to this voyage, about the beginning of the preſent century, were as follows; viz. "That as often as any ſhip of ours is let to freight to or from Perſia, our council on the place take care an agreement be made before them (of which they are to be judges) that it be reaſonable what the captains ſhall be allowed for the paſſage and accommodation of ſuch Armenians, Perſians, or other paſſengers; and to that end they are to ſend a proper perſon on board each ſhip, to ſee their accommodations be as they ought. That when the paſſengers return, the ſaid council enquire whether the captain has complied with his agreement; and if he has failed in any part, they muſt take care ſuch paſſengers have juſtice done them; and that the council on the place from whence the ſhip proceeds, adviſe thoſe, who reſide where ſhe is conſigned unto, with the terms of ſuch agreement. If, when this is done, the captains ſhall treat thoſe paſſengers unreaſonably, or will not do them that juſtice which the council ſhall award, let the council proteſt againſt ſuch commanders for their injuſtice and failure; and therein ſpecify the damage the company ſuſtains by the loſs of freight, occaſioned by ſuch diſcouragements to the freighters, or their vakeels or ſervants: or the hazard that may in probability happen thereon; and the council have then ſo far done their part; and we ſhall upon notice which muſt be ſent us from time to time, do the reſt. Although we muſt farther put you in mind, that you have, by charter-party, liberty to diſplace commanders when juſt reaſon offers; and if their oppreſſions are ſevere, we know no better reaſon to diſplace them, than the curing ſuch a growing evil."

The weights uſed by the company are maunds only, and theſe differ according to the nature of the commodities to be delivered by them.

All bargains at Gombron are made for ſhahees, and the company keep their accounts in them, reckoning them worth four-pence each, though that coin is rarely met with, but in its ſtead coz's and mamooda's are current every where. Horſes, camels, houſes, &c. are generally ſold by the toman, which is two hundred ſhahees, or fifty abaſſees, and they uſually reckon their eſtates that way: ſuch a one is worth ſo many tomans, they ſay, as we reckon pounds in England. The ſhahee, in the company's accounts, is reckoned worth four-pence Engliſh money.

The company do not at all interfere in the trade between Perſia and India: this they leave entirely to their factors and ſervants, and to ſuch country ſhips and private traders as put themſelves under their protection, and are content with paying the port duties. For the better regulation of this trade, orders are hung up in the conſultation of Gombron.

SECT. VI.

Giving a Deſcription of the Country in general, and the Quality of the Soil; alſo of their Huſbandry and Gardening; including Grain, Fruit, Trees, Flowers, Plants, Drugs, &c. alſo an Account of their Animals and Minerals.

PERSIA abounds with mountains, but has very few rivers: ſome of the mountains are ſuppoſed to be the higheſt on the face of the earth. Mount Taurus, which frequently receives different names, as it branches itſelf out into different provinces, runs through the country from weſt to eaſt. The loftieſt of theſe mountains are Ararat in Armenia, the five mountains which ſeparate Media from Hyrcania, and Parthia or Irac. Thoſe which divide Fars or Perſia from Carmania are exceeding high, the moſt famous of which is called Mount Jarron; but they are generally dry barren rocks, without trees or herbage upon them, except thoſe of Ghilan or Hyrcania, and the mountains of Curdeſtan, which are covered with woods, and very fruitful where they are manured. There are vaſt ſandy deſerts ſeveral days journey over in this kingdom, where there is ſcarce a drop of water to be found; and the land in general upon the frontiers lies uncultivated, to diſcourage their enemies from invading them; for there is not the leaſt ſubſiſtence to be met with for ſeveral miles, in travelling into the kingdom either from Turky or India. There are, however, ſome fruitful plains and vallies, in which their principal cities ſtand, which yield plenty of grain and herbage: and no country is more fruitful than the provinces which lie upon the Caſpian ſea, as we have already obſerved. But Hyrcania is very unhealthful in ſummer time, which ſome apprehend proceeds from the multitude of ſnakes and inſects which lie rotting upon the ground when the waters are dried up, as well as from the foulneſs of the water itſelf, which at that time of the year is ſo thick and muddy that it is unfit for uſe.

Though there is not a tenth part of Perſia cultivated, at preſent, yet when greater care was formerly taken to turn the waters into thoſe vallies which now produce neither graſs nor grain, theſe were extremely fruitful. In ſome provinces there are hundreds of fine aqueducts choaked up and buried in the ruins; ſo that it is not ſo much a defect in the ſoil, as the want of people, or at leaſt of huſbandmen and tillage, which renders Perſia ſo barren.

The ſoil in ſome parts is a hard gravel, and in others a ſtiff whitiſh clay almoſt as hard as a ſtone; but either of them are fruitful when well watered, and will bear often two crops, and ſometimes three in the courſe of a year. If we give credit to antient authors, there was not a more plentiful country in the world than Perſia; the reaſon of this alteration ſome aſcribe to the different diſpoſitions of the people who have inhabited it. The antient Perſians, the fire-worſhippers, it is ſaid, were obliged by the precepts of their religion, to cultivate the ground, and it was by them accounted a meritorious act to plant a tree, to bring the water into a field, and make a barren ſpot of earth produce graſs or grain: while the Mahometans ſeem to have no genius for improvements, or even to preſerve what their anceſtors have built or planted, but let every thing run to ruin: however, one reaſon of this neglect may be, that the property of the people is not ſecure to them; ſo that it is no wonder they have but little inclination to make improvements, when they can have no certainty of reaping any advantage

vantage from them; and an eſtate very rarely remains in a family for three generations.

Near great towns they improve their grounds with the dung and dirt of the ſtreets they carry out; but at a greater diſtance they throw their fields into little level ſquares, which they bank about, and then turn the water into them, letting it ſtand in the field all night; which having ſoaked it, the water is let out the next morning, and the ſun ſhining with almoſt perpendicular rays upon the moiſt earth, renders it fit for the production of any ſort of grain or plants. When the ground is light, they plow with two or three oxen or buffaloes; but in Ghilan, and other countries, where they meet with a ſtiff clay, and the ploughs being very large, it is as much as eight or ten oxen can do to draw them.

The principal, and almoſt the only kinds of grain produced in Perſia, are rice, wheat, and barley; they have no oats, and very little rye. Their ſeaſons are not the ſame in the north as in the ſouth: but when they are ſowing in one part of the country, they are reaping in another, and in ſome places it is not more than three months between the ſeed-time and the harveſt. Their land never lies fallow, but is ſown every year at leaſt; it is ſo meliorated and enriched by being flowed, and the heat of the ſun afterwards working on the mud, that it is never out of heart as ours is; and though we have not ſo warm a ſun, yet if we were to overflow ſome of our grounds as they do, it would be a vaſt improvement, eſpecially where dung and other manure is wanting. Rice muſt be conſtantly ſupplied with water till the harveſt, but the land is only flowed before the ſowing, to render it prolific for other kind of grain.

Moſt of the roots and ſallads we have in England, grow in great plenty in the kitchen gardens in Perſia: they have no leſs than twenty ſeveral ſorts of melons, during the ſeaſon they laſt, which is about four months; the common people make them their conſtant food: thoſe which come to maturity firſt in the ſpring, are round and ſmall: thoſe that are ripe in the latter part of the ſeaſon are the beſt and largeſt; ſome of them weigh eight or ten pounds, and are as ſweet as ſugar: at the tables of perſons of quality they have them all the year round, there being a way to preſerve them under ground till the ſeaſon returns. The beſt melons grow in Choraſan and Tartary, and they are carried as far as Iſpahan for the king's uſe, and as preſents to their friends. Cucumbers are another fruit much eaten by the common people; one ſort of them has ſcarcely any ſeeds in it, is eaten without paring or dreſſing, and is not reckoned unwholeſome. Some perſons will eat eight or ten pounds of melons at a meal, without being ſick.

They have ſeveral kinds of grapes in Perſia, ſome of which are ſo large, that a ſingle grape is a mouthful. The wine at Iſpahan is made of kiſmiſh's, a little round grape, and without any ſtones that can be perceived; but the beſt wines are made at Schiras. They keep their grapes all the winter here; and let them hang a conſiderable time on the vines, wrapped up in linen bags; the air is ſo dry, that they can for a very long time preſerve all kinds of fruit without ſpoiling.

The moſt delicious food in this country are dates; theſe are no where ſo good as in Perſia: the pulp which incloſes the ſtone is a clammy ſubſtance as ſweet as honey: they are laid on heaps when they are ripe, and melting they candy, or preſerve themſelves without ſugar. Foreigners are adviſed to eat moderately of them, becauſe they heat the blood, and occaſion ulcers in thoſe who are not uſed to them, and ſometimes weaken the ſight, but are obſerved to have no ill effects on the natives. The tree does not bear them till it is fifteen years old. It is ſlender, but very tall, and like other palms has no branches but on the top, and the fruit grows in cluſters of thirty or forty pounds weight.

Moſt of the fruits eaten in Europe may be had in Perſia, and would be there in much greater perfection, if they knew any thing of gardening; but they underſtand neither grafting, nor inoculating, nor managing dwarf trees; all their trees grow to a great height, and are loaded with wood. Their nectarines and peaches weigh ſixteen or eighteen ounces a-piece: there is an apricot red within, which is called the egg of the ſun; theſe are dried and exported in great quantities; they are boiled in water, which is thickened by the juice of the fruit, and makes a perfect ſyrup without ſugar. They have ſeveral kinds of excellent apricots, which are in ſeaſon one after the other.

In the north part of Perſia, apples and pears chiefly grow: they have alſo pomegranates of ſeveral kinds, alſo oranges, quinces, and prunes: they have ſuch a great variety of fruits, that above fifty different ſorts have been ſeen at an entertainment, ſome of which grew at the diſtance of three hundred leagues.

Olives grow in Hyrcania, near the Caſpian ſea; but they neither know how to preſerve them, or extract the oil. They have alſo plantations of ſugar and tobacco. Piſtachio nuts are almoſt peculiar to Perſia, and are tranſported all over the world. Here are likewiſe ſmall nuts, filberds, and almonds.

The cypreſs, palm, and mulberry, are among other trees in their gardens. There are large plantations of the latter for their ſilk-worms; theſe trees they do not ſuffer to grow up to a great ſize, becauſe the leaves are beſt when the ſhoots are young: therefore they grub up the trees when they grow old, and plant their grounds again. But the tree which is in as great eſteem as any in Perſia, is the ſenna: the body of this tree is very large, and ordinarily forty or fifty feet high, and ſtraight as the maſt of a ſhip, having no branches but on the head of it; the bark is of a bright grey, and the wood ſerves them to make doors, rafters, and for other uſes in building.

The trees that are moſt common in Perſia, are the plane tree, the willow, the fir, and the cornel tree. The Perſians imagine that the plane tree is a preſervative againſt the plague and other contagious diſtempers; and obſerve, that the plague has never raged in Iſpahan ſince this tree was planted in their ſtreets and gardens. The tree alſo which bears the gall-nut is very common in many parts of Perſia; and there are trees which yield gum, maſtic, and frankincenſe: that which produces frankincenſe very much reſembles a pear tree, and is found chiefly in Carmania.

There are trees in Perſia which produce manna of ſeveral ſorts: the beſt manna has a yellowiſh caſt, a large coarſe grain, and comes from Choraſan or Bactria; there is another ſort called tameriſk, becauſe the tree it drops from is ſo named, and is found in large quantities in the province of Suſiana: and there is a third ſort gathered about Iſpahan; which falls from a tree much like the tameriſk, but larger. The leaves of this tree drop liquid manna in ſummer-time, which the natives take to be the ſweat of the tree congealed upon the leaf: it has as ſweet a taſte as other manna. In the morning the ground under the tree is perfectly fat and greaſy with the droppings from it. The cotton tree is common all over Perſia; and they have another little tree which yields a kind of ſilken down uſed for quilting and ſtuffing of pillows. There is alſo a plant called hannah, that bears a ſeed which they beat to powder and colour their hands and feet, and ſometimes rub over their faces with it, apprehending it keeps their ſkin ſmooth, and preſerves their complexion; they ſometimes put the leaves of it, when bruiſed, to the ſame uſe.

In the deſerts of Carmania are found two little ſhrubs of a poiſonous quality; the firſt is called galbad ſamour, or the flower that poiſons the wind; ſome people imagining that this occaſions thoſe killing winds which blow in this province in the hot ſeaſon; the other ſhrub is called kerzebre, the trunk whereof is about as big as a man's leg, and grows about ſix feet high: its leaves are almoſt round, and it bears a flower like the ſweet-brier.

There are ſcarcely any trees to be found on the mountains, or wild fields in Perſia; theſe are, for the moſt part, deſtitute of all manner of verdure; while in their cities, and the villages for three or four leagues round them, the ſtreets and gardens are ſo well planted, that the houſes are hardly to be diſcerned at a diſtance. After travelling ſome few leagues, indeed, there is neither houſe, trees or ſhrubs for many miles, but all looks like a barren deſert; notwithſtanding which great part of this ſeemingly barren ſoil, were it watered and cultivated, would be as fruitful as the other, as it anciently was when a more induſtrious people poſſeſſed the country.

Flowers are found in great variety in ſome of the provinces. The ſouth part of Perſia has the feweſt, the exceſſive heat being there as deſtructive to them as ſevere cold. But the fields of Hyrcania are beautified and enriched with whole groves of orange trees, jeſſamins, and all the flowers we have in Europe. Mazenderan, which is the eaſt part of the country, is one continued parterre from September to April, and at that time is covered with flowers; and though this be their winter ſeaſon, it is nevertheleſs the beſt time for fruits; in the other months the heat is exceſſive, and the air ſo unhealthful, that the natives find themſelves under the neceſſity of retiring to the mountains. In Media the fields produce tulips, anemonies, and ranunculuſes; about Iſpahan and ſome other towns jonquils grow wild; they have alſo daffodils, lilies, violets, and pinks in their ſeaſon, and ſome perennial flowers; but they have the greateſt quantity of lilies and roſes. They

export abundance of roſe water to other countries. In the ſpring there is plenty of yellow and red gilly-flowers; and another red flower, which reſembles a clove, of a beautiful ſcarlet colour; every ſprig bears thirty of theſe flowers, which form a fine head as large as a tennis ball. Their roſes are white, yellow, and red; and others, white on one ſide, and yellow on the other; but, notwithſtanding all this great variety of beautiful flowers, their gardens are not comparable to thoſe of Europe. Flowers are very little regarded by them; ſo that they are often intermixed with fruit trees and roſe buſhes, without any order. No borders, or knots of flowers, are to be ſeen in their gardens, but large walks planted with trees; fountains, canals, caſcades, and pleaſure houſes, are all that muſt be expected in their fineſt gardens; which being ſo common, the Perſians take no pleaſure in walking in them, any more than they do in the fields; but place themſelves in ſome alcove, or ſummer houſe, as ſoon as they come into them, regardleſs of that exquiſite variety that every foreigner is enamoured with.

This country affords great plenty of phyſical drugs, as caſſia, ſenna, antimony, nux vomica, gum armoniac, galbanum, ſal armoniac, and a kind of rhubarb, with which they purge their cattle: the beſt rhubarb comes from China, or rather from eaſtern Tartary, which lies to the northward of it. Perſian poppies are in great eſteem, from the quantity of juice they yield, and the ſtrength of it: they grow four feet high in ſome places, and have white leaves. They draw the juice from them in June, when they are ripe, by making little inciſions in the head of the poppy; and a thick liquor oozes from them, which is gathered before ſun-riſe. It is ſaid to have ſuch an effect on the people who are employed in this work, that they look as if they had been buried and taken up again, and their limbs tremble as if they had the palſy. The liquor which is extracted from the poppies, in a little time grows thick, and is made up into pills: the Perſians give it the name of afion, and we call it opium. The Perſian bakers ſtrew poppy-ſeed on their bread, which inclines thoſe who eat it to ſleep; and the eating it is not reckoned unwholſome after their meals; the common people eat the ſeed almoſt at any time.

Saffron grows plentifully in Perſia, and aſſafœtida is to be had almoſt every where, which is admired by the natives of this country as well as India, and frequently eaten with their food: that which, to us is the moſt offenſive of all ſcents, is by them eſteemed a moſt refreſhing perfume, and at leaſt equal to muſk. Aſſafœtida is a liquor which diſtills from the plant called hiltot; it thickens after it is drawn, and grows as hard as gum: there is the white, and the black kinds of it, of which the white is reckoned the beſt to eat. The ſmell of this drug is ſo very ſtrong, that if any goods in a ſhip lie near it, the ſmell is communicated to them, how cloſe ſoever they are wrapped up, and it is almoſt impoſſible to clear them of it; nay, it affects the colour of them to ſuch a degree, that ſome rich ſtuffs of gold and ſilver (the latter of which are turned perfectly black, have been tarniſhed with it, notwithſtanding they were incloſed in cotton, and covered with ſeveral folds of ſear cloth.

In the ſands of Choraſan or the antient Bactria, mummy is frequently found. This is human fleſh embalmed, which has lain ſeveral ages in dry earth. Some of the bodies, it is ſaid, are ſo little altered, that the features may be plainly diſtinguiſhed. Beſides this common mummy, there is a precious gum which diſtills from a rock, to which the Perſians give the name of mummy. This is ſaid to perform miraculous cures; and is reckoned to be ſo valuable, that the governors of the provinces where it is found, ſend it to court under their ſeals, and the king engroſſes moſt of it.

The bezoar ſtone of Perſia has ſeveral thin coats over it; it is found in the bodies of goats and other animals; it is in much higher eſteem than the Indian bezoar.

Several kinds of beaſts, birds, fiſhes, and inſects, are found in Perſia. Among their cattle, the moſt ſerviceable are camels, horſes, mules, aſſes, oxen, and buffaloes; but the camel, for a beaſt of burden, much excels all the reſt, whether we conſider the weight he carries, the diſpatch he makes, or the little charge in keeping him. Of theſe camels there are ſeveral kinds; ſome of them have two bunches upon their backs, and others but one; and there is a third ſort, engendered between a dromedary or camel with two bunches, and a female with one, which are eſteemed much the beſt, and are ſold for twenty or thirty pounds a piece, for they are ſeldom tired, and will carry nine hundred or one thouſand weight. Thoſe which travel between the Perſian gulf and Iſpahan, are of a much leſs ſize, and do not carry above five or ſix hundred weight; yet theſe are almoſt as ſerviceable as the others, for they are much ſwifter, and will gallop like a horſe, whereas the others ſeldom exceed a foot pace: theſe ſwift camels are kept by the king and great men; they ſerve to convey their women from place to place, and carry their baggage: they are uſually adorned with embroidered cloths, and ſilver bells about their necks; a ſtring of ſix or ſeven of them are tied together when they travel, and governed by one man: they uſe neither bridles nor halter to hold them in, nor whips to drive them; but they are governed by the driver's voice, who ſings or plays to them as they travel: it is in vain to beat them if they tire, they will go never the better for it. When they are to take up their burden, the driver touches their knees, whereupon they lie down on their bellies till they are loaded, groaning, however, and giving ſigns of uneaſineſs, under a ſenſe of the fatigue they are about to undergo. They let them graze by the road ſize, with their burdens on their backs, on weeds and thiſtles, and ſometimes they feed them with balls compounded of barley-meal and chaff made up into a paſte, with which they often mix the cotton ſeed; but he is the leaſt feeder of any beaſt, conſidering his bulk. It is very happy alſo that the camels will live without water two or three days together, there being ſcarcely any to be met with in thoſe deſerts the caravans are obliged to paſs. They ſhed all their hair every ſpring, and are perfectly naked. Theſe creatures are very tame and tractable, except when the luſtful fit is upon them, which laſts thirty or forty days, and then they are very unruly, which makes their drivers increaſe their burdens at that time to keep their fleſh under. When once the male has covered the female, he grows ſluggiſh, and does not care to ſtir out of the ſtable. They copulate as other four footed animals do, except that the female lies down on her belly, as ſhe does to receive her burden: they do not engender backwards as ſome writers have erroneouſly aſſerted. They go with young eleven, or, as ſome ſay, twelve months.

Oxen, buffaloes, aſſes, and mules, are uſed indifferently for carrying of paſſengers or burdens; and their land being plowed by buffaloes and oxen, theſe beaſts are very ſeldom killed for food. The aſſes of Perſia are much larger and ſwifter than ours, and will perform a journey very well. But the fineſt beaſts are their horſes: theſe are beautiful creatures, and no where better managed than in Perſia. They have fine foreheads, and are exactly well proportioned, light and ſprightly, but only fit for the ſaddle, or at leaſt not uſed for any other purpoſe. They are never gelt, and wear their tails at the full length: but though they are lovely creatures to look on, they are neither ſo ſwift as the Arabian horſes, nor ſo hardy as thoſe of Tartary; and the king has always a ſtable of the Arabian breed. Horſes are very dear in Perſia, ſome of them being ſold for two or three hundred pounds, and ſeldom for leſs than fifty. The ſending ſuch numbers of them to India and Turky contributes more to enhance the price, than the ſcarcity of them. Their mules carry very well, and ſome of them are valued at thirty or forty pounds a piece: ſome aſſes are not valued at much leſs, after they have been taught to pace. The ordinary food for horſes is barley and chopt ſtraw; they have no mangers in their ſtables, but give their horſes their corn in bags, as our hackney-coachmen do. In the ſpring they cut green graſs for their horſes, but never make any into hay to be eaten dry: ſometimes they feed their horſes with balls made of barley-meal, as in India. Inſtead of litter, their own dung is dried and beaten to powder, and laid a foot deep for them to lie on; and if any of it be wetted, it is dried in the ſun the next day. Their horſes hoofs are much ſounder and harder than ours; and they are ſhod with thin plates, as the oxen are alſo, on account of their travelling over the ſtony mountains. In winter, they daub their horſes with a yellow herb called hannah, and ſometimes anoint their bodies with it as high as the breaſt, to keep out the cold; but it ſeems rather to be by way of ornament.

Large ſtables of horſes belonging to the king are diſperſed throughout the kingdom, for the public ſervice. A horſe is ſeldom denied to any man who demands one, if he will keep him; but ſuch perſons are accountable to the government for them when they ſhall be called out; but they have the liberty of riding them in the mean time. Theſe troopers horſes are ſometimes quartered upon people againſt their conſent, who would gladly be excuſed from the trouble and charge of keeping them; and if any horſe dies in their hands, oath muſt be made that he was

was well treated, and did not die for want of corn or looking after. Their horſes are ſubject to many diſtempers: ſometimes their legs ſwell, and a tumour riſes on the breaſt, which it is ſaid proceeds from eating too much barley: in this caſe, they clap a hot iron to the ſwelling, or lance it, and keep the ſore open, by running a yellow twig through it; but for lame or diſtempered horſes, a hot iron applied to the part is the moſt general remedy.

There are great plenty of ſheep and goats in Perſia; the natives ſeldom eat any other meat. Their ſheep are large, and remarkable for their fat tails, which weigh eight or ten, and, according to ſome, above twenty pounds weight. In ſome parts of Perſia alſo they have more horns than ours: ſome of their ſheep have ſix or ſeven horns, ſome projecting ſtrait from their foreheads, ſo that when the rams engage there is generally a great deal of blood ſpilt in the battle. The Perſian goats are not only valuable for their fleſh, but the fine wool they yield, of which great quantities are exported from Carmania annually. As the Mahometans, who are the governing part of the country, have an averſion to hogs, their Chriſtian ſubjects do not endeavour to increaſe the breed of that animal, unleſs towards Georgia and Armenia, where the Chriſtians are numerous; ſo that it is no wonder there are ſcarcely any to be met with.

There are not many wild beaſts either in the middle or ſouthern part of Perſia, there being no cover for them. They have ſome deer and antelopes, which are much of the ſame nature, except that they are ſpotted, and have finer limbs. In Hyrcania and Curdeſtan, the woody parts of the country, wild beaſts abound, ſuch as lions, tygers, leopards, wild hogs, jackalls, &c. In Media and Armenia there are abundance of deer, wild-goats, hares, and rabbits; and there are ſome, but not many, found on the mountains in almoſt every part of the country.

In the heart of Perſia, which is very dry, they are not much troubled with inſects, unleſs it be with ſwarms of locuſts, which ſometimes viſit them; they fly in ſuch numbers, that they appear like a cloud, and perfectly obſcure the ſun; and deſtroy the fruits of the earth, wherever they ſettle; but there are certain birds which generally viſit the country about the ſame time, and prevent the ruin of the huſbandman, by eating up the locuſts.

There are great numbers of ſerpents, toads, ſcorpions, and other venomous reptiles, in that part of the country which lies upon the Caſpian or Hyrcanian ſea; but many of them die in ſummer-time for want of water, and infect the air, rendering that part of the country very unhealthful at that time. The ſcorpions are of an immoderate ſize; and their ſting is mortal if proper remedies be not immediately applied; and a perſon ſtung by one of them is in ſuch torture, that he becomes raving mad for ſome time. Muſketoes, or gnats, are very troubleſome in the flat country near the Caſpian ſea. And there is a white fly in Perſia, no bigger than a flea, which makes no noiſe, whoſe ſting is like the prick of a pin. There are alſo the millepedes, almoſt like a caterpillar (the Perſians call them hezar-pai, or a thouſand feet); their bite is as pernicious as the ſting of a ſcorpion.

Tame and wild fowl, ſuch as geeſe, hens, ducks, partridges, ſnipes, &c. are almoſt in the ſame plenty and variety in Perſia as in Europe; but more of them in the north than in the ſouth part of the country. Turkeys have been exported to Iſpahan, but they do not thrive there. They take all imaginable care to increaſe and propagate the breed of pigeons on account of their dung, with which they raiſe their melons. Their dove houſes are five times as large as ours, of a round figure, and handſomely built of brick; it is ſaid there are not leſs than three hundred of them in the city of Iſpahan only. The dung is uſually ſold for four-pence the biſty, or twelve pounds weight; and the government, it ſeems, lays a tax upon it. Their partridges are reckoned the largeſt and beſt taſted that are any where to be met with. The pelican, which the Perſians call tacob, or the draw-water, is as remarkable as any of their fowls, for the body of it is ſaid to be as large as a ſheep, and his head is at the ſame time extremely ſmall: but it has a large bill of ſixteen or eighteen inches long, as big as a man's arm, and under the bill there is a large bag, which, travellers tell us, will hold a pail of water: they build their neſts in the deſerts for their ſecurity, where there is neither water nor inhabitants; and frequently go two days journey for water for their young ones; but they bring enough, in the above-mentioned receptacle, to laſt a conſiderable time. In the province of Choraſan there is another extraordinary bird, which has ſuch an appetite towards the water of a certain ſpring in that country, and ſo much ſagacity in diſcovering it, that they will follow any perſon that carries it in a bottle ſeveral hundreds of miles. We ſhall paſs over in ſilence many extravagant and improbable ſtories related by travellers of this bird.

No country in the world abounds more than Perſia with eagles, hawks, falcons, and other birds of prey, nor are they any where better inſtructed to take their prey. The king has eight hundred or a thouſand of them; and no man of the leaſt diſtinction is without his hawks and falconers. The Perſians breed up their very crows to fly at the game. We have already taken notice of the dexterity of their hawks in flying at birds and beaſts, &c. under the article of rural ſports; to which we refer the reader.

The ſame kind of ſinging-birds are to be found in Perſia as with us, ſuch as the linnet, chaffinch, nightingale, lark, &c. ſome birds are alſo taught to ſpeak; but we cannot learn that there are parrots or parroquets on this ſide India. There are, however, ſeveral parti-coloured birds to be ſeen in Perſia, with a plumage of blue, green, and yellow, beautifully mixed. There are ſuch numbers of ſparrows here, that they are very troubleſome to the huſbandmen; who are forced to place their ſervants in the fields all day long, to keep them from their corn, when the harveſt approaches.

There are ſcarcely any fiſh to be met with in the heart of Perſia, the few rivulets they have hardly ſupply the country with water for neceſſary uſes, and in the ſummer they are for the moſt part dried up: even the river Zenderhoud, to which the government at a prodigious expence have joined other ſtreams for the ſupply of the city of Iſpahan, is perfectly loſt in the ſandy deſerts about twenty leagues from thence, and it is more than probable there is not one ſtream, that riſes in the middle of the kingdom, which ever reaches the ſea in the ſummer; though in the ſpring, when the ſnow melts on the mountains, they may make a conſiderable appearance. Some writers affirm, indeed, but without the leaſt colour of proof, that the river Zenderhoud, though it diſappears about twenty leagues from Iſpahan, riſes again in Carmania, and falls into the ocean. There is a great plenty of ſea fiſh in the Perſian gulf and the Caſpian ſea: the rivers Kur and Arras alſo, which fall into the Caſpian ſea, are well ſtocked with river fiſh; but as theſe lie at too great a diſtance from Iſpahan to ſupply that city, they are conſequently deprived of that delicacy.

Among the many vaſt mountains in Perſia, we may reaſonably ſuppoſe that there may be ſome mines of gold and ſilver; but it ſeems there are none open, neither have they any account that ever any were wrought, unleſs their lead mines may be denominated ſilver, which yield an inconſiderable quantity of that metal, as all lead mines do, but not near enough to countervail the charge of extracting it. They have, however, good mines of iron, ſteel, copper, and lead: the iron and ſteel mines are in Hyrcania, Media, and the provinces of Irac and Choraſan; their ſteel is ſo full of ſulphur, that if the filings are thrown into the fire, they will give a report like gun-powder: it has a fine delicate grain, but it is as brittle as glaſs; and the Perſian artificers, who do not underſtand how to give it a due temper, cannot for that reaſon make wheels or ſprings, or any minute pieces of workmanſhip. Moſt of their copper-mines are near Seris in the mountains of Mazenderan; they mix it with Swediſh and Japan copper, and the proportion is one part foreign to twenty of their own metal. The greateſt quantity of ſilver is found in their lead mines, moſt of which are near the city of Yeſd.

In the mountain Damaverd, which divides Hyrcania from the province of Irac, ſulphur and ſaltpetre are dug. Antimony is found in Carmania, but it is a baſtard ſort. Emery is had near Niris: they have no vitriol nor mercury; and their tin is imported from abroad. There are two kinds of ſalt in Perſia, the one upon the ſurface of the ground, and the other dug out of the rock: the ſalt is ſo hard in ſome parts of Carmania, that the poor people make uſe of it inſtead of ſtone to build their cottages with. There are plains of ten or twelve leagues over, quite covered with ſalt, as others are with ſulphur and alum.

The Perſian marble is either white, black, or red, and ſome veined with white and red: it is dug near Hamadan, and in Suſiana: ſome of it will break into large flakes or tables, like ſlate; but the beſt comes from Tauris, which is almoſt as tranſparent as cryſtal: this kind is white mixed with green. In the country about Tauris alſo is found the mineral azure; but this is not ſo good as that which comes from Tartary, as it loſes its colour by degrees. In the provinces of Fars and Shirvan there is found abundance of bole armoniac, and a marle which the country people

people uſe inſtead of ſoap. There are ſome mines of iſing-glaſs in the ſame country. In ſeveral parts of Perſia we meet with naphtha; both white and black, it is uſed in painting and varniſh, and ſometimes in phyſic: there is an oil extracted from it, which is made uſe of on various occaſions.

Thoſe mines in Perſia, where the turquois ſtones are found, are moſt valuable; there is one of them at Niſapour, in the province of Choraſan, and another in a mountain between the province of Irac and Hyrcania: there has of late years been a third diſcovered, but the ſtones are not ſo fine and lively as thoſe in the old mines. All that come out of the old rock are preſerved for the king; and when he has taken thoſe he likes beſt, he orders the reſt to be ſold to the merchants, or others who chuſe to purchaſe them.

There was formerly the fineſt pearl-fiſhery in the world in the gulf of Perſia. We are told by a judicious and curious traveller, that it did not produce leſs than the value of a million livres one year with another, and that he himſelf ſaw a pearl taken out of it that weighed fifty grains, and was perfectly round; but the largeſt that were uſually met with in that ſea did not weigh above ten or twelve grains; all above that weight the fiſhermen were obliged, under the ſevereſt penalties, to lay by for the king. But whether the pearl banks are now exhauſted, or, in the late indolent reigns, the people are become as inactive as their governors; or, laſtly, whether it is that the Arabs, having made themſelves maſters of this ſea, and moſt of the iſlands in it, the fiſhermen are interrupted in their buſineſs, the pearl-fiſhery ſeems wholly to be diſuſed at preſent, and there are as few pearls to be met with in Perſia as in any other place.

We are informed, that there were two ſeaſons for fiſhing; the firſt in March and April, and the other in Auguſt and September; though a writer of credit mentions only one, namely, from the latter end of June till the end of September; and there were formerly to be ſeen, near the iſland of Baharen, two or three thouſand fiſhing-boats, in every one of which was a diver. They fiſh for the pearls in the following manner; the boats are brought to an anchor in five fathom water, and then the diver ſtrips himſelf naked; and having fixed a piece of horn, like a pair of ſpectacles, to his noſe, which prevents any water getting in that way, and tied a ſtone to one of his feet, that he may ſink to the bottom in an inſtant, he takes a net or a baſket with him, and deſcends to the bottom, there being a rope faſtened under his arms, and another to the baſket. Having ſlipped the cord which faſtened the ſtone to his foot, he preſently falls to gathering up the oyſters, or nacres, and puts them into his baſket; and, having remained under water as long as he can, makes a ſign to the people in the boat to draw him up, and afterwards they pull up the baſket: in the mean time the diver uſually refreſhes himſelf with a pipe of tobacco, and then goes down to the bottom as before; and thus he works from eight in the morning till eleven, and then goes to dinner; about twelve he begins to dive again, and continues it till three in the afternoon. It is ſaid theſe divers will continue under water near half a quarter of an hour at a time. Towards evening they carry their oyſters on ſhore, where they lay them on heaps; and when they begin to dry, the oyſters open of themſelves, and they ſearch diligently for the pearls, which the Banians and Armenians are ready to take off their hands, and, by ſorting and retailing them out to others, they get a very conſiderable profit.

SECT. VII.

Treating of the Language, Characters, Writings, Arithmetic, Learning, Muſic, Hiſtory, Chronology, Aſtronomy and Aſtrology, Philoſophy, Arts, &c. of the PERSIANS.

FOUR languages are ſpoken in Perſia, namely, 1. The Arabic. 2. The Turkiſh. 3. The Perſian. And, 4. A language which the Gaurs or Guebres, the poſterity of the antient Perſians who worſhip the fire, ſpeak: their language and characters are peculiar to themſelves, and cannot be the ſame with thoſe of the antient Perſians, inaſmuch as they underſtand none of the inſcriptions remaining at Perſepolis, neither are the characters of the preſent Gaurs any thing like thoſe at Perſepolis. The Arabic is the learned language; and in this the Alcoran and other books of divinity, as well as their books of morality, phyſic, and philoſophy, are written. The Turkiſh language is uſually ſpoken at court, and in the provinces adjoining to Turky. They generally ſpeak the Perſian tongue at Schiras, the capital city of Fars, or the antient Perſia.

The Perſian language is intirely modern, of the ſame date with their religion; and, beſides thoſe words which are peculiar to it, there are a great number of words of other nations, which have in their turns conquered Perſia, introduced into it; as thoſe of the Turks, Tartars, and Arabs. There are alſo an inconceivable number of European words mixed with it, as High Dutch, Engliſh, and French; but it is ſaid, there are more of the Engliſh than any other. Some of our Engliſh travellers give us inſtances of this, as broder for brother, &c. They take ſome of their words from the Greek and Latin, but they borrow more from the Arabic than all the reſt; inſomuch that a perſon is reckoned to be half inſtructed in Arabic, who has a perfect knowledge of the Perſian.

They have neither grammar nor ſyntax in the Perſian language, but make uſe of the Arabic rules. They have twenty-eight letters in their alphabet, and ſome reckon twenty-nine; but they are all conſonants except alif, which is their firſt letter, and has the ſound of our a; the letters you and ye are alſo, in ſome inſtances, uſed as vowels, and give a ſound to their other letters. They have no ſtops, comma, or paragraphs in their books; but, like our lawyers, when they enter upon a new clauſe, begin with a great letter, or an item. If they make any points, it is for young people who are learning to read; or for thoſe who deſire it, and will pay well for the trouble.

The Perſians make their paper of ſilk rags and cotton; it is extremely thin and ſmooth, and will bear but on one ſide; it is not ſo white and ſtrong as ours, nor in any reſpect comparable to it. Their ink is made of galls and vitriol, and the rind of pomegranate, with burnt rice powdered, which being made up into a cake, they diſſolve in gum-water. Inſtead of gooſe-quills, they make their pens of a reed ſomething larger than a quill. The characters are Arabic whatever may be the language they write in.

The Mahometans conſider paper as a ſacred thing; they eſteem it a very ill action for a man to burn or tear paper, and much more to put it to any vile uſes; for, ſay they, the name of God, or ſome of his ſaints, may be written upon it, and it would be impious to profane it in ſuch a manner. On the other hand they maintain, that if not written upon, it ought not to be put to any common uſe, ſince it is deſigned for writing matters upon it which concern religion, the laws divine and human, and ſuch other venerable purpoſes.

The art of printing is not yet introduced among the Perſians; their books are therefore all manuſcripts. They excel in writing, which is reckoned among the liberal arts. They write eight ſeveral hands: that which they call neſky, and is the hand the Alcoran is written in, is in moſt eſteem. They ſtand or ſit gracefully, holding the paper in their hands, and write with all imaginable caſe, notwithſtanding they have no table to lay their paper on as we have, and exceed the beſt of our clerks in the diſpatch they make. They do not write as we do, from the left hand to the right; but from the right to the left, as the Arabs do; neither do they write in a ſtraight line, but the lines are convex, or bending like a bow, and the margin is on the right hand. They will write over a book as big as the bible in a fair character for about ten pounds, provided the paper be found them; whereas we could not have a book of that quantity tranſcribed for fifty pounds. They have a kind of ſhort hand in Perſia, in which they uſe the letters of the alphabet; and the ſame letters, differently pointed, will have different ſignifications. They have a vaſt number of clerks in all their great towns, but there is hardly a livelihood for half of them. They ordinarily write from morning till night for five-pence or ſix-pence a day.

The Perſians make uſe of figures in their arithmetic, as we do; and their addition, ſubtraction, multiplication, and diviſion, differ but little from ours; but they go no higher; and with reſpect to the rule of three, they are intirely ignorant of it.

It is univerſally allowed, that learning flouriſhed moſt in the eaſt in the firſt ages; the Perſian Magi, in particular, from their extraordinary ſkill in aſtronomy and other ſciences, were thought to entertain a commerce with infernal ſpirits, ſo that a magician and conjurer became terms of the ſame import; but notwithſtanding their ſuperiority to other nations in this reſpect in antient times, we find, that at preſent the ſciences are not arrived to that perfection in Perſia as in Europe. They underſtand neither the celeſtial nor terreſtrial globes. They have, however, an aſtrolabe, can name the ſigns of the zodiac, and are not unacquainted

unacquainted with the other ſtars. Some years ago, when an European brought a pair of globes with him to Iſpahan, they were even ſurprized at their own ignorance.

Next to judicial aſtrology, which they have great faith in, the ſciences moſt in eſteem at preſent are, aſtronomy, geometry, arithmetic, natural and moral philoſophy, phyſic, and the ſtudy of the law. They ſeem to have a more than ordinary paſſion for poetry; moſt of their beſt pieces being written in verſe. Their poets are very nice as to the rhime, but ſomething negligent in their numbers. Their ſatire is chiefly levelled againſt the Turks, who certainly give them ſcope enough; for, compared to the Perſians, they are a very brutiſh and barbarous nation.

The antient philoſophers in the eaſt were all poets, according to the Perſians: and their wiſe leſſons were delivered in verſe, to render them the more amiable and venerable, and that the people might the more readily retain them in their memories. The ſubject of their poems at this day, alſo, is generally ſome piece of morality or philoſophy.

The Perſians excel more in poetry than in any other branch of literature, as they ſeem to have a genius peculiarly adapted to it. Their invention is fruitful and lively, their manner ſweet, their temper amorous, and their language has a ſoftneſs proper for verſe: one who did not underſtand a word of Perſian, would be delighted to hear their verſe recited, the very tone and cadence are ſo affecting. They mix verſe with all the proſe they write, and even in common converſation; imagining that verſe gives a force and luſtre to their fineſt thoughts, and impreſſes them on the memory.

The method taken by the antients to preſerve the memory of their great actions, was, to make them the ſubject of their ſongs, and ſing them in their aſſemblies, and at their feſtivals, as is the cuſtom of Perſia at this day, and we may add in moſt of the eaſtern kingdoms; herein the Grecians, and moſt nations in Europe imitated the Aſiatics. There are more volumes of excellent poetry to be found in Perſia, than in any other country; one of them, particularly, is the hiſtory of their kings, and contains ſixty-ſix thouſand verſes: the thoughts are noble and elevated, their expreſſions ſoft, and their terms always the moſt proper that can be deviſed: their alluſions are delicate, and all their figures abound with hyperbole. There is one poem, among others, called the ſtory of the patriarch Joſeph and Potiphar's wife, which raiſes all the paſſions to the higheſt pitch. Love is ſometimes the ſubject of their poems, as well as morality and hiſtory; but nothing immodeſt, or that coutenances obſcenity of any kind, is ever the ſubject of their verſe.

The Perſian muſic next demands our notice. They ſing and play by rule, though to an European ear, they ſeem to make but very indifferent harmony. Singing in parts is not practiſed among them; but they ſing after each other, and generally to ſome ſtringed inſtrument like the lute or viol: their men ſing better than the women; but many of them do not practiſe ſinging, it being, as well as dancing, looked upon as a ſcandalous exerciſe in Perſia. People of rank will not ſuffer their children to learn either the one or the other; but it is left almoſt intirely to the common wenches and proſtitutes, as it is all over the eaſt. It is reckoned indecent in people of any reputation to ſing; and the attempting it in company would render a man contemptible. The Perſians call their ſinging-women Caine, intimating that they derive their ſkill from the daughters of Cain, who they pretend were the firſt inventors of ſinging and muſic in Aſia. They have a great number both of ſtring and wind inſtruments of muſic; ſome reſemble in ſhape our hautboys and flutes, others the viol, harp, virginals, kettle drum, and trumpet; the latter of which is the moſt diſagreeable and monſtrous inſtrument for ſize and ſound, that can be met with: it is commonly ſeven or eight feet long, and proportionably wide at the great end, and as much as a man can hold up: theſe and their drums nearly drown all other ſounds; though as we have obſerved, the leſſer inſtruments have no great harmony in them. Their muſic, as it is called, ſerves chiefly inſtead of clocks, to let people know the time of day or night, ſounding conſtantly at certain hours, for they have no bells. When the king or any great man goes out of his palace, you have always notice of it by theſe drums and trumpets, which are placed over the palace-gate, or in ſome balcony or gallery, and are ſounded upon ſuch occaſions, being heard at a great diſtance. Muſic and dancing girls are in ſome places appointed to go before a great man when he travels, and conſtitute part of his equipage.

The ſtrings of their inſtruments are never made of gut, the touching of any thing belonging to a dead animal, eſpecially the entrails, being accounted a pollution; they make them, therefore, of twiſted ſilk, or braſs wire. The playing upon a muſical inſtrument ſeems to be prohibited by their religion; for which reaſon their eccleſiaſtics and devotees will not be preſent at entertainments where they are uſed; ſo that we need not wonder that the ſcience is not arrived at greater perfection in Perſia. Except ſome of the king's, their muſic is hardly worth the hearing: it being chiefly performed by a ragged ſtrolling rabble, for a livelihood, either upon feſtivals, the circumciſing of a child, or other joyful occaſions.

The people of the eaſt look upon aſtrology as the key to futurity, and they have an inſatiable curioſity for prying into things to come. The Perſians term aſtrology the revelation of the ſtars; and aſtronomy is ſtudied in Perſia purely for the ſake of it. This ſeems to be the principal end of their ſtudies; and they look upon a perſon to be to the laſt degree ſtupid and ignorant, who ſpeaks ſlightly of this ſcience, falſely ſo called. The aſtrologers of Perſia, at leaſt the moſt celebrated, are all natives of the province of Choraſan, or Bactria, and of the town of Genabed. The king never entertains an aſtrologer who is not of that town. The reaſon that the aſtrologers here have more ſkill in their art than elſewhere, is, we are told, becauſe the air is drier and purer, by which means they have a better opportunity of obſerving the motions and aſpect of the ſtars. If we conſider the number of aſtrologers that are in Perſia, the rank they hold, and the large penſions they receive from the crown, we may eaſily account for the confidence the people put in them: they receive from the government no leſs than four hundred thouſand pounds per annum. To the poſt of chief aſtrologer to his majeſty there is annexed a penſion of ten thouſand pounds per annum, and to the ſecond aſtrologer five thouſand pounds per annum, and to the reſt according to their ſkill. They receive alſo in preſents annually from the king, one year with another, two hundred thouſand pounds; and yet they are ſometimes arbitrarily puniſhed and put to death, according to the caprice of the prince, for the moſt trivial of offences, and even for actions the moſt innocent in themſelves: of which we ſhall give an inſtance.

In the reign of Sephy, on a day when the king and all the great men were aſſembled to ſee ſome criminals of ſtate cut in pieces, and the chief of the aſtrologers was there among the reſt; the king, viewing attentively the countenances of his courtiers, obſerved, that the principal aſtrologer ſhut his eyes at every ſtroke of the ſabre, as not able to behold ſo horrid a ſlaughter: the king thereupon called to the governor of a province who ſat near him, and commanded him to put out the eyes of that dog who ſat at his left hand, ſince he did not uſe them. It is evident that the ſtars had never revealed any part of the aſtrologer's deſtiny to him; for this cruel order was executed upon him in an inſtant.

A certain number of aſtrologers are conſtantly retained in waiting at the royal palace, and ſome of the chief of them about the king's perſon, except when he is in the haram with his women, who advertiſe him of the lucky or unlucky moments. Every one of them carries an aſtrolabe hanging at his girdle, in a little neat caſe, not bigger than the hollow of one's hand; they are conſulted not only in affairs of importance, but frequently upon the leaſt trifles: for inſtance, If his majeſty ſhall go abroad? If it be an auſpicious hour to enter the haram? If it be a proper time to eat, or to give audience? &c. When theſe queſtions are aſked, the aſtrologer immediately takes out his aſtrolabe, obſerves the ſituation of the ſtars, and, by the aſſiſtance of his tables, makes his aſtrological concluſions, to which intire and implicit faith is always given.

Eclipſes of the ſun and moon, are in general pretty juſtly calculated by the Perſian aſtronomers, who often foretel the very moment wherein thoſe luminaries will be obſcured; though there have been inſtances of their miſtaking half an hour, eſpecially in eclipſes of the ſun. But they differ from us in nothing more than in the calculation of the vernal equinox; there being ſometimes an hour's difference between them and the Europeans. Comets, they apprehend, always portend ſome great calamity; but generally ſuppoſe their malign influences are directed againſt ſome other kingdom, rather than their own. They had neither celeſtial globes, or charts, or teleſcopes for obſerving the conſtellations, till the Europeans imported them; they have ſince indeed endeavoured to imitate the celeſtial globes; having had before only ſome repreſentations of the conſtellations in a book called, The plan-

of Abdal Rahmen. It is obſervable, however, that the figures were nearly the ſame as on our globes; the longitudes and latitudes of the ſtars are alſo marked, but a little different from ours. They generally make forty-eight conſtellations; and the names of them, for the moſt part, are the ſame we give them; but ſome of them are different. The only inſtruments they uſe in any of their operations are the aſtrolabe and Jacob's ſtaff; and as with theſe alone they take the elevation of the pole, it cannot be ſuppoſed that their latitudes are very exact. Their aſtrolabes are very curiouſly made, being chiefly the workmanſhip of the mathematicians themſelves.

Takumi is the name given to the Perſian almanac, which contains the ephemerides of the enſuing year. It contains properly a mixture of aſtronomy and judicial aſtrology, giving an account of the conjunctions, oppoſitions, aſpects, longitudes, latitudes, and the whole diſpoſition of the heavens. It alſo contains prognoſtics on the moſt remarkable events, as war, famine, plenty, diſeaſes, and other occurrences in human life; with the lucky or unlucky times for tranſacting all manner of affairs, whether of importance, or not; directing the people to regulate their conduct accordingly. The feſtivals alſo are marked as in our almanac; but whereas we divide the year into four ſeaſons, they make only two, ſummer and winter. Though there are great numbers of theſe almanac-makers, and though they frequently diſagree even in their aſtronomical calculations as well as their aſtrology, they are nevertheleſs looked upon as infallible. Their prognoſtications are generally taken from the moon, believing that this ſublunary world, as it is termed, is much more influenced by this planet than by the ſun. Theſe aſtrologers, like other oracles, generally deliver themſelves in dubious and equivocal expreſſions, which may bear half a dozen meanings; and if their productions prove true in any ſenſe, or but in part, they are ſure to meet with applauſe, though they ſhould fail in ſome inſtances. They ſeem to regard the earth more than the heavens, and to be governed by probable circumſtances, rather than the conſtellations, in the predictions they make; and their predictions on that account frequently prove true. For inſtance, their almanacs are always publiſhed in the ſpring, when the winter is paſſed; and, according to the weather they have had, it is no difficult matter to foretel whether they ſhall have good or bad crops in the ſummer, eſpecially in a climate where the weather does not vary as in Europe; and from the ſame premiſſes they will be able to paſs a tolerable judgment on the health or ſickneſs of the enſuing ſeaſons.

As the aſtrologers are always about the court, and have ſo great a ſhare in the adminiſtration of affairs, and are in ſuch credit with all the world, they may be ſuppoſed to make very ſhrewd gueſſes in relation to politics. They cannot but obſerve the humours and diſpoſition of the prince and his favourites; the likelihood there is that one will be reſtored, and another diſgraced. Nay, they very well know what an influence they have in theſe caſes, inſomuch that there very rarely happens a conſiderable alteration in the ſtate, but it is brought about, and indeed is the effect of ſome prediction of their own.

There are ſeveral kinds of divination in uſe among the Perſians; for they do not believe that the ſtars reveal, and are indeed the cauſe of every accident and moral action; but alſo, that God is pleaſed to let them know their fate by lots, by the throw of a die, or even by toſſing up a piece of money; when theſe are done with due ſolemnity, and a religious ſerioufneſs. The aſtrologers are alſo profeſſors of the art of divination, though the Mahometan prieſts come in for a ſhare by this gainful trade; and for this purpoſe the very alcoran, their moſt ſacred writings, are proſtituted. When the prieſt is applied to, he makes a preparation ſuitable to the quality of the perſon who conſults the oracle. He purifies himſelf by bathing, puts on a clean robe, and having repeated certain prayers, he takes the alcoran in his hand, and opens it at a venture; and if the place he caſts his eye upon contains a poſitive command, the prediction is favourable, and the perſon may undertake the thing; but if it contains a negative, the contrary, and he ought to lay aſide the deſign. The greateſt doctors, from a regard to their learning and ſanctity, are the moſt ſought after on theſe occaſions.

There are offices for the diviners and aſtrologers in all the great towns of Perſia, where they tell fortunes, and interpret dreams. Beſides other methods, they have alſo a folio book, containing about fifty pictures, ſome repreſenting the ſigns of the zodiac, and others their prophets and ſaints; from this they pretend to give the interpretation of dreams, and diſcover all that is demanded of them.

Another part of the Perſian ſuperſtition conſiſts in charms and amulets. The amulets have certain inſcriptions on paper, and ſometimes on precious ſtones, and theſe inſcriptions they wear in little bags about them: they contain ſome paſſages of the alcoran, or ſentences of their ſaints or prophets, applicable to the diſeaſe or enchantment complained of. They depend alſo much on the diviners and aſtrologers with reſpect to the obſervance of days and times: and the aſtrologers, when the king is on a journey, will ſometimes make him riſe at midnight and begin his march in the worſt weather that can happen, and perhaps out of the high road, to avoid the unfortunate hour, or his evil ſtars.

The Perſians reduce their philoſophy under three heads; namely, phyſics, metaphyſics, and logic. Their great maſter is Ariſtotle, whom they have tranſlated into Arabic. Till very lately they did not believe there were Antipodes: but are of another opinion ſince the Europeans have viſited them. The philoſophy of Pythagoras, which prevails in India, is here taught by a ſect of Mahometans, called Sefys. Theſe underſtand the alcoran, and all its precepts; and, whatever regards external worſhip in religion, in a ſpiritual ſenſe; and though they practiſe corporal purifications with the other Mahometans, they do not look upon them as eſſential to their religion, which occaſions the reſt of their church to hate them mortally. They profeſs love to all the world, and to hate no man. They conſider all men as proceeding from one common father, and people of different ſects and perſuaſions as all ſervants of the ſame maſter; they teach that the joys of Paradiſe conſiſt of an intimate knowledge of, and a ſtrict union with, God; and that hell conſiſts in a regret for being ſeparated from him. Ethics, or moral philoſophy, ſeems to be more cultivated than any other in Perſia. Thoſe who profeſs it, ſhew a perfect reſignation under all misfortunes, and ſpeak of death, and even ſuffer it with great evenneſs of temper. Moſt moral virtues, particularly patience, fortitude, and temperance, ſeem to be deeply impreſſed on them.

Little can be ſaid of the geography of the Perſians, as they had neither terreſtrial globes, maps, or planiſpheres, till the Europeans introduced them. They thought there was a ſmall part of the earth habitable; and compared it to an orange ſwimming in a veſſel of water, the greateſt part whereof remains under water.

Hiſtory is but little cultivated in Perſia. They are ſo far from knowing any thing of the hiſtory of Europe, or any diſtant country, that they are ignorant of that of their neareſt neighbours; nor has the hiſtory of their own nation any thing of certainty in it, till the eſtabliſhment of the Mahometan religion among them. Their hiſtories, before that time, are but ſo many legends, without the leaſt appearance of truth. They pretend that the world was created ſeveral thouſand years before Adam; and that it was firſt inhabited by dæmons and ſpirits, who, rebelling againſt God, were thrown into hell, and that God introduced Adam and his poſterity in their room.

The Perſians begin their year at the vernal equinox. They complete their years by the number of moons, reckoning twelve moons to a year, or thee hundred and fifty-three days, ſo that their ſolar computation exceeds their lunar at leaſt twelve days in the year. Their epoch begins with the hegira or flight of Mahomet, which was in the month of July, ſix hundred and twenty-two years after the birth of Chriſt. And as the Jews computed their time by jubilees, the Chriſtians by indictions, the Romans by luſtras, and the Greeks by olympiads; the Perſians alſo, in ſome caſes, account by a revolution of four years.

Their week begins on the Saturday; ſo that the ſeventh day, which is their ſabbath, falls on a Friday: they call it adine, or tzemeh, that is the day when they aſſemble for religious worſhip. Upon the nuries, or new-year's-day, the great men wait on the king to wiſh him a happy new year, every one making him a valuable preſent, as do the chams who preſide over diſtant governments.

They divide the day into four equal parts, and the night into as many: and they have a hollow brazen veſſel with a little hole in it, which they ſet upon the water, and is filled in about the ſpace of three hours, and, when it ſinks, the watch is expired: of which notice is given by the public drums and trumpets in all great towns.

The Perſians call a phyſician hakaym, or the preſerver of life. There is not a country in the eaſt where phyſicians are in greater eſteem, or that produces a greater variety of medicines and phyſical drugs: it is a common ſaying in Perſia, that the aſtrologers and phyſicians devour the country. The king always entertains vaſt numbers in

in his pay, who are not leſs chargeable to him than his aſtrologers; but there is an eternal variance between them: for when the phyſician has preſcribed and prepared the medicine, the patient muſt wait till the aſtrologer aſſigns the lucky moment to take it: and if it has not the wiſhed-for effect, the aſtrologer imputes it to the ignorance of the phyſician, who, on the other hand, tells his patient that the reaſon it had no better ſucceſs, was, becauſe there was a miſtake made in the calculation of the aſtrologer.

The diſeaſe is chiefly judged of by feeling the pulſe, or conſidering the patient's urine, by which the phyſicians learn the diſtemper without ſeeing them; which ſeems neceſſary in Perſia in relation to the female ſex, who are never ſeen on any occaſion whatever; and when a phyſician deſires to feel a woman's pulſe, they give him her hand covered with crape or fine linen, having all the while a curtain between them. They ſeldom bleed in Perſia, but give emulſions and other potions in a fever, which is the moſt ordinary diſtemper in the country, and of theſe four or five pints ſometimes in a morning; but they never give clyſters, which ſome think proceeds from an exceſs of modeſty, or rather from a prohibition reſulting from their religion.

That the patient may not be diſpirited, the phyſicians tell him, with the greateſt aſſurance, if he is at death's door, that there is no manner of danger, and that they will reſtore him in a few days. In their preſcriptions, they always follow Galen, whom the Perſians call Galenous. The other great maſters in phyſic are Hermes Triſmegiſtus and Avicenna, or Abouſina, as they call him, the moſt celebrated phyſician and philoſopher of Aſia in his time.

In ſurgery the Perſians are very ignorant: their barbers are the only ſurgeons, and few of them underſtand any thing more than blood-letting. There is not a phyſician in Perſia that ever ſaw a body diſſected; but they have the leſs occaſion for ſurgeons, becauſe the air is ſo good, that green wounds almoſt heal of themſelves, and they are exempt from many of thoſe maladies which ariſe from a corruption and flux of humours among us.

The Perſian phyſicians are both druggiſts and apothecaries; and have their ſhops and ſervants to make up their medicines. The phyſician demands nothing for his advice, but only for his medicines, where the patient comes to the houſe; it is, however, uſual to make him a preſent. When the phyſician viſits the patient, he has about two guineas for the firſt, and one for every ſucceeding viſit; notwithſtanding there are multitudes of phyſicians in Perſia, the country in general is very healthy, except near the ſea-coaſt, and this is thought to proceed either from the dryneſs of the air, the temperance of the people, or the ſerenity of their minds.

Though the neighbouring kingdoms of Turky and India are ſeldom free from the plague, yet it very ſeldom viſits Perſia. They are equally ſtrangers to the ſtone, ſciatica, head-ach, and tooth-ach; and though it is true, many of them have the venereal diſeaſe, yet it is not attended with thoſe pernicious effects there, as in Europe: there are not thoſe blotches and breakings out which are found upon thoſe who have that diſtemper amongſt us. They eat, drink and bathe together, when they are affected with it; nor is any body aſhamed of having contracted it, but they ſpeak of it as of any other ordinary diſtemper; frequent bathing is thought to be of great ſervice to the Perſians under that diſorder, though it may communicate it to others.

The falling-ſickneſs, apoplexy, conſumptions, and ſmall-pox, are ſcarcely known amongſt them: but the diſeaſes the Perſians are moſt ſubject to, are fevers, St. Anthony's fire, pleuriſy, colic, dyſenteries and dropſies. Near the gulf of Perſia they are troubled with a ſmall worm of a prodigious length, which breeds in their legs: they are drawn out by twiſting them round a ſtick; but if they happen to break in the operation, it is of very bad conſequence to the patient. Near the Caſpian ſea, the common diſtemper is the yellow jaundice; and travellers obſerve that the people in general in Hyrcania have a yellowiſh ſickly countenance.

A fever is very ſoon removed by the Perſian phyſicians, but then they frequently throw the patient into a dropſy. Whatever may be the firſt diſeaſe with which the patient is attacked, the ſwelling of his legs generally ſucceeds, and it is frequently a great while before this is removed; it very often carries them to their graves, a dropſy being more fatal in Perſia than any other diſtemper. In the colic, and ſeveral other diſorders, they uſe burning and cauterizing: this is their laſt remedy, where the perſon is afflicted with wind. In a dyſentery, they give ſour milk, boiled with rice till it is dry. For the hæmorrhoids, they apply the oil of naptha. They never ſuffer the ſick perſon to change his linen or his clothes while the illneſs laſts, or to eat bread or fleſh: boiled rice, or a kind of gruel made of it, is almoſt the only diet of a ſick man; but in almoſt all diſtempers, the moſt general remedy in Perſia is the bath.

The baths in Perſia conſiſt of three rooms, the light into which is communicated from little round quarries of glaſs in the arched roof: the firſt is a great room, with wooden benches round about it; here they put off their clothes, and dreſs themſelves for the bath. The ſecond, which moſt commonly is ſquare, is ſix feet diameter, and has a kind of copper three or four feet ſquare ſet in the floor, covered with a flat copper-plate, which heats the water and the bagnio, the fire being underneath on the outſide. In the third room is the place for bathing. In the morning before day a ſervant goes up to the terrace on the top of the houſe, and ſounds a ſhell or horn, to give notice that the bath is ready.

When any perſon comes to bathe, he undreſſes himſelf in the firſt room, and ties a cloth about his middle, which reaches down to his knees; then he enters into the ſtove, whither a few moments after a ſervant comes, and pours a quantity of water on his ſhoulders, rubbing him from head to foot in ſo rough a manner, that thoſe who are not uſed to it think he is about to flay them: he afterwards ſhaves the perſon's face and head, if he deſires it, cuts the nails of his fingers and toes, handles his body, ſqueezes and rubs it, and ſtretches every finger and limb, as if he was about to diſlocate them; and this takes up about a quarter of an hour. After the perſon has been thus ſtretched and ſqueezed, he goes and plunges himſelf into the bath, and, being wiped with a clean linen cloth when he comes out, he returns into the firſt room, and puts on his own clothes again. The time limited for the men's bathing is from twilight in the morning till four in the afternoon, and the women go from that time till midnight.

When it is the women's turn to bathe, all the male ſervants of the bagnio withdraw, and are ſucceeded by girls.

The ladies are never ſo finely dreſſed as when they come to bathe; this is the only opportunity they have of vying with each other in the article of clothes, and their perfumes and eſſences are enough to ſtifle a perſon who is not uſed to them. In the bath called Collatin, at Iſpahan, ten perſons may bathe at once: but if you go to thoſe large baths the latter part of the day, the ſurface of the water will then be perfectly thickened with a greaſy matter which ſwims on the top of it, and proceeds from the infirm bodies of thoſe who waſh in it, and appears very nauſeous. But the Perſians who are uſed to it; when they plunge themſelves over head and ears into the water, as they are obliged to do when they would cleanſe themſelves from any legal pollutions, only ſtrike away the thick ſcum with their hands, and then throw themſelves in: and it is ſurpriſing that the Perſians are ſo healthy as their florid countenances demonſtrate they are, when we conſider that all ſorts of people, the infirm and the healthful, the infected and ſound, bathe together in the ſame water.

Perſons of diſtinction have bagnios in their own houſes; and thoſe of a lower rank have them adjoining to their houſes, the uſe whereof they reſerve to themſelves at certain times, but let them out to others, upon condition only of providing the neceſſary veſſels and other implements for bathing, and keeping up a conſtant fire in the place.

With reſpect to their painting, the Perſians do not, any more than the Chineſe, endeavour to imitate nature, but ſeem to delight in miſ-ſhapen and monſtrous figures; nor do they know any thing of perſpective. The Europeans far exceed them, both in the liberal and mechanic arts. One reaſon why they apply themſelves no more to painting and engraving, probably is, becauſe their religion diſcourages them; their preciſe doctors prohibit the repreſentation of every created animal. A Mahometan would not perform his devotions where there was a picture in the room, for the world. There are not in Perſia, at preſent, either ſtatuaries or founders, or any emboſſed work made. They draw their pictures commonly with a ſide face, ſcarcely ever with a full viſage; and when they do, they ſucceed very ill, for they do not know how to give the ſhades; even the figures of animals are aukwardly done. Their flowers are pretty well; and they have the advantage of us in the livelineſs of their colours, which are hardened and poliſhed by the dryneſs of the air.

It may not be amiſs to enquire into the education of the Perſians, and of their ſchools and colleges erected for that purpoſe. There are abundance of ſchools in every town, where, beſides the Perſian, the Arabic is taught. The alcoran

alcoran (which is looked upon as the ſtandard of good language, both for grammar and rhetoric), and their other ſacred writings, are all in this language. Perſons of condition chuſe to have private tutors for their children, before they ſend them to the public ſchools.

There are a great number of ſchools in every town in Perſia, and the expence of learning is very ſmall. Their ſchools are called Mekteb, which ſignifies an entrance; this being, they ſay, the gate, by which lads enter into the ſciences. They are taught here the Perſian and Arabian languages, with writing and accompts; which when they are arrived at ſome perfection in, they are removed to ſome college, or Medreſs as they call them, where their doctrine and the principles of their religion are taught. Their colleges are all endowed, and ſome of them very rich; the largeſt have fifty or ſixty apartments, and to each of them belong two chambers. In the beſt colleges, every ſcholar has about two ſhillings a day allowed him, which he lays out as he thinks fit; for they do not common together as with us. In ſome colleges the ſtudents have not more than a penny a day; and yet intereſt is made to get admitted into theſe, on account of having a lodging gratis, and other caſual advantages. Many, whoſe principal deſign ſeems to be to indulge in eaſe and idleneſs, get into them without any deſign to ſtudy, who live to old age in thoſe houſes, and have their wives and children with them.

We ſhall not be ſurpriſed to find that there are abundance of colleges in the great towns and villages of Perſia, when we conſider that theſe people lay out great ſums of money in public foundations. They uſually, firſt of all, build a caravanſera for the lodging of travellers gratis, afterwards a bagnio, a coffee-houſe, a bazar or market-place, and they alſo purchaſe a garden: theſe they let out, and apply the revenues ariſing from them towards building and endowing a college. The founder and his heirs have the appointment of the head and governors of the ſociety; and if the founder's eſtate happens to be forfeited to the crown, the king has the nomination.

In Iſpahan, there are forty-ſeven colleges, moſt of them of royal foundation, or which have devolved to the crown. There are profeſſors who teach the ſciences in every college, to whom the ſcholars make an annual allowance for their trouble; but as there are ſeveral who read lectures gratis, the ſcholars frequently reſort to theſe, and forſake their proper tutors. Thoſe ſtudents who are men of parts and learning, may have a handſome ſalary in any great man's houſe, for inſtructing his children, who are always educated in their own houſes. The head of the houſe admits or excludes whom he ſees fit, and pays the ſtudents their penſions monthly, ſo that they ſhew him abundance of reſpect.

Beſides their colleges, there are in every town thoſe who teach the liberal arts gratis; and theſe are frequently great officers who have been diſcarded, or have voluntarily retired from court. Theſe frequently furniſh their diſciples with books and paper, and entertain them at their own expence certain days in the week, and ſometimes clothe their pupils, and give them money: by which acts they endeavour to recover their reputation with the people: for nothing ſo much raiſes the reputation of a gentlemen in Perſia as the inſtructing a certain number of ſcholars at their own charge, and the being patrons of learning and learned men. There are no public diſputations or lectures in Perſia, as in Europe; but when the ſcholors have made ſome progreſs in the ſciences, they begin to diſpute with their reſpective tutors.

SECT. VIII.

Of the Riſe and Eſtabliſhment of the preſent Royal Family in PERSIA, the Prerogative and abſolute Sway of the PERSIAN Monarchs, Miniſters, Government, and Succeſſion of the Crown, together with a Continuation of the PERSIAN Hiſtory, to the preſent Time.

IT is a received opinion among the Perſians, eſpecially by their clergy, that none but prophets, their ſubſtitutes or ſucceſſors, have a right to dominion. They obſerve, that God has in all ages governed his people by prophets, who directed both the ſpiritual and temporal affairs; as Abraham, Moſes, Samuel, David, Solomon, and laſtly Mahomet, to whom, as they aſſert, ſucceeded Haly and the twelve Imams.

In order to give ſome account of the riſe and eſtabliſhment of the preſent royal family, we muſt obſerve that Tamerlane having defeated Bajazet, and marching through Perſia with great numbers of Turkiſh and Perſian captives, Chick Aidor, a doctor of law in great reputation for his ſanctity among the Mahometans, obtained of him the releaſe of moſt of his priſoners, which ſtill increaſed the fame of the Chick; inſomuch that when Tamerlane marched away, the Chick entertained thoughts of aſſuming the ſovereign power. The better to accompliſh his deſign, he gave out, that he was lineally deſcended from Haly, the ſon-in-law and only legal ſucceſſor of Mahomet; and took upon him the title of Calif, which ſignifies prieſt as well as prince. Iſmael Sefi, or Sophi, followed his father's ſteps, and, being ſucceſsful in ſeveral battles, eſtabliſhed himſelf in the government; and is reckoned the firſt king of the preſent dynaſty or family. To Iſmael Sophi ſucceeded Shah Thomas, who, being a cruel prince, was depoſed, and ſucceeded by his brother Mahomet Codabundi, who was a weak man, and famous for nothing but being the father of the great Shah Abbas, who reigned about an hundred years ago. This prince enlarged the empire on every ſide. He took the province of Candahor from the Great Mogul, conquered the kingdom of Lar and Ormus, and drove the Turks almoſt out of Armenia and Georgia. He encouraged all arts and ſciences; and as he found the Perſians were not at all inclined to foreign trade, he tranſplanted the Armenians of Julpha to Iſpahan, and made them his factors and merchants in every part of Europe and Aſia, where there was any traffic; and as he obſerved the pilgrimages to Mecca carried great quantities of treaſure out of his dominions, he went himſelf a pilgrimage to the tomb of Imanrezez, which is ſituated in Perſia, in hopes his ſubjects would carry their pious alms thither, and the money might circulate in his own country: he was ſo ſevere againſt thoſe who were guilty of the leaſt fraud, that he ordered a cook to be roaſted alive, and a baker to be baked in his own oven, for keeping of falſe weights. But with all his virtues, Shah Abbas has been generally charged with cruelty, eſpecially towards his ſon Sophi Mirza, a prince of great expectations, and the darling of the people.

Sefi Mirza, by being bred up among the ſoldiery, and frequently commanding them in the moſt hazardous enterprizes, became extremely reſpected in the army. Whether he was really concerned in any conſpiracy with the generals to depoſe his father, does not appear; but the king was ſo apprehenſive of it, that he did not think himſelf ſecure while his ſon lived. Some writers tell us, that Shah Abbas having rendered himſelf odious to the principal chams by his repeated cruelties, they made an offer of advancing Sefi Mirza to the throne; which the father being made acquainted with, commanded a nobleman, who attended him, to bring him his ſon's head: but he excuſing himſelf, another courtier, named Bebut Bey, undertook to do it, and, ſurpriſing Sefi Mirza as he came out of the bagnio, attended only by one page, acquainted him it was his father's pleaſure he ſhould die, and immediately ſeized the unfortunate prince, and threw him upon the floor, who, lifting up his eyes to heaven, cried out, "Good God! what have I done to merit this diſgrace? Curſe on the traitor who was the occaſion of it: but ſince it is God's will, his and the king's be done." The words were ſcarce ended, when Bebut ſtabbed him twice with a poniard, and, cutting off his head carried it to his father. This tragical event the people were no ſooner acquainted with, than they aſſembled at the palace gates, and it had well nigh occaſioned a general inſurrection.

The mother of Sefi Mirza upbraided the king with his cruelty and tyranny, and, in the tranſport of her paſſion, flew in his face; all which his majeſty took very patiently, and with tears in his eyes demanded of her, "What ſhe would have had him do, when he was informed there was a conſpiracy againſt his life: beſides, it was now paſt redreſs: that none had a greater ſhare of grief than himſelf, and of two evils he had choſen what he then eſteemed the leaſt; though if his ſon was alive again, he would run any hazard, rather than take the ſame meaſures." And indeed he diſcovered all the ſigns of grief imaginable: he covered his face and would not ſee the light for ſeveral days; he mortified himſelf by faſting, and mourned a whole year; and in the place where his ſon was killed, he built a ſanctuary, endowed it with large revenues; and, to revenge himſelf on the Perſian lords, who had inſtilled theſe fears and jealouſies of his ſon into his head, he ordered them to be invited to a feaſt, and to mix poiſon with their wine, and ſaw every one of them expire before his face. The king commanded Bebut Bey, who had murdered the young prince ſo readily and officiouſly, to cut off the head of his own ſon; and when he brought it to his majeſty in

his hand, he told him, that the reflection of what he had done, would certainly bring him to his grave; the king replied, that now he was capable of judging what his grief muſt be, and bid him comfort himſelf, that in this particular he was equal to his royal maſter. Shah Abbas, having reigned about forty years, died anno 1628, appointing his grandſon Shah Sefi, or Sophi, the ſon of Sefi Mirza, his ſucceſſor, who was at that time not fifteen years of age.

The adminiſtration continued in the ſame hands Shah Abbas had left it in for ſome time: but Shah Sefi was no ſooner come to man's eſtate, than he began to call the principal miniſters to a ſevere account, and cut off the head of Ali Kouli Chan, viceroy of Perſia, who had deſerved well of his country, and contributed as much as any general to the conqueſts that were made in the late reign: he alſo ſent for the heads of his three ſons, and of ſeven other great lords of the court. His reign was violent and tyrannical; and he drank to that exceſs, that in one of his debaucheries he killed the queen, for which he was under the deepeſt concern when he grew cool, and prohibited the drinking of wine in any part of his dominions; but in a year's time he fell again into the ſame courſes, which put a period to his life, after he had reigned fourteen years, and was ſucceeded by his ſon Shah Abbas II. being then about twelve years of age.

This prince was greatly reſpected for his bravery, and hoſpitality to ſtrangers, eſpecially Chriſtians; but ſo addicted to his father's vice of drunkenneſs, that he ordered three of his women to be burnt becauſe they refuſed to drink as long as he did. According to ſome, he died of an inflammation cauſed by hard drinking; while others affirm, that he was carried off by the venereal diſeaſe, after he had reigned one and twenty years.

Shah Sefi the ſecond, ſucceeded his father. But the grandees, apprehending that this prince had been dead, were about to advance his younger brother Hamzel Mirza to the throne, till they were undeceived by an old eunuch, who aſſured them that Shah Sefi was alive. This prince changed his name, and took that of Solyman: it is obſerved, that in his reign the kingdom was afflicted with war, famine, and epidemical diſtempers; but his government was much milder than that of his immediate predeceſſors: he died on the 29th of July 1694, and was ſucceeded by his ſon Shah Sultan Hoſſein, whom his father expreſsly enjoined, not to put in practice that cruel cuſtom of putting out the eyes of his brothers; but whether he obeyed his commands is uncertain, it being difficult to know what is done in the ſeraglio. We have before related, that this prince, after a long and indolent reign, was depoſed by Mahamood the ſon of Mereweys; who being aſſaſſinated by Eſdriff, one of his officers, who ſucceeded him, Shah Thomas, the young ſultan, invited Kouli Khan or Shah Nadir, to join his forces; which he conſenting to, Eſdriff was defeated, and put to a cruel death. Kouli Khan afterwards defeated the Turks; elated by his ſucceſs, and aſpiring to the empire, he depoſed and afterwards murdered Shah Thomas.

As there are ſeveral remarkable and well authenticated circumſtances, of more recent date, relative to this uſurper Kouli Khan, we ſhall here introduce a particular account of him. He was born at Chalat, in 1687, which principality he was heir to. Being offended at his uncle's treatment of him, he repaired to Choraſan, and entered as a private ſoldier in the Perſian army in 1712, and was in 1719 promoted to the rank of colonel. The governor of Choraſan afterwards gave him the command of the Perſian troops in that province; with which he defeated the Uſbeck Tartars. Being afterwards diſguſted at the conduct of the governor, who contrary to his promiſe, had promoted a young nobleman to the rank of general in preference to him, he upbraided the governor in ſcurrilous terms, who ordering him to be baſtinadoed, he afterwards fled to the mountains where he headed a band of robbers, with which he ravaged the country, and plundered the caravans. His uncle having obtained his pardon for theſe outrages, he repaired to Cholat, where he ſoon afterwards murdered his uncle, and poſſeſſed himſelf of the place which had been deemed impregnable. Becoming exceedingly formidable by the addition of ſix thouſand bold and hardy troops, he attacked and took the city of Nechabar by ſtratagem. In 1728, he was appointed commander in chief of the Shah's forces, and received the diſtinguiſhing title of Tachmas, or Thomas Kouli Khan. After the murder of Shah Thomas, he declared Abbas Mirza, an infant ſix months old, and the ſon of the late monarch, emperor, but reſerved the power and riches of the empire in his own hands. He afterwards marched againſt the Turks, drove them before him, and beſieged Bagdat; but was defeated in a moſt bloody battle, on the 18th of July 1733, by Topal Oſman, at the head of one hundred thouſand men; his army conſiſting of ſeventy thouſand; but he afterwards defeated the Turks in two battles, in the laſt of which they loſt forty thouſand men, with all their camp, and the brave Topal Oſman was among the ſlain. He afterwards marched to Schiras, where he cruſhed a powerful rebellion; and in 1734, gained great advantages over the Turks and Tartars, reducing the open country of Georgia and Armenia. In 1735, he deſtroyed great part of the Turkiſh army at Arpa Kavi; and in 1736, the young Shah Abbas dying, he was elected emperor by the Perſian chiefs and nobles.

After his acceſſion to the throne, Nadir Shah became a moſt deſpotic tyrant, deſtroying the royal family, putting many of the nobility to death, and ſeized their eſtates, not even ſparing the church lands. He concluded a peace with the Turks and Ruſſians, and reduced the revolted Agſans to obedience. After theſe exploits, he defeated the armies of the Great Mogul, whom he took priſoner, poſſeſſed himſelf of Delhi the capital of Hindoſtan, put multitudes to the ſword, and plundered the empire of its riches to the amount of eighty-ſeven millions five hundred thouſand pounds ſterling. Among other valuables was the imperial throne, intirely ſet with jewels: he alſo took three hundred elephants, ten thouſand horſes, the ſame number of camels, and a great quantity and variety of cannon and warlike ſtores. Theſe immenſe treaſures he depoſited in his principality of Chalat, putting them under the care of twelve thouſand Georgians, who were Chriſtians; he next made the Uſbeck Tartars tributary to Perſia. He quelled ſeveral inſurrections in the year 1741. In 1742, his eldeſt ſon attempting to murder him, was afterwards brought priſoner to his father, who ordered his eyes to be put out. He exerciſed the moſt ſhocking cruelties in all his expeditions: friends and enemies, armed and unarmed, were alike the objects of his barbarity: he demoliſhed whole cities and towns, laid waſte fertile provinces, plundered people of all ranks, and murdered ſeveral millions of the Perſians, and people of other countries. In 1744, he defeated and took priſoner a pretended prince whom the Turks had ſet up againſt him; but, to the ſurpriſe of every one, permitted him to eſcape puniſhment, though he beheaded two hundred and eighty-two of his followers. He defeated the Turks in 1745, and in 1746 and 1747 was engaged in ſuppreſſing rebellions and inteſtine commotions. After this time he was judged to be in a ſtate of inſanity; his actions being for the moſt part abſurd and unaccountable: and though a gleam of humanity would at certain times appear for a moment, yet avarice and the moſt deteſtable cruelty generally marked his conduct. As this cruel and blood-thirſty tyrant ſeemed to outdo in barbarity the moſt inhuman monſters of antiquity, he was at length become inſupportable; ſo that on the ſecond of July 1747, five of his principal officers aſſaſſinated and ſlew him in his chamber, but not before he ſtruck off the head of one with his ſabre, and wounded another. The people were overjoyed on hearing of his death, put to death his blind ſon, his grandſon, and even his women, that none of ſuch a deteſtable ſtock might be found to ſucceed him, and prove the ſcourge of mankind.

We have inſerted this account for the general ſatisfaction of our readers, as many of the hiſtorical and geographical books publiſhed of late years tend to diſappoint the expectations of the public, by deſcribing this country with reſpect to its ſtate before the time of Kouli Khan, omitting to give its true modern deſcription; treating of cities that are merely ideal, and provinces that are at preſent totally deſerted and uncultivated; of millions that have been deſtroyed, and magnificent ſtructures demoliſhed and laid in ruins. Since the above-mentioned tyrant aſcended the throne, that unfortunate country has remained in the moſt diſordered condition; and whatever revolutions may have ſince happened, they have not come to hand, ſufficiently authenticated for us to communicate to the public. But to proceed; no prince in the world is more abſolute than the Perſian monarch; he has the lives and eſtates of his ſubjects entirely at his diſpoſal: his orders are implicitly obeyed, be they never ſo unjuſt, or given at times when he is ſo little maſter of his reaſon, that he knows not what he ſays or does. Nothing can ſave the greateſt ſubject, when he is determined to deprive him of his life or eſtate; neither zeal for his perſon, preſent or paſt ſervices, will in the leaſt avail. If he is diſpoſed to ruin them, it is done by a word of his mouth, or by a ſign, and executed in an inſtant, without any form of law, or evidence of the fact: the common people, who are at a diſtance from the court, have greatly the advantage of the quality in this reſpect.

reſpect. There are very ſeldom inſtances of any oppreſſion or ſevere judgments executed upon theſe; but they ſeem to enjoy as much ſecurity as in any country in the world; and perhaps the magiſtrates are the more inclined to govern equitably, in regard they are ſenſible that nothing can ſcreen them from the reſentment of their ſovereign, if they are found to have acted contrary to law or equity.

The king's orders are obeyed out of conſcience by the people, who believe that his commands ought to be executed againſt the very laws of nature: ſo that if the ſon be commanded to be his father's executioner, or the father the ſon's, it muſt be complied with. But if any thing is enjoined to be done in prejudice of their religion, they are not obliged to obey him, but ought to ſuffer any thing rather than violate the law of God.

The king having commanded a prime miniſter in the Perſian court to drink with him, he excuſed himſelf, telling the king that he had been a pilgrimage to Mecca, and could not drink without violating the laws of their religion. To which the king anſwered, Thouſands have gone in pilgrimage to Mecca, and yet drink wine: drink, therefore, when your ſovereign commands you. But this gentleman ſtill refuſing, the king abuſed him in the groſſeſt manner, made the ſervants throw wine in his face, and down his boſom, and pour it into his mouth by force. Then he threatened him with immediate death, to which he anſwered, The king had a right to his life, but not to his religion; and he choſe rather to die than drink. And though his majeſty did not think fit to put his threats into execution, he turned him out of his employment: however, he was afterwards reſtored with abundance of honour, and the king ſeemed to value him the more ever afterwards for his reſolution.

It is recorded by an hiſtorian of credit, that Shah Sefi, without any provocation, ordered that one of the greateſt officers of the crown ſhould have his ears cut off in his preſence by his own ſon, which was immediately executed. Then he commanded the ſon to cut off his father's noſe, which he alſo executed. Whereupon the old gentleman finding himſelf thus abuſed by his own ſon, and by order of the king, whom he had not offended, ſaid to the cruel prince, Ah, Sir, after this, I ought not to live any longer, cauſe me therefore to be put to death; which he had no great trouble in obtaining; but that it might not ſeem a favour, he added to the cruelty of the order, by appointing his own ſon to be his immediate executioner, bidding him cut off his father's head, and he ſhould have his whole eſtate; which was readily complied with by this unnatural parricide.

Another proof of the tyranny of the Perſian government, is, the cuſtom of executing the governors of provinces, and great officers of ſtate, without giving them an opportunity of making their defence, or being informed of the crime they are charged with. It is uſual for the king, two or three times in a year, to ſend every governor the calaat, or royal veſt; and theſe are ſent by ſuch perſons as the court intends a favour to; for the cham, or governor, to whom they are ſent, always makes a conſiderable preſent to the meſſenger. When he comes within two or three miles of the place where the governor reſides, the meſſenger ſends him word to come and receive the calaat; but, inſtead of a fine coat, the governor is ſometimes preſented with a halter, and is diſpatched without any farther ceremony. This makes the governors very watchful over their conduct; and they are always under diſmal apprehenſions when they hear the calaat is arrived, knowing how common it is to have their beſt actions miſrepreſented to the prince. The Perſians ſay in defence of this practice, that the court ſeldom proceeds with that ſeverity, but in extraordinary caſes, where the fact is notorious, and there is danger of a rebellion, if they ſhould cite the perſon accuſed to anſwer; that if it be otherwiſe, they always give him an opportunity of anſwering the charge. The king looks upon thoſe about the court as ſlaves he has purchaſed, and dooms them to be puniſhed or put to death as he ſees fit, not thinking himſelf obliged to obſerve thoſe formalities.

There is no privy council of ſtate in Perſia, as in the European governments; but the king acts as he is adviſed by the prime miniſter and great officers: that which moſt perplexes the miniſtry, is, the cabals that are carried on by the women in the haram: the reſolutions that are formed here frequently thwart their beſt laid ſchemes; and the miniſters do not only run the riſque of having their counſels rejected, but they very often turn to their own deſtruction if they are not ſuitable to the intereſt or inclination of the moſt favourite ladies

With reſpect to the ſucceſſion of the crown of Perſia, we muſt obſerve that it is hereditary in the male branches, but the females are excluded: but the ſon of a daughter may inherit, though his mother could not. What ſeems moſt particular in their laws of ſucceſſion in Perſia is, that a blind man ſhall not inherit; and as thoſe males who proceed from the female branches are as capable of ſucceeding as thoſe who derive themſelves from the males, that cruel policy of putting out the eyes of all that are allied to the crown is executed upon every male of the royal family, whether they proceed from ſons or daughters. As there are no common executioners in Perſia, the orders for putting out the eyes of the royal infants are executed by any one the king happens to pitch upon; and they are not content with doing it by a hot iron held to them as formerly, but the very eye balls are ſcooped clean out with the point of a knife or dagger, according as the perſon is provided who is ſent on the buſineſs; but who not being uſed to ſuch operations, the poor children are put to inexpreſſible torture, and ſometimes loſe their lives under their hands.

The Perſians ſeem to excuſe this barbarous cuſtom of putting out the eyes of the royal infants, by telling us, that it prevents all diſputes about the ſucceſſion, and a great deal of bloodſhed; and that they are more merciful than the Turks, who deſtroy every branch of the royal family. On the other hand, the Perſians permit them to live, give them wives, and ſuffer them to enjoy all the pleaſures that blind men are capable of in the haram. But how melancholy muſt it be for theſe miſerable princes to reflect, that all the males which proceed from them will be ſerved in the ſame manner themſelves have been, and have their eye-balls torn out of their heads!

SECT. IX.

Giving an Account of the pompous Titles of the PERSIAN Monarch, the Arms he aſſumes, &c. alſo of the Princes of the Blood, Prime Miniſter, great Officers of State, Generals, eccleſiaſtical Officers, civil Magiſtrates, &c.

THE uſual title of the king of Perſia is Shah, or Paſha, the diſpoſer of kingdoms, which is the higheſt title known in Aſia, and equivalent to that of emperor in Europe. He is alſo ſtiled Sultan, Khan, Caun, or Cham. One of their kings, in his letters, ſtiled himſelf, victorious Lord of the world, the moſt valiant prince deſcended from Chelk Sephy, Mouſſa and Haſſein. His ſubjects, in their addreſſes, call him, the moſt renowned of all men living; the ſource of power, majeſty, and glory, equal to the ſun, ſubſtitute of Heaven, object of all men's vows, &c. &c. With theſe, or ſuch titles, all petitions and repreſentations to the throne abound: but when they ſpeak to the king, they uſually ſtile him the Lieutenant of God, or the prince by whom God diſpenſes his grace and favour to men. The princes of the blood royal are called Mirza, &c. ſignifying the ſon of a prince. The arms of the king of Perſia are a lion couchant looking at the ſun as it riſes over his back.

The Perſians, like the Romans, prefer all men indifferently to poſts in the ſtate and army: the gown-men ſometimes command as generals, and ſoldiers ſit as judges in the courts of juſtice, and the ſame perſon has been prime miniſter and high prieſt. Regard is ſeldom paid to a perſon's birth and fortune in his promotion; but the king diſpoſes of places as he apprehends his ſubjects qualified for them. They enjoy their poſt during life, and ſometimes their children after them, where they have behaved well.

The commiſſion of a great man, intended to be inveſted in an office, is ſent to him written on a roll of paper two or three feet long, in a fine large character, mixed with gold and colours, and put into a purſe made of gold brocade; and with it is ſent the calaat, or rich habit which the king always gives to thoſe he deſigns to honour. The new officer immediately goes to court clothed in the royal habit, and, when the king appears in public, he proſtrates himſelf three times before him with his face to the ground, after which he riſes up and takes his place in the preſence-chamber, or room of ſtate, according to his rank. When a perſon is diſgraced, it is done by ſending for his commiſſion, or the ſeal of his office, as the caſe is, and ſometimes he is ordered to confine himſelf to his houſe till his majeſty's pleaſure is farther known. If a great man is apprehended for any crime, they take all his family and near relations into cuſtody, and confiſcate their goods and eſtates, if found guilty; otherwiſe, the owners have them reſtored.

The

Thornton sculp.

GRAND PROCESSION *of the* PERSIAN AMBASSADOR

When sent to transact Public Affairs *with a* Foreign State.

The Atamadoulet, Grand Vizir, or Vizir Azem, is the firſt miniſter in the kingdom. No buſineſs of conſequence in the ſtate is tranſacted but by the direction of this miniſter, nor any grant or act of ſtate of the king's held to be valid till counter-ſealed by him. The prime miniſter in Perſia, if it be thought fit to diſcharge him, is uſually permitted to retire and end his days in peace with his family; whereas, on the other hand, the grand vizirs in Turky, ſeldom die a natural death.

The Divan Beghis, or Bey, is the ſecond poſt in the government: his office is uſually compared to that of lord chief juſtice or lord chancellor; but they are ſuppoſed to centre in the ſame perſon in Perſia. The word Beg, or Bey, ſignifies Lord, and that of Divan a counſel or court to whom the adminiſtration of juſtice is committed.

The generals are of the third rank: in time of war, a generaliſſimo is appointed. The next place is poſſeſſed by the general of the courtchis, which are a body of thirty thouſand horſe of Turkiſh or Tartar original. The third place among the ſoldiery is the general of the muſqueteers, a body which ſerve on horſeback, but fight on foot, like our dragoons. The fourth is the general of the coulars, or royal ſlaves, as they are called; and the laſt, the maſter of the ordnance.

The Vacanaviſh, or ſecretary of ſtate, occupies the next poſt. This officer regiſters the public acts, and has the care of the records: he alſo appoints a deputy in every province of the empire, who tranſmits all affairs of conſequence to him, to be laid before the miniſtry.

The Mirab, or lord of the water, is the laſt great officer. Every province has its particular mirab, who takes care to diſtribute the waters of the rivers and aqueducts in ſuch proportion, that every part of the country may have an equal ſhare. Theſe are the principal officers of ſtate in Perſia.

The officers of the houſhold are, the Nazir, who ſeems to be both lord treaſurer and ſteward; and all ambaſſadors and foreigners tranſact their affairs with this gentleman: but there is a comptroller, and ſeveral other officers which are a check upon him, as he is on the prime miniſter, and thoſe two have a very great influence in the court of Perſia.

The Ichicagaſi Baſſa commands all that attend in the outward palace; as the maſters of the ceremonies, porters, uſhers, and the guards themſelves. When the king goes out, this lord marches before him with a great ſtaff covered with gold and precious ſtones. He always ſtands ready to obey his majeſty's orders, and ſee them executed; but never ſits before the king, as ſeveral other officers of inferior quality do.

The next office is the maſter of the horſe. All the ſtuds and ſtables of the horſes in the kingdom are under his government, and that of a great number of officers who are ſubordinate to him.

The great huntſman is the fourth officer of the king's houſhold: he has not leſs than a thouſand huntſmen and followers under him. They carry to the chace, when the king hunts, lions, ounces, panthers, and dogs, who are all bred to follow the game.

The principal phyſician and chief aſtrologer, which are poſts of great honour and profit, take place after the great huntſman.

The high chamberlain is alway's a white eunuch, and has as great an influence on affairs as any officer about the court. He ſerves the king at table on his knees, taſtes his meat, dreſſes and undreſſes him, has the overſight of the wardrobe, and the government of all the eunuchs in the palace.

The chief eccleſiaſtical officers are, the Grand Pontiff or High Prieſt, the Ancient of the Law, the Cadi, and the Mufti. The grand pontiff is uſually ſtyled the Sedre in Perſia: they alſo give him the title of Prince of their religious rights, Head of the true church, ſubſtitute of Mahomet, and Lieutenant of the twelve Imans or Caliphis, who ſucceeded their patriarch Haly.

The ſupreme judge in the eccleſiaſtical courts is the Sedre, who takes place in all public aſſemblies next to the Atamadoulet or prime miniſter. The ſecond eccleſiaſtical judge is the Antient of the Law, whom the Perſians ſtyle Cheik Iſlam: his juriſdiction is little inferior to the Sedre's. The Cadi is the third eccleſiaſtical judge in Perſia: he takes cognizance of the ſame cauſes with the two former: but his authority is confined to ſome particular town or diſtrict. The Mufti is the fourth officer, who has not the ſame authority here as in Turky; for he cannot controul or reverſe the proceedings of inferior courts. The other dignitaries and eccleſiaſtical officers have no manner of juriſdiction, and are kept pretty much in ſubjection to the temporal power, upon account of thoſe pretenſions they make to the ſupreme authority, and other principles they maintain, not very conſiſtent with the power of the crown.

The chams, in their reſpective provinces, live in as much ſtate as their ſovereign, having exactly the ſame kind of officers as are in the king's court, with the ſame titles; there being ſcarce any other difference but in their numbers and penſions. They have their poſts for life; and if they behave well, their children after them.

There are three officers in every province put in by the government, who are independent of the cham; namely, the janitchin his lieutenant, the vizar or receiver general of the king's revenues, who hath alſo the management of the lands belonging to the crown, and the government of all places where the crown lands lie; and, thirdly, the vacanaviſh, or ſecretary, whoſe buſineſs it is to take an account of all tranſactions of moment in the province, and tranſmit them to court.

There are other officers, which are independent on the cham, namely, the governors of cities and caſtles, who are called Daroga; theſe are put in directly by the king, and have their lieutenants and vacanaviſh alſo independent of them; and the ſame perſon who is governor of the city, is never made governor of the fort that belongs to it. There are alſo in every town the cadi or civil judge; the mayor or head officer among the trading people, and the provoſt or ſheriff: and every particular trade has a warden or maſter. There is an officer alſo not unlike our conſtable, who has a watch, and is concerned in keeping the peace in the night-time in every great town.

Capital puniſhments are very rare in Perſia, and the ſentence is in moſt caſes paſſed by the king himſelf. The governor of every town is the chief judge in criminal and civil caſes too, if he pleaſes to interpoſe; and may inflict any pains on offenders ſhort of death. The uſual puniſhment is a fine, which always goes to the king, or rather to the governor of the province, who generally brings the crown indebted to him in his accounts.

The vizirs and receivers of the king's revenues uſually obtain their places by virtue of the preſents they make to the eunuchs or favourites at court, and by engaging to increaſe the revenue of the province beyond what it has ever been before; and they generally keep their word, at leaſt to their patrons and friends that promoted them, and to the enriching themſelves. Complaints indeed are frequently carried to court againſt them; but by the artifices of the miniſters concerned in the booty, it is a long time before they get acceſs to the king. When the complaint is from a large country, there are uſually ſeveral hundreds of the perſons aggrieved come up with it to the palace-gate through which the king uſually goes out, and there with lamentable cries, rending their clothes, and throwing duſt into the air, they demand juſtice. If they come to deſire an abatement of their rents or taxes on account of the drought or unſeaſonable weather, as they frequently do, they carry with them withered branches of trees, or ſuch as have their leaves devoured by locuſts; whereupon the king ſends to be informed of the occaſion; and the people preſenting their petition in writing, ſome great officer is appointed to examine their buſineſs.

Whenever his majeſty orders a governor's head to be cut off, the order is diſpatched by the prime miniſter under the king's ſeal, and ſent by ſuch a perſon as the king thinks fit. When the meſſenger arrives at the place, he goes to the houſe of the lieutenant, governor, or ſome other great officer, and ſhews him the king's order, and that the execution is appointed to be done in his preſence: whereupon he takes him with him to the houſe of the perſon proſcribed, and, producing his order, he falls upon the unfortunate man, and cuts him to pieces with his ſabre, crying out only when he falls upon him, "by the king's command." Whenever a miniſter is diſgraced, though the government do not proceed capitally againſt him, yet his whole eſtate is confiſcated, and he experiences a moſt terrible reverſe of fortune in a moment, being deprived of his goods, his ſlaves, and ſometimes of his wives and children.

Notwithſtanding places in the Perſian court are ſo precarious and frequently hazardous, no people in the world purſue preferment with a keener appetite: they come to court morning and evening, although for the moſt part they cannot hope to come into the king's preſence; becauſe he is frequently for ſeveral days ſucceſſively with the ladies in the haram.

SECT.

SECT. X.

Treating of the PERSIAN Laws, Courts of Juſtice, Proceedings in Criminal Caſes, and Puniſhment of Offenders.

THE chief law-book reſorted to by the Perſians is the alcoran: if they do not find the deciſion clear there, they have recourſe to the book called, The ſayings and acts of Mahomet, and afterwards to the ſayings and acts of the Imans; and they have yet another book called cheraiet, which is a collection of judgments both civil and criminal, but they are couched in ſuch obſcure and equivocal terms, that the judges in their interpretations make them ſpeak what language they pleaſe. There ſeems indeed but little occaſion to conſult theſe books at all; for the king, the governors of provinces, and vizirs, frequently ſit in judgment, and determine arbitrarily without regard to the alcoran or any other law-books.

Though the ſpiritual and temporal courts differ very much in their determinations, yet there never are any diſputes between them: for the temporal courts having the government on their ſide, are never oppoſed by the ſpiritual; and beſides, each of them has, for the moſt part, a diſtinct branch of buſineſs aſſigned it. The eccleſiaſtical courts take cogniſance chiefly of deeds and contracts, marriages and divorces, ſucceſſion of eſtates, and other litigious matters. The temporal courts are employed either about criminal cauſes, or ſuch as are plain and obvious, about which there is not much room for diſpute: and if there be any intricacy in the affair, they generally require the opinion of ſome of the learned doctors of their law.

A man is at liberty at any time to claim his right, even the party's own deed will not avail him where he can ſhew any force or fraud, or that he was impoſed upon. Where there are no witneſſes, an oath is tendered to the perſon who denies the charge; and he is ſworn upon the alcoran with great ſolemnity. When the judge ſends for the alcoran, which being brought him in a linen-cloth, himſelf and all the court riſe in reſpect to the ſacred book; then the judge, taking it in both his hands, reverently kiſſes it, and touches it with his forehead; and, having opened the book, offers it to the perſon who is to ſwear, who kiſſes it in the ſame reverent manner the judge has done, and, putting his hand upon it open, ſwears to ſpeak the whole truth. When a perſon of a different religion is to ſwear, the oath is adminiſtered agreeable to the mode obſerved in their reſpective countries. Every magiſtrate hears cauſes in his own hall, or ſome convenient room in his garden, as there are no tribunals or courts erected at the public charge: he has no other aſſeſſors or aſſiſtants but a clerk or ſecretary, who is a man of law.

Writings and conveyances ought legally to be ſealed and executed before a migiſtrate, and atteſted by him; and it is a common thing, after the judge has atteſted a writing by putting his ſeal to it, for the parties to deſire all perſons who happen to be about the court to add their ſeals; ſo that there are ſometimes three or fourſcore ſeals to one deed: but they do not ſign them as with us. There are neither notaries, clerks, or regiſters in Perſia to record any kind of contracts except marriage contracts, which are regiſtered before the Cadi, but the parties uſually keep authentic copies and counter-parts by way of caution.

As there are no public priſons in Perſia, ſo there are no ſheriffs or gaolers who have the cuſtody of priſoners; but every magiſtrate who has the cogniſance of theſe offences, confines the priſoner in ſome part of his own houſe till he is brought to his trial, which is uſually in twenty-four hours after he is taken; and ſentence is no ſooner paſſed than it is executed: ſo that there is very little occaſion for a common gaol, and the judges ſervants perform the office both of gaolers and executioners.

The proceedings in the criminal courts are much the ſame as in the civil. The party aggrieved exhibits his petition to the magiſtrate, who orders a ſervant to apprehend the offender, and bring him before him; and when he has been examined, ſometimes the ſame day, or at fartheſt the next, he is ordered to prepare for his trial. Criminals of ſtate have the carcan or three-cornered yoke put about their necks, to which the right hand is faſtened; and the king uſually ſits in perſon in judgment on ſuch offenders, at which time he is always clothed in red. Tumults and diſorders are ſeverely puniſhed in Perſia, which is one reaſon they very rarely happen; and murder and houſe-breaking are ſcarcely ever heard of.

If a perſon is ſo unfortunate as to kill another, and the fact be proved before the judges, the offender is not puniſhed by the court, but delivered up to the relations of the deceaſed, to put him to death in ſuch manner as they ſee fit. On ſuch an occaſion as this, all the relations and friends of the deceaſed aſſemble, and with loud cries demand that, according to ancient cuſtom, they may have the blood of him who was murderer of their kinſman; which the magiſtrate ſeldom fails to promiſe them: but ſometimes the murderer, by preſents to the judge, and offers of large ſums to the relations of the deceaſed, procures a pardon. If the relations will be ſatisfied with nothing leſs than his blood, the judge ſays to them, "I deliver to you the murderer according to law, make yourſelves ſatisfaction with his blood for the blood that he hath ſpilt; but remember that God is merciful." The judge's ſervants hereupon are ordered to obſerve the directions of the proſecutors, and guard him to the place they deſire; and they follow the criminal with a thouſand curſes, beating and abuſing him all the way he goes. When he is come to the place appointed, he is delivered up to the relations, who ſometimes inflict the moſt cruel tortures they can invent on the miſerable wretch; and even the women, it is ſaid, who ſcarcely ever appear abroad on any other occaſion, will come and imbrue their hands in the offender's blood.

Ordinary crimes are uſually puniſhed by fines, where the parties are men of ſubſtance; but where they are not, they give them a certain number of blows with a cudgel on the ſoles of their feet, not under thirty, and not exceeding three hundred. Their feet are ſwollen with the blows and turn black, and ſometimes the nails of their toes come off. Pick-pockets and little pilfering rogues are marked with a hot iron in the forehead, and houſe-breakers have their right-hand cut off. The ſame puniſhment is inflicted on thoſe who counterfeit or debaſe the coin, for the firſt offence; but for the ſecond their bellies are ripped open. This is the uſual puniſhment for capital offences: and they execute it after this manner: the criminal's feet are tied to a camel, and his head hanging down to the ground, his belly is ripped open, ſo that all his bowels come out, and hang over his head: he is dragged in this manner through the principal ſtreets of the town, an officer marching before him, and with a loud voice informing the people of the nature of his crime. He is afterwards hanged up by the heels upon ſome tree, and it is ſometimes ſeveral hours before he expires.

They have other kinds of puniſhments for capital crimes, as impaling, ſetting them up to the chin in the earth, cutting off the hands and feet, and leaving the criminal in this condition till he dies. They ſometimes precipitate the malefactor from a high tower, by which he is daſhed to pieces: this puniſhment is commonly inflicted on women who have committed capital crimes. They ſometimes uſe tortures to procure a confeſſion, as pinching off the fleſh with red-hot pincers: but the moſt ordinary way of examining offenders, is, while they are beating the ſoles of their feet, called the baſtinado.

There is no part of the world where people travel with greater ſecurity than in Perſia. But if a perſon happens to be robbed, the rabdars or guards of the road, are immediately diſperſed all over the country, give notice of it from one guard to another, and the country is raiſed upon them in an inſtant: and as there are very few woods to conceal themſelves in, and large deſerts to croſs before the robber can diſpoſe of his booty, it is ten to one but he is apprehended. When complaint is made to any governor of a robbery, he ſends for the rabdars, neareſt to the place where the robbery was committed, and requires them to make ſatisfaction, on pain of forfeiting the ſecurities they have given for their places; for they all give bond to make ſatisfaction for ſuch robberies as are committed in their limits: but if they are not able to do it, he orders them to be baſtinadoed, and the money to be levied on the neighbouring villages; and ſometimes as much more as there is occaſion for, which goes into his own or his officers pockets. Beſides this, the party robbed is obliged to make the governor a handſome preſent, on the returning him his money or effects. If a robbery be committed in a city, the watch are obliged to make ſatisfaction, or produce the thief.

SECT. XI.

Giving an Account of the Haram, or the Apartment of the Women belonging to the King of PERSIA, in the Royal Palace of ISPAHAN, their Treatment in general, the Guards, &c.

THERE are ſeveral diſtinct buildings in the royal haram, which have no communication with each other. The following are the ranks of women who reſide there;

there; namely, 1. The princeſſes who are born in the place, whom they call Begum, as they do the princeſſes of the blood royal in the Mogul's court. 2. Thoſe by whom the king has any children or who are his miſtreſſes; theſe have the title of Canum, which is equivalent to that of cham or chan among the men. The third and loweſt rank, whom the king has never taken to his embraces, and many of whom he hardly knows, have the title of Katun, or ladies only. All the reſt have the common appellation of ſlaves, and are employed in ſervile offices.

When a king dies, thoſe ladies he has converſed with as wives are ſhut up in a quarter by themſelves, from whence they are not permitted to ſtir out as long as they live, except the mother of the ſucceeding prince, who has generally a mighty influence on affairs, and almoſt ſovereign authority, within the limits of this palace.

A great variety of beauties are confined in the king of Perſia's haram: for the chans and governors are continually ſending up a freſh ſupply of young virgins from all parts of the empire. If they have intelligence of a woman of ſingular beauty in any family, they immediately demand her: and it is ſaid, their parents are not very averſe from parting with their daughters, but rather proud they have an opportunity of obliging their prince; eſpecially ſince it may be a means of raiſing the wholy family; for whenever a young lady enters the ſeraglio, a penſion is ſettled on her neareſt relation. If ſhe become a confident or miſtreſs to his majeſty, it is increaſed; and if he have children by her, ſhe ſeldom fails to procure the advancement of all her relations. There are the daughters of the governors of provinces, and the greateſt lords of the court, in the haram; but there are many more Georgians and Circaſſian virgins of meaner birth, who generally captivate the young monarch's heart, as they are ſaid to exceed all the reſt in beauty.

The unnatural and cruel practices of the haram are ſaid to be very ſhocking. While the king is without children, every one of his miſtreſſes is fond of having them, as they are in hopes their iſſue will ſucceed to the crown, on which their happineſs very much depends; but when they find the king has ſeveral children already, they do all they can to prevent their being with child, or procure abortion when it happens; for, except the firſt happy woman that has a child, the reſt, after they have any, are confined to an apartment, where they live in perpetual apprehenſions of having their children murdered or deprived of ſight at leaſt, upon barbarous maxims of ſtate, which ſeldom fails to be executed ſooner or later, either in the reign of the preſent king or that of his ſucceſſor. Hence the ladies of the haram principally aim at being married to ſome great man; which they ſometimes accompliſh by inſinuating themſelves into the good graces of the king's mother, the mother of his eldeſt ſon, or the king himſelf. The women of the haram are alſo ſometimes married to clear the palace and leſſen the expence, when they grow too numerous: but they ſeldom ſend them out of the haram who have been with child by the king; which is one reaſon they are not very fond of his favours.

The guards of the haram conſiſt of three bodies: namely, 1. The white eunuchs, who guard the outward gate; theſe never come within ſight of the women, leſt it ſhould excite ſome amorous inclinations in them. 2. The black eunuchs; theſe come properly from the coaſt of Malabar in India: their ſtation is in the ſecond court; and the eldeſt and moſt deformed of theſe are picked out to attend the ladies, and carry meſſages backwards and forwards: the reſt are employed either in the gardens, kitchens, or other places remote from the womens' apartments. The third and innermoſt guard, it is ſaid, is compoſed of women who are commended by ſome antiquated matron that receives orders from the prince himſelf, and, by the eunuchs which attend, conveys his majeſty's commands to the guards without. The women of the haram are all lodged in ſeparate chambers, or two in a chamber at moſt, and then they put an old woman and a young one together. Thoſe ladies who delight the king moſt with their ſinging, their dancing, or their wit, are ſure to become the envy of the reſt.

The king is never formally married to any of his miſtreſſes, but takes which of the ladies in the haram he ſees fit to his bed, without any manner of ceremony. The miſtreſſes he is intimate with are but a ſmall number: the others indeed ſing, and dance, and play before him, and contribute to his pleaſures in another manner; but, from the diſtractions he meets with from a variety of conſorts, he generally fixes upon ſome one who may properly enough be ſtyled the queen of the haram.

The ladies in the haram paſs their lives in idleneſs and luxury, lolling almoſt the whole day on carpets, with their little ſlaves rubbing and chafing them, which is the moſt common amuſement in the eaſt. They ſometimes take opiate, or ſmoke their country tobacco, which is ſo mild, that it may be taken from morning till night without diſturbing their heads. Their food is dreſſed by their ſlaves, who alſo make and waſh their clothes. The ladies never viſit out of the palace, but they are viſited by their relations. Other ladies of the greateſt quality in Perſia ſcarce ever go abroad but upon ſome extraordinary occaſions, as to a wedding, a lying-in, or upon ſome feſtival: but their viſits uſually laſt ſeven or eight hours. They take with them their female ſlaves and eunuchs, and the huſband uſually ſends a governante and eunuchs of his own to obſerve their conduct till their return.

The king's ladies ſeldom ſet out from the haram but in the night: a troop of horſe uſually marches a hundred paces before them, and another troop in the rear, crying out, Courouc, courouc, by which every man underſtands he is to retire to a proper diſtance: the eunuchs with their battoons alſo on horſeback march between the guards and the women; and if any man is found in the way, or within the limits prohibited, he certainly loſes his life. If they march through a city, the men of the ſtreet they march through, and thoſe adjoining, are all obliged to leave their houſes and fly to ſome other part of the town, as thoſe of the villages in the country are for a league together on the right and left of the road through which they are to march; and a detachment of dragoons is uſually ſent half a day before to drive them away. They fire their muſkets at little intervals as they march, to give notice of their approach, and all men who hear it fly as faſt as they poſſibly can; and it is ſaid, there have been frequently inſtances of people being killed by the eunuchs, who have not been ſo wiſe, or rather ſo fortunate, as to get out of the way in time: for if a man ſhould be faſt aſleep, or dangerouſly ill, he is liable to be killed. We are told, that in the reign of Abbas II. one of the ſervants, whoſe employment it was to ſet up the tents, being weary with the march, after he had put the tent in order, laid himſelf down to ſleep, the king and his women being then at a conſiderable diſtance: but the fellow happening to overſleep himſelf, and being found there by the eunuchs, they wrapt him up in the carpet he lay on, and buried him alive.

There are a vaſt number of eunuchs diſperſed through the whole kingdom of Perſia, eſpecially in the king's palaces, and thoſe of the quality, where they have almoſt every thing of value intruſted to their care, and in a manner conduct the affairs of their maſters. The women never ſtir abroad without them, either on a viſit, or even to the baſh: but they are not permitted to interrupt their privacy in their chambers. The eunuchs alſo teach the children of the family to read and write, and inſtruct them in the principles of their religion, till it is thought fit to put them into the hands of the learned; and even then the eunuchs have the care of the young gentlemen, not ſuffering them to be at any time out of their ſight; and the king's children, who never ſtir out of the haram till they come to the throne, have no other maſters. Some few of theſe eunuchs are verſed in the liberal and mechanic arts; and it is happy where the prince who ſucceeds falls into the hands of one of them, for otherwiſe he comes as a mere novice to the throne.

In Perſia, an eunuch between eight and ſixteen years of age is ſold for a hundred pounds at leaſt; and ſometimes for two hundred, according to their capacities: they chuſe to buy them young, becauſe of breeding them up to their hands, and they ſeldom change their maſters while they live. The king does not entertain leſs than three or four thouſand eunuchs of one ſort or other: men of the firſt rank have uſually half a dozen; and thoſe of inferior quality, two or three in their houſes. They are generally very diligent in their reſpective employments, and faithful to their maſters. Their whole deſire and ſtudy ſeems to be, to procure the eſteem and confidence of their lord, which their prudent management ſeldom fails to obtain. But with all theſe good qualities, it is ſaid, they are found to be revengeful, deceitful, and unmerciful, and that it is very rare to find a man of true courage among them.

SECT. XII.

Treating of the Power and natural Strength of the Kingdom of PERSIA; its Situation with Reſpect to the circumjacent Countries, and the PERSIAN Manner of engaging their Enemies.

PERSIA is not a deſpicable kingdom, if we conſider its vaſt extent, ſituation, or the condition of its neighbours,

bours. As to its ſituation, it is defended on every ſide either by ſeas, deſerts, or lofty mountains, which render the approach to it extremely difficult; and with reſpect to their neighbours, they have none except the Turks that they need have any apprehenſion of. The Tartars on the north are divided into a number of little diſtinct principalities or hords, and only make incurſions on ſmall bodies, but will ſeldom ſtand a pitched battle. The Indians are a contemptible enemy, whom the Perſians have always beaten; and the Turks have been ſo taken up with their wars with the Chriſtians, that they have not been at leiſure to turn their arms againſt Perſia for many years. The wars between Perſia and Turky ended with the taking of Babylon, or Bagdat, by the Turks: Perſia has enjoyed a profound peace on the ſide ever ſince. This town was conſtantly the bone of contention between theſe two mighty powers; but the Perſians finding great difficulties both in taking and keeping this place, were at length contented to give it up.

The Perſian forces conſiſt of the troops of the ſtate, and the king's troops. Thoſe of the ſtate are entertained by the governors of the reſpective provinces, and paid out of certain lands appropriated for that purpoſe, and are divided into militia and regular troops. The regular troops are called courtchis: they were originally of Tourcomania, or Tartary; a ſtout hardy race of people who lived in tents. Theſe are the ſoldiers who are properly called cooſelbaſhes, or redheads, ſo ſtyled when they came to the aſſiſtance of the Chiek Sefi, the firſt prince of the late royal family; for which ſervice he allowed them the honour of wearing red caps or turbans of a particular form, like that he wore himſelf. They held the firſt rank in the kingdom till the reign of Abbas the Great, who endeavoured to diminiſh and ſuppreſs them, on account of the unreaſonable influence he obſerved they had in all affairs of ſtate, depoſing and ſetting up what princes they thought fit, like the Turkiſh janiſaries.

The muſqueteers, or troops of the crown, conſiſt of twelve thouſand men: though they march on horſeback, they fight on foot. Theſe uſed to be oppoſed to the Turkiſh janiſaries, and were of great ſervice in engagements. The other body conſiſts of ten thouſand horſe: theſe were called coulars, and, like the muſqueteers, carried fire-arms, inſtead of bows and arrows. They are tall and well made: and the king has a particular confidence in their courage and fidelity. They were called coulars, or ſlaves, to ſignify their particular attachment to their ſovereign; the term ſlave, in Perſia, as well as in India, being an honourable title, and preferable to that of ſubject; nay, we are told by a French author, that Coulam Shah, or king's ſlave, is equal to that of marquis in France, becauſe all that have that denomination are ſure to be preferred to ſome poſt, if they behave well.

There are two other ſmall bodies, the one antient, called ſophies, or ſephies, inſtituted for a guard to the king's perſon by Chief Sefi. They are not above two hundred men, and wear the Sophi's cap on their heads, and for their arms have a ſabre, a poniard, and an axe, which they carry on their ſhoulders. The ſecond body are called the ziezairi, or the ſix hundred, who are all of the ſize of grenadiers, and ſtout young fellows. The king finds all the troops with horſes, arms, and accoutrements, but every man provides himſelf with clothes according to his fancy: the ſoldiery have no particular livery, any more than the ſervants of the king's houſhold, or of any great man.

Conſidering the extent of the kingdom, the Perſian armies were never large; Abbas the Great had never more than one hundred and twenty thouſand men in his ſervice at once; but the ſoldiers have ſince that time been ſo ill paid, that many of them have entered into foreign ſervice, or applied themſelves to other employments: ſo that at this time it is ſuppoſed that all the troops in that vaſt kingdom do not amount to upwards of forty thouſand men.

The diſcipline of the Perſian troops is very unlike that of the Europeans, who excel them as much in the art of war as the Macedonians did the Perſians. Not being encumbered with artillery or baggage, they make prodigious ſwift marches, and frequently fall upon the enemy in his camp or quarters with incredible fury, when he leaſt ſuſpects ſuch a viſit. At other times they will cut off his proviſions, and turn their waters from their uſual courſe; and having ſufficiently harraſſed them in a long march through a deſart country, will fall upon him when he is fatigued and diſpirited. When an enemy makes head againſt them, they will fly till they have drawn him into ſome diſadvantageous ground, and then return to the charge again. They never throw up any entrenchments about their camps, which are commonly defended by ſome mountain, or difficult paſs; but they intrench in ſieges, and uſually take a place by undermining it, at which they are amazingly ſkilful. As they do not trouble themſelves with artillery, ſo neither have they any waggons or ſuttlers, their camp being ſupplied by the country people with proviſions, which chiefly conſiſt of rice and fruit.

The conſtant method of the Perſians is, when they are apprehenſive of an invaſion, to cauſe all the people to withdraw from the frontiers, and deſtroy the country in ſuch a manner, that the enemy ſhall find nothing to ſubſiſt on, not leaving ſo much as a blade of graſs or a tree upon the ground.

The Perſian colours are made of rich ſilk; for a device, they have ſome paſſages of the alcoran, or part of their confeſſion of faith; and ſometimes a lion, with the ſun riſing over his back, wrought in them. The great ſtandard-bearer, whom they call Alemdar Baſſa, is one of their principal military officers. The pay of the ſoldiers does not paſs through the officers hands; but every man receives it of the farmers of ſuch lands as are appropriated to that purpoſe; the officers pay is very good, the general of the muſqueteers, and the general of the coulars, have each of them upwards of three thouſand pounds a year. The Perſians are excellent markſmen, as well with their fire-arms as with their bows and arrows.

They uſually, in time of peace, keep a body of ſix or ſeven thouſand men in Chaldea towards Babylon, to prevent the incurſions of the roving Arabs. The governor of Armenia has about five thouſand men under his command, and the governor of Georgia a like number. In Choraſan, the antient Bactaria, they have uſually eight thouſand men, to bridle the Uſbeck Tartars; and another ſuch body in the province of Candahor towards India; and theſe troops, being the out-guards of the empire, and almoſt in conſtant action, are eſteemed pretty good; but the reſt who are cantoned in the inland country, they have enjoyed ſo long a peace, that they have not the air of ſoldiers.

Though the Perſians have a ſea-coaſt of three hundred leagues to the ſouthward, and the Caſpian ſea on the north, they have notwithſtanding no naval forces, or any ſhips or veſſels whatever. They formerly built ſome veſſels on the Caſpian ſea, to protect them againſt the Coſſacks; but they have none there or any where elſe at preſent. The Muſcovites generally tranſport the Perſian merchandize in their own veſſels to Aſtracan, and have the navigation of this ſea pretty much to themſelves, which has facilitated their conqueſts on that ſide; and it may be difficult for the Perſians to remove them, if they fortify the coaſt, and can be conſtantly ſupplied and ſupported by ſea from Muſcovy.

SECT. XIII.

Deſcribing the Revenues of the Crown of PERSIA; the different Tenures of Lands; alſo of the Lands belonging to the King, the Church, private Perſons, and unoccupied Lands, &c.

WE ſhall, in the firſt place, conſider the ſeveral tenures, by which the lands are held, and what kind of property the ſubject hath in his eſtate. The lands in occupation are of four kinds; viz. Firſt, the lands of ſtate. Second, the king's demeſne lands. Third, the lands of the church. And laſtly, thoſe belonging to private men. The lands of the ſtate are much the greateſt part of thoſe which are cultivated, and are in poſſeſſion of the governors of the provinces, who take their own ſalaries out of them, and aſſign the reſt for the payment of the officers and troops they maintain. The demeſne lands are the king's particular eſtate, for the payment of the officers of his houſhold, the troops he maintains, and other purpoſes. The church lands are the donation of their princes, or private men, and are accounted ſacred, being never taxed or confiſcated. The lands of private men are holden of the crown for the term of ninety-nine years, paying an inconſiderable annual rent; at the expiration of the term, it may be renewed for the ſame number of years on advancing one year's income. The unoccupied lands are let by the king's officers to perſons who chuſe to build on them, or convert them into gardens or plowed fields, on the ſame terms as thoſe laſt mentioned. The king's officers exact a third part of the annual produce of the lands let to huſbandmen; but the rent is ſometimes leſſened, according to the particular agreements of the parties, or an abatement made when any great deſtruction is made by hail, drought, locuſts, graſshoppers, or other inſects; and, if any diſpute ariſe, upon an appeal to court,

orders

orders are given to make ſuch allowance as the nature of the caſe requires. The king has likewiſe a third part of the huſbandmen's cattle, and a ſtill greater ſhare of the fruit. He has alſo the ſeventh fleece, and the ſeventh of the breed of the cattle in thoſe lands which are not appropriated to his uſe, which is a great addition to his revenue; for the ſhepherds of Perſia, like the antient patriarchs, poſſeſs vaſt flocks and herds, on which they continually attend. The people of the eaſt call theſe wealthy ſhepherds ſaranet chin, from whence we have the word ſaracen, meaning, an inhabitant of the fields. The king has an officer called Ichomban Baſhi, or chief of the ſhepherds, reſiding in every province, who takes the ſeventh of the cattle for the king's uſe, viz. of ſheep, aſſes, mules, camels and goats: the king is alſo entitled to every third colt, and to a third part of the ſilk and cotton.

The king of Perſia has the ſole property of minerals and precious ſtones, and two per cent. of all the money. The money raiſed by the waters is another conſiderable part of the revenue. A tribute of a ducat per head, is alſo paid to the crown by all people who are not of the religion of the country, whether natives or foreigners: and a tax of tenpence is impoſed on every ſhop of the working trades, and twenty-pence on the others.

As the Perſians have no conſiderable port except Gombron, conſequently their cuſtoms and port duties do not amount to much. The merchandizes carried into or out of Perſia, by land, pay only a ſmall ſum for a camel's load, and proportionably for every mule or ox.

The caſual part of the revenue exceeds all the reſt; it conſiſts in what ariſes from the confiſcated eſtates, and the preſents which are made by the great lords, governors of provinces, &c. and particularly thoſe which are made on new-year's-day. They preſent the king with wrought ſilks, horſes, aſſes, beautiful boys and girls, gold, ſilver, precious ſtones, perfumes, and every thing rich and curious, and which may ſerve for uſe, ornament, or pleaſure.

Several handicraft trades, ſuch as carpenters, maſons, and ſome others, pay no duties to the crown; but theſe are obliged to work for the king when he requires it, without any pay: whatever buildings or palaces the king erects or repairs, he has only the materials to find. The maintenance of ambaſſadors, and the providing them with carriages, is done alſo at the charge of the country they paſs through, and coſts the king nothing.

When the king has a mind to reward a perſon for any ſignal piece of ſervice, this is alſo done at the expence of another: he ſends him perhaps to one of the chans, or great courtiers, with the calaat or royal veſt; for which the chan uſually makes the meſſenger a preſent of ten times the value, or more, according to the poſt he is in. The king ſometimes expreſſes the very ſum he expects ſhould be paid; which is moſt commonly exceeded, as the perſon values the prince's favour.

The revenue of Perſia, one year with another, amounts to upwards of four millions ſterling of our money; which conſidering that their troops are moſt of them paid out of the lands of the ſtate, which are not reckoned into this account, is very conſiderable; but as the ſplendor and magnificence of the Perſian court is much beyond any thing we have ſeen in Europe, poſſibly very little of it may remain in the treaſury at the year's end.

We ſhall here take notice of the ſeals under which acts of ſtate are paſſed in Perſia: they have five ſeals which are uſed in five ſeveral branches of buſineſs; one is uſed in all ſuch affairs as concern the demeſne lands. A ſecond for commiſſions, letters patents, &c. The third only in military affairs. The fourth about the revenue. And the fifth in things relating to the houſehold. There are no arms engraven upon them; but on one of them there are the names of the twelve Imans or Patriarchs, on the others a ſcrap of the alcoran, or ſome pious expreſſion, ſhewing their dependance on God and his prophet Mahomet. The form of one of the ſeals is round, two others are ſquare, and the other two of an irregular form. The largeſt are of the ſize of a crown piece, and the others about half that bigneſs. They are made of turquoiſes, rubies, emeralds, or ſome other precious ſtones. The principal ſeal the king always wears about his neck.

SECT. XIV.

Of the Religion of the PERSIANS.

MAHOMETANISM is the Perſian religion, as explained and interpreted by Haſy, the nephew and ſon-in-law of Mahomet, and one of his ſucceſſors in the empire, and, according to the interpretations of the eleven Imans, the ſucceſſors and deſcendants of Haly in a right line.

The Perſians and Turks differ as much about the interpretation of the alcoran, as they do about the ſucceſſors of Mahomet; the Perſians hold that the comments made by Haly and his ſucceſſors the Imans, ought only to be regarded; while the Turks adhere to thoſe of Abubeker, Omar and Oſman, and theſe in many points are directly oppoſite to the other. The Perſian ſect, or the followers of Haly, are called Chia; and the Turks, who rely on Abubeker, Sunni. Neither of theſe ſects will believe that thoſe of the other can be ſaved, but hate one another to a greater degree than they do Chriſtians or Pagans, and ſeldom ſpeak of one another but with imprecations and curſes.

The Mahometans call their religion Iſlam, which ſignifies ſubmiſſion to the commands of God; but the ordinary appellation which they give themſelves is that of Muſſelmoon, which we pronounce Muſſelman, and ſignifies the being of the number of the faithful. In the beginning of Mahometaniſm, the diſciples of that religion were more cruel and ſanguinary than they are at this day, affording no quarter to thoſe who did not make a profeſſion of their faith in theſe words, namely, "There is no other God but God, and Mahomet is his prophet."

They have two articles of faith, and five of practice; 1. That there is no other God but God. 2. That Mahomet was ſent from God. 3. That they ought to obſerve their corporeal purifications. 4. That they pray to God at the appointed times. 5. That they give alms to the poor. 6. That they faſt all the month of Ramezan. 7. That they go in pilgrimage to the temple of Mecca, if they can. To which the Perſians add another article of faith, viz. 8. That Haly is the vicar of God. On theſe eight heads, therefore, I ſhall collect what the Perſians hold moſt material.

The Perſians hold, that good works are neither the cauſe nor the means of ſalvation; but that our good works are only a ſign we are intended for happineſs, and a mark of God's favour towards the performers of them; and, on the contrary, that wicked acts are a ſign of eternal reprobation. They alſo maintain, that all ſouls were created long before the world was made; and many of their doctors believe the metempſychoſis, or tranſmigration of ſouls; eſpecially in relation to the ſouls of the prophets, ſaints, and good men. The generality of them are of opinion that the creation was begun upon the firſt day of the week, as the Chriſtians do, and that then God created the earth in the form we ſee it, with mountains and valleys. That the ſecond day he created the trees, plants, flowers and herbage. On the third minerals, light and darkneſs. On the fourth the rivers, cattle, fiſh and fowl. On the fifth the heavens, with the ſun, moon, ſtars and angels. And that on the ſixth he created man, male and female.

They believe that both good and evil angels were made of the ſubſtance of light or fire; that they are compoſed of ſoul and body, and that their ærial bodies may be ſo condenſed as to become viſible. That the firſt time the evil angels diſobeyed God, the good angels fought with them, and brought them captives to heaven, where God pardoned them: but God afterwards creating man, and commanding all the angels to worſhip him, the evil angels, through pride, rebelled again; whereupon God curſed them, and precipitated them from heaven into that place which their deſpair and fury made a hell of.

As to what we call original ſin, they will not allow it to be a ſin in our firſt parents. They maintain that that act was only a deviating from perfection, or leaving the better for that which was not ſo good: and they found their opinion upon that ſuppoſition, that the prophets were impeccable and free from ſin, being ſanctified from their mother's wombs, and they eſteem Adam a prophet of the higheſt rank.

As to the day of judgment, they believe that there is a private judgment paſſed on every grown perſon ſoon after death. That in the mean time the ſouls of the faithful are filled with joy and comfort, while the wicked, on the contrary, ſuffer the cruelleſt pangs of remorſe. They ſay, the ſoul wanders from place to place till the body is interred; and that after it has undergone the firſt examination in the ſepulchre, it enters into a fine ærial body prepared for it, where it continues till the general reſurrection, when it will be reunited to its former body: for the ſoul, ſay they, can never act but by the mediation of ſome body: and they will by no means have it remain in a ſtate of inſenſibility till

till the laſt day. But the Perſians, it ſeems, are not all of one mind, either as to the place where departed ſouls ſhall remain, or their happineſs or miſery during this interval: but they have a middle ſtate for thoſe who have done neither good nor hurt as infants and fools; theſe, they ſay, ſuffer neither pleaſure nor pain, as they have deſerved neither the one nor the other.

They alſo believe, that in the reſurrection the ſoul ſhall be reunited to the very ſame body it parted with: but they ſay our bodies ſhall not be changed in any material point, they will neither be tranſparent nor aerial; they will not, indeed, be crooked or deformed, or ſubject to old age or infirmities, or troubled with excrements, &c. but, ſay they, if you deprive the body of all its ſenſes and appetites, and every thing that is material, with what propriety can you call it the ſame body? After the laſt judgment, they hold, that all men muſt paſs over a certain bridge no wider than a razor's edge: that unbelievers and the wicked will infallibly fall in their paſſage into hell, or the bottomleſs pit, as we call it, where they will be everlaſtingly tormented: but the faithful ſhall be ſo guided and ſupported, that they ſhall paſs over the bridge ſwifter than a bird flies through the air, and enter into heaven. Some believe that none can be ſaved but thoſe who believe in Mahomet; others, that good men of every religion may be ſaved; and a third ſort allow ſalvation to all thoſe who have been diſciples of true prophets, as the Jews and Chriſtians they acknowledge were: others believe that only atheiſts will be damned: and they ſay, that God will call to his aſſiſtance in judgment, Mahomet, Haly, and the Imans, his lawful ſucceſſors; and all other true prophets, who will every one intercede for their reſpective diſciples.

The Perſians differ among themſelves with reſpect to the beatific viſion: the general opinion is, that God will not be viſible, even to the happy, who will only behold a bright raviſhing light, ſuch a one as the imagination cannot at preſent conceive; but all their doctors hold, that there will be degrees of rewards and puniſhments, according as men have deſerved; and as the alcoran makes ſeven heavens for the bleſſed, according to the virtue they have attained to, ſo ſome of their doctors make ſeven hells for the wicked. Many of their doctors alſo take the promiſes and threatenings in the alcoran, relating to another life, in a ſpiritual and allegorical ſenſe; and that the happineſs of heaven conſiſts in being employed about ſuch objects as are proper for the ſoul, as in the knowledge of ſciences, and in the ſublime operations of the underſtanding; and after the body, it ſhall be furniſhed with pleaſures ſuitable to its nature, and receive as much ſatisfaction as it is capable of, but not by meats and drinks, and ſenſible enjoyments, as in this world. That hell alſo conſiſts in a cruel regret and deſpair for the loſs of paradiſe; and that the body will be afflicted with the moſt violent pains. If you demand of them whether they do not think that the beatific viſion will be a thouſand times more raviſhing and delightful than all the pleaſures of ſenſe: they anſwer, there can be no ſuch viſion, becauſe there muſt be ſome proportion between the power and the object; and that there is no proportion between a finite created thing and an infinite, and conſequently man can never ſee God. If you aſk them how they can ſuppoſe that in Paradiſe, where it is agreed on all hands that immortality reigns, we ſhould be taken up with corporeal things, which endure but for a time, and periſh in the enjoyment: they boldly tell us, that thoſe things are not made to ſupply any neceſſities of nature, but for pleaſure; and that all thoſe pleaſures we enjoy in this life, we ſhall enjoy in a much higher degree in heaven; for this world, they hold, is but a type of heaven, and all that we ſee came from thence, although it be extremely degenerated from the original.

If it be objected to them, that if we eat and drink in heaven we ſhall be ſubject to ſome neceſſities which follow eating and drinking: they anſwer, that thoſe delicious meats ſhall evaporate in a perfumed ſweat by the pores: and though it be generally ſaid that the Mahometan women are excluded heaven, this is only to be underſtood of the women of this world, who will not be in the ſame heaven with the men, but in another place will enjoy equal pleaſures: that there will be alſo other celeſtial women created for the faithful, far excelling any they have ſeen below. As to the duration of the world after the laſt day, the greateſt part of the Perſian doctors hold that it will not be diſſolved, but changed and purified; and ſhall afterwards be the habitation of bleſſed ſouls to all eternity.

As to the prophet Mahomet they teach, that God ſent him into the world unlearned and ignorant in every ſcience, to be his ambaſſador to all people, as well Arabs as Barbarians: and that this ambaſſador has abrogated all other religions, except in ſuch points as have been eſtabliſhed and ratified by him afreſh. That this unlearned prophet was divinely conſtituted Lord of all mankind, and that God has made the belief and profeſſion of all thoſe things which the prophet taught and commanded neceſſary to ſalvation.

The Perſians pretend that their prophet was bred up in ſuch ignorance that he did not know a letter; and this they make a great evidence of the divinity of his miſſion. They ſay alſo, that he was poor and friendleſs; and appear wonderfully ſurpriſed when they hear us ſay, that their legiſlator eſtabliſhed his religion by the ſword. And as our Saviour is ſaid not to have preached till he was two and thirty years of age, they ſay their prophet did not begin to preach againſt the worſhip of idols till he was forty years old. They tell us that God having intended from all eternity to ſend their prophet Mahomet into the world, he gave notice of it by all the prophets which preceded him: but that the Chriſtians on one hand have applied to Jeſus Chriſt, and the Jews to their Meſſias, thoſe things which were foretold of him, and which could not agree with any but Mahomet: and that they had ſuppreſſed and altered ſeveral other paſſages which treat of him: and this the Mahometans in general firmly believe. As to the common people, they admire that any one can deny Mahomet to be a prophet; but much more that he ſhould be thought an impoſtor. We, ſay they to the Chriſtians, acknowledge your prophet and honour him, and avow his miſſion, why then will you not acknowledge ours? and perſuade themſelves, that this can only proceed from pure malice: which is thought to be the occaſion they ſo much deteſt and abhor thoſe of our religion.

The third article of the Perſian creed is, 'that Haly is the Vicar and Lieutenant of God;' and indeed they exalt him ſometimes above Mahomet himſelf, and make him almoſt equal with God.

The Perſians never ſpeak with that deteſtation of any thing as they do of Abubeker, Omar, and Oſman, who were the rivals of Mahomet in power, and whom the Turks believe to have been the true ſucceſſors of their prophet, but the Perſians hold them to be no better than uſurpers: however the Turks do not equally abhor Haly, but acknowledge him to be the true ſucceſſor of the prophet after the three former, and frequently call them the four friends and companions.

The ſuperſtition of the bigotted part of the Perſians, reſpecting their purifications, is ſo extravagant, that if they were all equally affected with it, it would be impoſſible for people of another religion to live amongſt them; for they look upon themſelves to be defiled by the touch of a perſon of another religion, or by any thing that ſuch a one has touched, and by conſequence they will taſte no food dreſſed by one of another perſuaſion, or even drink out of the cup that he has uſed. Notwithſtanding the drinking wine is ſo expreſsly forbidden by their law, and their commentators are ſo very ſevere againſt the practice of it, ſeveral of them, and particularly the men of the ſword, will drink pretty freely of it; and when they are aſked by a Chriſtian how they do to diſpenſe with this precept; they anſwer, in the ſame manner as you diſpenſe with drunkenneſs and wenching, which is no leſs forbidden Chriſtians.

The bigotted Perſians lay much greater ſtreſs upon the ceremonial part of their law than the moral; their waſhings and purifications muſt be obſerved, whatever is left undone; having that maxim of their prophets frequently in their mouths, "that religion is founded in purity, that one half of religion conſiſts in keeping one's ſelf undefiled." They ſcarce perform any act of devotion without waſhing; their prayers are vain and criminal which are offered up with unwaſhed hands; and it is the higheſt profanation to touch the alcoran in ſuch a ſtate of uncleanneſs; which is the reaſon that there is frequently written on the cover of the alcoran and other books of devotion, theſe words, viz. "Touch not this book with impure hands." Their corporeal purifications are called reharet, which ſignifies all manner of purifications on account of religion, whether done with water or earth; for when they cannot meet with water, as in the deſerts ſometimes, then they are allowed to ſcour themſelves with earth: and as they are obliged to pray five times a day, ſo they are obliged to clean themſelves as often, unleſs they are ſure they have not polluted themſelves between one prayer and another.

Thoſe things which, in the opinion of the Perſian doctors, render a man unclean, are ſummed up together as follows: viz. The urine of any animal, the blood of any animal

animal but inſects, except what remains in the fleſh after it is dreſſed for food; the ſemen coitus of any animal; a dog and a hog are reckoned impure creatures, and all infidels; though many of the Perſians except Jews and Chriſtians, and do not look upon their touch as impure, becauſe they allow their religions to be of divine inſtitution: mead and beer are alſo reckoned impure, as being intoxicating liquors; but opium, becauſe it is not liquid, is eſteemed pure, though it intoxicates no leſs than wine. And laſtly, the touch of any dead animal, as well as a dead corpſe, defiles a man: but waſhing, it ſeems, will purify things inanimate that have been polluted, as if a dog have drunk out of a veſſel, or licked a diſh, if it be ſcoured firſt with ſand, and waſhed afterwards twice with water, it becomes clean again; but ſome of their doctors have ſuch an averſion to a hog, that they ſay, the veſſel he drinks out of ought to be waſhed ſeven times: if blood or urine happen to be ſpilled on any clothes or furniture, they muſt be well waſhed and ſcoured, at leaſt the places ſoiled, before they can be uſed: the eating out of gold and ſilver plate, is ſaid to defile the meat, but if the meat be taken out of a gold plate and put into a china diſh it is not unclean. And notwithſtanding gold and ſilver utenſils are prohibited, the king and court and other grandees of the kingdom uſe them frequently, which their doctors tell us they atone for by their alms: but great men in moſt countries ſeem to act as if they were ſuperior both to the religion and laws of the kingdom where they live.

The officers in Perſia declare the times of prayer from a terrace, and not from the tops of high towers or ſteeples, as other Mahometans do. On common days there is not more than one or two of theſe criers employed, but upon feſtivals there are ſometimes ten or a dozen of them, particularly on Fridays, their ſabbath, and in Lent; and it is not to be conceived how their voices are heard, for they rend their throats with all their might. When the people hear theſe criers call to prayers, every one riſes up and goes to his prayers, not to the moſque or temple, for they are not called thither, but in their houſes, or wherever they think fit: however, there are eight things ſaid to be requiſite towards praying acceptably, namely, application of the mind or attention, the affection of the heart, faith, modeſty, reverence, hope; and two outward qualifications, viz. purity of body, and of every thing one touches, or is ſurrounded by, and proper geſtures, as turning their faces towards Mecca, the motion of their hands, the proſtrating their bodies to the earth, &c. They divide their prayers into two kinds, 1. Thoſe which they are indiſpenſably obliged to offer up, and, 2. Thoſe which are adviſeable or expedient, in order to arrive at a greater degree of perfection, which are termed by ſome prayers of ſupererogation: however, theſe are not different forms, but only a repetition of the other. Every man is obliged to pray five times a day, reckoning from twelve at noon to twelve the next day; for the Mahometans begin their day at noon, as our mariners do. The firſt hour of prayer is exactly when the ſun is in the meridian. The ſecond is in the evening, viz. from the time the ſun is forty-five degrees above the horizon, till half the diſk appears. The third, when it is ſo dark one cannot diſtinguiſh colours. The fourth prayer is to be made on lying down to ſleep, for which no fixed time is limited. And the fifth in the morning, which may be performed at any time between the diſappearing of the ſtars and noon.

Though the Perſians are not at this time ignorant of the nature of eclipſes, yet they ſtill retain and uſe certain prayers at ſuch times, as if they ſtill thought they portended ſome dreadful calamity, or at leaſt that it is a mark of God's diſpleaſure, to be deprived of the light of the ſun or moon. They pray every man for himſelf, either in the temple or a private houſe, as they pleaſe; maintaining, that no perſon ought to read the alcoran or prayers in the temple to the congregation, but an Iman (a patriarch or prophet), or one lineally deſcended from him. They look upon it in general as an act of piety to commemorate their deceaſed friends at certain times, and ſome of them are of opinion that God will increaſe the happineſs, or leſſen the miſery of departed ſouls, at the importunity of their ſurviving friends, but they are not all agreed as to this matter. They do not pray to their ſaints, or even to Haly or Mahomet, as mediators to intercede for them; but believe they may receive ſome advantage from the prayers of holy men on earth, and that their own omiſſions may be ſuppoſed by others.

The Perſians lay out their alms chiefly in public buildings, as upon caravanſeras, or houſes of entertaintment for travellers in great towns, and on the road, where they are lodged gratis; in making bridges, cauſeways, ciſterns, and receptacles of water, moſques, colleges, and bagnios: but they have no hoſpitals for the ſick, as in Europe.

The derviſes and faquirs in Mahometan countries are a kind of begging friars, who extort the people's alms from them almoſt by force, looking upon themſelves to be much holier, and in many reſpects ſuperior to thoſe they demand an alms of: they travel in ſuch large companies, that it is hardly ſafe for people in villages to deny whatever they aſk, and they may be ſaid rather to levy a tribute, than to live upon charity. The alms which are aſcertained by their religion are a kind of tythes of corn, cattle, money, merchandiſe, &c. though they do not amount to near a tenth, and are only taken of the neat profits after all the rent and charges deducted; and theſe are not given to the prieſt, but applied to pious and charitable uſes, like the other, from whence they have received the ſame denomination of alms: the clergy live upon the glebe or revenues with which their churches are endowed, and what they got by the education of children; but they collect the tythes and have the diſtribution of them.

The tythes are applied to the maintenance of the Mahometan faquirs, or begging friars, to the redeeming ſlaves hardly uſed by their maſters; for the relief of inſolvent debtors; and for the relief of ſtrangers who happen to be in diſtreſs in their country. The reſt are employed in public buildings, in erecting temples, caravanſeras, colleges, &c. There is alſo the quantity of ſeven or eight pounds of rice, or other grain, or fruits, annually paid for every head, the day after their great faſt or Ramezan, which is applied to the ſame uſes the tythes are applied: their ſaints and devotees, who ſet up for an extraordinary piety, pay ſeveral other ſums to the uſe of the poor, beſides thoſe expreſsly commanded by law, and of ſpoils that are taken in war a fifth or double tythe is paid for the above purpoſes.

The Perſian religion does not expreſsly command any other faſt than that for the month of Ramezan, unleſs upon ſome extraordinary occaſion, as by way of penance, or to avert any calamity, or the like: but the diſciples of this religion are adviſed to perform many other faſts, which their zealots do not fail to comply with: this word Ramezan is the name of the ninth month of the year, and their Lent is ſo called, becauſe the faſt is obſerved from the beginning to the end of it: when this moon firſt appears, which is uſually in the evening immediately after ſun-ſet, it is proclaimed by the holy criers in great numbers, on the terraces of their moſques, who publiſh it as a moſt ſupriſing piece of news, and ſing certain hymns on the occaſion; the people anſwer in joyful cries, and illuminate the ſtreets, and from the terraces of the bagnios the horns ſound to give notice that the baths are ready: for they begin their faſts, as all other acts of devotion, with waſhing and purifying themſelves, which is ordinarily done at the bath: the end of the faſts is ſolemnized in much the ſame manner as the beginning; the criers give notice of the ſucceeding moon from the moſques, the people teſtify their joy by their acclamations, the ſound of muſical inſtruments, and the like.

The diſciples of the Perſian religion are required to make a pilgrimage once in their life-time to Mecca: this is the town in Arabia where their falſe prophet Mahomet was born: the principle end of the pilgrimage to Mecca is to viſit the kabba or chapel of the patriarch Abraham, and perform certain acts of devotion, in the courts that ſurround it, and not on account of Mecca being the birth-place of Mahomet, much leſs becauſe his tomb is there, for that is at Medina, above two hundred miles to the north of Mecca. The principal things the pilgrims perform, when they come to the town, are the following; namely, the going in proceſſion ſeven times round Abraham's chapel: the kiſſing a black ſtone there, of which more hereafter; the ſpending a certain portion of time at Mount Ararat; the ſacrificing a ſheep upon Mount Menah in remembrance of Abraham's going to ſacrifice his ſon; the drinking of the water of the well Zemzen; the taking ſeven turns between the little hills of Safa and Merva; and the throwing ſtones over their heads in the valley of Menah, all which, it is ſaid, they do in imitation of the patriarch Abraham, and which God has enjoined them as an indiſpenſable duty, particularly that of the ſacrifice.

The way the pilgrims go at preſent is by Boſſora or Bozra, ſeated near the bottom of the Perſian gulph: they were forced to endure a thouſand inſults in this paſſage; the Arabian princes, through whoſe territories they paſſed, extorting money from them almoſt every day, on one pre-

tence or other, and they had the leſs mercy on them on account of their being heretics: whereupon the court of Perſia for ſome time forbad the pilgrims to go by land to Mecca, ordering them to ſail round Arabia into the Red Sea, as the pilgrims of India: whereupon the Arabian princes, finding their revenues much leſſened, ſent embaſſadors to the Perſian court to aſſure them that all abuſes ſhould be regulated, and the pilgrims might have a free paſſage without thoſe exhorbitant exactions.

If any perſon dies in Perſia who has not gone in pilgrimage to Mecca, either in perſon or by proxy, the cadi or civil magiſtrate ſeizes on ſo much of his fortune, as the charges of the pilgrimage would have amounted to, for the good of his ſoul, and this he employs in ſending one to Mecca for him; but this is to be underſtood of men of ſubſtance, for the inferior ſort of people are not obliged to go in pilgrimage.

The caravan of pilgrims ſets out from Bozra on a certain day, in order to be at Mecca at the time the law requires, and is convoyed thither by the Arabs, who keep them in the deſerts forty or fifty days, though the journey might eaſily be performed in twenty; they are guided by the ſtars in their paſſage, and for that reaſon, as well as on account of the heats, they travel in the night time, and as the air is dry and pure, the ſtars afford them light enough: there are no inns or caravanſeras in this deſert, but the pilgrims lye in tents, as they do alſo till they have performed their devotions at the kabba; in the day time they pitch their tents near ſome well by the Arabs camp, where they have all neceſſary proviſions brought them by the natives.

The pilgrims, having paſſed the deſert, pitch their tents at a little diſtance from Mecca, and on the day appointed for performing the rites above-mentioned, which is always on the firſt day of the month Zilhah, they put off all their clothes, and perform the purifications required in a great baſon or receptacle of water; after which they wear no other clothing but a linen cloth about their middles, and another about their ſhoulders, intimating thereby, that they are dead to the world, having no regard to their ornaments, or reliſh for any thing but heavenly things.

Their principal religious feſtivals are, that in commemoration of Abraham's ſacrificing his ſon, and that of the martyrdom of the two Imans, Hoſſein and Haſſein. This latter feſtival is celebrated in memory of their patriarch Hoſſein, who, having loſt a battle, retreated with his broken troops into a deſert near Babylon, called Kerbele, where, having been purſued fourteen days, he fell at length into the hands of his enemies, and died fighting valiantly, having firſt received ſeveral wounds. It continues the firſt ten days of the month Maharam, during which time there are no trumpets, or muſical inſtruments, ſounded at the uſual hours; and thoſe who obſerve it ſtrictly, neither ſhave their head nor face, or go to the bagnio. They will never begin a journey, or undertake any thing of conſequence at this time; many of them rend their clothes, paint their ſkirts black, and appear with ſorrowful dejected looks, as in a time of public mourning: you will ſee from morning till night, in all the ſtreets, parties of the mob, ſome almoſt naked, others ſtained with blood, and others in armour from head to foot, with naked ſwords in their hands; ſome appear faint, and ready to periſh, with their tongues hanging out of their mouths, and all the ſigns of deſpair and anguiſh, crying with all their might, as they paſs by, Hoſſein! Haſſein! (Haſſein was the elder brother of Hoſſein, who loſt his life in the ſame war). What they endeavour chiefly to expreſs is, the heat and thirſt with which the legend relates Hoſſein was afflicted with in the deſert, to ſuch a degree, it is ſaid, that he became black, and his tongue hung out of his mouth. During this feſtival, the Perſians are extremely charitable: they look upon it as a crime to refuſe a poor man an alms at this time. Before the houſes of the great men alſo ſtand great veſſels of ice and water, that none may ſuffer thirſt, as their great ſaint Hoſſein did; and the king every day entertains at leaſt four thouſand people, who attend the proceſſions. There are abundance of machines and pageants carried at this feaſt, chiefly to move the compaſſion of the people, and excite their rage againſt their enemies the Turks.

We ſhall here take notice of ſome religions which are tolerated in Perſia. And firſt, of the Gaurs, or antient Perſians, generally ſtiled Ignicolæ, or worſhippers of fire, being diſtinguiſhed thereby from all other people. They are diſperſed throughout Perſia, and have colonies in the ſuburbs of ſeveral great towns, and particularly near Iſpahan there is a village inhabited only by Gaurs. Many of theſe people, who refuſed to ſubmit to the Mahometan religion, fled into India, and are ſettled about Surat. It is obſerved of the Gaurs, that they are neither of ſo good a complexion or make as the Mahometan Perſians, which is thought to proceed either from their not intermixing with the Georgians, &c. as the others do, or from their applying themſelves principally to huſbandry, and laborious employments, in which they are more expoſed to the weather. The men wear their hair and beards long, a ſhort cloſe veſt, and a cap not much unlike our hats; they are all of them either huſbandmen or mechanics, never applying themſelves either to the liberal arts or merchandize, and their language and characters are underſtood by none but themſelves. They regard agriculture not only as a uſeful and innocent profeſſion, but honourable and even meritorious: they hold that this was the firſt buſineſs men were employed in, and for which the gods themſelves have the greateſt regard: the prieſts teach them that, next to the begetting of children, the manuring the ground, and planting trees, are the moſt virtuous employments they can be concerned in: and this, ſome gentlemen obſerve, is the reaſon that Perſia was ſo much more fruitful under the dominion of the antient Perſians than it is at preſent; they encouraged nothing more than agriculture and huſbandry, planting and gardening, and their religion taught them that thoſe things were meritorious; while the Mahometan race look no farther than the preſent generation, and do not ſo much as aim at improvements.

The Gaurs, who are a remnant of antient Perſians, are an innocent harmleſs people, and allowed to live under their own laws and magiſtrates, confirmed by the preſent government; their religion allows them to drink wine, and eat all manner of fleſh, except beef; nor are they ſcrupulous about the dreſſing it, as the Mahometans and Pagans are, who would think themſelves polluted, if one of another religion or ſect was to cook their meat; they do not care, however, to mingle with another people, and eſpecially the Mahometans, but match always in their own tribe; neither a plurality of wives, or divorces, are ſuffered by their religion, unleſs the firſt wife has remained barren nine years, and then they are allowed to take a ſecond: theſe people are as ignorant as other ruſtics uſually are, and can give but a very poor account even of their own religion or hiſtory. Their principal temple is on a mountain near the city of Yezd, and there the high-prieſt of their religion reſides with great numbers of his clergy, who live in a kind of convent, or ſeminary. The prieſts are employed there in much the ſame ſervice the veſtal virgins were at Rome, namely, in keeping in the ſacred fire, that it may never be extinguiſhed; and, according to their traditions, this fire was lighted about four thouſand years ago on this mountain, by their great prophet Zoroaſter, and they live in hopes of his return, and of ſeeing their religion and antient government triumphant again in Perſia: they differ from other Pagans, in their averſion to certain animals, for they loook upon it as their duty to deſtroy all noxious vermin, and eſpecially ſuch as ſpoil the fruits of the earth.

We ſhall now take ſome notice of the religion of the Armenians, who form a conſiderable body in the Perſian empire, eſpecially if we include all thoſe other Chriſtians who have joined them on the account of the large privileges granted them by the Perſian government. The Armenians were originally of the Greek communion; but they are ſaid to differ of late in ſeveral particulars both from the Latin and Greek churches; they have two patriarchs of their own, who have under them many archbiſhops and biſhops, but the archbiſhop of New Julpha and his ſuffragans, it is ſaid, are not ſubject to either of them, and the Perſian government, though Mahometan, has as great an influence on the choice of their patriarchs and biſhops, as the Chriſtian princes have in the election of biſhops in this part of the world. The Popiſh miſſionaries have been indefatigable in their endeavours to procure the Armenian churches to acknowledge the Pope for their head, and in ſome few places, it is ſaid, they have prevailed; but for the generality, the Armenians of Julpha are not more ſet againſt the Mahometans, than they are againſt the Romiſh miſſionaries.

Their clergy conſiſts of patriarchs, archbiſhops, biſhops, prieſts, and monks of the order of St. Baſil. Simony is hardly looked upon as any crime among them: the patriarch, it is ſaid, obtains his confirmation from the government by bribes or preſents. The monks are the only part of their clergy that are prohibited marriage: but a clergyman is not ſuffered to ſay maſs for the firſt ſeven days after his marriage; and whenever he is ſuffered to adminiſter it,

it, he is ſhut up in the church for five days before, and five days after, and ſuffered to eat nothing but rice and herbs, nor is he permitted to go home to his wife and family. They receive their orders from the hands of the biſhops, and may be ordained at eighteen years of age. Both clergy and laity are obliged to keep ſo many faſts, that one half of the year is ſpent in faſting, when they abſtain from all manner of fleſh and fiſh: and ſo auſtere are the lives of ſome of their biſhops, that it is ſaid they ſcarce eat fleſh or fiſh more than four days in the year. At the communion, they give the bread dipped in the wine to all the congregation; when the prieſt, with the bread and chalice in his hand, ſays three times, the people repeating it after him, "I confeſs, I believe that this is the body and blood of the Son of God, who takes away the ſins of the world; and who is not only our ſalvation, but the ſalvation of all the world."

Before their four great feſtivals, of Chriſtmas, the Annunciation of the Bleſſed Virgin, Aſcenſion-day, and the feaſt of St. George, they faſt eight days without taſting fiſh, fleſh, eggs, butter, or oil; and their devotion is ſo great for their national St. George, that ſome of them, it is ſaid, will faſt three or four days ſucceſſively before that feſtival, without eating any thing. They faſt alſo every Wedneſday and Friday in the year, except between Eaſter and Aſcenſion-day.

When a child is baptized, the prieſt plunges it three times naked in a veſſel of water, pronouncing nearly the ſame words on the occaſion as are uſed here: he alſo anoints the infant with their holy oil, firſt on the head, then on the mouth, the ſtomach, neck, hands, and feet. This anointing is held as neceſſary as the baptiſm of water, or rather is baptiſm itſelf; for on the anointing the ſeveral parts, and making a ſign of the croſs, they repeat the words, "I baptize thee in the name of the Father, and of the Son, and of the Holy Ghoſt." This oil is made of ſeveral ſweet flowers and aromatical drugs, by one of their patriarchs, and as no baptiſm can be duly performed without it, they ſell the oil at an exceſſive rate to ſuch prieſts and biſhops as are ſubordinate to them, who alſo make a large profit of it on theſe occaſions.

They uſually give the child the name of the ſaint that ſtood in the calendar next before the chriſtening, or that which immediately follows; and if the ceremony happens to be performed at Chriſtmas, or on the feſtival of baptizing the croſs, the infant is dipped three times in the river Zenderhood, or ſome great water. The Armenian church keep to the old ſtyle in ſolemnizing their feſtivals as the Proteſtants do; the reject the doctrines of purgatory, but believe, however, that the ſouls of the juſt remain in a ſtate where they ſhall know neither joy nor ſorrow till the reſurrection, but what proceeds from a reflection on their paſt lives; and hold that the prayers of good men may be of ſome advantage to them. As for the wicked, they believe that they are ſent immediately to hell. Extreme unction is adminiſtered by them either juſt before or after death.

The Armenians believe but one nature in Chriſt: they do not ſay, however, that the human nature was ſwallowed up in the divine, as the firſt Entydians did; nor do they believe a confuſion of natures in Chriſt; but that the divine and human nature are united in his ſacred perſon, as the ſoul and body are in man, and ſo make but one: but the Roman Catholics glory much that they agree with them in the doctrine of tranſubſtantiation, and from thence infer, that it was once the doctrine of the univerſal church.

The Mahometan Perſians aſſiſt in great crowds at their great feſtival of the baptiſm of the croſs, in memory of our Saviour's baptiſm, and ſometimes the king himſelf has appeared at this ſolemnity. The Armenian biſhops and their clergy go in proceſſion on theſe occaſions to ſome great reſervatory of water, with a croſs carried before them; and having read prayers ſuitable to the occaſion, and ſung ſeveral anthems after their manner, to the ſound of the country muſic, the biſhop plunges the croſs into the water ſeveral times, after which, happy is the perſon that is ſprinkled by it; their own baptiſm, it is thought, can ſcarce convey greater privileges to them.

The Armenians marry their children uſually in their infancy to prevent their being carried into the harams of the great men; for either the Perſians are ſo juſt that they will not take any man's wife from him, or they are too nice to meddle with a woman who has been in the poſſeſſion of another: but though the parties are frequently contracted at four or five years of age, the marriage is ſeldom celebrated till they are eight or ten.

Some days after the wedding, the portion ſtipulated to be given with the bride, is ſent to the huſband's houſe, conſiſting of fine clothes, gold, ſilver, and jewels, according to the quality of the parties. They add alſo uſually ſome fruits and ſweet-meats, which are all carried in fine boxes and cabinets, attended by ſuch muſic as the country affords; ſometimes this is deferred till the birth of the firſt child, when a rich cradle is provided, and all other neceſſaries proper for a new-born infant.

When an Armenian dies, the perſon whoſe office it is, waſhes the body with conſecrated water taken out of the church, and puts on the corpſe a new white ſhirt, and other linen. Then having ſewed it up in a new linen bag, it is carried to the church on a bier, without a coffin, attended by the prieſts and relations, with lighted tapers in their hands; and having placed it before the altar, a prieſt reads the ſervice appointed, and then they leave the body in the church with the candles burning about it all night. In the morning after maſs is ſaid, it is carried to the archbiſhop or biſhop's gate, who ſays a prayer for the repoſe of the deceaſed's ſoul; after which it is carried to the burying-place, the biſhop and prieſts ſinging their prayers till it is laid in the grave; then the biſhop taking up a handful of earth, throws it on the corpſe, ſaying, three times, "From earth thou cameſt, and to earth thou ſhalt return, remain there till the coming of our Lord." Then they fill up the grave, and the relations and friends return to the houſe of the deceaſed, where they find a good dinner, and are ſplendidly entertained for ſeveral days ſucceſſively, if the relations are people of ſubſtance.

The Georgians who adhere to the diſcipline of the Greek church, are very numerous, but they are not found out of their own country of Georgia (the antient Iberia) which is the moſt northerly part of the Perſian empire: as for thoſe of them, which come to Iſpahan, they go under the general name of Armenians, and communicate with them; but of the Greek and Georgian churches I ſhall ſpeak more largely when I come to treat of Turky.

There is ſtill another people in Perſia, who go under the name of Chriſtians, whoſe religion ſeems to be a compound of Chriſtianity, Judaiſm, and Mahometaniſm: they are called Chriſtians of St. John, and ſometimes Sabean Chriſtians, and inhabit near the gulph of Perſia, in the province of Chuſiſtan, where it is computed there are not leſs than twenty thouſand families of them. St. John Baptiſt is their great ſaint, from whom they pretend to derive their original, and they have a tradition that his ſepulchre is at Chuſter, the capital of Chuſiſtan, or Suſiana. They do not acknowledge Chriſt to be the Son of God, but eſteem him to be a prophet, as the Mahometans do; and the reaſon they are called Chriſtians, is ſuppoſed to be from their great veneration for the croſs, which they reverence even to idolatry. The Perſians hold that circumciſion is not abſolutely neceſſary to ſalvation; but, however, they do not omit it, if there be an opportunity of performing it according to the rites.

The Perſian moſques or temples are never conſecrated; but when they are built, the people are invited to perform their devotions there, which is all the ceremony uſed; but as their religion does not oblige them to pray in temples, the great men ſeldom come thither; and their mollas preach as frequently in the ſtreets and public places of reſort, as in their moſques; the common people, however, chuſe to perform their devotions in their temples, eſpecially on Fridays, their ſabbath, and upon the great feſtivals when there is uſually a ſermon, or a good moral diſcourſe delivered by ſome molla; but the people are not very attentive to theſe preachments, for ſome will be reading, others ſleeping, and perhaps others ſmoking or eating in ſermon time; every one does what he pleaſes, ſo as he does not diſturb the preacher: their mollas are never conſecrated, but take up the office of preachers, and lay it down again as they ſee fit: thoſe who deſign for the prieſthood, begin with clothing themſelves in a plain modeſt garb, a white turban, and a kind of caſſoc of camblet, reaching down to their heels; then they apply themſelves to ſtudy, and obtain the title of talebolm, or ſearchers after knowledge; they alſo live abſtemiouſly, and put on a grave phariſaical look; afterwards they go in pilgrimage to Mecca, or to the tombs of their Imans, if they can raiſe money enough to defray the charge, and at their return get themſelves regiſtered in the Sedre's books, in order to obtain preferment when it falls, either in ſome convent or endowed moſque, and they are advanced higher uſually according to their diligence or merit.

There are three principal officers in every great moſque: 1. The Montelevy, who takes care of the furniture and ornaments. 2. The Molla or Preacher. 3. The Moazem,

zem, who calls the people to prayers. The clergy of Perſia in general are not rich, receiving no dues from the people, but depending altogether upon the endowments of their houſes or churches, and what they get by the inſtruction of children, either as private tutors, or maſters of ſome public ſchool.

Beſides the mollas, there are ſeveral other ſorts of people in Perſia who paſs for eccleſiaſtics, as the mirs and the zeriffs, who are of the family of Mahomet by the male line; and the ſaieds, who are the deſcendants of Fatima, Mahomet's daughter; the mirs have the privilege of wearing a green turban, but are not ſo much honoured in Perſia as in Turky, becauſe they are looked upon to be in the Turkiſh intereſt: the derviſes and faquirs, which as far as I can perceive are but two names for the ſame profeſſion, are alſo looked upon as religious people; but, with all their pretences to a ſevere, abſtemious life in public, they are diſcovered to be profeſſed libertines in private.

The Jews are alſo diſperſed throughout Perſia: there are reckoned to be about twenty thouſand families of them, a poor miſerable people, many of them artificers, others of them pretend to magic, and telling of fortunes. Their women inſinuate themſelves into the good opinion of the ladies in the ſeraglios of the great, who it is ſaid, give great faith to their predictions; they alſo prepare love potions, and ſuch trumpery for the ſilly creatures, who ſtudy all ways to gain the affection of their tyrants. The Jews were formerly the uſurers of the country, but ſince the arrival of the Banians of India, they have had little to do with any thing of that kind, and are forced to take up with leſs beneficial employments; which brings me to ſpeak of the Pagan Indians in Perſia, who have now engroſſed almoſt all the ready money of the country. Theſe are diſperſed all over Perſia, and it is computed that there are not leſs than ſixteen thouſand of them in the city of Iſpahan. They are allowed the like liberty in the profeſſion of their religion, as the Jews and Chriſtians are. The Perſians endeavour indeed to gain proſelytes, by granting rewards and privileges to thoſe who will embrace Mahometaniſm; but in this country no reſtraint is laid on the conſcience reſpecting matters of religion.

SECT. XV.

Of the Marriages of the PERSIANS, &c. and of the Condition of their Children.

THE Perſians are allowed four legal wives, with whom they may enter into formal contract before the civil magiſtrate; but they have ſeldom more than one; for the reſt of the women, who wait upon her, have in like manner the honour of their maſter's bed, and their iſſue are equally legitimate; ſo that there is no ſuch thing as a baſtard in Perſia, thoſe born before and thoſe after marriage having the ſame privileges; nor is it any diſadvantage for a ſon to be born of a concubine, or even of a black ſlave, in regard to his inheritance.

Love is the leaſt motive for entering into a contract with a lawful wife, as ſhe is called, eſpecially among the great, nor does ſhe expect much of it, but it is the number of ſlaves, the cloaths, the equipage, and the figure the man makes in the world, which are great inducements for the woman, or her friends, to match into any family.

The Armenians marry their children in their infancy, when they meet with an advantageous match: this they do for a political reaſon, leſt their daughters ſhould be ſent to the haram; but the parties do not cohabit till they arrive at a ſuitable age.

The Perſian marriages are attended with the following ceremonies. When both the parties have given their conſent, and the terms ſettled by the mediation of friends, proof thereof is made before the cadi, or civil magiſtrate, who cauſes the ſame to be regiſtered: but as far as I can find, the parties themſelves do not appear in perſon before him, or go to the temple to ſolemnize the marriage, as with us: but the bridegroom the day before he takes home his bride, ſends her a habit, ornaments and jewels, ſuitable to her quality; and the next day, towards the evening, mounting on horſeback, with the richeſt furniture he can procure, and attended by his friends, the muſic and dancing girls, he goes to fetch home his wife, who meets him part of the way mounted alſo on a camel or horſe; but ſo veiled, that her face cannot be ſeen; ſhe is alſo attended by her friends and relations in their gayeſt equipage, with her ſlaves, cloaths, and baggage: both companies being joined, they march to the huſband's houſe, with lighted torches, the drums and trumpets ſounding, and muſic playing before them, the mob following with joyful acclamations, and wiſhes for the happineſs of the new-married couple.

When they arrive at the houſe, the bride is led to her apartment, where the huſband follows ſoon after, and this is the firſt view he has of her face: the company ſpend the remainder of the evening, and ſometimes ſeveral days ſucceſſively in feaſting and rejoicing at the bridegroom's houſe; but the men and women are in ſeparate apartments; the muſic, dancing girls and mob are alſo generally well entertained, if it happen to be the wedding of a man of quality.

Theſe are the only wives the Perſians have, according to the notion we have of a wife: but they have alſo a kind of wives or concubines, whom they agree with either for life or for a certain time, to ſerve them in the capacity of bedfellows. Theſe contracts alſo, it is ſaid, are regiſtered before a magiſtrate; and where a man parts with one of theſe, ſhe muſt remain ſingle forty days before ſhe contracts with another, to ſee if ſhe be with child; for in this caſe, the firſt man muſt keep her till ſhe is brought to bed, and her children afterwards. The laſt kind of wives are a man's ſlaves, whom he takes to his bed, and diſpoſes of as he pleaſes, without any ceremony: but the children of theſe are in as good a condition as the reſt, inheriting according to their ſeniority; ſo that if the ſon of a ſlave be the eldeſt, he has an elder brother's portion.

If a woman be divorced without any fault on her part, ſhe ſhall have the dowry her huſband ſtipulated to give her, which after her death will go to her children. Divorces are very eaſily obtained here, eſpecially wher both parties agree to it: the uſual ſuggeſtions for a woman to obtain a divorce, are that the huſband takes up too much time with his ſlaves and concubines, and does not afford her due benevolence, or elſe that the huſband is impotent; in either of which caſes the magiſtrate will grant a divorce, and both the man and the woman are at liberty to marry elſewhere.

By the Perſian law the girls are held to be of age at nine years of age, and the boys at thirteen, and no longer under the direction of their guardians; and where a guardian dies, the magiſtrate will ſometimes admit them to be of age ſooner, upon examination. The eldeſt ſon is always guardian to the younger children, and infants have that privilege, that their eſtates cannot be ſeized for the debts of the deceaſed till they come of age, and are able to plead for themſelves. Where a perſon dies inteſtate, there is an officer in every city and province, who takes care to ſecure the eſtate and effects of the deceaſed, and ſee them diſtributed among his relations, in ſuch proportions as the law requires.

With reſpect to the funeral rites of the Perſians, and their behaviour towards the dying and dead, we muſt here obſerve, that when a rich man is drawing towards his laſt hour, they ſet up lighted lamps, or make little fires on the terrace of his houſe, that the people in the neighbourhood, and thoſe that paſs by, may pray for him. They alſo ſend for a molla, or prieſt, who puts him in mind of reviewing his paſt life, and repenting of his ſins; to which the dying man uſually anſwers, Taube, or, I repent. When he can ſpeak no longer, they continue to read ſome chapters of the alcoran to him till he expires. His death is ſoon known by the diſmal groans and lamentations of thoſe about him: the relations immediately ſet up a great howl, rend their clothes, tear off their hair, beat their breaſts and act like people in the utmoſt deſpair, eſpecially the women, intermingling ſad complaints, and uttering the moſt tender expreſſions to the dead corpſe, as if it was really ſenſible of their grief. The corpſe is afterwards wrapped up in a new linen cloth, or winding ſheet; and if it be a man of figure, there are certain paſſages out of the alcoran, or out of ſome other of their ſacred books, written upon it: and they tell us of one of their great miniſters of ſtate, who was wrapped up in ſo large a ſheet, that the whole alcoran was written on it. In this condition the body is repoſited in ſome place at a diſtance from the houſe; and if it be to be buried a great way off, it is put into a wooden coffin filled up with ſalt, limes and perfumes to preſerve it; for they embalm their dead bodies no otherwiſe in Perſia, nor do they ever embowel them, as with us.

If they are buried near the place where they die, they are carried thither directly from the place where they are waſhed without much ceremony, the people who attend the corpſe following in no manner of order; indeed at the interment of people of diſtinction, the enſigns of the moſque are carried before them on long pikes, one has an iron hand at the end of it, which they call Haly's hand; others have creſcents; and on the reſt are written the names of Ma-

homet, his daughter Fatima, and his twelve ſucceſſors: they have alſo ſtreamers of ſilk, and led horſes, which carry the turban and arms of the deceaſed: there are no bearers appointed on purpoſe for carrying the corpſe to the grave, but the neighbours offer their ſervice, and if a perſon of faſhion meets a funeral, he will alight from his horſe, and help to carry the corpſe to the place of interment.

They lay the corpſe in its winding ſheet, without a coffin, with the face towards Mecca, and if it be a great man, they lay by him his turban, his ſword, his quiver, and his bow, and an arch is built on that ſide near the grave. The reaſon of making this arch is upon the ſuppoſition that the ſoul re-animates the body ſoon after the interment, and is examined by certain angels, concerning his faith and manners.

Their mourning uſually laſts forty days: it does not conſiſt in wearing black clothes (for black they deteſt, and look upon it to be the devil's colour, an infernal habit) but their mourning conſiſts in lamentations for the deceaſed in a torn and negligent garb, and the moſt lively expreſſions of grief and deſpair, which they repeat two or three times a week during the time above-mentioned; after which they bathe and ſhave, and dreſs themſelves in their uſual habits, and the mourning is finiſhed: their wives are the moſt inconſolable, for a widow ſeldom marries a ſecond time.

We ſhall now give a deſcription of the mourning of the Armenians at the graves of their deceaſed friends, annually, the night before the ſolemnization of the feſtival of the holy croſs.

The Armenian women, clothed in white linen veils, and ſo muffled up that nothing but their eyes could be diſcerned, about two or three hours before day, came to the Chriſtian burying-place, bringing with them wood, coals, tapers, and incenſe; there they made fires by the tombs of their reſpective relations and friends, and placed lighted tapers upon them, continually throwing incenſe on the fire, lamenting their loſs, and addreſſing themſelves to the deceaſed, in the moſt tender and affectionate expreſſions: then they threw themſelves on the graves, and embraced and bathed them with their tears. This was ſucceeded by the moſt diſmal groans and cries that can be imagined. At a little diſtance, the place where this was tranſacted looked like the ruins of ſome town juſt deſtroyed by the flames in a dark night, there being ſuch an intermixture of ſtones and fire, with the cries and lamentations of people in the utmoſt deſpair.

The men, it ſeems, remained at home while the women were employed in this ſolemnity, but ſent perpetually after their wives, under pretence of enquiring how they did, poſſibly leſt the darkneſs of the night ſhould give them an opportunity of purſuing their intrigues, inſtead of viſiting their departed friends. There were alſo a multitude of prieſts attending at the burying-place, to offer up prayers for thoſe who deſired it; and theſe being all clothed in black, as the women were in white, made an odd ſort of a ſhow. The prieſts were paid for the prayers they ſaid on this occaſion, ſome of them ſix-pence, others ten-pence, but none give them more than twenty-pence. There are ſeldom leſs than three thouſand Armenian women, who come from Julpha, to attend the graves of their deceaſed friends at this time, who ſo perfume the air with the incenſe and aromatic gums they throw into the fire, that the city of Iſpahan is ſenſible of it at more than a mile's diſtance. The ceremony being concluded about two hours after day-light, the common people continued to go thither moſt part of the day, not to mourn, it ſeems, and bewail the loſs of their friends, as thoſe in the morning had done, but to ſmoke and divert themſelves, as uſual at feſtivals, and on other joyful occaſions.

SECT. XVI.

Of the antient Structures, Ruins, Sepulchres, and other memorable Antiquities of the PERSIAN.

THE palace antiently called the houſe of Darius, which was the reſidence of the Perſian monarchs, is called, by the modern inhabitants of the place, Chil-mina, or the Palace of Forty Pillars. It is ſituated at the foot of a mountain, called the Royal Mountain. It extends three thouſand feet from north to ſouth; and from eaſt to weſt one thouſand nine hundred and ninety-five feet, to the mountain itſelf. But having before given a large account of this celebrated edifice, more generally known by the name Perſepolis, we ſhall omit ſaying any thing further of it in this place.

A great variety of ruins preſent themſelves to the eaſtward of the above-mentioned, which conſiſt of windows, avenues, portals, paſſages, &c. They extend about four hundred and fifty feet from eaſt to weſt; and about ſeven hundred and twenty-five from north to ſouth, and three hundred from the columns and mountains. The earth is covered with the fragments of ſeventy-ſix columns in the midſt of theſe ruins. And about one hundred and eighteen feet to the ſouthward of theſe is an edifice elevated above the reſt of the ruins, on an hill. The front is compoſed of a range of ſtones eight feet deep: it extends one hundred and thirteen feet from eaſt to weſt, but is not embelliſhed with any ornaments.

There are ſome ſubterraneous paſſages pretty far to the ſouthward of the laſt mentioned ruins; which, from a ridiculous notion that no light will burn in them, the natives will not enter, though it is ſuppoſed that immenſe treaſures are lodged in them; but ſome European travellers, having ventured to enter them with lights, which were not extinguiſhed by an inviſible power, as the natives abſurdly imagined, perceived that theſe paſſages terminated in a ſmall, narrow, and impaſſable kind of aqueduct.

There are two antient ſepulchres of Perſian monarchs near the mountains, the fronts of which are ornamented with various figures repreſenting men and different kinds of animals; and at about two leagues from theſe ſepulchres are four other tombs reſembling the others, only cut higher in the rock. This place derives its name from one Noxi Ruſtan, a fabulous perſon, who is reported to have been a potent prince of gigantic ſtature, that he was forty cubits high, and lived one thouſand one hundred and thirteen years. The figure of a man on horſeback, which, the people ſay, repreſents Ruſtan; he is in a Roman dreſs, and has alſo a bonnet riſing from a crown, with flowing hair, a long beard, and his left hand upon the hilt of his ſword; but notwithſtanding the report of his prodigious ſtature, both he and his horſe are of the common ſize. Before him is a woman with flowing hair, wearing a crown; ſhe is dreſſed like Minerva, and holds up part of her drapery with her left hand. A third figure repreſents a warrior with a tiara on his head, and his left hand placed on the hilt of his ſword. In another compartment is an imperfect appearance of men fighting on horſeback. All theſe figures are carved in the rock. This tomb of Noxi Ruſtan is ſuppoſed to have been erected by Darius Hyſtaſpes, as it correſponds with the deſcription given of it by Herodotus and other antient writers.

At two hundred paces diſtance, on the weſtern ſide of the mountain, are two tables cut in the rock. That to the left repreſents two men on horſeback, one of whom graſps a circle, of which the other has quitted the hold. Some imagine that the firſt is Alexander, and the other Darius, who by this action reſigns to him the empire.

Near the city of Seamachie, at a place called Pyrmaraas, are the tombs of Seid Ibrahim and Tiribabba his tutor, both which are viſited by a great number of pilgrims, who perform their devotions there; and near the city of Ardobil is the ſepulchre of Shah Sefi, which is viſited with great pomp by the Perſians on Whitſun-monday. This tomb is three feet in height, nine in length, and four in breadth, made of white marble, and covered with crimſon velvet; a great variety of gold and ſilver lamps hang down from the roof of it, and on each ſide are two very large candleſticks of maſſy gold, with wax candles in them. There is alſo a ſpacious arched gallery finely gilt, which is uſed as a library, containing a great number of manuſcripts in the Perſian, Arabic, and Turkiſh tongues, ſome written on parchment and others on paper, all ſuperbly bound, beautifully painted, and elegantly covered with plates of gold and ſilver. There are alſo above four hundred porcelain veſſels, many of them capable of containing ten gallons, in various niches on the ſides of the library. There is near this ſpot, another tomb erected to the memory of Seid Tzeibrail, who was only a peaſant, but the father of Shah Sefi. This tomb is ſix feet high, of an oval form, raiſed ten ſteps, adorned with glaſs of ſeveral colours, and ſurrounded with iron grates: the roof is of azure gilt, and in the midſt of it there is a large tower of blue and green ſtones; the floor is covered with rich tapeſtry; and round the walls are vaults or chambers for the education of children. The gold and ſilver lamps hang about it, in which there are lights every night. The tombs of many of Shah Sefi's family are contained in a ſmall chapel oppoſite to this.

CHAP. II.

THE NEW HISTORY AND DESCRIPTION OF THE EMPIRE OF

CHINA.

SECT. I.

Treating of the Boundaries, Situation, Provinces, great Wall, Iſlands, Rivers, Canals, Inland Navigation, and Face of the Country.

THIS opulent and extenſive empire, which appears to be a world within itſelf, and which includes Chineſe Tartary, is bounded by the dominions of Ruſſia, on the north; by the Pacific Ocean on the eaſt; by the Indian and Chineſe ſea, on the ſouth; and by the kingdoms of Tonquin, Tartarian Thibet, Ruſſian Tartary, and part of Indoſtan and India beyond the Ganges, on the weſt. It lies between ninety-five and one hundred and thirty-five degrees of eaſtern longitude, and between twenty-one and fifty-five degrees of north latitude; being about one thouſand eight hundred miles in length, and one thouſand five hundred in breadth. It takes its name from a Chineſe word, which ſignifies central; as the natives, ſuppoſing the world to be flat, fancied it was ſituate exactly in the middle.

This country is divided into ſixteen provinces; viz.

1. Pe-ke-li,	9. Shan-ſi,
2. Kyang-nan,	10. Shen-ſi,
3. Kyang-ſi,	11. Se-chuen,
4. Fo-kyen,	12. Quan-tong,
5. Che-ky-ang,	13. Quang-ſi,
6. Hu-quang,	14. Yun-nan,
7. Ho-nan,	15. Quew-chew,
8. Shang-tong,	16. Ly-au-tong.

The northern, called the Tartarian provinces, are ſeparated from Proper China by a wall of brick and ſtone, ſtill almoſt entire, one thouſand five hundred miles in length, being carried over mountains and vallies from Mogul Tartary in the weſt, to the Kang ſea in the eaſt. This wall was built by the Chineſe, to prevent the incurſions of the northern Tartars, but is not of much uſe at preſent, ſince China and thoſe Tartarian provinces have been united under one prince.

Pe-king, Shan-ſi, and Shen-ſi, are the next three provinces which lie within the great wall. The three provinces of Shang-tong, Nan-kin, and Che-ky-ang, lie upon the eaſtern coaſt of the Chineſe ſea: Ho-nan, Hu-quang, and Kyang-ſi, are midland provinces; Fo-kyen, Quang-tong or Canton, and Quang-ſi, upon the ſouth-eaſt, are maritime provinces; and Se-chuen, Quew-chew, and Yun-nan, are ſituate in the ſouth-weſt, and adjoin to Tonquin and weſtern Tartary.

Thoſe iſlands in China, which are the moſt extenſive, are, Formoſa, near the weſt of Fo-kyen; Ay-nan, ſouth-weſt of Canton; Macao, a ſmall iſland in the mouth of Canton river, inhabited by the Portugueſe; and the Baſhee iſlands, which lie between Formoſa and the Philippines.

The chief rivers are, 1. Yamour, which divides Chineſe from Ruſſian Tartary on the north. 2. Argun, which divides Chineſe from Ruſſian Tartary, on the weſt. 3. Crocceus, or Ho-am-bo, which riſes in the confines of weſtern Tartary, and, running eaſtward through the kingdom of China, falls into the Kang ſea. 4. Kiam, which alſo riſes in weſtern Tartary, and, running eaſtward, diſcharges itſelf into the gulph of Nan-kin. 5. Ta, which, riſing in the province of Quew-chew, runs ſouth-eaſt, and falls into the bay of Canton; on this river are the mountains and ſtraits of Sang-wan-hab. Of theſe, the rivers Crocceus and Kiam are vaſtly large, and not fathomable in ſome places, if we may credit the Chineſe account of them.

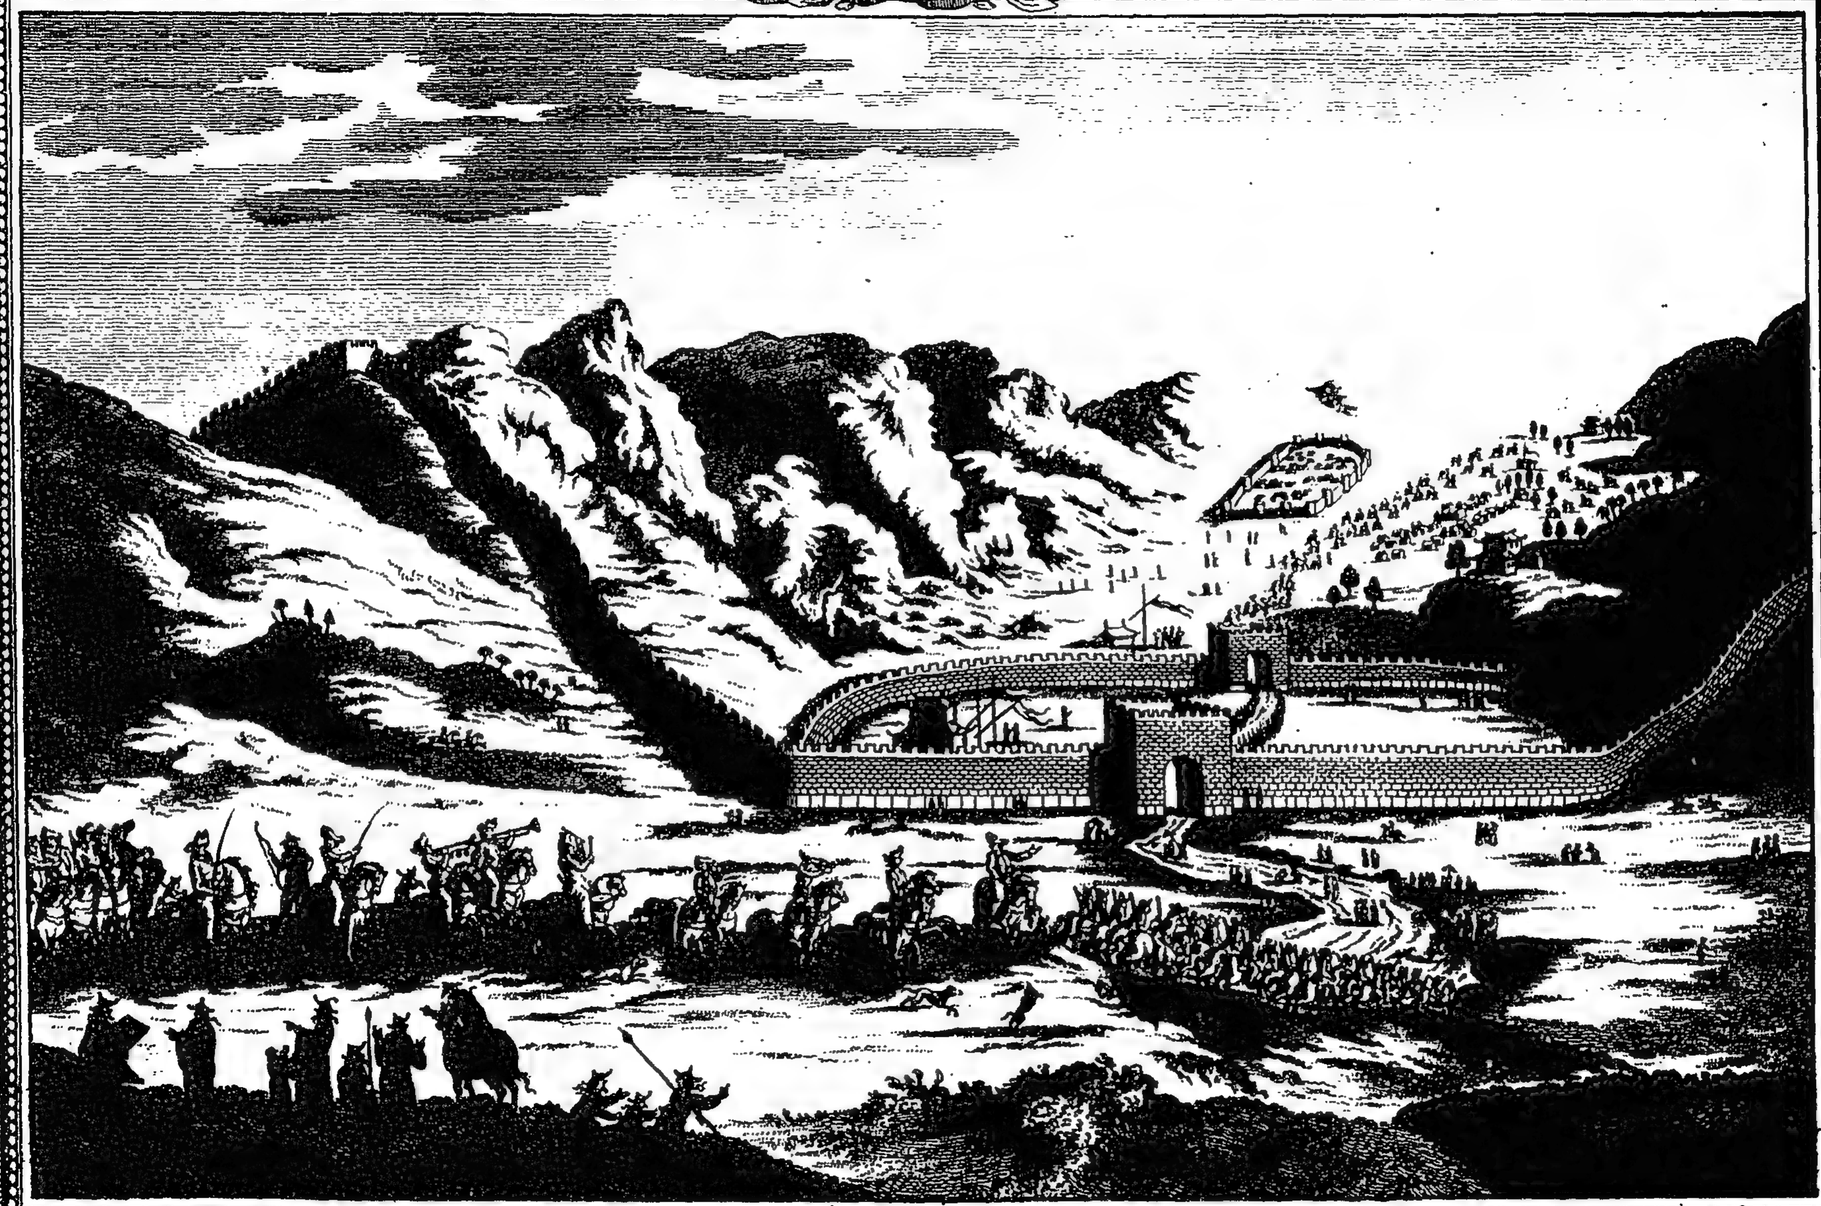
Beſides theſe rivers, ſpacious canals are cut through the country; and ſo many of them, that a traveller may go to every town almoſt by water. Over theſe canals are magnificent bridges, whoſe arches are of marble, and ſo high, that veſſels may paſs through them with their maſts ſtanding; but the moſt remarkable is the flying bridge, built between two mountains on the river Wang-ho.

Their towns ſtand ſo thick upon their rivers and canals, that a traveller is no ſooner paſſed through one town, but he comes in ſight of another; and wherever there is a town on ſhore, there is another of boats upon the water, inſomuch that it is ſaid, almoſt as many people live upon the water as upon the land.

Their veſſels are made as commodious as their houſes: many of the Chineſe are born, live and die in them, and keep their hogs and poultry on board. Beſides theſe veſſels, there are rafts or floats of timber perpetually going up and down their rivers and canals, upon which there are built little huts or cabbins, and here the people live till they have diſpoſed of their timber. Thus great quantities are conveyed upward of a thouſand miles, from the ſouthern provinces almoſt to Pe-king.

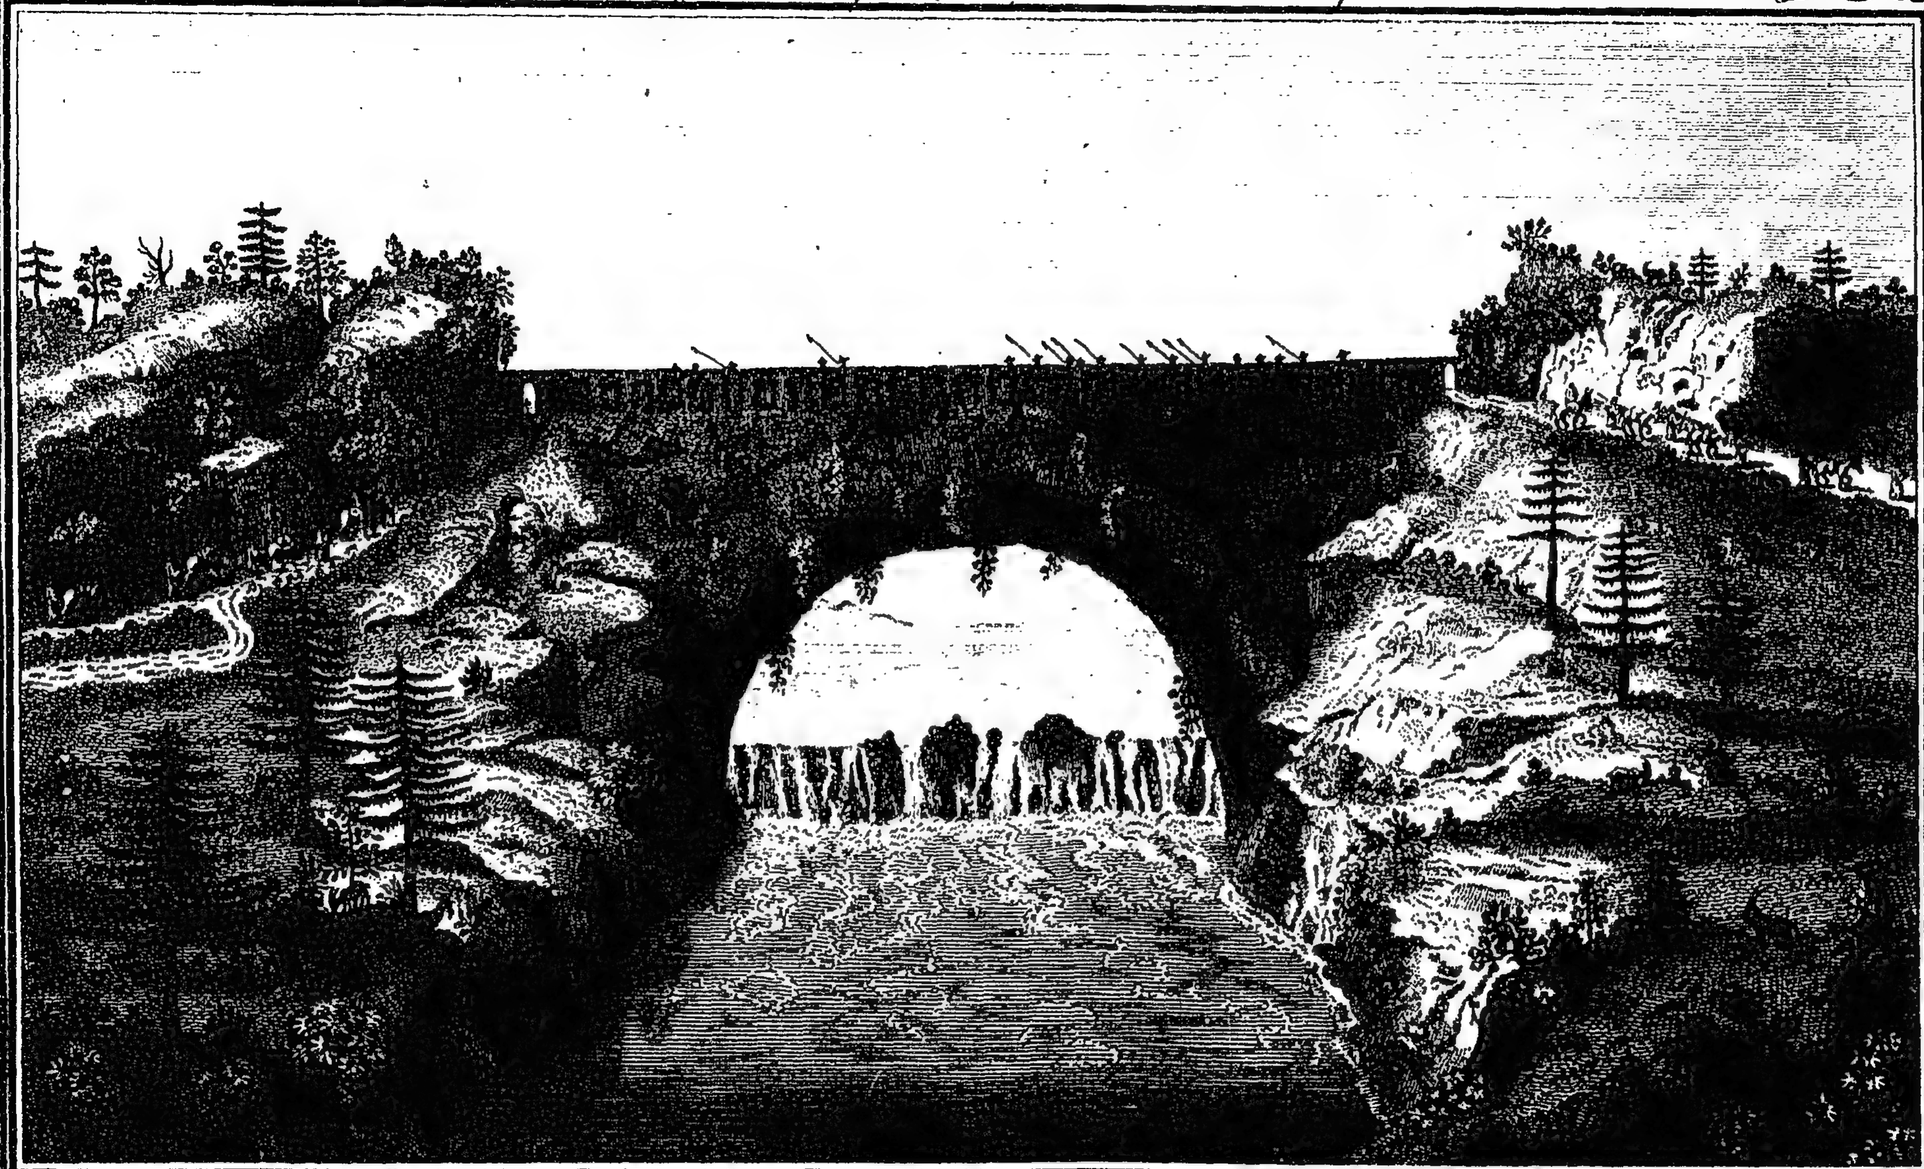
Though the provinces of Yun-nan, Quew-chew, Se-chuen, and Fo-kyen, are mountainous, yet China in general is a flat country. Che-ky-ang, indeed, the eaſtern part whereof is a plain, fruitful country, hath high mountains towards the weſt. The country of Quang-tong and Quang-ſi, which are admired for their fertility near the ſea-coaſt, are encumbered with rocks and barren mountains at a diſtance from the ſhore. The provinces of Kyang-ſi, Shan-ſi, and Shen-ſi, have more mountains than valleys.

SECT. II.



Treating of the principal Towns, Palaces, Temples, Cities, and Number of People, in CHINA.

THE Chineſe towns are uſually built in one form, that is ſquare, where the ground will admit of it; and the principal gates open towards the four cardinal points, eaſt, weſt, north, and ſouth; and ſpacious ſtreets, croſſing each other, run the whole length of the town. We ſhall here mention the chief towns of every province, and give a particular deſcription of thoſe which have been thought beſt deſerving the notice of travellers.



Niuche is the capital of the province of the ſame name. Pitehee is the capital of Corea, and Chin-yan of Lea-tonge. Theſe are ſituated without the wall.

The capital of the province of Pe-king, and of the whole empire, is of the ſame name. It is ſituate in one hundred and eleven degrees of eaſtern longitude (making London the firſt meridian) and in forty degrees of north latitude. It ſtands in a fruitful plain, not far ſouth of the great wall. The town conſiſts of two cities joined together, one called the Tartar city, and the other the Chineſe city; for when the Tartars conquered this country, about one hundred and ſixty years ago, they drove out the Chineſe, but gave them leave to build another city contiguous to the old town, which was then pretty near the form of a ſquare, but ſince the addition of the other, makes an irregular figure. Theſe cities are twenty miles in circumference, beſides the ſuburbs: the whole contains two millions of people. The emperor's palace, including the parks and gardens, is near four miles round, and ſtands in the middle of the Tartar city.

Pe-king is ſurrounded with a wall and ditch; the principal ſtreets are one hundred and twenty feet broad, and three miles in length. Every tradeſman ſets up a board before his ſhop painted and gilded, on which are written the names of the goods he ſells; and, being adorned with colours and ſtreamers on the top, make a very gay appearance. The walls of the Tartar or royal city are above ſeventy feet high, and perfectly cover the town, for the houſes are very low, being built no higher than the ground

A View of the celebrated GREAT WALL of CHINA,
by which divides that Empire from Tartary, & was originally built to prevent the Incursions of the Tartars.

A Prospect of the PORCELANE TOWER at Nan-King in China.

floor, becauſe Pe-king has ſuffered much by earthquakes, which are frequent here.

The gates of this city are ſtill higher than the walls, and have a fort of equal height built before them: the arch of each gate is built with marble, but the walls are of brick: they have no outworks beyond the walls, but there are ſquare towers in them at proper diſtances from each other.

The ſtreets of Pe-king are perpetually crowded, though a woman is ſeldom ſeen in them, the reaſon whereof may be that all proviſions are brought thither by land carriage, no river or canal coming within three miles of the city, which occaſions the ſtreets to be filled with carts, camels, horſes, and other beaſts of burden, with their drivers, inſomuch that it is difficult paſſing the gates in a morning or evening. The artificers or handicraft traders alſo contribute to increaſe the croud, as they work in the houſes of thoſe that employ them, and are perpetually looking out for buſineſs. The magiſtrates alſo have their guards when they appear abroad, and all people of diſtinction a numerous attendance, which makes the town appear ſtill more populous and thronged.

The emperor's palace is three miles in circumference, and conſiſts of nine vaſt courts, in the fartheſt of which he reſides. This apartment is ſupported by large marble pillars, the roof covered with gilded ſhining tiles, which look like gold. It is aſcended by white marble ſteps; the rooms, adorned with carvings and paintings, make a very grand appearance, and three or four thouſand mandarins or great officers are always attending when the prince gives audience on public occaſions.

The chief mandarins have very magnificent palaces, which take up a great extent of ground, as they have but one floor; they conſiſt of ſeveral open courts, in which the buildings are not contiguous; they are ſo fond of privacy, that they have no windows towards the ſtreet; and will not ſuffer their neighbours to have any, that can look in upon them; and within the gate is always a ſkreen, to prevent a ſtranger's looking in: the furniture of their houſes conſiſts of pictures, japan cabinets, chairs, tables, and varniſhed ſkreens, and their beds are exceeding fine. In ſummer their curtains are ſilk, finely wrought, or the fineſt gauze to defend them againſt the gnats; in winter their curtains are of thick coarſe ſilk, and their counterpanes of the ſame. They have no feather-beds, but lie upon quilts or mattraſſes.

This great city is guarded both day and night by ſoldiers, who patrole the ſtreets, with their ſwords; they alſo carry whips in their hands, with which they laſh without diſtinction all perſons concerned in any riot or outrage, to the diſturbance of public tranquillity; there is, beſides, in this city, a garriſon of ſixty thouſand men, to preſerve good order, and prevent irregularities. No clubs, balls, or other nocturnal meetings are permitted here. In the principal ſtreets they found the five watches of the night on a drum of an extraordinary ſize, or elſe on a large bell, ſuppoſed to be the largeſt in the world, except the great bell of Moſcow. This great bell of Pe-king was caſt near four hundred years ago, and weighs twenty thouſand pounds; but the Chineſe bells affords a very dull ſound, having only wooden clappers. A watch conſiſts of two hours.

Nan-kin, the capital of the province of that name, and heretofore of the whole empire, is called the ſouth court, as Pe-king is the north court, ſituate in one hundred and eighteen degrees of eaſtern longitude, and thirty-two degrees of north latitude. It is ſtill more populous than Pe-king, ſtanding on the river Kiam, which is here three miles broad, and forms a very commodious port. Here ſilk, and all other Chineſe manufactures, may be purchaſed at the beſt hand. Beſides the river, there are abundance of navigable canals, which bring the merchandize of every province thither.

Before the gates of this, and almoſt every other great town, are two magnificent towers erected, and near them a pagod, or idol temple, dedicated to the genius, or guardian angel of the place. Triumphal arches alſo are erected to the honour of ſuch great men as have been eſteemed ornaments to their country. Temples alſo are erected to the memory of Confucius, the philoſopher; and other benefactors. The grandeſt of all the Chineſe buildings, is the porcelain tower, which ſtands before one of the gates of Nan-kin, being above two hundred feet high, of an octangular figure, containing nine ſtories, each ſtory benching in, and decreaſing in breadth, as it increaſes in height, forming a kind of pyramid; it is faced with porcelain, or china-ware, from whence it has its name; above the eighth ſtory is a cupola, which riſes thirty feet higher than the tower, with a gilded ball over it; this tower has ſtood upwards of three hundred years, and is eſteemed the moſt elegant building in the eaſt. Near this city is the moſt famous temple of Paulin-Shi, in which are ten thouſand images.

The capital of Quan-tong is Canton, ſituate in the ſouth of China, near the mouth of the river Ta, and is the moſt reſorted to by foreign merchants of any part of China. It is almoſt the only town the Europeans trade to at preſent, and conſequently is immenſely rich; it is ſaid to exceed all the cities of Aſia in the number of pagods or idol temples, palaces, or public buildings, and there are in it no fewer than thirteen magnificent triumphal arches. The ſtreets are paved, but narrow; the ſhops make a fine ſhew; and thoſe tradeſmen, who deal in the ſame kind of goods, uſually ſtand in the ſame quarter of the town. Their windows, in ſummer, are of cane, to let the air through; but in winter, of oyſter-ſhells, ſcraped till they are tranſparent, which however give but a feeble light. They have charcoal fires in the middle of their rooms in winter. The walls of their rooms, inſtead of hangings, are covered with thin white paper. There is a market held almoſt in every ſtreet, for all manner of proviſions. Frogs are eſteemed the moſt delicious food, and bear a much greater price than any other meat, though they are of a blackiſh hue. Viper broth was in reputation here long before it was in London. Here is the remarkable water-caſtle, which is ſo much admired by travellers. We may here remark, reſpecting the diet and dreſs of the people of this empire, that the Tartars and Chineſe, by their intermarriages, are become in a manner the ſame people: they are not to be diſtinguiſhed either by their ſtature or features, any more than by their habits, in which the government requires both nations to be uniform.

The town of Macao is ſituate on a ſmall iſland at the mouth of the river Ta, or Canton. The Portugueſe took poſſeſſion of the iſland in their firſt voyage to China, and had a vaſt trade here: but were at length forced to ſubmit to the dominion of the Chineſe: however they are permitted to govern their own people by the laws and cuſtoms of Portugal. The Romiſh miſſionaries, when they are perſecuted and driven out of China, uſually retire to this place.

Fu-chew is the capital of the province of Fo-kyen.

Amoy, or Emoui, is a port-town in the province of Fo-kyen, oppoſite the iſland of Formoſa. The Engliſh had a factory here; but were obliged, by the unfair dealings of the Chineſe, to diſcontinue their voyages thither.

Nimpo, which is another large city in the province of Che-ky-ang, has a commodious harbour, and a very great foreign trade, eſpecially wih Japan, from which it is diſtant but two days ſail.

Nan-yang is a city on the river Kiam. Tong-chew, a city one hundred and eighty miles north-weſt of Canton. Kiew, Hew-kew-hien, a city on the river Kiam. Shaw-chaw, a city one hundred miles north of Canton.

The town of Chuſan is ſituated on an iſland near the coaſt of Che-ky-ang and Nankin, north-eaſt of Nimpo, where the Engliſh once had a factory; but not finding the advantage in trade they expected, retired to Canton, which, as we before obſerved, engroſſes moſt of the European trade.

The reſt of the chief towns of the ſeveral provinces are Tay-ven, capital of the province of Shan-ſi; Sin-gan, capital of Shen-ſi; Koyſong, capital of Ho-nan; Hang-chew, capital of Che-ky-ang; Nan-chang, capital of Kyang-ſi; Vu-chang, on the river Kiam, capital of Hu-quang; Ching-try, capital of Se-chuen; Quew-yang, capital of Quew-chew; Yun-nan, capital of Yun-nan; Quew-lin, capital of Quang-ſi. In the whole it is computed, there are one hundred and fifty capital cities; one thouſand three hundred and twelve of the ſecond claſs; two thouſand three hunnred and fifty-ſeven fortified towns; ten millions of families, and upwards of fifty millions of people. Some compute there are fifty-eight millions of people in China, which, it is ſaid, may be eaſily known by the poll-tax; every man being obliged to hang a little table over his door, ſpecifying the number of ſouls he has in his houſe, the truth of which is from time to time examined by an officer appointed for that purpoſe.

SECT. III.

Of the Perſons, Habits, and Genius of the People of CHINA.

THE Chineſe men are not very handſome in their perſons; their ſtature is rather low: nor are their complexions to be admired, eſpecially in the ſouthern provinces of the empire, which lie near the tropic, where the heat of the ſun muſt neceſſarily make them tawny; but in the northern

northern provinces, both their ſtature and complexion are much mended. They have flat, broad faces, black hair, little dark eyes, ſhort noſes, and thin beards; pulling moſt part of them off with tweazers, inſtead of ſhaving, reſerving only whiſkers and ſome long hairs on the bottom of their chins. The nail on the little finger of their left hand is ſuffered to grow a great length beyond the finger, and ſcraped and poliſhed with abundance of care; by people of condition, this being looked upon as one of the diſtinguiſhing marks of a gentleman in this part of the world.

The Chineſe were mighty proud of the hair of their heads, and uſed to tie it up as our women do in a roll; but the Tartar ſovereigns have compelled them to ſhave their heads, leaving only one lock on the middle of the crown, over which they wear a cap ſhaped like a bell, which does not come ſo low as their ears, and therefore they carry a fan in their hands, to ſcreen them from the ſun. The Chineſe who left their country on the Tartar conqueſt, and fled to the neighbouring iſlands, ſtill wear their hair.

The men wear a veſt, with full, long ſleeves, which come down to their fingers ends. Over the veſt they wear a looſe coat, ſhorter than the veſt, with ſhort ſleeves; and when they viſit, or receive company, they have a gown thrown over all; they wear alſo ſhirts and breeches, or rather trowzers, which reach down half way of their legs, theſe are made of ſattin quilted; they werr alſo ſilk boots, or buſkins quilted, an inch thick, and over the foot put on a ſlipper, with a thick ſole, for the boots have no ſole: men of faſhion are never ſeen without their boots, in company, either at home or abroad. But though the Chineſe men are thus cloathed, when they are in company, the natives of the ſouthern provinces throw off their caps, gowns, veſt, &c. when they are with their families, or intimate friends in private, and wear nothing but a thin pair of drawers; and the common people, mechanics and labourers, go about the ſtreets with only a pair of drawers on, and are exceeding tawny.

Great coats are worn by the Chineſe in rainy weather; which are covered with a kind of green oil-ſkin; and they have boots made of good ſtrong leather, when they ride out. At their girdles, they hang their pouch of tobacco, their pipe, which is braſs, their handkerchiefs, and the little chop-ſticks they eat with, and their knife, for they have no other pocket. In winter, people of diſtinction wear rich furs, lamb-ſkins, or quilted cotton. Their ſcymetars, or broad ſwords, are worn on the left thigh, with the point bending forward.

Officers of ſtate and magiſtrates, have ſome animal embroidered on their cloaths, either in gold or ſilver, which expreſſes the nature and dignity of their reſpective offices. The military men chuſe lions, dragons, or tygers; and the civil magiſtrates, birds; which may not be improperly ſtiled their arms, as they diſtinguiſh the ſeveral degrees of honour they have been advanced to, though theſe are diſuſed when they are out of place; honours not being hereditary in China.

The women, who are kept at home, and not expoſed to the ſun, are fair enough; and, except that they have little eyes and ſhort noſes, may vie with our European beauties. Their features are, in other reſpects, tolerably engaging. Their principal beauty is thought to lie in their little feet. As ſoon as a girl is born, her feet are bound up ſo hard, that they cannot grow to their natural ſize; which makes them walk a little aukwardly, the foot of a grown woman not being bigger than that of a child of three years of age. They wear embroidered ſilk ſhoes, in ſhape much like our womens, except that they are turned up at the toes, and that the heels are round and of an equal bigneſs from top to bottom: theſe they make themſelves, and are very proud of ſhewing their fine feet when they have an opportunity.

The ladies uſually dreſs in their hair, part of which is made up in a roll, and faſtened with a bodkin: the reſt is divided into two locks, which fall gracefully upon the neck. In the northern provinces they wear a ſort of caul of thin ſilk over their hair; and in cold weather, in Pe-king, they wrap a kind of cornet, or black hood, about it. They wear, as the men do, a long veſt of fattin, red, blue, or green; the elder women chuſe black or purple; over this they have a looſe gown with wide ſleeves, ſo long that they would reach the ground, if they were not held up.

The Chineſe youth, being bred up under a ſtrict diſcipline, and taught to pay the profoundeſt reverence to their parents and ſuperiors, they ſoon get the command of their paſſions, or at leaſt, find means to conceal them. When they have an intereſt to manage, no people know better how to inſinuate themſelves into the good opinion of thoſe they deal with, or improve an opportunity when it offers; nor will they decline the moſt hazardous undertaking, where they have any gain in view: Throngs of people are perpetually in motion upon their rivers, on their coaſts, and upon the roads; trade and commerce ſeem to be the ſoul of that people, and the ſpring of all their actions; nor do they much ſcruple impoſing on thoſe they deal with, of which many of them are ſo far from being aſhamed, that they will laugh at the man they have bubbled. A foreigner goes in great danger of being cheated, if he truſts to his own judgment, and if he employs a Chineſe factor, as is uſual, both factor and merchant will ſometimes combine together to deceive the ſtranger.

They continually apply themſelves to diſcover the inclinations, humours and tempers of thoſe they have any commerce with; and keep up a fair correſpondence even with their greateſt enemies. However, there do not want inſtances of fair dealing, and open generous uſage, and fidelity not to be corrupted.

There are no duels amongſt them; all their revenge is ſecretly managed, and they cannot only diſſemble their malice, but ſeem patient even to inſenſibility, till they have a favourable opportunity to ſtrike home. Their great men are engaged in a perpetual purſuit of places and great poſts, and carry on their deſigns by bribes and preſents, as in other courts: yet as the laws prohibit theſe practices, and refer all to the merit of the candidate, the moſt ſubtle and deſigning amongſt them ever put on the greateſt appearance of modeſty and ſelf-denial; but however the Chineſe may excel in cunning, it is obſerved, that their courage is not extraordinary.

SECT. IV.

Of the Diet, Liquors, Ceremonies at Table, Saluts, Viſits, &c. of the CHINESE.

THE Chineſe are far from being nice or ſuperſtitious in their diet; they do not only eat all kinds of fleſh, fiſh and fowl as the Europeans do, but horſe fleſh is in great eſteem among them; nor are dogs, cats, ſnakes, frogs, or ſcarce any ſort of vermin refuſed; but rice, roots, pulſe and garden-ſtuff are the common food. Broths and ſoups they have alſo made either of fleſh or fiſh, which they mix with their rice. Salt and pepper are never brought to table, the meat being ſeaſoned in the dreſſing. They eat their fleſh boiled, fryed, and broiled; but it is cut into little ſquare pieces, like dice, before it comes to table. They uſe neither cloth, napkins, knives, ſpoons or forks, but two little round ſticks of ebony, or other wood, ſometimes tipped with ſilver at the ends, with which they take up their meat very dexterouſly; and for their rice and broth they hold the cup to their mouths and lade it in with their little ſticks. They uſe high chairs and tables, contrary to all the people of the eaſt beſides, who ſit croſs-legged upon the floor. Every perſon almoſt has a little lacquered table to himſelf at an entertainment, on which is ſet meat and rice in little china diſhes or ſaucers, and ſometimes their diſhes are of ſilver.

Their principal liquor is tea; they ſeldom, if ever, drink cold water; poſſibly their water is not wholeſome till it is boiled, and ſettled, for it is very foul, eſpecially that of all the rivers, which carries with it a blue or yellow ſlime: and the original cauſe of their drinking tea probably was to refine the water, and make it more palatable. They have ſtrong liquors alſo, particularly hockſhue, which is brown beer made of wheat, and ſamſhue, as they call it; ſpirits, but have no wine, though the country abounds in fine grapes.

They are exceedingly ceremonious at entertainments; every one handles his little chop-ſticks, and carries the meat to his mouth when the reſt of the company do. They drink alſo all at once; taking the cup in both hands they firſt carry it as high as their heads, and then drink without ſpeaking a word. There ſtands a man to keep time, that one may not eat or drink before another; to begin firſt, or make another wait, is reckoned extreme rude. When a freſh diſh appears, they flouriſh their little ſticks again, and having taken two or three mouthfuls the maſter of the ceremonies makes a ſign for them to lay down their arms, which they do exactly in the ſame order they took them up. Then the liquors are preſented the of which they ſip a little, but no man drinks more than he cares for; if he makes the motion it is ſufficient

thus they ſit ſilent at table three or four hours, till the maſter gives the ſign to riſe. Then they walk into the garden, and at their return they find a deſert prepared, conſiſting of dried fruits and ſweetmeats, which they eat with their tea, and a ſet of players are brought in to act a comedy for their diverſion.

Theſe ceremonies required at their entertainments are eſteemed very ridiculous and troubleſome by ſtrangers, but they are looked upon in another light by the natives; they obſerve they are part of the conſtitution, and contribute towards civilizing their people: that thoſe outward condeſcenſions and obliging expreſſions, required of all ſorts of people, in high or low life, tend to promote peace and good order in the ſtate, as well as in every neighbourhood; that the prohibiting coarſe and ſcurrilous language prevents a great many quarrels, and as for oaths and obſcene diſcourſe, theſe are never heard of amongſt the Chineſe. They ſalute one another by laying the right hand on the breaſt, and bowing a little; and when they approach a prince, or great man, they kneel upon one knee, till they are bid to riſe; but it would be an affront, it ſeems, to ſalute a great man as he paſſes along the ſtreets, unleſs the perſon has particular buſineſs with him; but the people ſtand up when ſuch a one paſſes by, fixing their eyes upon the ground, and with their arms acroſs.

When a gentleman deſigns to viſit another, he ſends a ſervant to meet him with a note, intimating his intention; and being informed he is at home, he ſets out, and is received according to his quality. If the perſon he goes to viſit is much above him, the perſon viſited does not ſtir out of his chair; if they are equal, he receives his gueſt at the hall door; and if the viſitor be much his ſuperior, he goes out into the ſtreet to meet him, where they embrace each other with a great deal of ſeeming affection, and a ſet of ſhort compliments paſs, which are preſcribed them; the one knows what he is to ſay, and the other what he is to anſwer, and they ſtop at every door, where their bows and cringes are repeated; one ſays, "Pray walk," and the other anſwers, "It muſt not be;" which being repeated three or four times, the ſtranger ſuffers himſelf to be overcome, and goes on to the next door. If there be more gueſts than one, when they come into the room where they are to be entertained, the next diſpute is who ſhall ſit uppermoſt; and after a great deal of cringing, every one takes the place which belongs to him, according to the poſt or employment he has in the government; they are obliged to ſit upright, with their eyes fixed upon the ground, their hands ſtretched out on their knees, and their feet even; they are to look grave and compoſed, and muſt not be too talkative; and ſometimes there is not a word ſpoken more than the compliments preſcribed. When they do ſpeak, it is with all the ſubmiſſion imaginable, and never in firſt or ſecond perſon; for inſtance, inſtead of ſaying, "I am obliged to you for the favour you have done me," they will ſay, "The favour my lord has done me, who am ſo much beneath him, has laid his ſervant under the higheſt obligations." And inſtead of ſaying, "I preſent you with this curioſity which my country produces," they will ſay, "Permit the ſervant to offer his lord this curioſity which his poor country affords." Again, whatever comes from his lordſhip's noble province is well wrought, or extraordinary fine. And never ſay, "I" or "You," but "Your ſervant" or "Your ſcholar" did ſuch a thing; The doctor, or My lord, ſaid this or that; and not, You ſaid, or You did it; this would be reckoned the height of incivility, and a manner of ſpeaking only to be uſed to ſlaves.

Tea is the uſual liquor drank upon a viſit; and much ceremony is there uſed in taking the diſh, carrying it to one's mouth, and ſetting it down, or returning it to the ſervant; and when they take leave, much the ſame cringes are repeated as when the gueſts arrive. Ambaſſadors are allowed maſters of the ceremonies to inſtruct them forty days before they are admitted to their audience, that they may commit no blunders, and many of the Chineſe will be offended with ſtrangers, if they omit to cringe and fawn, according to the rules preſcribed them.

The Chineſe are ſo far from putting off their caps when they ſalute one another, that it is reckoned very indecent to appear before their betters bareheaded: and upon this account, in conformity to the cuſtom of that country, the Pope thought fit to diſpenſe with the miſſionaries appearing bareheaded in the Chriſtian churches in China.

Gaming, though prohibited by the Chineſe laws, is much practiſed amongſt them, and there are inſtances of thoſe who have followed it ſo immoderately, that they have played away their eſtates, wives, and children; which they will ſometimes hazard upon a card, or a ſingle caſt of a die.

SECT. V.

Giving a Deſcription of the Highways, travelling, and Carriages of the CHINESE.

HIGHWAYS are thrown up from one end of the kingdom to the other, though more people travel by water on their canals, than by land; and their grand canals are faced with ſtone, the veſſels being drawn by the ſtrength of men.

Their highways are conſiderably raiſed over vallies and low grounds; and they cut paſſages through mountains and rocks, that travellers may the more eaſily paſs them. Their roads are about twenty yards wide; and at proper diſtances they have little wooden buildings, thirty feet high, called mercuries, erected upon them, to direct the traveller; they are not unlike their triumphal arches, and ſtand at about a mile and a half diſtance from each other; over them are written, in large characters, the names of the towns whither the roads lead, and their diſtances, which are exactly meaſured at the charge of the public. The country militia keep guard here, and have a guard-houſe, for the ſecurity and protection of travellers, and forward all expreſſes and diſpatches that are ſent to or from court. The guards examine people that go armed, and, if they cannot produce a paſs, detain them. Such care is taken, that a robbery is ſeldom heard of: another reaſon that ſo few robberies happen is, all people are employed; for it may be ſaid, with a great degree of certainty, that there is not an idle hand to be found from one end of the empire to the other.

Their roads are conſtantly in good repair; which is attributed to the emperor's annually viſiting the different provinces; and whether he goes, or not, it is given out that he deſigns to make a progreſs through ſome part of his dominions; and if he finds the roads bad, the governors and magiſtrates of the places through which he paſſes are in danger of loſing their heads. It is, however, very inconvenient travelling by land in a dry ſeaſon, the ſoil being light and beaten to powder by conſtant trampling and the numerous carriages, inſomuch that they travel all day through clouds of duſt; which is one reaſon why many people chuſe, in ſummer-time, to go by water.

The Chineſe have horſes, mules, and camels to ride on, but they chiefly travel in litters carried on men's ſhoulders, or by mules. Some gentlemen travel in vehicles, which they denominate chariots, with two wheels, not unlike poſt-chaiſes. Their travelling chairs are made of cane, but have no windows, only the upper part of the front is open; the chairmen carry the poles on their ſhoulders, and not in their hands as with us. The Tartars uſually ride on horſeback both in towns and upon the roads; their ſaddles are made like thoſe in Turky, and, like the Turks, they ride very ſhort, with their knees almoſt as high as the top of the ſaddle; and when they engage an enemy, they riſe up and ſtand on their ſtirrups, to give the greater force to the ſtroke they make.

Goods are frequently carried by porters on their backs; the roads are full of them: the boats are drawn by men almoſt naked, both driven hard and uſed almoſt as barbarouſly as beaſts of burden are in this part of the world.

Upon all the roads are houſes for the entertainment of the governors and officers, going to and returning from their poſts, where they live at the public expence, and have horſes and carriages provided for them at every ſtage: and here all other travellers may have the ſame conveniencies, that can procure an order for it, which is not difficult to obtain; and if they have not ſuch an order, may be accommodated with every thing they want at a reaſonable price. A book of the roads is publiſhed by authority, wherein the diſtances of towns are aſcertained, and the ſtages proper to reſt at; and the men that carry chairs or litters, it is ſaid, will travel five miles in an hour.

SECT. VI.

Containing an Account of the Nature of the Soil, its Produce, their Huſbandry, Plants, Animals, Mines, &c.

AS China, like other countries, of a large extent, conſiſts of hills and vallies, we muſt therefore naturally expect to meet with a great variety of ſoils, grain, fruit,

plants and animals. The mould or vegetable earth is exceeding light and porous in moſt provinces, ſo that a ſingle ox or buffalo will draw the plough, and in ſome places the ploughs are drawn by men. The mountainous provinces of Shen-ſi, Ho-nan, Quan-tong, and Fo-kyen indeed are not very fit for tillage, but they are covered with excellent timber. In the provinces of Pe-king, Shan-ſi, Shang-tong, and Fo-kyen, wheat and barley thrive well; and in Hu-quang, Nan-kin, and Che-ky-ang, which are low countries, and frequently flooded, they have great plenty of rice.

When they have cleared a field of weeds, that is intended for rice, they turn the water into it, and reduce it into a perfect hotch-pot; and having ſown the rice firſt in beds, where it comes up too thick to yield much, they tranſplant it into their fields, when it is grown ſix or eight inches high, and ſupply the fields with water, in which it grows till the rice is almoſt ripe; after which the water being dried up in the fair ſeaſon, they cut and threſh it out, uſually in the fields where it grows, and in ſeveral provinces have two crops in a year. The rice is more like oats than any other grain; the ſtraw hard and ſolid, of which whiſks are made; and we frequently find ſome grains of rice left in the ſtraw. There needs no dung to render the land fruitful which is ſown with rice; the water ſupplies the place of dung, as well as rain; but for wheat and barley, they uſe all manner of compoſt, and frequently burn the turf, the aſhes whereof are eſteemed a good manure. In the corn fields we ſee neither trees, hedges, or ditches; they do not loſe an inch of ground that will produce corn.

This country, extending from the tropic of Cancer to the latitude of fifty degrees and upwards, has all the fruits proper to hot and cold climates, and ſome plants that are not found in any other part of the world. They have moſt of the fruits that are known in Europe, as peaches, apricots, figs, grapes, apples, pears, walnuts, cheſnuts, and olives, but make no oil of the laſt; there are alſo cocoas, mangoes, guavas, plantains, ananas or pine-apples, which they have brought from India; they have, likewiſe, pomegranates, melons, oranges, lemons, citrons, limes, and other tropical fruits; and from hence the Portugueſe tranſplanted thoſe fine ſweet oranges, called China oranges, which come to as great perfection in Portugal as in China. There is a great variety of ſweet oranges, beſides thoſe imported by the Portugueſe; ſome of them are preſcribed to ſick people, being roaſted in the embers; others are ſqueezed flat, and converted into a wet ſweet-meat, of which jars are frequently brought to England.

They have alſo ſome fruit which do not grow in Europe, particularly the fruit lichi is in great eſteem among the Chineſe, and is peculiar to the country. It is a kind of plum of the ſize of a large walnut, the meat is ſoft and wateriſh, and has a moſt delicious flavour, and has a long ſtone; this fruit, being dried, turns black and wrinkled like a prune: they preſerve them all the year to eat with their tea, to which it gives a ſharpneſs much more agreeable than ſugar.

The largeſt fruit that grows in China is the jaka, which has within it a great many yellow nuts, and afford a delicious kernel. This fruit grows to the body of the tree, for, it is ſaid, the tree is too weak to bear it.

There are trees in the province of Quang-ſi, which inſtead of pith, have a ſoft pulp, of which they make flour of a pretty good taſte.

The varniſh-tree, whoſe leaf and bark reſemble the aſh, ſeldom grows more than fifteen feet high. When it is about a foot in compaſs, they make inciſions round it with a pruning-knife, and hang veſſels underneath them in the evening, and find a conſiderable quantity of the liquor in them the next morning; but the people who draw the varniſh, or work in it, are forced to cover themſelves from head to foot, or they endanger their healths, if not their lives. This varniſh preſerves the wood, beſides giving a beauty to cabinets.

An oil is alſo drawn from another tree almoſt like varniſh, which has not thoſe ill effects which the former has: this is ſometimes called lack, from whence things waſhed with it are called lacquered ware; but the words lack and varniſh are moſt commonly mixed together, and uſed indifferently for each other.

China is remarkable for a ſort of white wax, not made by bees but gathered from trees, which they have in ſuch abundance, that it ſerves the whole empire. It is found chiefly in the provinces of Hu-quang and Shang-tong: it is produced by an inſect not bigger than a flea, which has a ſting ſo ſharp, that it pierces the bark, and even the body of the trees. The country people gather the eggs of this inſect in the ſpring, from whence proceed worms, which they place at the foot of the trees that are proper for them: they creep up and diſperſe themſelves through all the branches, and penetrating to the very pith, convert their nouriſhment into wax as white as ſnow, which they work out of the hole they have made; it hangs congealed in drops about the tree, and the people gather it and make it into cakes for the market. Their tallow, which is produced by a certain tree, will be mentioned under the next head of plants. Neither cloves, nutmegs, mace, or cinnamon, grow in China.

There is another fruit peculiar to them called louyen, or dragon's eye, it is exactly round, yellowiſh when it is ripe, full of juice, and very cool and inoffenſive. Of all their trees, their tallow-tree is the moſt remarkable: it is of the height of a cherry-tree, the leaf ſhaped like a heart, and of a lively red; the fruit is encloſed in a rind divided into three ſegments, which open when it is ripe, and diſcover three white kernels as big as a ſmall nut; theſe trees being planted in a ſtraight line chequerwiſe, this mixture of white and red makes them look like a parterre of flower-pots at a diſtance; but what this tree is moſt valued for is the kernel, which has all the qualities of tallow, both in ſmell, colour, and conſiſtency, and they make their candles of it; but the wick being made of ſmall dry ſtick, inſtead of cotton, they cannot poſſibly burn ſo clear as ours, and create a very offenſive ſmell.

They have alſo a tree like the walnut-tree peculiar to this country, which bears a ſeed about as big as a pea, much like pepper, and which the inhabitants uſe inſtead of it. Their kitchen gardens abound in all manner of herbs and ſallads, roots, peas, and beans, and a variety of other pulſe.

No fountains are to be met with in any part of China, except in the emperor's gardens.

Tea or tcha, is a plant peculiar to this country: it uſually grows at the foot of ſome mountain, and the beſt upon a ſtony ſoil: the root reſembles that of a peach-tree, and its flower that of white wild roſes. The tree is of all ſizes, from two feet to an hundred in height, and ſome of them are ſo thick, that two men cannot graſp them according to the Chineſe herbal. But though there may be ſome very high and large trees, as thorns will ſometimes riſe to a great height, it is accounted but as a buſh or ſhrub, and generally grows about as high as a roſe-tree. It is planted upon little hills, each plant about three feet diſtance from another, and does not commonly grow wild. A judicious traveller tells us, he ſaw this plant in the province of Fo-kyen, where it grew upon the ſide of a little hill, and the plant was not above five or ſix feet high; that ſeveral ſtalks an inch thick a-piece were joined together, and dividing at the top into ſeveral little branches, formed a kind of cluſter like our myrtle: that the trunk ſeemed dry, but bore green branches and leaves; the leaves are narrow, ending in a point, and were an inch, or inch and a half long, and indented; that the oldeſt were white and brittle, and taſted bitter; the young ones were ſoft, ſmooth, reddiſh, and tranſparent, and pretty ſweet to the taſte.

The three ſorts of tea commonly brought to Europe, are all from the ſame plant, and only the ſeaſons of the year when it is gathered, the different manner of curing it, and the ſoil makes the difference. Bohea or voiij, ſo called from ſome mountains in the province of Fo-kyen, where it grows, is the very firſt bud gathered in the beginning of March, and dried in the ſhade: the imperial or bing tea is the ſecond growth in April; and ſingle or common green tea the laſt, in May and June, which are both dried in little pans over the fire. The tea ſhrub is an evergreen, and is in the flower from October to January. The ſeed is ripe in September and October following; but for one freſh and full ſeed there are a hundred naught. Its ſeed veſſels are tricapſular, each capſula containing one nut or ſeed; but though there be the veſtiges of ſeveral only one comes to perfection. It may be neceſſary to obſerve further, that we are aſſured the bohea is cured by laying the leaves on hot copper-plates, and the other is dried in the open air, and both the green and bohea have ſome ingredient mixed with them, which may contribute to produce the ill effects complained of; for though all tea be naturally green, yet that colour is heightened by ſome ingredient; and the bohea is changed yellow by another ingredient; but how or with what drugs this is done, the Chineſe have hitherto concealed from us. We ſhall only add, that this ſhrub does not grow either in the coldeſt or

CHINESE, *method of taking* WILD-DUCKS. *Also their way of* CATCHING FISH, *and a famous* WATER CASTLE.

the hotteſt parts of the country, but between twenty-five and thirty degrees of north latitude, and more in the province of Kyang-ſi than any other; and though this plant will grow almoſt in any climate, it degenerates, and is good for little, if it be tranſplanted and carried to any country, though lying under the ſame parallel.

Ginſeng, or man-plant (ſo called, becauſe the root divides into two branches, reſembling a man's thighs) is uſed as a tea by the Chineſe, who for that purpoſe infuſe the leaves, and ſometimes the root in boiling water. The natives aſcribe the virtue of every other ſimple to this plant; but it is ſo ſcarce, and conſequently dear, that none but the court, and people of condition, can afford to purchaſe it. A ſingle diſh is enough to drink at a time: more would produce ill effects. This is gathered in Tartary, and the provinces bordering upon it: the natives call it the plant which diſpenſes immortality, beſides other pompous names.

The weeping-willow tree is much admired by the Chineſe, who plant it on the ſides of all their canals and rivers, and near moſt of the ponds in their gardens; they deem its ſhade the moſt pleaſing of any, and their paſtoral poets mention it with peculiar reſpect.

The iron-tree is alſo a native of this country: its wood is ſo extremely hard and durable, that anchors are formed of it, which, the Chineſe affirm, will laſt longer than thoſe which are made of iron.

The bamboo or cane-tree, is pretty high and thick: the bud has an excellent flavour, and the pith is very agreeable eating; it grows in marſhy grounds, is uſed in buildings, and the tubes of it are often converted into water-pipes.

The herb of a thouſand years alſo grows in China. This, the natives pretend, never dies: and they have a flower called mu-tang, much admired, which opens like a roſe; and it is of a purple colour, ſtreaked red, white, and yellow, which grows upon a ſhrub in their gardens; but this country does not produce a great variety of flowers.

Some of the Chineſe emperors have not thought huſbandry below their care. Their hiſtories relate that the Emperor Ven held the plough himſelf; and that his empreſs planted mulberry-trees, bred ſilk-worms, and cloathed her family with the ſilk they produced; and they have a yearly feſtival at the vernal equinox, when the governors of towns and provinces, march in proceſſion, with the inſtruments of huſbandry carried before them. The Emperor Hiaen, it is related, applied himſelf to the ploughing and ſowing the ground three years ſucceſſively, and ſent perſons ſkilled in huſbandry to the moſt diſtant provinces, to teach the people how to improve their grounds: and many books have been wrote by their princes on the ſubject of tillage.

Their animals are, camels, horſes, oxen, ſheep, hogs, ſome few elephants, and all manner of wild beaſts. Their beſt horſes are brought from Chineſe Tartary: thoſe in the ſouth of China are a ſmall breed, not fit for draught, or to carry burthens. The black hogs, with bellies that touch the ground, come from this country. Their ſheep are like thoſe of Turky, having great tails that weigh ſeveral pounds. Here are alſo rabbits and hares in great numbers. They have all manner of poultry, and hatch their eggs in ovens, heated with horſe-dung, as in Egypt; and here is an odoriferous ſtag, which produces muſk.

They abound alſo in ſea and river fiſh; and beſides the common way of taking fiſh in nets in their rivers and canals, they make uſe of a large fowl, or cormorant, which ſtands perched on the ſide of a boat, and when the maſter gives the ſignal, the bird takes its flight, and looks out for game, and having ſeized a fiſh, brings it to its maſter: ſome fly great numbers of theſe birds at once, and they will divide a river or lake amongſt them, and return to their maſters with the fiſh they have taken; and if the fiſh are large they will help one another to bring it to the boat, after which they take their flight again in ſearch of more: having ſtrings about their necks which prevent their ſwallowing any, till their maſter leaves off, and then they are ſuffered to prey for themſelves. Beſides the fiſh we have, there are ſome ſorts we want, particularly the gold and ſilver fiſh, which gentlemen keep in baſons in their gardens. They are not much larger than a man's finger: the male is of a fine red to the middle, and the reſt, with the tail, of bright yellow or gold colour: the female is of a ſilver white; the tail of either gathered thick like a noſegay: but theſe need no further deſcription, as ſome of them have been brought alive, and are now to be ſeen in England.

The Chineſe have mines of copper, lead and iron; and a mineral called tutenag, which has the reſemblance of tin; and it is ſaid there are gold mines. It is certain, gold is more plentiful in China than in any other country, which is the reaſon that private merchants, when they have made their fortunes by trading in India, bring home their wealth in gold duſt, which they purchaſe in China; and indeed all the gold found there is duſt waſhed down from the hills into rivulets, which being almoſt dry in the hot ſeaſon, the natives employ themſelves in taking up the ſand in ſieves and baſons, and ſeparating the gold from it. There is this further reaſon that private men bring home in gold duſt the amount of the riches they have acquired in India, namely, becauſe they are not permitted to bring to England any of the goods imported by the Eaſt India Company.

SECT. VII.

Containing an Account of the Manufactures and Traffic, Silk, Porcelane or China-Ware, &c. of the CHINESE.

THE chief manufactures of China are, ſilk, porcelain or china-ware, and cabinet-work. The Chineſe ſilk is reckoned the fineſt in the world. That which the natives eſteem the beſt is produced in the provinces of Nankin and Che-ky-ang: but foreigners ſet a great value on that of Canton. Great quantities of raw ſilk are imported from thence at preſent, as the duties (which were lately ſo high that they amounted to a prohibition) have been reduced by act of parliament. Wrought ſilks are alſo imported from China by the Engliſh Eaſt India Company; but theſe are exported again, being prohibited to be worn here. Both plain and flowered ſilks are brought over, but the figures are not raiſed, conſiſting only of different colours and ſhades: the principal figure is uſually a dragon, being the imperial arms which Fo-hi, the founder of the empire, gave, it is ſaid, four thouſand years ago. They work another dragon in their ſilks, called mam, with four claws, which every one is permitted to wear.

They have alſo manufactures of velvets, crapes, druggets, ſerges, and tammies; but they make no cloth, though they have exceeding good wool. In the northern provinces they ſet a great value upon Engliſh cloth, of which the India Company have been obliged to ſend over a great deal, and it was dearer than ſilk in China; but ſince ſo many other European nations have traded to India, the demand for the Engliſh cloth has greatly decreaſed.

There is a very great manufacture of cotton linen in this country, and another ſort of linen made of a plant called lo, which grows the bigneſs of a man's finger, and is found no where elſe. When it is dry, they bind it up in ſheaves, and water it like flax or hemp. The firſt ſkin being peeled off and thrown away, they divide the fibres of the next into ſmall threads, and, without beating or ſpinning, make a kind of linen of it, which is tranſparent, and exceeding cool and light. The common people uſually wear coarſe blue linen quilted with cotton, or lined with ſheep ſkins in the winter; and people of condition line their veſts and gowns with the ſables or fox-ſkins in cool weather: they only turn up their ſleeves, or border their veſts with ermines, which are very ſcarce here.

The Chineſe have two ſorts of raw ſilk; one is made by wild worms in the fields and upon the trees of the foreſt, which has no gloſs, is of a grey colour, very ſtrong, and waſhes like linen; it is highly valued, and coſts more than ſattin: for the other ſilk, they feed the worms in their houſes, with mulberry-leaves, forty days, and manage it as in Europe. They are ignorant of the art of wire-drawing, and conſequently have no gold and ſilver thread: to ſupply this defect, they roll their ſilk in thin wire plates, to give it the tinge; and ſometimes, inſtead of gilding the thread, they apply the leaf gold to the ſilk in the piece. This ſplendid finery ſoon tarniſhes, and is worn only by mandarins of high rank, and the ladies of their family.

Another very conſiderable manufacture in this country, is the porcelain or china-ware. It is made of a very ſtiff clay, or rather, ſoft white ſtone, found in the quarries of the province of Kyang-ſi; the pieces whereof being waſhed, and ſeparated from the other earth wherewith it is mixed, are beaten to a very fine powder, which they make into a paſte, and knead and beat it a long time afterwards, that the water may the better incorporate with it. They uſe a particular water, which is not to be found in the ſame part of the country the earth is: it is impregnated with a peculiar ſort of ſalt which purifies and refines the clay more than any other. When the paſte is ſufficiently kneaded, they

they form their veſſels and expoſe them to the ſun morning and evening; but take them in when the ſun is too hot, or it will warp them. Thus they dry the veſſels by degrees, and paint them as they find the earth proper to receive it. They alſo waſh over the cups with a ſort of lye or varniſh made of the ſame matter the porcelain is compoſed of, which gives them a particular luſtre. After this they bake them in a furnace, which they heat with a gentle uniform fire, and, for fear they ſhould receive any damage from the air, they do not draw them out immediately after they are baked, but let them cool gradually before they expoſe them to the air; from whence it appears that it requires a great deal of care and patience to bring this neat ware to perfection: but it is a great miſtake to think it takes up a hundred years, as ſome have reported; nay, it is evident that it is not many months about; for we ſend them the patterns of ſeveral veſſels from Europe, which they imitate, and return us the kinds we propoſed in a very ſhort time. The voyages which formerly took up nine months, is now accompliſhed in about five.

Their china-ware is of three different ſorts; and is diſtinguiſhed by the different colours: the firſt is yellow, and though this is coarſer than either of the other, yet, it being the imperial colour, is always uſed in the Emperor's court, and is not allowed to other people. The ſecond ſort is grey, with abundance of ſmall irregular lines in it croſſing one another; theſe are the moſt beautiful, but very rarely brought to Europe. The laſt, and moſt common ſort, is white, painted with flowers, trees, and birds, of a pure blue, which our merchants principally buy up. This ware is valued according to its fineneſs, its whiteneſs, the ſmoothneſs, the painting, and faſhion. The fineneſs is diſcovered by the tranſparency, which may be judged of by the edges where it is thinneſt. The whiteneſs is not to be judged of by the outward varniſh, but the earth itſelf is to be examined; and this appears the whiter the older it is, when the varniſh is in ſome meaſure worn off. If there be the leaſt wharl or roughneſs upon the ſurface, it is accounted a very great fault; it ought to be perfectly ſmooth and even throughout.

Their red painting, it is obſervable, are ſeldom very lively upon theſe veſſels, though they do not want very fine reds in China; but their blue is excellent; however, if care is not taken by the workmen, the whiteneſs of the porcelain will be ſullied by a blueiſh water which flows from the colour. Their flowers, it is obſerved, are pretty juſt in their painting; but their human figures monſtrous: and the reaſon of it is ſaid to be, becauſe regular pieces are not ſo taking in China as the miſ-ſhapen ill-proportioned pictures they ſend us.

The proceſs of painting the porcelain is ſomewhat tedious, and employs a great number of hands; it is the buſineſs of one to make the coloured circle near the edge; another traces the flowers, which are painted by a third; a fourth is employed in the formation of birds and other animals; a fifth forms rivers, rocks, &c. and a ſixth is engaged in the figures of men and women. Though they acquit themſelves tolerably well in drawing flowers, and in ſome other imitations, yet their repreſentation of animals are for the moſt part very aukwardly executed; which muſt be either the effect of ignorance in the rules of ſymmetry and proportion, or muſt proceed from an affectation of the groteſque.

They dip a pencil into the varniſh, when they paint in gold or ſilver, and draw the flowers and birds they deſign, and, letting it lie till it begins to dry, they lay on thin leaf gold and ſilver, or pin-duſt. Japan being the country we firſt received the fine cabinets from, we give this name to the lacquered ware we import from China and Tonquin; and perhaps it is all denominated Japan ware, becauſe the Japaneſe are the greateſt maſters in this art.

Paper in China is made of the inward bark of the bamboo, or large hollow knotted cane, which they beat, and make their ſheets ten or twelve feet long; it is mighty thin and ſmooth, and waſhed over with a ſort of varniſh, to prevent the ink's ſinking: but it is not ſo laſting as the paper of Europe; for being made of the bark of a tree, the worm is apt to take it; and this is the reaſon they have no ancient manuſcripts in China: their libraries conſiſt only of copies of authentic originals, being forced to tranſcribe or reprint their books in the ſpace of a few years.

The Chineſe ink is compoſed of lamp-black, extracted from ſeveral materials; but the beſt is made of hog's greaſe burnt in a lamp; they mix a ſort of oil and perfumes with it, which gives it an agreeable ſmell; having made it into a paſte, they form it into little long ſquare ſticks with a mould, and dry them; when they write they rub this ſtick in a little water, and it will make a ſhining black ink, which never ſpreads beyond the ſtroke of the pen or pencil, though the paper is ſo fine that it ſometimes ſinks through, and diſgraces the writing.

The making of ink is eſteemed a very reputable employment in China; and is even ranked among the liberal arts, from its utility to the ſciences, we may reaſonably ſuppoſe. In the city of Hoei-tcheou, famous for the fineſt ink, the ink-makers have ſeveral ſmall apartments lighted up both day and night with lamps, where they manufacture this uſeful article.

The Chineſe carry on a very extenſive trade with foreigners, moſt of the nations of Europe importing the produce of their country: but they never make any long voyages themſelves. All their merchandize is tranſported to Europe by European ſhips; but with all the nations of India the Chineſe trade in their own bottoms, but no people are more induſtrious, or will run greater hazards to increaſe their fortunes than theſe people will in the Indian ſeas: they have alſo a vaſt inland trade, from one province to another, by their canals, every province being ſupplied by water-carriage, with the merchandize of thoſe that lie the moſt diſtant from them. The profit they make of the ſilks, china-ware, and other produce of their country, is immenſe: as few countries produce the ſame articles, they ſet what price they pleaſe upon them, and receive chiefly ſilver in return: and yet ſo cautious they are, that they will not ſuffer the nations that bring them all this wealth to enter their towns.

Canton is the only port we traffic with, and there we are admitted no further than the ſuburbs. They ſee how the Dutch have depoſed many of the Indian princes, and uſurped the dominion of their reſpective countries: they know that their forces are not equal to European armies: and, to ſay the truth, it is only their great diſtance from Europe, and the vaſt extent of the Chineſe dominions, that ſecures them in the poſſeſſion of their country. If China lay as near France as Germany does, the grand monarch would long ago have made a conqueſt of it, and monopolized all its rich produce. The Dutch would, no doubt, have done it, if they could have ſent colonies ſufficient to have kept ſo large a kingdom in ſubjection to them. The ſame pretences would have ſerved them to have invaded China, as they made uſe of for attacking Java, Macaſſar, and the Spice iſlands, which would have been acquiſitions equally valuable to them.

If the foreign merchants do not ſettle ſome preliminaries with the hippos, or commiſſioners of the cuſtoms at Canton, before the ſhips ſail up the river, they will be notoriouſly impoſed upon in China. The ſupercargoes and captains, therefore, are adviſed to remain at anchor at the Portugueſe iſland of Macao, till the meaſure of the ſhip, and the licence for a free trade are adjuſted; and when they come up the river, preſents muſt be made to the Cuſtom-houſe officers, or they will be very troubleſome; but it is more adviſeable to give them from time to time ſmall preſents, than to advance large ſums; for if they are ever ſo large, they will be forgot, if their memories are not frequently refreſhed. An even temper and mild language, it is obſerved, are qualifications very neceſſary for our ſupercargoes; they will do well to imitate the Chineſe in theſe articles, who are greater proficients in the art of diſſimulation.

Very little is gained by any merchandize ſent to China; the profit ariſes by the goods imported from China; and there is the greateſt care in the world required in the ſupercargo to prevent his being impoſed on. If he does not view the goods with all imaginable caution, and examine their weights and meaſures, he muſt expect to be cheated: and at laſt they have ſo many tricks, that it ſeems neceſſary to weigh the goods in Engliſh ſcales after them. Where men have truſted to their package, they have been as much deceived as in their weights. They have found cheſts, boxes, and caniſters, ſo exactly counterfeited and marked, that they have not doubted of their being their own, when they have been changed for others, filled with damaged goods, in the room of thoſe they brought with them.

Our merchants, beſides china-wares, tea, ſilks, and lacquered ware, bring home quickſilver, copper, camphire, fans, pictures, ſoy, borax, lapus lazuli, galingal and tutenag; and, notwithſtanding the exportation of gold is prohibited, their governors themſelves will ſell it clandeſtinely, and our merchants may gain near fifty per cent. by it. Pieces of uncoined ſilver are taken away by weight, inſtead of money. When payments are made in plate, ſuch as diſhes, bowls, tankards, baſons, &c. they will cut a piece out of them, and try the fineneſs of the ſilver.

Goods carried to China, beſides plate and bullion, are cloth, perpetuanas, camlets, red, black, blue and violet colours, which do little more than pay the duties, and bring the prime coſt. Lead turns to the beſt account of any thing ſent thither by the company. A private trader may carry coral in branches, amber-beads, horſe-piſtols with gilt barrels, ſword-blades of about fourteen ſhillings a dozen; clocks and watches that look well, but are of a ſmall price, and any new toy, which if he can carry on ſhore, without paying the duty, he may make a better voyage than with all ſilver; otherwiſe his charges will exceed his profit. Theſe ſmall articles laſt mentioned, the company do not concern themſelves in; but permit the officers and private men to try their fortunes with them. We muſt obſerve here, that the watches ſome years ago exported from England to theſe parts, being of ſuch indifferent workmanſhip, our rivals the French have in a great meaſure undermined us in that branch of trade.

In the laſt century, the charters for monopolizing the India trade were once looked upon as a national grievance, and in the reign of Charles II. ſeveral eloquent ſpeeches were made in parliament againſt monopolizers in general, and this of the India trade in particular, but without the deſired effect. It was however, expected at the Revolution, that this trade would have been laid open. But the company, by their powerful intereſt among ſome leading men in the ſtate, procured an act of parliament for an excluſive trade; which was farther ſecured to them by the vaſt ſums of money they advanced for the ſervice of government; and the immenſe quantity of wealth that has accrued to the company of late years from their trade and poſſeſſions in various parts of the Indies, together with the emolument ariſing from it by loans and otherwiſe, has moſt ſtrongly cemented their former good underſtanding, and eſtabliſhed their commerce on an immoveable baſis.

SECT. VIII.

Of the CHINESE Arts and Sciences, Language, Learning, Method of Education, Laws, &c.

THE reaſon that the Chineſe fall ſhort of the Europeans in the ſpeculative ſciences, does not proceed from any defect in their capacities or intellects (for they are acknowledged by all to be a very ingenious people) but from their ſituation; being ſeparated ſo far from the reſt of the learned world, and converſing with none but people ſo much inferior to themſelves, it is rather to be admired they have made ſuch great advances in arts and ſciences, than that they have gone no further, conſidering they have had no advantage by travelling, or any foreign aſſiſtance; their knowledge being very defective when the Europeans firſt came amongſt them.

Their knowledge of phyſic is but trifling: which is not to be ſurprized at, ſince they are ignorant of natural philoſophy, phyſics, and anatomy, which are the foundation of it; but pretend to mighty ſkill in pulſes, and will pronounce what diſtemper the patient is afflicted with, how long it will laſt, and whether it be like to prove fatal, after they have duly conſidered the pulſe. They are not always to be relied on, the Jeſuits obſerve, but their ſkill in this particular is wonderful, though they can much eaſier reſolve what the diſtemper is, than aſſign a remedy for it. They have no apothecaries, but every phyſician prepares his own medicines, which are generally made up in pills, but ſeldom purge, nor do they ever let blood or give a clyſter; they imagine that diſeaſes generally proceed from a malignant corrupt wind, which they endeavour to diſſipate by applying red hot needles or irons like buttons to that part; and thus they torment and cauterize their patients upon the ſlighteſt indiſpoſition. And ſome diſeaſes, eſpecially that called the mordechin, which is a violent cholic and vomiting, occaſioned by indigeſtion, is cured by applying a red hot iron plate to the ſoles of the feet; but nothing is more frequently preſcribed than cordials, which are extracted from herbs and roots. They abound in ſimples, which have their different virtues. Their frequent drinking of tea is ſaid to preſerve them from the ſciatica, as well as the gout and ſtone, with which they are never afflicted. The root ginſeng, which has been mentioned among their plants, is eſteemed one of their beſt cordials: and the root called pao china is an excellent ſudorific, and purges the humours and corrupted blood. Every man is permitted to practiſe phyſic in China; no degrees or qualifications are required but a good aſſurance, ſo that their phyſicians are generally no better than thoſe pretenders to phyſic which diſgrace this country.

They have long diligently applied themſelves to aſtronomy, and made above four hundred obſervations, as well of eclipſes and comets as conjunctions: however in this they were not exact, but have regulated many things ſince the Jeſuits came amongſt them, and ſuffered them to reform their calendar; but however the Chineſe may have failed in the mathematics, they are perfect aſtrologers, there being little more requiſite to render one maſter of that ſcience, than the being an expert juggler, and knowing how to lie artfully, in which the Chineſe are ſaid to excel. There are, it ſeems, pretenders there as well as here, who by the ſtars foretell all events, and in their almanacs ſhew the lucky and unlucky days for marrying, undertaking journies, voyages, or any buſineſs of conſequence. The Chineſe divide their day into twelve parts, whereas we make twenty-four; and begin their day from the hour of twelve in the night. They had no clocks or watches till the Europeans carried them thither; but they had ſun-dials, which were divided into four parts, each part containing twenty-four ſubdiviſions, which added to the four larger diviſions made the whole to conſiſt of one hundred parts. But they have of late regulated their dials, and reckon their time almoſt as we do.

The months in their almanacs are lunar; and in theſe are ſpecified the times when the ſun enters into every ſign, together with the equinoxes, ſolſtices, the courſes of the planets, and their places in the ecliptic, their oppoſitions, conjunctions and neighbourhood to ſome remarkable fixed ſtars; but before the miſſionaries taught them, their tables of eclipſes were very incorrect. The people imagined, when there happened an eclipſe of the ſun, that there ſtood a great dragon in the heavens, ready to devour him; and therefore beat upon their brazen pans and drums, to drive him away; and ſtill it is ſaid, the magiſtrates and great officers at Pe-king, when the ſun is eclipſed, fall upon their knees, and looking towards the ſun beg the dragon to have compaſſion on them, and not deprive them of the beneficial influence of this glorious luminary.

Inſtead of letters, the Chineſe uſe characters, which compoſe a kind of ſhort hand, where one letter ſignifies a word or a ſentence; and though they have a different dialect in different provinces, ſo that the people do not underſtand each other, yet the characters in writing are underſtood by every one, as a figure of 3 or 6 is underſtood in every country in Europe. There are more than twenty thouſand of theſe characters; and he is eſteemed a very learned man that is maſter of fifteen thouſand. Indeed great part of their lives is taken up in acquiring their own language, which is thought to be one reaſon of their not being better proficients in the ſciences; but there are ſeldom more than two or three hundred of them underſtood by the common people.

The method of printing in China is very different from that practiſed in Europe. The author of a book in this country firſt gets it fairly tranſcribed; then the engraver glues each leaf upon a ſmooth board, and cuts through the written paper; ſo that the character perfectly reſembles the original copy, nor is there any difference between the print and written hand. Hence the boards uſed in printing a book of an ordinary ſize would fill a large room: whereas we ſet a ſheet with the twenty-four letters, and having made an impreſſion, diſtribute the letters, and ſet another ſheet with them; but then their way of printing has this advantage of ours, that they can have as many impreſſions as they pleaſe; there is no occaſion to ſet the preſs again, and there can be very little occaſion for a corrector; for the author having his copy fairly tranſcribed, the engraver ſpreads the leaves on a board, and cuts through the paper, and, conſequently, the copy perfectly reſembles the manuſcript.

Where men ſtand candidates for preferment, they are required to have ſuch learning as the country affords. Money will not do alone, where a perſon is perfectly unqualified to execute the office he deſires; though where two are equally qualified, a preſent, judiciouſly applied, will have its weight. When a young fellow has made himſelf, in ſome meaſure, maſter of the language, and been examined by the magiſtrate of the place where he reſides, he is admitted a ſtudent in ſome college. For a ſecond degree, he paſſes an examination before the chief magiſtrate of the province. On taking a third degree, he is examined by the emperor's commiſſary. And the laſt degree is taken at the capital city of Pe-king, their travelling charges being borne by the government. Here the emperor frequently examines the candidate in perſon, for the dignity of the prince is not thought any reaſon for exempting him from a learned education; and, conſequently, he is generally qualified to

judge of the merit of another. When the doctors, as they are termed, have paſſed this examination, garlands of flowers or other tokens of the emperor's favour are conferred on the moſt deſerving; ſome of them have places aſſigned them in the royal academy, and uſually ſucceed to the beſt poſts in the government, as vacancies happen.

The Chineſe have no hereditary nobility, or any other diſtinction of quality but what the office a man executes gives him; ſo that, except the deſcendants of Confucius, the whole kingdom is divided into magiſtracy and commonalty. There are no baſe tenures, their lands are properly their freeholds, having no ſuperior lord but the emperor, and he can by his own authority tax all the lands both of prieſts and people as he pleaſes. There being no ſuch thing as quality or nobility, the whole nation apply themſelves to trade or huſbandry, and have no idle hands among them, or drones that live intirely upon the labour of others. One of their emperors uſed to ſay, that if he knew a ſlothful perſon in his dominions, who refuſed to work, he ſhould think another of his ſubjects would ſuffer on his account.

Some writers affirm, that the Chineſe had the compaſs long before us; but if they had, they made but little uſe of it, never venturing out of their own narrow ſeas; and, indeed, they were very indifferent mariners and ſhipwrights. They had no topmaſts, nor did they ever go up the mainmaſt to furl the ſails, which conſiſted of matting, but let the yard down upon the deck before they took it in: and their ſhips were built with flat heads and ſterns, and could only ſail before the wind.

They had alſo gun-powder and guns when the Europeans came amongſt them, but hardly knew how to uſe them till the miſſionaries inſtructed them: and it is ſuppoſed, they were inſtructed in the uſe of the compaſs, as well as in making gun-powder, by the Arabians and Egyptians, who learnt theſe things of the Europeans, and had colonies in the iſlands in the Chineſe ſeas when the Portugueſe arrived there, if they had not on the continent of China.

A gentleman who travelled to the Eaſt Indies in the reign of his late majeſty George II. has given the following character of the people of China. The Chineſe, ſays he, are a very ingenious and induſtrious people, as is evident from the great number of curious manufactures eſtabliſhed among them; but though ſkill in the handicraft arts ſeems to be the moſt valuable qualification in this people, yet their talents are but of a ſecond rate kind, for they are much outdone by the Japaneſe in thoſe manufactures which are common to both countries; and they are in many inſtances incapable of rivalling the mechanic dexterity of the Europeans. Their principal excellency is in imitation, and they accordingly labour under that poverty of genius which conſtantly attends all ſervile imitators. This is conſpicuous in works which require great truth and accuracy, as in clocks, watches, fire-arms, &c. for in all theſe, though they can copy the different parts, and can form ſome reſemblance of the whole, yet they never could arrive at ſuch a juſtneſs in their fabric as was neceſſary to produce the deſired effect. In ſtatuary and painting, they ſeem ſtill more defective; their painters, though in great eſteem, rarely ſucceed in drawing or colouring human figures, or in the grouping of large compoſitions; and though in flowers and birds their performances are much more admired, yet even in theſe, ſome part of the merit may be imputed to the native brightneſs and excellency of their colours, rather than to the ſkill of the painter, ſince it is very unuſual to ſee the light and ſhade juſtly and naturally handled, or to find that eaſe and grace in the drawing, which are to be met with in the works of European artiſts: there is a ſtiffneſs and minuteneſs in moſt of the Chineſe productions, which are extremely diſpleaſing; and it may be truly aſſerted, that theſe defects in their arts are intirely owing to the peculiar turn of the people, amongſt whom nothing great or ſpirited is to be met with.

This people are remarkable for their thieviſh diſpoſition; an inſtance of which we ſhall here inſert: ſoon after Commodore Anſon arrived at Canton, he perceived that ſome perſon or perſons had ſtolen a topmaſt from the ſhip's ſtern. A reward being offered to any one that would diſcover where it was, the ſhip's mandarin thereupon informed the commodore, that ſome of his attendants had found the topmaſt, deſiring that he would ſend his boat for it; whereupon Mr. Anſon gave the mandarin's linguiſt a ſum of money to deliver to his maſter as a reward; which the linguiſt thinking fit to conceal, Mr. Anſon diſcovered his roguery, and the mandarin ſeized all that the linguiſt had gained in the commodore's ſervice, which was near two thouſand dollars; and he was ſo ſeverely baſtinadoed, that he was in danger of being killed. The fellow afterwards came a begging to Mr. Anſon, and being upbraided with his knavery, ſaid, "Chineſe man be very great rogue," but intimated his betters were as great villains as he was. This writer proceeds to relate, that the Chineſe ſelling every thing by weight, they crammed the ducks and fowls they ſold to the commodore with ſtones, and they died ſoon after he received them. And the hogs he bought, killed by the Chineſe butchers, were full of water; and if they were bought alive the people gave them ſalt to make them drink, and found means to prevent their diſcharging it by urine. Other hogs they ſold, which died not long after, and, when they were thrown overboard, the Chineſe were ready, with their boats, to take them up, a hog which had died a natural death being as valuable with them as a living one.

SECT. IX.

Treating of the CHINESE Monarchy, the Conſtitution of their Government, Succeſſion of the Crown, Courts of Juſtice, Magiſtrates, Laws, &c.

THE monarch of this great empire rules with an abſolute ſway. Among the reſt of his titles, the emperor is ſtiled, Son of heaven, Sole Governor of the earth, Great Father of his people, &c. His throne is hereditary unleſs he thinks fit to paſs by the next heir, and appoint another to ſucceed him. If he alters the ſucceſſion, the act muſt be ratified by his great council, conſiſting of the princes of the blood and great officers of ſtate, who ſometimes take upon them to oppoſe his deſigns, and attempt to ſet aſide thoſe whom he deemed to be his next heirs. If he cannot prevail with them to agree with him, he diſplaces them till he gets a majority that will comply with him; but this, it ſeems, is ſuch a deſperate experiment, that he ſeldom proceeds to ſuch extremes.

Notwithſtanding the emperor and moſt of the Tartars, in the grand council, were ready to allow the Chriſtians a toleration, yet there being a majority againſt it, the motion was dropped: and as there are boards or councils for every branch of buſineſs, the prince ſeldom acts arbitrarily, but refers all matters to the deciſion of the courts to which they reſpectively belong; neither does he apply the revenue to any particular uſe, until his orders are ratified by the commiſſioners of his treaſury. His forces are not ſent on any expedition, without the concurrence of a council of war: but notwithſtanding it is related of theſe emperors, that they are indefatigable in buſineſs, they are ſurrounded, like other eaſtern monarchs, it appears, by crouds of ladies, and ſeldom ſhew themſelves to the people above once a week; perhaps they retire, that they may be more at leiſure to conſider the complaints of their ſubjects. And he has attendants or agents in every court to overſee the proceedings of the judges and officers, of whom, it is ſaid, the greateſt princes ſtand in awe.

Governors of provinces or towns are obliged to ſend faithful accounts of their adminiſtration to court, and a miſrepreſentation, it is ſaid, would be fatal; but they are ſo dextrous in blinding the eyes of thoſe whoſe buſineſs it is to be a check upon them, that their adminiſtration is very ſeldom diſapproved; and indeed, unleſs the prince is a ſuperior genius to his miniſters, and can penetrate into their dark ſchemes, the beſt laws and regulations that can be made will be evaded, and they are evaded with a witneſs in China. Every thing is carried by bribery. They may have good laws, but they are ſcarce ever put in execution; the magiſtrates, as well as people, act in open defiance of them; a circulation of bribery runs through every court.

Large ſums of money are frequently extorted from the governors of provinces by the great officers and preſidents of the ſuperior courts; and thoſe governors no leſs oppreſs and fleece the governors of the towns in their provinces; who are obliged to do the like by their inferiors, in order to make up the ſums required of them; and whoever complains, runs the hazard of being ruined: a general connivance prevails among the officers. The emperor, probably, is the only perſon that is not acquainted with their extortions.

Some of the children of viceroys and great men are always kept about the court, on pretence of giving them a good education; and this, indeed, is one very good reaſon; but it is ſuppoſed they have a better, namely, the ſecuring the fidelity of their parents.

There are courts of juſtice in every province, reſembling thoſe in the capital; but no ſentence of death is executed till the caſe is reported to the emperor, and he ratifies it.

No law is more religiouſly obſerved among the Chineſe than that of ſubmiſſion to parents. If a father complains his ſon is diſobedient, there needs no further evidence to put him to death; if a man ſhould deride or ſtrike a parent, the whole neighbourhood is immediately alarmed, and riſe to bring the criminal to juſtice; he is ſentenced to be cut in pieces, and afterwards burnt, his houſes and lands deſtroyed, and to remain ſo to deter others from committing the like crime. The ſovereign himſelf is under a neceſſity of giving obedience to this law. It is related, that one of their emperors having baniſhed his mother for ſome gallantries ſhe had been guilty of, the people never left petitioning him, till they had compelled him to recall her. They would not deſiſt, though he had cauſed ſeveral of them to be beheaded for their inſolent advice; ſo tenacious are the people of this tenet of their law.

The Chineſe puniſh treaſon and rebellion with the greateſt rigour; the criminal being condemned to be cut in pieces, the executioner ties him to a ſtake, and firſt fleas his forehead, letting the ſkin hang over his eyes; for a very wiſe reaſon, as ſome pretend, namely, that he may not ſee how barbarouſly he is mangled; and having cut and tormented the offender till he is weary, what remains of him is torn in pieces by the mob: and where the crime is very great, the children of the offender ſuffer with him.

They puniſh murder by death, which is inflicted different ways: the meaner ſort are beheaded, as being deemed the moſt ignominious puniſhment: and perſons of quality are ſtrangled, which of all deaths is looked upon to be the moſt reproachful with us.

Theft or adultery are not puniſhed to death, unleſs ſome great violence is done to the party, but by the baſtinado; or the offender has a thick board hung about his neck, and expoſed every day, the crime being written on the board.

As no criminal is executed but by the emperor's expreſs order, malefactors are conſumed in priſons: the priſons in the great cities are ſo large, that they conſiſt of ſeveral ſtreets with market-places. In Canton alone, it is ſaid, there are not leſs than fifteen thouſand priſoners. The offenders are allowed to work in the day time for their livings; the Chineſe not being much given to acts of charity, and the emperor's allowance but mean.

A very common puniſhment among the Chineſe is the baſtinado, or ſeveral blows of a cudgel on the buttocks as they lie on their faces on the ground, from which the mandarins are not exempt, nor is it reckoned very ſcandalous among them. The offender, if he be able, after this diſcipline falls down before the magiſtrate and thanks him for his kind correction, though one blow is almoſt enough to lame him, if the executioner be not bribed, which it is ſaid he frequently is. It is a common thing for men to let themſelves out to be baſtinadoed in the room of the criminal; which, if true, diſcovers no ſmall weakneſs or corruption in their magiſtrates, thus to defeat the intent of the law.

In China, courtezans are allowed by public authority, and are under the regulation of the ſame officers who take care of the temples and the emperor's ſacrifices.

They have no lawyers or advocates, but every man manages his own cauſe: for we are told, that the plaintiff having drawn up his caſe or plaint in prayer, in ſuch a form as cuſtom requires, comes to the tribunal; and having beat on a drum at the ſecond gate, falls on his knees, raiſing his hands as high as his head; after which he delivers his paper to an officer, who carries it to the mandarin. If the ſuit appears to be frivolous and vexatious he is ſeverely baſtinadoed; but otherwiſe it is given to the proper officers to examine, who having made their report, it is either confirmed or altered by the judge. But theſe writers are not pleaſed to inform us, whether the defendant be ſummoned to anſwer, or in what manner he makes his defence, which is ſuch an omiſſion as can hardly be forgiven: but as it is impoſſible to determine juſtly in any cauſe without hearing both ſides, we muſt conclude that no man is forejudged without being permitted to offer what he has to ſay in his defence, among ſo polite a people as the Chineſe are repreſented to be. There is a liberty of appeal, it ſeems, to the ſuperior tribunals, or a man may paſs by the inferior courts and bring his cauſe before the higher judicatures at firſt, if he apprehends juſtice will not be done him at home.

The laws of China are ſo plain, and their policy ſuch, that the emperor may diſpatch all the buſineſs relating to the empire by applying himſelf to it but two hours in a day; this to any one who conſiders the multitude of people under his government, and conſequently the great variety of buſineſs here, muſt be looked upon as impoſſible; neither a few hours or a whole day can be ſufficient to read over the petitions only that may be ſuppoſed to be preſented him in this vaſt empire. He muſt certainly be informed of the purport of them by his officers, and determine as they are pleaſed to repreſent facts to him. Thus it is in all kingdoms in Europe, and cannot be otherwiſe in China, which is much larger than any of them. The moſt that can be expected of a prince whoſe dominions are not exceeding ſmall, is to make choice of able miniſters, and to preſerve his people from notorious oppreſſions: as for reading all petitions, and determining of all cauſes which come by appeal to the ſuperior courts himſelf, the Jeſuits may as well tell us he works miracles, which they themſelves alſo pretend to in that part of the world, and they will be equally believed.

The emperor of China, attended by a multitude of the great officers in their robes, the prince of the blood, and tributary kings, who fall proſtrate on their faces before him, gives audience to ambaſſadors in a large room of ſtate, ſupported by four rows of varniſhed pillars, where the throne is placed, and the roof is covered with ſhining yellow tiles. The throne is about three or four feet high, in the faſhion of an altar, and covered with ſables, on which the emperor ſits croſs-legged, after the manner of the Tartars.

When the Czariſh ambaſſador had his audience of leave, the emperor was ſeated on his throne, and a herald called aloud to the lords of the court to ſtand up and bow to the earth; which they did three times; and in the mean time the drums beat, the bells rung, and the muſic played; and the ambaſſador being brought within eighteen feet of the throne, was placed within two Tartar princes, while he made his compliments to the emperor. As he returned, he obſerved the emperor's guards ſtood in the fourth court, clothed in red callico, with figures as big as a crown printed upon them; and that they had little caps with yellow feathers, being the emperor's colour, and were armed with ſcymitars and lances. The ambaſſador was conducted by one of the emperor's chariots drawn by an elephant, from the palace to his apartment.

The emperors of the preſent Tartar family ſhew themſelves to the people about four times a month; whereas thoſe of the Chineſe race ſeldom appeared in public.

The emperor viſits the frontiers of Tartary almoſt every year, at which times thirty or forty Tartar princes attend to do him homage. He commonly rides poſt when he viſits the provinces, with a few of his officers, guards being planted along the road for his ſecurity. But the emperor never appears in that ſplendor, we are told, as when he goes to ſacrifice in the idol temples. Upon this occaſion there marches firſt four and twenty trumpets with golden coronets, and as many drums; then twenty-four men with gilded truncheons, after whom come one hundred ſoldiers with fine halberts; after theſe an hundred ſerjeants at mace, who are followed by four hundred fine lanterns, and as many gilded flambeaus; after theſe come two hundred lances, followed by four and twenty banners with the ſigns of the zodiac, and fifty-ſix more with the conſtellations painted upon them; then four and twenty magnificent umbrellas, with a cupboard of gold plate borne by the officers of the court; after theſe the emperor follows on horſeback glorioufly dreſſed, his houſen and furniture covered with gold and precious ſtones, and he is ſhaded with gilded umbrellas held over his head by the pages of honour: he is followed by the princes of the blood, viceroys, and miniſters of ſtate in their robes; after whom come five hundred young gentlemen, attended by a thouſand footmen dreſſed in carnation ſilk, and worked with ſtars of gold and ſilver: after them is carried an open chair, like a triumphal chariot, by thirty-ſix men, and another follows it carried by a hundred and twenty men, ſo large, that it would ſerve for an apartment: after theſe come two chariots drawn by elephants, and two more by horſes, each chair and chariot having a guard of fifty men; and the proceſſion is followed by two thouſand mandarins, and as many officers of the army richly dreſt.

The emperors of China do not in general live in that ſplendor and luxury to which other eaſtern monarchs are ſo much accuſtomed; but content themſelves, except on public occaſions, with a moderate attendance, a decent frugality at their tables, and a well regulated œconomy in all their public expences. They divide with their miniſters the cares of government, not laying the whole burden on their ſhoulders, while they indulge themſelves in eaſe and pleaſure; they are indeed obliged, by the laws of their country,

country to take a conſiderable ſhare of the trouble upon themſelves, and to read and anſwer petitions and remonſtrances. The neceſſity of juſtice in him tends to make him wiſe and intelligent, and render him the idol of his people: he does not poſſeſs his authority as a conqueror or a legiſlator, but as a father; as a parent he reigns, governs, rewards, and puniſhes. His two ſovereign councils are, 1. The extra council, compoſed of the princes of the blood royal; and 2. The council in ordinary, which conſiſts of thoſe princes, and ſeveral miniſters, who jointly inveſtigate matters of ſtate, and make report to the emperor of their proceedings.

The revenue of the emperor is immenſe, amounting to upwards of twenty-one millions per annum; and his army conſiſts of ſeven hundred and ſeventy thouſand men. He has an unlimited power to declare war, proclaim peace, or conclude treaties. How the Chineſe pay their civil liſt and five millions of ſoldiers (computed to be the whole number of towns in the empire) with about twenty millions of money, is not eaſy to determine.

The public revenues are not farmed, nor do they paſs through the hands of ſeveral under receivers; but the chief magiſtrates of each city regulate and collect the levies, and remit them to the treaſurer-general of the province, who tranſmits the ſurplus to Pe-king, after the reſpective governors, officers and ſoldiers of the province, have received their pay, and defrayed other neceſſary charges of government.

With reſpect to the Chineſe money, copper and ſilver are their only current metals, as there is no gold coin in the kingdom: that metal paſſes in trade as a commodity, and even ſilver is not coined, but cut in pieces for particular payments; and in that caſe it is eſtimated by its weight alone, and not by any mark or device ſtamped by royal authority: they pay capital ſums in ingots or bars of ſilver. Moſt trading people carry with them a balance. This balance reſembles the ſtilliards, and will give the preciſe weight of the minuteſt thing, to the thouſandth part of an ounce. Their foot is much about the length of ours. Their copper money is the only ſort that is ſtamped with any character or inſcription; but they do not impreſs it with the head or image of the emperor.

SECT. X.

Treating of the Religion, Temples, and Superſtition of the CHINESE; alſo of the Progreſs of the Chriſtian Religion in CHINA.

IT is remarked by writers of undoubted credit, that of all idolaters upon the face of the earth, the Chineſe have fallen into the feweſt abſurdities; for that being fully convinced of the being of God from the works of creation, they have ever adored and worſhipped the deity as the one ſupreme God, the King of heaven and earth, or rather that eternal mind which they imagine animates both heaven and earth. Though there are ſeveral inferior deities which they worſhip, as the firſt inventors of arts, mountains, rivers, &c. yet they never ſacrificed to vice, or worſhipped ſuch impure deities as the Egyptians, Grecians, and Romans did.

Religion in China is divided into three ſects: firſt, the followers of Lao-kium, who lived, as they ſay, above five hundred years before Chriſt. He taught that God was corporeal, and had many ſubordinate deities under his government; his diſciples ſtudy magic, and pretend to make that drink which will give men immortality. The ſecond are the ſect of the learned, who are the diſciples of the ſo much celebrated Confucius, who left many admirable precepts of morality, and inſtructed the people in philoſophy. He ſpeaks of God as a moſt pure and perfect principle, the fountain and eſſence of all beings; and though we are told he prohibited idolatry, he has temples and images erected to him, and is worſhipped with the profoundeſt adoration, as appears from the Pope's decree againſt the Jeſuits for allowing in their converts this idolatrous worſhip. There is a third ſect much more numerous than either of the former, who worſhip the idol Fo, or Foe, whom they ſtyle, the only god of the world. This idol was imported from India about thirty-two years after the death of our Saviour; his prieſts, the bonzes, teach ſeveral moral precepts; and that there is a ſtate of rewards and puniſhments after this life. They alſo inculcate into their followers, that it is not lawful to kill any living creature, or to drink wine; and do not forget to inſtruct them how much it is their duty and intereſt to entertain and nouriſh their prieſts, and to build them temples and monaſteries, and perform the penances they enjoin. If they neglect theſe things they threaten them with the greateſt torments after death; or that their ſouls ſhall animate ſome vermin or beaſt of burden.

We are told of one whom the bonzes had prevailed on to believe that his ſoul ſhould go into one of the emperor's poſt-horſes, and that they had adviſed him to eat little, and endure it patiently, and God might be induced the next remove to let him poſſeſs ſome perſon of quality; but the man was under ſuch horror at the apprehenſion of being a poſt-horſe, that his being a man of figure afterwards gave him but little ſatisfaction. He could not ſleep day or night, but hearing that the Chriſtians did not undergo thoſe changes, and were men as well in the other world as here, he ſent for the father to baptize him, who aſſures us that he died a very good Chriſtian. The doctrine of Confucius is the religion of the emperor, the princes of the blood, and all people of learning and diſtinction in the empire.

The bonzes, who are the prieſts of that ſect who worſhip the idol Fo, undergo the ſevereſt penances, by which they imagine they merit much, and can apply their merits to whom they pleaſe. In their temple is an image of immortality, repreſenting a fat man, ſitting croſs-legged; another called the image of pleaſure, twenty feet high; and between them another image thirty feet high, with a crown on his head; beſides which, they have a great number of little images in their houſes, which they worſhip as well as Confucius and their anceſtors. The ſun, moon, and ſtars are alſo the objects of their adoration.

A living man, whom they ſtyle, the Great Lama, is worſhipped by the Tartars; his prieſts are from him called lamas: he is alſo called, the eternal father; and is never ſeen by day-light, but in his temple by the light of lamps: he ſits on a raiſed floor, dreſſed in the robes of a ſovereign prince; and thoſe that approach him fall proſtrate on the ground, kiſſing his feet; and his diſciples believe that he lives for ever. The Tartar princes do not think themſelves ſettled on their throne until they have obtained his bleſſing; and the emperor of China goes annually into Tartary to adore him: however, the emperor, on a political account, pays an equal regard to the prieſts of both religions. He honours Confucius, and ſacrifices in the Chineſe temples; and the miſſionaries pretend, that it was only reaſons of ſtate that prevented his profeſſing the Chriſtian religion, though at other times they are pleaſed to confeſs that he declared he could not believe, much leſs embrace it.

It is a received opinion among the great men in China, and even ſome of their emperors, that it is poſſible for men to obtain immortality even on earth. Innumerable books have been written on this ſubject; nor can the daily inſtances of mortality, even among thoſe who have the greateſt opinion of the preſcription which is to effect this change, and preſerve them from all corruption and decay, convince them of the folly and abſurdity of their opinion.

One of their emperors, who was confident he had purchaſed the immortal draught, was cured of the whimſy by one of his favourites in the following manner: The emperor having a cup of this water of life before him, and declaiming upon the virtues and excellency of it, while he turned his back, the favourite had the aſſurance to drink off part of it; whereupon the emperor in a rage threatened him with immediate death: to which the wiſe miniſter calmly replied, Do you ſuppoſe you can deprive me of life now I have drank of the immortal cup? If you can, what have you loſt? if you cannot, I am become equally immortal with you. This ſhort way of reaſoning, it ſeems, reduced that prince to his ſenſes, when all other arguments ſeemed to be ineffectual.

Mahometaniſm has obtained a great footing in China, ſome of the Tartar tribes on the frontiers being of that religion, and there were reaſon to imagine that the emperor of China was a Mahometan. There are alſo great numbers of Jews in China.

Without the gates of every city almoſt there is an idol temple, and others on the ſides of highways far from towns, where travellers are hoſpitably entertained; and near every temple is a tower erected to the memory of ſome ſaint or hero, filled with images, and lamps that burn continually. To every temple belong a ſociety of prieſts, who offer liquor, rice and other proviſions to the genii of the place, of whom people come frequently to inquire what ſucceſs they may expect in their undertakings. There are cloiſters alſo of religious devotees, who undergo unheard of penances to obtain the name of ſaints among the people, and merit the happineſs of another ſtate.

The Chineſe have as great faith in their aſtrologers and fortune-

fortune-tellers as in their gods: they govern all their affairs by the direction of these people, and will not undertake a journey, or any business of moment, without first consulting when will be the most fortunate day or hour to begin it. These fortune-tellers also pretend to calculate nativities, and, by knowing the day of a man's birth, will tell him what shall hereafter befal him in the world: nor does it affect their credit, how often soever the people are deceived; for, like their brethren on this side the globe, they still follow the deceiver, and will not be persuaded they are imposed on.

The Christian religion was first introduced into China by the Portuguese, who about the year 1498 made several settlements, and planted several colonies, on the coast of the farther India, and in the Spice islands, and arrived at Canton, in China, in the year 1517, where they were permitted to traffic, and fix a colony on the little island of Macao, at the mouth of the river of Canton, which the Portuguese possess at this day; but as subject to the crown of China. Their missionaries were not permitted, however, to go over to the continent, till some years after Francis Xavier, from his indefatigable labours stiled the apostle of the Indies, who died in the year 1552, and was never suffered to set foot ashore upon the continent of China: The Portuguese laboured for more than thirty years after, in vain, to get their missionaries admitted into that kingdom.

It is universally allowed by historians, who have treated of the affairs of China, that Roger and Riccii, two Jesuits, were the first that were permitted to reside on the continent, who became very acceptable by their skill in the mathematics; but the Chinese were amazed, when they saw them produce a map of the world, to find that China was so very small a part of it. These Jesuits were permitted to compose a catechism, and explain the Christian doctrines, and gained great numbers of converts among people of figure; but at the same time were insulted by the mob. They continued their mission, however, for seven years, till a new viceroy came to Canton, and obliged them to retire to Macao; however, they were soon after recalled, and, being joined by other missionaries, obtained leave to reside in the capital city of Pe-king, whither they carried presents for the emperor, among which were a clock and repeating watch; but a little before they arrived at Pe-king, they were stopped by an eunuch, a commissioner of the customs, and imprisoned, on pretence that a crucifix, which they carried in a portmanteau, was a charm, which might affect the emperor's life: however, an order soon after arrived for bringing those foreigners up to Pe-king, where they were well received by the emperor, and their presents accepted, and a house and maintenance were assigned them, with the liberty of making what proselytes they could; among whom, they relate, were many princes of the blood, and the converts increased so fast, that in the province of Kiang-si alone, there were ninety churches, and forty-five oratories.

The bonzes raised several persecutions against them; but nothing proved more fatal to them than the opposition they met with from the dominican friars at Macao; one of this order declaring, that the Jesuits had a design to depose the emperor, and usurp his throne; that the places they were settled in, between Canton and Pe-king, favoured their design; and that the Dutch fleet which was then upon the coast, was intended to protect them; that the governor of Pe-king was in their interest, and that the Christians of Japan were ready to join them when a favourable opportunity offered.

When the intelligence of the pretended conspiracy was brought to the viceroys and governors of the provinces, they were exceedingly alarmed: and one of the missionaries, passing through Canton before the forgery was discovered, was condemned to the bastinado, under which he died; but Riccii was protected by the emperor at Pe-king, and the falsity of the report being proved, he lived in that capital in peace till the year 1610, when he died, aged eighty-eight years, twenty-seven of which he had resided in China; and the emperor had such a regard for him, that he ordered a piece of ground to be set apart for building him a tomb, which was afterwards the burying-place of the Jesuits.

In the year 1617, a persecution being raised against the Jesuits and their proselytes, they were all obliged to retire to Macao; but there happening a war with the Tartars in the reign of the succeeding emperor, he recalled them, knowing they would be very useful to him in the management of his artillery, and they lived unmolested in the kingdom till the year 1628. Two years after the Jesuit Adam Shaal, resorted to the court of Pe-king, and was highly caressed by the emperor and his ministers, on account of his skill in the mathematics; and the same year the dominicans and franciscans were admitted into China, where they and the Jesuits boasted of having made a great number of converts; and, notwithstanding the revolution that happened in 1640, when Xun-chi, king of Nou-tche made a conquest of China, the Jesuits maintained their ground, and were no less in favour with the emperors of the present Tartar race, than they were with those of the Chinese.

Adam Shaal was made president of the society of mathematicians by the emperor Xun-chi, which had been under the direction of the Mahometans for three hundred years before. He reformed the calendar, which increased his interest at court; and the emperor was so sensible of the service the learned Europeans were capable of doing him, that he sent for fourteen more of the missionaries to court, among whom was father Verbiest; and the Jesuits insinuate, that they should have made a convert of the emperor, if the ladies of the court had not prevented it, on his reproving that prince for entertaining one of them; but the more probable opinion is, that the emperor was offended, on their advising him to part with his women; that being a subject which few princes will bear to be touched upon; however, it is said, this emperor professed great friendship for Adam, and sent for him when on his death-bed. Father Verbiest, who had served the successor of this emperor in quality of mandarin, and also instructed him in the mathematics, dying during his reign in 1688, he caused him to be buried with great funeral pomp, allowing two hundred golden crowns for that purpose, and, at the tomb, expressed his acknowledgments of the great services he had contributed to himself and the state, the great affection he had for him, and how much he bewailed his death.

When Kang-hi, the son of Xun-chi, the first Tartar emperor, ascended the throne, Adam Shaal was made preceptor to the young monarch, who was then but eight years of age, and the bonzes (priests of Fo) were expelled the palace; whereupon they presented a petition to the regents, setting forth, that the Jesuits had been banished their country for their disaffection to their natural princes, and would infallibly raise a rebellion in China: that they had introduced a number of foreigners into the empire, who travelled through the provinces, and made plans of their strong towns, and that they only waited a favourable opportunity to raise a rebellion. To this petition they annexed a book published by Adam, containing a list of their churches, and of the converts they had made, which the bonzes suggested was the muster-roll of an army, which they could bring into the field on the first signal; that their beads were marks whereby the conspirators knew one another, and shewed, in the popish books they distributed, the picture of Christ crucified, saying, "Behold the God of the Christians nailed to a cross, "for attempting to make himself king of the Jews; this "is the God they invoke to favour their treasonable "conspiracies against the government." This charge against the Jesuits being brought before the tribunal of rites, they were imprisoned and laid in irons, and the Christian religion was declared to be a false and pernicious doctrine.

Adam Shaal was condemned to die, and though the sentence was never executed, he died under the hardships he suffered in the year 1666; twenty-five of the missionaries were banished to Macao; but four were still permitted to remain at court, who some time afterwards procured an order for recalling the rest of their brethren, and procured a declaration from one of the principal tribunals; "That the Christian law had been un-"justly condemned, and that it taught nothing incon-"sistent with the welfare of the state." The Christians were thereupon tolerated, and put into possession of their churches again, in the year 1671. Father Verbiest, as we observed before, taught the emperor mathematics, and caused light brass cannon to be cast, which gained the emperor great advantages in his wars, by which he became so much in favour, both with prince and people, that multitudes of converts were daily made, and Verbiest wrote to Europe for more missionaries, whereupon Lewis XIV. sent over six Jesuits from France, among whom was Le Compte, who resided in the Chinese court many years, and wrote the best history of that kingdom which has been published. These Jesuits arrived at Nimpo in China, in the year 1688; Verbiest being dead before their arrival, they were presented to the emperor soon after, who always

kept ſome of them near his perſon, who improved him ſo far in the mathematics, that he wrote a book upon that ſubject. Some of the viceroys in the diſtant provinces, however, raiſed a perſecution againſt the Chriſtians, in which they were countenanced by ſome tribunals, and it was as much as the emperor could do to protect them; he adviſed them to be very circumſpect in their conduct, and give as little offence as poſſible, or his appearing their protector might endanger his throne.

The miſſionaries having received great encouragement from the emperor, more of them were ſent over from France; and the French King, Lewis XV. ſettled an annual revenue of nine hundred livres a year upon twenty of them that were ſent to China and India. The fathers Gerbillon and Bouret having cured the emperor of an ague, he gave them a large ſum towards building a church, which they finiſhed, and made it one of the fineſt temples in that part of Aſia.

Such was the complaiſance of the Jeſuit miſſionaries to the Chineſe Chriſtians, in ſuffering them to retain the worſhip of Confucius, their anceſtors, the heavens, &c. that they might have remained in China, and made proſelytes to this day, if the Dominican and Franciſcan friars had not oppoſed this practice, and charged the Jeſuits with countenancing idolatry, which created great feuds among the fathers; ſo that they perſecuted one another in the courts of China with great violence, repreſenting their opponents as diſaffected to the government, and ſeveral of them were impriſoned, and ſeverely uſed by the Chineſe magiſtrates. At length both parties appealed to the Pope. The Jeſuits repreſented, that unleſs they complied with the Chineſe in theſe articles, the Chriſtians would infallibly be expelled the country; and inſiſted, that theſe compliances, when they proſtrated themſelves before his image, were only to pay their reſpects to him as a legiſlator; that the libations and ceremonies obſerved before the images of their parents, only expreſſed the veneration and affection they had for their deceaſed relations; and this they procured the emperor of China to certify to the Pope. Whereupon his holineſs deputed the Cardinal de Tournon his vicar in China, with full authority to examine and determine this matter.

The cardinal having admoniſhed the miſſionaries to lay aſide their animoſities and diſputes, which had given great ſcandal to the infidels, as well as to thoſe who had been converted to Chriſtianity, he decreed, and commanded all the miſſionaries, eſpecially the Jeſuits,

1. That in their writings and ſermons they ſhould diſapprove and condemn only ſuch doctrines and cuſtoms of the Chineſe as were inconſiſtent with the Chriſtian faith.

2. That they ſhould declare, that the offerings made by the Chineſe to heaven, the moon and other planets, to ſpirits and inventors of arts, were only due to God, the creator of all things; that they ſhould condemn particularly the offerings to Confucius, and the adoration of the pictures of deceaſed men, as inconſiſtent with the ſervice of the true God, and with the declaration of the Pope, the only infallible guide of the Chriſtians in all matters that concern religion. This decree was dated at Nan-kin, 28th June, 1707, and ſigned Charles, Patriarch of Antioch, Cardinal, &c.

The Jeſuits and miſſionaries of other orders continued to wrangle on theſe heads until the year 1720; during which time the Jeſuits were careſſed at court, while the others were thrown into priſons and ſeverely proſecuted. At length a deputation being ſent to the Pope, to know if he would admit of no alteration in the decree of Cardinal de Tournon, Cardinal Meſſabarba was firſt ſent over with the Pope's anſwer; but the Jeſuits ſo managed matters, that he was not permitted to ſee the emperor for ſome time, and could only read the anſwer of his holineſs to the mandarins. The following is the explanation of the decree,

1. The miſſionaries may tolerate in private houſes the uſe of tablets, containing only the name of the dead perſon, putting on the ſide of it a convenient explication.

2. They may tolerate all the Chineſe ceremonies towards deceaſed perſons, which are not ſuperſtitious, but merely civil.

3. They may render to Confucius a worſhip merely civil, adding a convenient explication; and it may be lawful to light candles, burn incenſe, and offer meat, by way of oblation before the tablets.

4. They may permit the reverences of genuflexion and proſtration before the corrected tablets, the tombs, or the dead bodies themſelves.

5. They may permit tables to be ſet with all manner of meats and fruits before the tombs of the deceaſed, as a civil honour and act of piety towards them, without obſerving any ſuperſtitious rite.

The decree was ſigned, "CA. Alexandrinus & Legatus Apoſtolicus."

Theſe articles having been ſubmitted to the judgment of the mandarins, they declared, that the emperor would be ſatisfied with this anſwer; but Suarez the Jeſuit obſerved to them it was all a trick, for the words, "This is the ſeat of the ſoul of the deceaſed," were to be omitted; however, the Jeſuits and mandarins being of another opinion, the anſwer was tranſlated, put in writing, and carried to the emperor.

The legate was admitted to an audience on the 20th of Nov. 1720, and directed to appear in the ſame eccleſiaſtical habit he wore in Italy; but the emperor preſented him with his own robe at the audience, put it over his European habit, and after an entertainment, at which his majeſty gave him a glaſs of wine with his own hand, he proceeded to aſk the legate ſeveral queſtions, particularly, whom thoſe pictures repreſented, which the miſſionaries brought from Europe? He anſwered, They might be the pictures of the Lord Jeſus, the bleſſed Virgin, or of ſome ſaints or angels. "But why," ſays the emperor, "do you put him on wings? This is what the Chineſe cannot underſtand: it is abſurd to give wings to men." The emperor then taking up three pieces of ſilk off the table, one white, the ſecond red, and the third yellow, and addreſſing himſelf to the aſſembly, ſaid, "If any one ſhould maintain that the red was white, and the white yellow, what would any of you think of it?" intimating, that the miſſionaries required them to believe inconſiſtencies, in their pretended explanation of the Chineſe rites, as well as in the doctrines they taught. The legate anſwered, Chriſt being aſcended to heaven, had conſtituted the Pope and his ſucceſſors his vicars on earth, to determine controverſies; and that Clement II. enlightened by his Spirit, could not be deceived. The emperor replied, "Can the Pope judge of the rites of China, which he has never had any perſonal knowledge of, any more than I can judge of the affairs of Europe?" The legate anſwered, "He does not pretend to be judge of the affairs of China, but of what cuſtoms and uſages the Chriſtians ſhould be allowed to practiſe, and what ought to be prohibited, as inconſiſtent with Chriſtianity." The emperor told the legate, that he had tried to unite all the miſſionaries of different nations, Portugueſe, French, Italians, and Germans; but they were always quarrelling among themſelves, and even the Jeſuits could not agree together; he was ſurprized at their diſunion, as they all profeſſed to propagate the ſame religion. And he wondered the Pope could give any credit to them, ſince ſome affirmed what the other denied: From ſuch contradictory repreſentations, how can the Pope take upon him, ſays his majeſty, to judge of the affairs of China? the legate anſwered, He was aſſiſted in his determinations by the Holy Spirit, who never ſuffered his holineſs to err in religious matters. His majeſty anſwered, "I love your religion much, I adore the ſame God you do; and if there be any thing you do not underſtand in our rites, I will explain it to you;" intimating again, that the Pope could be no judge of them, for want of ſufficient evidence; adding, that the decrees concerning the Chineſe rites, had not been made with a view to religion, but were levelled purely againſt the Jeſuits. At another audience, the emperor ſaid, he ſhould not ſuffer the Pope to determine any thing concerning the Chineſe rites; that belonged to him, his viceroys and governors: and when Meſſabarba deſired he might remain ſuperior of the miſſionaries in China, he received no anſwer to that, and the emperor confirmed the decree of the tribunal of rites, "That no Europeans ſhould for the future be ſuffered to propagate their law," which he apprehended might produce fatal effects: and the legate was ſoon after inſulted by the mandarins in a moſt outrageous manner, for maintaining the authority of the Pope's bull, and declaring his determinations infallible; and ſeveral of the Dominican and Franciſcan miſſionaries were ſent to priſon; Meſſabarba, however, obtained the releaſe of the priſoners, and then retired to Macao, where he reſided ſix months, and in the year 1722 returned to Europe; about which time the emperor Kang-hi died, and, being ſucceeded by Yong-tchin, all the miſſionaries were baniſhed to Macao in 1723, and upwards of three hundred churches were either raſed to the ground, or converted to profane uſes. Some European mathematicians, who were uſeful to the court (namely the Jeſuits) were ſuffered to remain at Pe-king; but the Chineſe converts who refuſed to apoſtatize, and

return

return to their antient ſuperſtition, amounting to about three hundred thouſand ſouls, were uſed with great rigour: one of the princes of the blood, in particular, with his family, amounting to three hundred of both ſexes, were baniſhed to the deſerts of Tartary. Many converts were impriſoned, underwent the baſtinado, and other puniſhments: but the Chineſe had more mercy on them, than Chriſtians in this part of the world have on one another, for few of them were condemned to die for the religion they profeſſed.

The Jeſuits were the chief promoters of the proſecution of Cardinal Tournon, formerly the Pope's vicar in China, for they did not ceaſe to accuſe him to the emperor, till they effected his ruin; and however the Jeſuits may apologize for their conduct in this and other inſtances of the like nature, it appears that the late Pope Benedict confirmed the decrees of his predeceſſors againſt the worſhip of Confucius, reproaching the general of the Jeſuits with the practices of their order in China, and prohibited his ſending any more miſſionaries thither without his leave; from whence and ſeveral other circumſtances, we may conclude, that the Jeſuits have never been intirely expelled from China, but are ſuffered to make a kind of half Chriſtians ſtill; that is, ſuch as worſhip both Popiſh and Chineſe idols; which has probably given birth to the aſſertion, that Chriſtianity is tolerated in China; whereas, on the contrary, we are informed, that ſince the above-mentioned fatal period, the Chriſtian religion hath been ſo far from gaining ground there, that it is more perſecuted now than ever, and that thoſe are expoſed to the moſt ſevere cruelties, who have courage enough to appear in its defence.

SECT. XII.

Of the CHINESE Marriages and Divorces.

THE union of the ſexes by marriage, or rather the bringing them together, is thought of ſo much advantage to the ſtate, by increaſing population, that it is diſgraceful for a man to live ſingle twenty years; but theſe matches are very improperly termed marriages, becauſe the conſent of the parties is never aſked; the parent or guardians enter into a contract, when both the boy and girl are infants in a literal ſenſe; and when they come to years of maturity, the young gentleman ſends the lady a preſent ſuitable to her quality; a ſplendid cavalcade is made, the bride is conveyed to the houſe of her ſpouſe, and this is all the ceremony that is uſed on theſe occaſions. Her ſpouſe never ſees her till ſhe enters his doors; then he unlocks the chair that brings her, and is either ſurprized with her beauty, or ſhocked with the ſight of ſomething he does not like. However, he is at liberty to return her to her friends that moment, if he is content to loſe the preſents that have been made her, with which he may be ſaid to have purchaſed his wife; for he never receives any fortune with her, beſides her cloaths. The lady has not the like option; if her huſband will keep her, ſhe is not allowed to retreat, how much ſoever he proves to be her averſion, and how many wives and concubines ſoever he may have beſides. Thus it is in all eaſtern nations, where a plurality of women is allowed by law. There ſeems, however, to be one, who may properly be ſaid to have her huſband's heart, to whom he gives the command of all the reſt; ſo that the lady inſtead of being his companion, if ſhe is not the favourite, may more properly be ſtyled his ſlave than his wife: nor are her children in a better condition than the children of his concubines, who have all an equal title to his eſtate. If it be demanded, where they find females ſufficient to let every man have a number of wives, ſince the Chineſe do not follow the practice of the Turks and Perſians, by importing them from other countries? it may be conſidered, that as the men marry at twenty, and the girls at twelve years of age, all the females between thoſe ages are ſupernumeraries; beſides, the poor people in moſt countries, who are much the majority, are forced to content themſelves with one wife apiece, and then it will be no difficulty to furniſh their ſuperiors with a variety of females, out of thoſe that are above twelve, and under twenty, notwithſtanding it is admitted that there are as many men born as women in every nation.

The friends of the parties, before every marriage, enquire of ſome prieſt or pretended conjuror, whether it is likely to prove a happy match, and which is the luckieſt day or hour for conſummation: when the man has once received his wife, he cannot turn her off, unleſs it be for adultery, or ſome notorious crime; but in theſe caſes he may ſell her, and purchaſe another with the money, notwithſtanding the Chineſe women are uſually guarded with great ſtrictneſs, and not ſuffered to ſee their neareſt male relations; yet ſome huſbands have given their gallants free liberty to viſit them; and there are women who have prevailed on thoſe that have the diſpoſal of them, to inſiſt on the liberty of having her admirers reſort to her after marriage; but this is ſo much abhorred by the generality of the Chineſe, that their iſſue are not allowed the privileges that other children have. As to the common people they ſeem to be ſo much aſhamed of living ſingle after the age the cuſtom of their country requires them to marry, or they have ſuch a ſtrong propenſity towards matrimony, that they will ſometimes conſent to become ſlaves, on condition they may have a ſlave in a family for a wife, when they are not in circumſtances to purchaſe one.

The Chineſe ladies being ſeldom ſuffered to appear in company, either within doors or without, never have any concern with trade, but amuſe themſelves with painting or needle-work, or with birds, dogs, or other animals, as ſome of the ſex do here.

It is cuſtomary in China to give three names to their ſons: 1. The common name of the family, or ſurname: 2. A proper name; and a third when they are advanced to any preferment or employment. The daughters are called by their father's ſurname, even after marriage, and diſtinguiſhed only by their ſeniority, being called the firſt, ſecond, or third daughter of their father.

There being a great number of eunuchs in the emperor's court, and in the families of the great, who have not only the care of the women, but the management and direction of moſt of their affairs; the poor women frequently caſtrate their ſons, in order to qualify them for preferment; which is almoſt as barbarous a cuſtom as expoſing them in the ſtreets and highways: or ſtrangling them with their own hands, as they ſometimes do, if they find they are not able to maintain them; for poverty ſeems to them worſe than death.

SECT. XIII.

Containing an Account of the Feſtivals, Funerals, and Tombs of the CHINESE.

THEIR two principal feſtivals are celebrated, one in the beginning, and the other about the middle of January. The former is celebrated by viſiting, feaſting, making preſents, &c. The other is called the feaſts of the lanterns, when every family, both in the city and country, on the ſea-coaſt and the rivers, light up large painted lanterns ſtuck full of wax candles or ſmall lamps, which repreſent cavalcades, ſhips under ſail, armies engaging, horſes galloping, ſpectres, and other objects: theſe repeſentations or figures are ſet in motion by perſons concealed, by means of ſtrings or pullies that cannot be perceived at a diſtance. Some Chineſe doctors have aſſerted, that this feaſt of the lanterns originated from the hanging up lanterns in the ruins of the palace of Ki, emperor of China, who, being an effeminate prince, erected a lofty tower adorned with guns, for one of his concubines, where living for ſome time in ſhameful eaſe and indolence, his ſubjects cauſed him to be depoſed by a neighbouring prince; and the magnificent palace being afterwards pulled down, lanterns were hung up in every part of the city to perpetuate the event. Others derive it from the following circumſtance: A certain mandarin, who was greatly careſſed by the people, having an only daughter drowned by falling into a river, he looked for her a whole night by the light of lanterns, all the inhabitants of the diſtrict following him with lanterns and torches to aſſiſt in ſearching for the lady. The particular affection which the people had for their mandarin, or elſe the ſingularity of the adventure, ſet them to work with their lanterns the ſame night of the following year, and this cuſtom gradually ſpreading, occaſioned a public annual feſtival to be obſerved in the manner above-mentioned.

At a third feſtival, the emperor himſelf always attends. After the example of his anceſtors, the prince goes every ſpring in great pomp and ſolemnity into a field, and plows up a few ridges of land. This is in order to encourge and animate the peaſants in the buſineſs of agriculture; and the mandarins, in their reſpective provinces, go through the ſame ceremony.

Another feſtival is alſo kept by the Chineſe, the chief ceremony of which conſiſts in carrying about the country a monſtrous cow with gilded horns: this cow is formed of

clay; and behind it walks a little child, with one foot bare, beating the cow with a rod, as if to drive her forwards. A company of comedians attend them, playing all kinds of antics. Thus they proceed to the palace of the mandarin or governor of the diſtrict, where they break the cow in pieces, and take out of her belly a great number of little cows formed alſo of clay, which they diſtribute to the multitude; and the ceremony concludes with a ſpeech in praiſe of agriculture, pronounced by the mandarin himſelf. Some of theſe cows, which are conſidered as emblems of labour and induſtry, are ſo large and heavy, that forty men can ſcarcely ſupport them. This feſtival is celebrated by country-people and labourers, who drag after them their ſeveral implements of huſbandry.

With reſpect to the funeral ceremonies of the Chineſe, we muſt obſerve, that no ſooner do theſe people come to years of diſcretion, than they make proviſion for their deaths: every man furniſhes his houſe with a coffin, among other moveables, to put him in mind of his mortality: and wealthy people incloſe a piece of land for a burying ground, where they erect a tomb, and a magnificent temple over it, to which they are brought when they die, though at never ſo great a diſtance from home: but ſuch tombs are generally erected in ſolitary places, or by the highway ſide, at a diſtance from towns. None are ever buried within the walls of a city. The poor have a common burying-place, alſo, at ſome diſtance from the town they die in. Their coffins are made of a very laſting wood, ſeven or eight inches thick, which makes them appear much larger than ours: but they are of the ſame form, and finely japanned without, which very much preſerves the wood, and makes it the more durable, as well as beautiful. The Egyptians, as well as the Chineſe, we find endeavoured to preſerve their remains as long as poſſible, imagining, we are told, that as long as any part of the body is left, the ſoul continues about it.

The death of a gentleman is no ſooner known to his relations, but they meet and perfume the corpſe, dreſs it in the beſt cloaths, and, having placed the body upright in a chair, his wives, children, and friends, ſucceſſively fall down before him, and lament their loſs. Three days after, a large room is hung in mourning, that is, with white linen; and the third day, the corpſe, being put in the coffin, is laid there in ſtate, an altar erected before it, and an image of the deceaſed placed upon the altar. The relations then attend again, bringing lighted wax-torches and incenſe, which they burn, and proſtrate themſelves before the corpſe: the ſons then place themſelves on one ſide of the coffin, cloathed in white, and his wives and daughters ſtand on the other, behind a curtain, bewailing themſelves in moſt moving ſtrains; the prieſt at the ſame time ſinging mournful hymns, ſuitable to the occaſion: diſhes of meat are ſerved up for ſeveral days ſucceſſively, and placed upon a table, and at night the prieſts divide the meat among them. The coffin being very thick and cloſe, no offenſive ſmell can be perceived. The funeral is frequently put off for ſeveral months, and ſometimes years, a paper being ſet over the gate of the houſe, reciting the virtues and commendable qualities of the deceaſed; the ſons ſleeping upon mats about the coffin ſeveral nights, and eating no fleſh, or drinking any ſtrong liquors, or having any commerce with their wives; nor can the ſon enter upon any office or employment for three years after the death of his father: and it is reckoned impious even to laugh, or take any manner of pleaſure, during the time of mourning.

The friends and relations of the deceaſed, being invited by the ſon to attend his father's corpſe to the grave, the proceſſion begins with thoſe that carry the images or pictures of men, women, beaſts, and birds, attended with a great number of torches; trophies, triumphal chariots, pageants and tables, with diſhes of meat, alſo are carried before the corpſe. Then follow the prieſts with drums, muſic, and jingling bells, and next the coffin, under a large arched canopy carried by twenty or thirty men, the ſons follow the coffin on foot, ſupporting themſelves with crutches, as not able to ſuſtain themſelves without. The women then advance in cloſe chairs, covered with white ſilk, rending the air with their cries; and beſides theſe, are other women, who are hired to make a diſmal mournful noiſe on theſe occaſions. Being arrived at the tomb, which may be taken for a palace, the company enter it by a grand portal, having a leſs gate on each ſide of it; and the corpſe being depoſited in it, an altar is erected before it, and lights left burning on the altar; the friends of the deceaſed viſiting the tomb at certain ſeaſons, and proſtrating themſelves before it, with their faces to the ground. They burn incenſe, pour out wine, and offer diſhes of meat to the deceaſed, which they are not ignorant becomes an entertainment for the prieſts when they are gone. The character of the deceaſed being engraved on marble, is placed before the altar. Every man alſo has a tablet in his houſe, whereon are engraved the names of his great grandfather, his grand-father and father, whom they worſhip; and their great men have temples erected to their memory, and a yearly ſacrifice offered to them.

Both men and women, during the firſt year of mourning, wear white coarſe linen, almoſt torn to rags; the ſecond year their cloaths are ſomething better, and the third they are allowed to wear white ſilk.

A widow mourns three years for the death of a huſband, and the man one year for his wife, and one for a brother.

Great men, whoſe circumſtances will allow it, erect temples to the memory of their anceſtors, when a yearly ſacrifice is offered. The emperor ſacrifices to ſeven of his anceſtors, the tributary kings to five, and a mandarin to three.

SECT. XIV.

Containing the Hiſtory of CHINA, from the earlieſt Accounts, to the Conqueſt of that Empire by the TARTARS.

WE were, about three hundred years ago, as little acquainted with this country, as with the continent of America, or the new world. As we owe the diſcovery of both to navigation, or the knowledge of the compaſs, China might with as much propriety have been denominated a new world, as America; for though it was ſituate on the ſame continent with Europe, neither the Egyptians, Greeks, or Romans, give us the leaſt intimation, in their hiſtories, that there was ſuch a country on the face of the globe. It is amazing, that when the Egyptian and Phœnician fleets ſailed as far as India, and brought home the fine ſpice, that they ſhould never meet the Chineſe ſhips, or hear of this country when they viſited thoſe very ſeas that border upon China: but ſo it is in fact: we can expect no light, therefore, from any nation but their own, of what happened before the fifteenth century; and what the Chineſe call their hiſtory, is little more than ſome ſhort minutes, containing the names of princes that probably never had an exiſtence; we may be aſſured that the firſt part of their pretended hiſtory is fabulous, and for the reſt, by their own confeſſion, their records have been loſt or deſtroyed; and their paper is ſo ſubject to the worm, that it will not laſt many years. What they have recorded therefore of later years, are only copies of copies; there are no originals to be found.

If we might credit thoſe who pretend ſuch care has been taken to preſerve an impartial hiſtory, as never was obſerved by any other people, the hiſtory of China would exceed all others; for they relate, that there are a certain number of regiſters appointed by the government to record all material tranſactions, and daily to minute down the words and actions of their princes, with their reſpective remarks upon them; and that without conſulting one another, they throw their ſeveral papers into an office, which is never opened while the reigning prince, or any of that family remain upon the throne; but when the crown devolves on another houſe, the doors are opened, and all theſe records are put in order and examined, out of which the hiſtory of the preceding reigns are compoſed, and the examples of their beſt princes recommended to their ſucceſſors, whilſt the conduct of others is ſeverely animadverted upon. Thus their princes, like thoſe of Egypt, undergo a kind of formal trial after their deaths, for the inſtruction of their ſucceſſors.

Our time would be employed to little purpoſe, were we to take notice of any facts which are ſaid to have been tranſacted above four thouſand years ago, becauſe they admit that huſbandry, and all manner of arts and ſciences, were introduced within that period. If the world had continued more than one hundred thouſand years, as ſome of their hiſtorians relate, no doubt but planting, ſowing, cloathing, and other uſeful and neceſſary arts, muſt have flouriſhed much ſooner; but the Chineſe, however, appear ſomething wiſer than many of the antient philoſophers, who held that the world was made by chance.

Moſt legiſlators and founders of kingdoms having judged it neceſſary to derive their origin and authority from heaven, to induce their ſubjects to ſubmit to their dominion; in like manner, their firſt monarch, Fo-hi, who is ſuppoſed to have lived about the time of the flood,

The Dress, Agriculture, Encampment, &c. of the TAGURI-TARTARS

Bennett Woon sculp.

than their Chineſian neighbours in the ſouth; and their horſes, and other cattle, are ſuperior to theirs. The Chineſe troops are ſupplied with horſes chiefly from this country; and from hence comes that valuable herb ginſeng, and the rhubarb root. The air of the country is exceſſively cold, though they lie under the ſame parallel as we do; as it is obſerved with reſpect to the weſtern continent of America, that it is as cold in the latitude of fifty, as it is with us in ſixty: the ſame is obſerved of that part of Chineſe Tartary, which lies in the latitude of fifty, which is occaſioned by the wind blowing over a long tract of frozen country in the winter.

The Tartars eat all manner of meat, except hogs-fleſh; but delight moſt in the fleſh of wild horſes, which they hunt as they do other game. Their drink is water or mare's milk. They have very little wheat or rice: oats is almoſt the only grain they have, of which they make both bread and drink. Their religion is Paganiſm; and, beſides the Chineſe idols, they worſhip the great Lama. Theſe people formerly burnt their dead; but they now bury them, like the Chineſe.

The weſtern Tartars live in tents, and remove from place to place for conveniency of paſture, their herds of cattle, and what they get in hunting, being their principal ſubſiſtence. The eaſtern Tartars live in towns, but are neither ſo numerous or ſo regular and beautiful as the towns of China; many of them lie in ruins, and are perfectly deſerted for warmer ſeats and a more fruitful country: for, as has been obſerved already, upon the conqueſt of China, their emperor invited all the little Tartar clans to join him, and tranſplant their families to Pe-king, in order to eſtabliſh himſelf and ſecure his conqueſt; and from that day to this, all men of any ſpirit, who are not deſtitute of ambition, have reſorted to the court of China, where they have almoſt a certainty of meeting with preferment, and conſequently their native country is abandoned and left in a more wretched condition than before their union with China. They had the honour indeed of being conquerors, and ſetting a prince of their nation upon the throne; but are notwithſtanding become a province to the kingdom they conquered: they are governed by a military force, and garriſons placed in all their ſtrong towns; the manners and cuſtoms of the Chineſe alſo prevail more and more among the Tartars every day. However, the Tartars that remain in their own country, and do not attend the court, muſt be allowed to differ from the Chineſe in many reſpects: They are neither ſo effeminate or luxurious as their more ſouthern neighbours, nor do they apply themſelves to traffic near ſo much; hunting, horſemanſhip, and other manly exerciſes take up great part of their time. They would be aſhamed to be ſeen in chairs or litters, like the ſoft Chineſe, but eſteem it much more glorious to be found at the head of a troop of horſe. Like other northern countries, they alſo allow their women all innocent liberties, and both ſexes converſe together with freedom; and poſſibly it will be found a very juſt obſervation, that the braveſt people have been ever the leaſt troubled with a ſpirit of jealouſy, and kept their women under the leaſt reſtraint.

The Tartars are not famous for arts and ſciences; nor do we hear much of their laws: the will of the prince ſeems to be the only meaſure of their obedience; nor have they any books or hiſtories among them, which give any light into their original.

SECT. XVII.

Treating of the CHINESIAN TARTAR Kingdoms and States.

HISTORIANS have divided the Tartars into innumerable tribes or hords, but we ſhall here give ſome account of the neighbouring kingdom of Thibet, and the Uſbeck Tartars.

The kingdom of Thibet is bounded by the Calmucks land on the north, by China on the eaſt, by India on the ſouth-weſt, and by Uſbeck Tartary on the weſt. This country is ſituate in an excellent climate, between thirty and forty degrees of north latitude; but is very mountainous, which probably obſtructs the paſſage between India and China by land: and ſeems to have been one reaſon that we had no communication with the Chineſe, before the Portugueſe found out the way to China by ſea. It is certain they are a very potent people, and more dreaded by the Chineſe than any other nation. They are governed by a cham or chan, which ſignifies a ſovereign prince in that part of the world; but whether they are abſolute or limited monarchs, hiſtory does not inform us, though the former is moſt probable. Part of them are Pagans, and part Mahometans. Thoſe that border upon China have the ſame idols and bonze prieſts as the Chineſe have; and thoſe are for the moſt part Mahometans which lie next to Mongalia and Uſbeck Tartary.

Uſbeck Tartary is bounded on the north, by the country of the Calmucks; on the eaſt, by Thibet; on the ſouth, by India; and on the weſt, by Perſia and the Caſpian ſea. The moſt conſiderable rivers are thoſe of the Oxus, which divides it from Perſia; and the Sihun, which runs from the ſouth-eaſt to the north-weſt, and diſcharges itſelf into the Caſpian ſea. It is a fine fruitful country, lying between thirty-five and forty-five degrees of north latitude, and carries on a briſk trade both with the eaſtern and weſtern countries of Aſia. The chief town was Samarcand, ſituate in ſixty-ſix degrees of eaſtern longitude, and forty degrees of north latitude, once the reſidence of the great Tamerlane, and the metropolis of his empire.

The preſent capital is Bochara, ſituate on the river Oxus, about ſixty miles ſouth-weſt of Samarcand, and frequently gives name to the country. The people here, as in other Tartar countries, are divided into a great many hords or tribes, but ſubject to one monarch, their grand cham. This is a polite nation; and their ſtature, features, and complexion not to be found fault with, eſpecially if compared with the Calmucks, their northern neighbours. The religion of the Uſbecks is Mahometaniſm, and their rites and cuſtoms much the ſame as thoſe of their brethren in Turky. Their great leader, or great Cham, Tamerlane, was the ſon of Zam, Cham or Chan, the chief of all the Mogul tribes: he firſt diſtinguiſhed himſelf by repulſing the Ruſſians, who had invaded his country, and having given them a total defeat, obliged them to ſubmit to ſuch terms as he thought fit to impoſe. He married the daughter of his uncle, another cham or chan of the Moguls, whoſe dominions he ſucceeded to on his uncle's death: the Chineſe invading his country, he was not content with repulſing them, but carried the war into their own country, and demoliſhed part of the wall they had erected for the defence of it, made himſelf maſter of the capital city of Pe-king, and the Chineſe emperor tributary to him: the fame of his actions having reached the weſtern kingdoms of Aſia, they ſent ambaſſadors to him, to implore his protection againſt the furious Bajazet, emperor of the Turks; whereupon he aſſembled moſt of the Tartar tribes, and being joined by a body of Ruſſians, it is computed his army amounted to near a million of men, with which he marched through the countries north of the Caſpian ſea, and then bending his march to the ſouthward, paſſed mount Caucaſus, continuing his march through Circaſſia and Georgia, and the countries ſituate between the Caſpian and Euxine ſeas: theſe countries being in alliance with him, and furniſhing his army with proviſions in their march, and as they were Chriſtians, looked upon Tamerlane as their deliverer from Turkiſh tyranny; he did not, however, rely entirely on his confederates to furniſh ſo vaſt an army with proviſions; but his fleet on the Caſpian ſea, attended the army in their march with all manner of neceſſaries, inſomuch that his ſoldiers were not ſuffered to plunder, or take any thing by violence in the countries through which they paſſed: if a ſoldier took but an apple or bowl of milk, without paying for it, he was put to death. Sebaſtia, in Armenia, was the firſt city that oppoſed his march, the garriſon returning very inſolent anſwers, when they were ſummoned to ſurrender; whereupon he inveſted the place, but did not make any attack for a week; in the mean while, the inhabitants looking upon the town to be impregnable, on a ſudden their walls and towers fell down, having been undermined; and the garriſon ſeeing themſelves laid open to the enemy, were forced to ſurrender at diſcretion; according to the Turkiſh account, Tamerlane cauſed the ſoldiers of the garriſon to be bound hand and foot, and thrown into pits that were dug for that purpoſe, where they were buried alive; but though this does not ſuit with the character of this humane conqueror, yet the ſtory ought not to be totally rejected, for it is evident many great generals have done the like on the firſt invaſion of a country, in order to ſtrike a terror into their enemies; and if that was his deſign he had his end, for few towns refuſed to ſurrender to him afterwards at the firſt ſummons.

When Bajazet had received advice of Tamerlane's ſucceſs, he advanced towards him with an army of one million of ſoldiers, when a bloody battle was fought in the plains of Stella, in which the Turks were totally defeated; and Bajazet, being taken priſoner, was at firſt treated by Tamerlane with great humanity; but afterwards behaving with inſolence, was confined by the conqueror in an iron cage, and carried with him wherever he went; but the haughty

haughty Turk, not being able to brook this ignominious kind of puniſhment, daſhed out his brains againſt the bars of his moveable priſon. As for Tamerlane, he ſoon after ſubdued the greateſt part of Leſſer Aſia, took the city of Perſia in Bythinia, conquered Syria, and reduced Egypt; after which he returned back to his own country, and died in the year of our Lord 1404. But as theſe tranſactions have a more immediate reference to Turky, we ſhall treat of them more largely when we come to that part of our work.

CHAP. III.

THE KINGDOM OF COREA.

THE kingdom of Corea, or Korea, which is a large peninſula, is ſituated between China and Japan, and lies between the thirty-fourth and forty-third degrees of north latitude. It is about four hundred and fifty miles in length from north to ſouth, and about two hundred and twenty-five in breadth from eaſt to weſt. It is divided into eight provinces, has two hundred cities, with many caſtles and fortified places.

In the northern parts of the kingdom the climate is exceeding ſevere; and the ſnow ſometimes falls in ſuch quantities, that the people are forced to work a paſſage under it, in order to get from one houſe to another, fixing a ſmall board to their feet, to keep them from ſinking into the ſnow. The inhabitants, in the northern part, live upon barley, having no rice, and clothe themſelves in ſheep-ſkins and coarſe hempen cloth; but the ſouthern parts produce every neceſſary of life. The Japaneſe have lately taught them to plant and dreſs tobacco, which is ſmoked by both ſexes. They have alſo ſilver and lead mines; all ſorts of cattle, tame and wild fowl, horſes, wolves, and tygers, but no elephants; and there are many crocodiles in their rivers, the moſt conſiderable of which are Ya-lu, and the Tu-men.

The Coreans are in general well-ſhaped, of a comely aſpect, friendly to ſtrangers, but treat barbarouſly thoſe who are ſo unfortunate as to be ſhip-wrecked on their coaſts. They are at the ſame time effeminate, much given to pleaſure, and of a timid diſpoſition. People of condition dreſs in a purple-coloured ſilk gown with long and wide ſleeves, and a ſaſh; they alſo wear fur caps and linen buſkins. The common people wear cotton or hempen cloth. In the country, the houſes are mean, except thoſe belonging to people of diſtinction, which are handſome and ſpacious.

Contracts for marriage are made at the age of ſeven or eight years; but are prohibited to the third degree of kindred; the females are in that caſe brought up by the father-in-law, except an only daughter. A man is allowed to have ſeveral wives, provided he keeps only one at home; but the grandees are permitted to keep three or four at their houſes, one of whom acts as ſupreme miſtreſs. They in general treat their wives as ſlaves, and divorce them at pleaſure. The moſt conſiderable part of the father's ſubſtance devolves to his eldeſt ſon, and the reſt among the other male children, the daughters being excluded.

The Coreans bury their dead only in ſpring and autumn, and in the mean time place the corpſe in a kind of hut made of ruſhes, raiſed upon four ſtakes in their courts or gardens. The deceaſed lies in a double coffin, cloſely cemented together, dreſſed in his beſt apparel, with ſome toys lying near him. They ſet out in proceſſion with the body at day-break, the bearers ſinging all the way, keeping exact time with their ſteps and voice, while the reſt of the company fill the air with doleful lamentations. The graves for the common people are five or ſix feet deep, but people of rank are depoſited in ſtone vaults, as with us. After the funeral is over, they make their offerings to the deceaſed monthly, at the full of the moon. Children mourn three years, with great ſolemnity and abſtinence, for their fathers; their dreſs, during this time of ſadneſs, being very mean.

They do not much concern themſelves about religious worſhip, the whole of which conſiſts chiefly in external ceremony. But here are ſome of the followers of Confucius, and others who eſteem the religion of Foe, there being many temples conſecrated to this deity. Moſt of them believe the doctrine of tranſmigration, and a future ſtate of rewards and puniſhments: they have alſo a great number of monks amongſt them, who go bareheaded, and refrain from any connection with the female ſex: neither are they allowed to eat the fleſh of any animals. There are alſo two monaſteries for religious women: one for daughters of the nobility, and the other for young women of inferior rank.

The Coreans are exceedingly ignorant of geography, ſuppoſing the globe to conſiſt only of twelve kingdoms, and extend their maps no farther than Siam. Their language has a ſet of characters peculiar to itſelf; but the literati adopt the Chineſe, whoſe method of printing they follow. The education of their children is free from all ſeverity: they implant into their tender minds a ſenſe of honour: the principal part of their learning conſiſts in the knowledge of moral philoſophy, taking the great Confucius for their model.

Their chief trade is with the Japaneſe, particularly with the iſlanders of Tſaſſima ſubject to Japan, who bring to their factory, at Pouſan in Corea, ſweet-ſcented wood, alum, paper, pepper, buffaloes horns, &c. and receive cotton and ginſeng in exchange.

The only ſpecies of money uſed by the Coreans are called caſis, which are current no farther than the frontiers of China: in other parts they make their payments in unſtamped wedges or ingots of ſilver.

Though the king of Corea is no more than a vaſſal to the emperor of China, he rules with abſolute ſway, keeps a great number of houſhold troops in his ſervice, which guard his palace, and attend him wherever he goes. When his majeſty is paſſing, none muſt preſume to look at him. He is lord of all the lands in the kingdom, and beſtows them on whomſoever he pleaſes, and for whatever term of years he thinks proper: he has a council of ſtate compoſed of ſeveral miniſters; but none may give his opinion till firſt aſked by his majeſty, nor meddle in any ſtate concern without his permiſſion. If they behave well, they are continued in office during life.

The Coreans chuſe their magiſtrates of cities, and governors of fortified places every third year. Theſe are either baniſhed, or ſentenced to ſuffer death, if found guilty of mal-practices.

The revenues of the crown conſiſt principally in the rents of land granted to the people: the king has, beſides, the tythe of every thing productive of profit, either by land or ſea.

In Corea, the penal laws are extremely rigorous. Rebels and traitors, together with their whole families, are cut off without the leaſt mercy, and their habitations levelled with the ground. If a wife kills her huſband, ſhe is placed up to her ſhoulders in the earth in ſome high road, and a hatchet is placed cloſe to her, with which every one except thoſe of noble family, is obliged to give her a chop as he paſſes by her; and where a murder of this kind is committed, the magiſtrates of the place are ſuſpended from the execution of their office. But though a woman is ſo ſeverely puniſhed for murdering her huſband, yet the laws juſtify and protect the man who kills his wife detected in adultery; or if he gives her up to juſtice, ſhe is condemned to die, but is allowed to chuſe the mode of her ſuffering death, in which caſe they generally cut their own throats. It is aſſerted by ſome writers, that huſbands, eſpecially if they are of ſuperior quality, are puniſhed with death for adultery. If an unmarried man be detected in criminal converſation with a married woman, they puniſh him by ſtripping him down to the waiſt, and leaving him only a pair of drawers on; after which, they ſmear his face with lime, pierce an arrow through each of his ears, and tie a kettle on his back, which is beat upon as he paſſes through the ſtreets, and laſt of all he receives the baſtinado. The perſon who kills a free-man is obliged to ſwallow a quantity of vinegar with which the body of the murdered perſon has been waſhed, then the criminal is trampled under foot, and kicked on the belly till he dies. Nearly the ſame puniſhment is inflicted for theft.

The baſtinado here is generally given on the poſteriors, and ſometimes on the ſhins and ſoles of the feet. When on the ſhins, they bind the ſufferer's legs to a couple of benches, the one at his feet, and the other under his hams; and in this poſture they ſtrike him on the legs with a ſort of

of laſh, but not more than thirty ſtrokes at a time, which they repeat two or three hours afterwards, till the whole of the ſentence is executed. When an offender receives the baſtinado on the ſoles of his feet, they compel him to ſit down on the ground, and then tying his two great toes together, fix them in a wooden frame, and thus inflict the puniſhment. Women and apprentices generally receive the baſtinado on the calves of their legs. Perſons in arrears to the king, or who refuſe to pay their debts, are baſtinadoed on the ſhins every fifteen days till they pay the money. State criminals are tried by the grand royal council.

The military government in Corea very much reſembles the civil. Each province has a general, or chief of the militia, with four or five colonels under him, each of whom commands a regiment; and that the king may know the exact number of ſoldiers he has in pay, the inferior officers are obliged to keep an accurate liſt of all the men belonging to their reſpective corps, which they tranſmit at ſtated times to their ſuperior officers.

Their ſhips of war have commonly two maſts and about thirty oars, with five or ſix men to each oar, which, with the marines, make about three hundred men in each ſhip: their ſtores chiefly conſiſt of cannon and pot-granadoes; and every province has its particular admiral, who is obliged annually to review the ſhips of war belonging to his province. They have always a number of ſhips in commiſſion, every city being compelled to fit out one complete ſhip.

Corea was originally inhabited by different people, who each had their reſpective princes, law maxims, and cuſtoms; but they afterwards became one nation. The moſt conſiderable of theſe early natives were deſcended from the Tartars, and named Kau-kiu-li.

The firſt king of Corea is ſaid to have been a nephew of Gheon, Emperor of China, who for ſome miſdemeanour, ſeized and threw him into ſome Chineſe priſon; but Gheon, being afterwards dethroned by Vou-vang the founder of the thirteenth family or dynaſty, the nephew, whoſe name was Ki-tſe, was reſtored to his liberty. He retired to Corea, where he introduced the Chineſe laws, civilized his people, and conducted the public affairs with great wiſdom and prudence; but at the ſame time harboured the reflection that Vou-vang was an uſurper, and had deprived his family of the imperial crown. This event took place in the year before Chriſt 1120.

Ki-tſe's ſucceſſors enjoyed the throne of Corea near nine hundred years; but Tchuang-ſiang-vang, emperor of China, at length ſubdued the Coreans, and reduced the title of their king to that of hean, or count, with a very limited authority. A prince of the family of Ki-tſe, named Chun, aſſumed the title of king, but was ſoon after dethroned, and the race of Ki-tſe became extinct at his death.

Vey-nan, who was a native of China, then forced his way to the throne of Corea; and, in order to ſecure his uſurpation, courted an alliance with the emperor of China, and obtained the title of vang or king: but the ſovereignty did not long continue in the family of Vey-nan; for his grandſon was maſſacred, and the Chineſe profiting by the confuſion ariſing from this event, conquered Corea a ſecond time. In proceſs of time it was reſtored to its ancient monarchical form of government; and the king ſubmitted to pay a tribute to the emperors of China. Since that period, Corea has undergone various revolutions; being ſometimes under vaſſalage to the Chineſe, at other times tributary, then independent, and almoſt always at war with that nation. It is tributary at this time; and the king of Corea, on his acceſſion to the throne, receives his confirmation upon his knees from the emperor of China.

CHAP. IV.

THE NEW AND COMPLETE HISTORY AND DESCRIPTION OF

INDIA.

SECT. I.

Diviſion of TONQUIN, its Situation and Boundaries, Rivers, Climate and Provinces; Deſcription of the Natives, their Habits, Manufactures, Produce of the Country, Animals, Language, Sciences, Government, &c.

GEOGRAPHERS uſually divide India into two parts; namely, India beyond the Ganges, and India on this ſide of it. We ſhall firſt enter upon the deſcription of that diviſion which lies beyond the river Ganges, becauſe it adjoins to China, which we have laſt treated of.

This country comprehends, 1. The kingdom of Tonquin. 2. Cochin-China, and Chiampa. 3. Siam, including Malacca, Cambodia, and Laos. 4. Pegu and Martaban. 6. Ava, Arracan, Tipra, and Acham, excluſive of the iſlands; the whole lying between ninety-two and one hundred and nine degrees of eaſtern longitude, and between one and twenty-eight degrees of north latitude.

The kingdom of Tonquin, which is the firſt of theſe diviſions, is bounded by China on the north and eaſt; by the bay of Cochin-China, on the ſouth and ſouth-eaſt, and by the two ſmall kingdoms of Laos and Bowes (bordering on Siam) on the weſt: it is ſituate between one hundred and one hundred and nine degrees of eaſtern longitude, and between twenty-one and twenty-ſeven degrees of north latitude; it is about five hundred miles in length, and about four hundred in breadth. It is divided into eight provinces, viz. eaſt, weſt, north, and ſouth provinces, Tenay, Tenhoa, Ngeam, and Cachao. There are ſeveral ſmall iſlands at the extremity of it.

In ſailing up the river Domea, a fine level fruitful country preſents itſelf to view; in which there are no trees, except about the villages, but an agreeable variety of rice ground and paſtures. Further within land, on the north, it riſes into hills. The air, in dry ſeaſons, is generally healthful.

The ſouthern part of this country lies in the form of a creſcent, about a ſpacious bay of the ſea, near one hundred miles wide; the depth in the middle, is about forty-ſix fathom, and there is good anchorage in every part of it. The rivers Rockbo and Domea run into this bay, which riſing in the mountains on the north-weſt, take their courſe to the ſouth-eaſt, and, running almoſt parallel, diſcharge themſelves into the bottom of the bay, at about thirty leagues diſtance from each other. The Europeans trade with the natives, up the river Domea, which is near two miles over at the mouth; but there are ſo many ſands at the mouth, that a ſhip cannot be carried over the bar without the aſſiſtance of a pilot.

In this country, the year is divided into the wet and dry ſeaſon, as in thoſe places which lie between the tropics. The wet ſeaſon begins in April or May, and laſts till the beginning of September; in which time, however, there are conſiderable intervals of fair weather, eſpecially in the mornings; the three firſt months of this ſeaſon are very unhealthy. In September the rain and wind are generally moderate; and yet in that month and October happen the Tuffoons (Typhones), which are ſuch violent ſtorms, that no ſhips venture out of the harbour during that time. The tuffoons happen uſually about the new or full moon; it is fair, pleaſant weather, and little wind twelve hours before the ſtorm begins. The wind having blown very fiercely for twelve hours from the north-eaſt, and attended with thunder and lightning and heavy rains, it grows calm on a ſudden; but in the ſpace of an hour changes to the ſouth-weſt, and blows with equal violence from that quarter. They have the faireſt weather when the ſun is at the greateſt diſtance, which is the caſe in moſt countries between the tropics. The rains are heavieſt when the ſun is vertical, but the ſeaſons are not always alike: ſometimes they have not rain enough for their rice, which commonly grows in water, or a very moiſt ſoil.

Cachao, or Kecchio, the capital city, is ſituate about one hundred miles up the river Domea, in one hundred and five degrees of eaſt longitude, and twenty-two degrees

thirty minutes north latitude, on an elevated ſituation, having neither wall or moat about it. There are about twenty thouſand houſes in it, moſt of them low thatched cottages, and ſome few built of brick; their ſtreets wide, but ill paved, and ſeveral muddy ponds, which are very offenſive in the dry ſeaſon.

In the middle of the city ſtands the king's palace, which, with the parks and gardens that ſurround it, is eight or nine miles in circuit. There is another palace meanly built, in which the chova or general reſides; before it is a grand parade for exerciſing the ſoldiers, and a houſe where the train of artillery, conſiſting of fifty or ſixty iron guns, are lodged, and ſome mortars. There is alſo a ſtable of war-elephants, and another of the king's horſes near the parade.

The town of Domea is ſituate about ſixteen or eighteen miles up the ſame river, where the Dutch ſhips, which trade to this country, uſually lie; but the Engliſh ride three miles higher. The Dutch have a factory at Domea.

Upon the ſame river, about eighty miles from the ſea, ſtands Hean; it conſiſts of about two thouſand houſes, and has a garriſon of ſoldiers in it. The Chineſe, who trade between this place and Japan, have factors here.

In the flat country there are abundance of villages, which are ſurrounded with walls or banks of earth, to defend them againſt the annual floods.

The natives of Tonquin are of a middle ſtature, tawny complexion, black long hair, which falls down on their ſhoulders; they have black eyes, and their teeth are dyed black. They wear the nail on the little finger of the left hand as long as the finger, as the Chineſe do. They are very faithful and diligent, ſubmiſſive to their ſuperiors, and fairer dealers than the Chineſe.

Their proviſions are dreſſed and ſerved up in an elegant taſte; and they perfume both their tables and their diſhes. Their uſual fare conſiſts of rice dreſſed various ways, eggs, pulſe, roots, fowls, fiſh, buffalo, pork, beef, and frogs. They have neither table-cloths or napkins; and inſtead of forks, uſe ivory or ebony ſticks as the Chineſe do, and eat nearly in the ſame manner. The food of the common people is rice, dried fiſh, and pulſe, and tea is their uſual drink; but the higher claſſes mix arrack with their tea, and often become intoxicated with it. The grandees have halls in their houſes, for the diverſion of ſinging and dancing in the evenings; and every villa hath its houſe of mirth and paſtime, where the people aſſemble, eſpecially on their feſtivals, and cauſe plays to be acted. They have ſeveral kinds of muſical inſtruments, ſuch as kettle-drums, trumpets, violins, guitars, and hautboys. The actors are generally about half a dozen in number; and the dances are performed by the women, who ſing at the ſame time. They have likewiſe merry-andrews, to excite the laughter of the ſpectators.

The tonquneſe, is a gown girt about with a ſaſh: the ſexes are ſcarce diſtinguiſhable by their dreſs. People of condition wear Engliſh cloth, red, blue, or green, or elſe ſilk of their own manufacture; their caps made like the crown of a hat, of the ſame materials as the gown; the common people wear cotton or calicoe; the ſoldiers the ſame, but ſhorter, and all of them wear cotton breeches, or drawers, which reach down below their knees.

The common people are good mechanics; but their lords, who are owners of the lands, keep them ſo miſerably poor, that they are frequently forced to remain idle, for want of materials to work upon. The Dutch, who marry temporary wives in this country, employ them as their factors to buy the materials; and ſet the poor people to work, and have their goods ready againſt the ſhipping arrives.

Silk and lacquered ware are their chief manufactures, the country produces alſo turpentine, lignum-aloes, fine perfumes, and wood for dying, reſembling logwood.

The principal grain that grows here is rice, but they have cocoa-nuts, guavas, mangoes, plantains, oranges, and all other tropical fruits: their ſoil alſo produces betel and arek root, which they are extremely fond of.

There are great numbers of elephants in this kingdom, and the reſt of the peninſula, alſo ſome horſes, oxen, buffaloes, and the ſame kind of hogs we meet with in China. They have ſcarcely any ſheep or wild beaſts; but plenty of fiſh and poultry.

They have no mines of gold or ſilver; but there are iron and lead mines in abundance. Silk worms are alſo here in ſuch plenty, that ſilk is almoſt as cheap as cotton. Sugar canes likewiſe thrive well in this country; and they have a ſort of tea which they call Chia bang, the leaves of which they boil; as alſo another kind called chia way, the leaf of which is not fit for any uſe; but the flower, when dried before the fire, makes a very agreeable liquor by infuſion. The oranges of Tonquin are ſaid to excel all others for richneſs of flavour: here are alſo various kinds of flowers, and among others, very beautiful lilies and jeſſamines, though the Tonquineſe do not diſcover much taſte for this elegant ornament of nature. They have commonly two crops of rice yearly, which being their chief food, the cultivation of it is the peaſant's whole employ.

Snakes, ſcorpions, and other reptiles and inſects, are as troubleſome here as in other hot countries; but none more ſo than the ants, which march in large bodies, and devour every thing they can penetrate; they will eat through a bale of ſilk in a few hours time.

Tonquin having been a province of China, their language is a dialect of that nation, and their characters the ſame; their learning conſiſting chiefly in underſtanding theſe characters, they are examined what progreſs they have made in this ſtudy, when they ſtand candidates for any place, as in China. In the mathematics, aſtronomy, and other ſciences, they equal the Chineſe, and have been improved like them in theſe ſciences, by the Popiſh miſſionaries who viſited this country from Europe.

The ſovereign or bova, has barely the title of king: he has no ſhare in the government. The general is veſted with the regal power; he makes the king a kind of priſoner in his own palace, but allows him to appear at certain times, and receive the homage of his ſubjects, and the general himſelf ſeems to adore him before the people, declaring, he takes upon him the adminiſtration of the government, only to eaſe his ſovereign of the trouble of it, and that he may enjoy his pleaſures without interruption. His majeſty's ſervants are all appointed by the general, and have orders not to ſuffer any of the reſt of his ſubjects to come near him. The general diſpoſes of all offices, civil and military; has a guard of two hundred elephants, beſides his horſe and foot guards, and uſually has a ſtanding army of thirty thouſand men in and about the capital city, and ſixty or ſeventy thouſand men in other parts of the kingdom, particularly on the frontiers of China, which is the power they ſtand moſt in fear of. When the army marches, the generals and great officers are mounted upon elephants; a caſtle or rather a great room being fixed upon the back of this monſtrous beaſt, in which a dozen men may be accommodated, and diſcharge their muſkets or ſhoot their arrows. They have no naval force, only ſome little coaſting veſſels, with which they never venture far out to ſea. They have no ſails, but make uſe of oars only.

Among a great number of feſtivals celebrated by the Tonquineſe, two of them are kept with more than ordinary ſolemnity. The firſt is held at the beginning of the year, which with them commences with the new moon neareſt to the end of January, and ſometimes three or four days ſooner; this feaſt continues about twelve days; but the firſt days are rather ſpent in lamentation than rejoicing; for then they ſhut up their habitation, and keep within-doors, for fear, as they pretend, of meeting with ſome unlucky object in the ſtreet, which might prove to them an omen of ill fortune the enſuing year. On the following day they begin their feſtivity, when booths and ſtages are erected in the ſtreets, in which are repreſented different kinds of ſhows; nothing is then heard but the ſound of muſical inſtruments, and the wild uproar of riot and licentiouſneſs. The ſecond grand feſtival is kept in the ſixth moon, with the ſame kind of mad merriment. Excluſive of theſe, they obſerve two monthly feaſts, in which religion has ſome ſhare, it being cuſtomary at theſe feaſts to ſacrifice to their anceſtors, by oblations of proviſions at their tombs. Another of their ſolemn feaſts is called can-ja, on which their king gives his public benediction to the country, and plows two or three furrows with his own hands for the encouragement of agriculture. The natives practiſe faſting and prayers by way of preparation for this feſtival; which cuſtom they have undoubtedly borrowed from the Chineſe; as may be ſeen, in our account of that people.

The officers of ſtate and chief magiſtrates in Tonquin are generally eunuchs, who are an imperious ſet of people, difficult of acceſs, and exceedingly covetous, though they have none but themſelves to make proviſion for; and indeed it is a common obſervation, that they who have the leaſt occaſion for money, covet moſt; and whatever an eunuch has ſcraped together, falls to the government, when he dies; he has not even the power to diſpoſe of any part of it by will; and this is the reaſon that their extortions

tions and oppreſſions are ſo much connived at: but to theſe mal-practices are imputed the extreme poverty and want of trade in the lower claſs of people, who have no encouragement to work, poſſeſſing nothing they can call their own.

The religion of the people of Tonquin differs but little from that of the Chineſe, Confucius is adored with equal veneration by one part of them; while others are worſhippers of Foe; but they have other images that are not met with in China, particularly the elephant and the horſe. The temples or pagodas are very ſmall, ſome of them but juſt big enough to contain the image. Their prieſts have cells about the temple, where they attend to offer up the prayers of the devout, who bring them their petitions in writing, which the prieſt reads aloud before the image, while the diſciple lies proſtrate on the ground in a ſupplicating poſture. People of figure ſeldom come to the pagoda, but perform their devotions before an image placed upon an altar in one of the courts of their own houſes; ſome dependant reading the petition inſtead of a prieſt, while his maſter proſtrates himſelf on the earth. On the paper are enumerated the ſeveral inſtances of the petitioner's good fortune, for which he returns his thanks to heaven, as for riches, honours, preſervation, &c. concluding with a prayer for the continuance of them: after which, the paper is burnt in a pan of incenſe, and then the poor neighbours and dependants are called in, and made to partake of an entertainment the maſter has provided for them. Whenever they make their addreſſes to heaven, the poor are ſure to be relieved; the devout ſupplicant looking upon this as the readieſt way to obtain a favourable anſwer to their requeſts.

The Tonquineſe are as much addicted to ſuperſtition as their neighbours. They, like the Chineſe, conſult the aſtrologer, or pretended fortune-teller, whenever they are about to undertake any thing of moment, and have their lucky and unlucky days; and as every hour of the day has the name of ſome animal, as the horſe, or the like, the beaſt who marks the hour a man is born upon, is always carefully avoided by them.

It appears from the relation of a late traveller, that the court of Tonquin ſhewed no inclination to embrace Chriſtianity, but he ſuppoſed that many of the poor people had been induced to profeſs it, on account of the rice the miſſionaries diſtributed among them: that the fathers lived as merchants at Hean, and thought proper to conceal their miſſion; apprehending, probably, they were not acceptable to the court, who made no other uſe of them, than to learn ſome branch of the mathematics.

Young people are not ſuffered here to marry without the conſent of their parents; and females are ſeldom diſpoſed of in marriage before they are ſixteen years of age. When a youth is diſpoſed to marry, he firſt applies to the father of the maiden, and makes him a preſent. After the articles are agreed upon, the man ſends to the houſe of the young woman ſuch preſents as have been ſtipulated; and on the wedding day the fathers of both parties, accompanied by their friends, conduct the bride to the houſe of the bridegroom, where the ceremony is performed in great haſte. They have always a feaſt, which laſts for three or more days, on theſe occaſions.

Here, as in moſt other Pagan countries, a plurality of women is allowed, and very little difference is made between a wife taken upon contract, and a concubine. Their children are equally entitled to inherit, and the natives are ſo far from being diſturbed by jealouſy, that it is ſaid, they will offer their women to the European merchants, or rather let them out, for they expect ſome conſideration for the favour. Here men are allowed to take temporary wives, as the Dutch do, to tranſact their affairs in their abſence. And by this commerce the women ſometimes raiſe fortunes, and afterwards become matches for the moſt conſiderable men in the country. The men are alſo at liberty to divorce their wives for any trifle almoſt, but then they muſt reſtore the effects ſhe was poſſeſſed of at the time of the marriage, and keep the children; but the wife cannot obtain a divorce unleſs the huſband is charged with ſome very notorious crime. The puniſhment of a woman convicted of adultery, is to be thrown to an elephant bred up for ſuch executions; who, taking her up with his trunk, toſſes her up in the air, and when ſhe falls, tramples her under his feet, cruſhing her to pieces with as much eaſe, as one might kill a moth. A man may ſell both wife and children here, which makes a divorce very unneceſſary on the man's part; for this amounts to ſomething more than a divorce. In a ſcarcity, the poor people ſell their children with very little reluctance; for by this means, they frequently ſave their children's lives, as well as their own. And in this part of the world, we ſee people very ready to part with their children, to any one that will maintain them, without demanding any conſideration for them: and why is this more unnatural than the Tonquineſe ſelling their children to preſerve themſelves?

Their funerals differ very little from thoſe of the Chineſe: we ſee the like proceſſions and the like mourning, only they burn the corpſe, and put the aſhes into an urn: they carry proviſions to the tomb where the urn is depoſited, which is diſtributed among the prieſts and poor people, after they have been offered to the deceaſed, and the idol placed on an altar before the corpſe; over the tombs of people of condition, they erect a wooden tower four or five and twenty feet high, and the prieſt aſcending to the top of it, makes a funeral oration, enumerating the virtues and good qualities of the deceaſed: after which, he comes down and ſets fire to the tower, which is ſoon conſumed to aſhes, being built of very ſlight materials; and then the people ſit down to an entertainment, which is provided for them. Fifty hogs have been dreſſed and diſtributed at a funeral, with the greateſt quantity of fruit that ever was ſeen together.

When the king dies, he lies in ſtate ſixty-five days after his deceaſe, and his table continues to be ſerved every day as if he was alive; the meat being diſtributed every evening among the prieſts and poor people. After which a very ſplendid proceſſion is begun towards the royal burying-place, which is about two days journey from Cachao: but they ſeldom reach the tombs under ſeventeen days. The mandarins, great officers, and magiſtrates, are obliged to mourn three years for the prince, the gentry ſix months, and the common people three, and no diverſions are allowed for three years after the funeral.

There is great emulation among the opulent, in providing coffins for themſelves; in framing theſe coffins, they cement the boards together; but make no uſe of nails, leſt that ſhould have the appearance of laying a conſtraint on the deceaſed.

With reſpect to the origin of the Tonquineſe, and the revolutions in their kingdom, little can be ſaid with certainty, as they were for many ages ignorant of the art of writing. One of the firſt kings mentioned in their hiſtory was Ding, ſaid to have reigned 200 years before Chriſt, and to have been raiſed to the throne by a troop of lawleſs robbers; but as he proved a tyrant, his ſubjects revolted, and murdered him. Long wars enſued; after which, Le-day-han was elected king, in whoſe reign the Chineſe invaded and over-ran the kingdom. This prince, however, defended himſelf with great bravery, and defeated them ſeveral times, but could not drive them out of the country. On the death of Le-day-han, Li-hal-vie was placed on the throne, who vanquiſhed the Chineſe, and drove them out of his territories. The poſterity of this prince reigned peaceably for ſeveral generations; and the laſt king of this family leaving behind him but one daughter, this princeſs ſhared the throne with a nobleman whom ſhe eſpouſed; but another grandee, named Ho, conſpired againſt the queen, ſubdued her huſband in battle, put both of them to death, and took poſſeſſion of the crown; which treachery and cruelty occaſioned a revolt of his ſubjects, who applied to the Chineſe for aid, and thereby occaſioned their entrance into the kingdom with a numerous army, which drove away the tyrant, and as a reward for their ſervices, poſſeſſed themſelves of the government, obliging the Tonquineſe to accept of a viceroy from China, who introduced the Chineſe laws and cuſtoms, and intirely changed the form of the conſtitution.

In proceſs of time, however, the Tonquineſe headed by Li, who was a man of a moſt intrepid ſpirit, revolted from the Chineſe; and, taking up arms, put them all to the ſword, and compelled the emperor to conſent to a diſhonourable peace. Li was then crowned king of Tonquin; and all that the Chineſe were able to obtain, was, that the kings of Tonquin ſhould hold the crown in fealty under the emperors of China, and pay them a triennial tribute. This treaty was concluded about the year 1200 after Chriſt, and both nations have faithfully obſerved the articles ever ſince. When the emperor of China ſends his ambaſſadors to Tonquin, to collect the tribute, they behave with the utmoſt haughtineſs; inſomuch that when the king has occaſion to treat with them on any matters of importance, he is obliged to wait upon them, inſtead of their attending on him: and a prince of Tonquin muſt previouſly obtain a confirmation from the hand of the emperor of China, before he can aſcend the throne of his anceſtors. The deſcendants of Li ſat upon the throne for two centuries, after which enſued many revolutions.

About the year 1400 of the Chriſtian æra, a ſimple fiſherman, named Mack, uſurped the crown, but was dethroned by Tring, the uſurper, who coloured his uſurpation with the pretence of reſtoring the family of Li to the throne, and accordingly cauſed a young prince of that houſe to be crowned; but he reſerved to himſelf the regal power, under the name of chova, or general of the realm, only beſtowing on the prince the bare title of ſovereign. This uſurper, Tring, had a brother-in-law, whoſe name was Hoaving, ſon of a governor of the province of Ting-wa, to whom Tring lay under ſome particular obligations; for this governor had not only ſhewn great friendſhip to him, in aſſiſting him in his enterpriſe with the troops of his province, but likewiſe gave him his daughter in marriage; and, beſides, on his deathbed, entruſted to him the guardianſhip of his only ſon, who was the above-mentioned Hoaving. Reflecting with great concern on the conduct of his brother-in-law and guardian, in having employed his father's forces to ſet any other than himſelf on the throne of Tonquin, Hoaving conceived on the occaſion ſuch a ſpirit of reſentment, that he not only refuſed to do homage to the new king, but openly took up arms, made himſelf maſter of Cochin-China, antiently a province of Tonquin, and, after the example of his brother-in-law, cauſed himſelf to be proclaimed chova at the head of his army.

Theſe two generals governed with abſolute authority, the one in Tonquin, and the other in Cochin-China, and waged war with each other as long as they lived, with nearly equal ſucceſs on both ſides. They tranſmitted the title of chova to their ſucceſſors, and their deſcendants enjoy it to this preſent period of time in both kingdoms. But we ſhall here confine ourſelves to the chova of Tonquin, where indeed are at preſent two ſupreme magiſtrates or ſovereigns, the one titular, the other real; the former has the name of bova; but in the chova are veſted all the powers of government. The authority of the bova principally conſiſts in giving the form of ratification to the decrees of the chova. The dignity of the latter is hereditary, and his eldeſt ſon ſucceeds him; but the ſucceſſion of bovas is uncertain; for when a bova leaves ſeveral ſons, the chova chuſes which of them he pleaſes, and may even raiſe a collateral branch to the dignity. The chova keeps a great number of concubines, it not being cuſtomary for him to marry till his advanced age affords him but little hope of his having any more children; when he always eſpouſes a princeſs of the royal family, who ranks above his concubines, and bears the title of mother of the kingdom. The concubine who bore the king his firſt ſon, takes place next to the queen, and is treated with diſtinguiſhed honour.

SECT. II.

Containing a Deſcription of the Situation, Boundaries, Towns, Produce, Inhabitants, &c. of COCHIN-CHINA.

THIS kingdom, which includes Chiampe, is ſituate between one hundred and four and one hundred and ten degrees of eaſt longitude, and between ten and ſeventeen degrees of north latitude; it is bounded by Tonquin, on the north; by the Indian ocean on the eaſt and ſouth; and by Laos and Cambodia, on the weſt, being about four hundred miles in length, and one hundred and fifty in breadth. It was originally a province of Tonquin, but has formed a diſtinct kingdom for upwards of three hundred years. It is tributary to China, like Tonquin.

The Kemois mountains run the whole length of it from north to ſouth, dividing it from Cambodia; but towards the ſea the country is generally level. The air of this country is not ſo hot as that of Tonquin, though it lies nearer the equator, for which ſeveral reaſons may be aſſigned, as the advantages of the ſea breezes, of which Tonquin has not ſo great a ſhare; Tonquin lying upon a bay where the winds have not ſo free a courſe, while this country lies open to the ocean. It is alſo obſerved, that the countries which lie near the tropics, as Tonquin does, are much hotter than thoſe that lie near the equator; for the countries which lie under either tropic have the ſun over their heads near three months, whereas the ſun paſſes ſwiftly over the countries near the equator, and does not return thither again for near ſix months; and it may add to the heat near the tropics, that the days are an hour and half longer at the tropic than they are at the equinoctial, and the rains and cloudy weather continue longer there alſo than at the tropic.

This kingdom is divided into five or ſix provinces, and is well-peopled. The king reſides at the capital of Kehue. Along the coaſt are ſeveral iſlands ſubject to this kingdom, which produce many uſeful fruit trees. This country produces great plenty of rice and ſugar; and they have gold and ſilver mines. Eagle-wood, calambac, an ordinary ſort of tea, and ſeveral kinds of drugs grow here.

An inundation happens regularly every year in Cochin-China, about the middle of autumn, leaving behind it a kind of ſlime, which fertilizes the land. In this wet ſeaſon, the people ſail about the country in barks: and, in order to be ſecure in their houſes, are obliged to erect them on piles, that the water may flow beneath them. They build their houſes chiefly with the bamboo cane, one ſtory high; the window frames are cloſed up with Japan paper, or ſhells ground tranſparent: the partitions of their chambers are formed of ſcreens, and their floors covered with mats, which ſerve them for ſeats and beds; but the rooms of the rich are more elegantly furniſhed. They have no kitchens in their houſes, for fear of accidents by fire, but dreſs their proviſions by the river-ſide: they are obliged to extinguiſh their fires on hearing the beat of a drum, whenever the wind blows from the ſea.

They are a temperate people, and live chiefly on rice and fiſh, which they have in great plenty. Though they are but imperfectly civilized, yet they poſſeſs that felicity which might excite the envy of more poliſhed ſocieties: they have neither thieves nor beggars; and are remarkable for their hoſpitality. Though they do not encourage pride and luxury, yet the wealthier ſort entertain friends in a ſumptuous manner.

At public feſtivals, the common people meet in the ſtreets, where in a circle they eat their proviſions on mats, while tumblers and merry-andrews divert them with their antic tricks. The monarchs of Cochin-China are deſpotic, and very difficult of acceſs. He gives audience at his palace-gate in a ſort of ſtate-litter, ſuperbly gilt, and reſembling a cage. No perſon muſt approach nearer to him than at the diſtance of eighty paces. He keeps his ſeraglio at his palace, where it is guarded by eunuchs. He rides ſide-ways on an elephant, when he goes abroad, and is accompanied by guards; he wears a turban of the fineſt callico on his head, pendants of the richeſt brilliants in his ears, and bracelets on his arms: but his body is almoſt bare, having only a covering round his middle, and in his left hand he holds a ſpear, or rather a long javelin.

All the provinces in the kingdom, and courts of juſtice, are governed by mandarins, who, if convicted of mal-adminiſtration, are ſure to be puniſhed with death. The king has the intire diſpoſal of all the offices of ſtate, and even the lives and fortunes of the people. Treaſon and rebellion are not only puniſhed with the moſt dreadful tortures, but very ſevere penalties are likewiſe inflicted on all the kindred of the traitors. Other heinous offences are puniſhed with death, or the loſs of a limb: though it muſt be acknowledged, that the almoſt irreſiſtible influence of money too often ſcreens the guilty from puniſhment.

Notwithſtanding the Cochin-Chineſe are intirely ignorant of the ſciences, they are very ſkilful mechanics; and far ſurpaſs the Tonquineſe in the manufacture of ſilk. They make ſugar-mills and water-engines, but can make no ſort of fire-arms. Their foreign trade is not very conſiderable; the chief articles they export, are, ſilk, cotton, betel, aloes, wax, japan-wood, caſſia and ſugar; the chief part of which are purchaſed by the Chineſe, who have ingroſſed almoſt the whole of this trade to themſelves.

The only money current in Cochin-China conſiſts of pieces of copper ſtruck by the Chineſe, which reſemble thoſe uſed by the Tonquineſe. Silver is extremely ſcarce with them; for a man who is poſſeſſed of eighty or a hundred piaſtres, is deemed wealthy.

With reſpect to the religion, marriages, funeral ceremonies, mourning for the dead, &c. of the Cochin-Chineſe, they are the ſame as in the neighbouring kingdom of Tonquin.

SECT. III.

Containing a Deſcription of the Situation and Extent of the Empire of SIAM, the Provinces it is divided into, their chief Rivers, Monſoons, Winds, Tides, Climate, Mountains, capital City, royal Palace, and principal Towns.

THE Malayans call this empire Tſiam; but the name Siam was given it by the Portugueſe, which, in the Peguan language, ſignifies free, though they have not at preſent much liberty to boaſt of. Under Siam we may comprehend not only Proper Siam, but Malacca, Cambodia, and Laos; for theſe were lately provinces, and are great part of them yet tributary to this kingdom: and

though the Dutch have encroached on the dominions of this prince, particularly in Malacca; and other remote provinces, have rebelled and thrown off their allegiance, and are now ſet up for petty ſovereigns, this cannot be ſuppoſed to have extinguiſhed the right of the lawful prince. There is this farther reaſon alſo for treating of them together, namely, that their religion, laws and policy, perſons, manners and cuſtoms, have very little to diſtinguiſh them.

Siam extends from the firſt degree of north latitude to the twenty-fifth, if we reckon from the ſouthernmoſt point of Malacca to the northernmoſt part of Laos; the longitude is not altogether ſo certain; this city of Siam heretofore being reckoned to be in the one hundred and forty-fifth degree of longitude, and by late obſervations in one hundred and twenty-one: and ſtill greater miſtakes have been diſcovered in the ſituation of China, which is now found to be five hundred leagues nearer us than former accounts made it.

Siam including Malacca, Cambodia and Laos, is bounded by Tonquin and Cochin-China, towards the eaſt, by the gulph of Siam, and the Indian ſea towards the ſouth, by the bay of Bengal towards the weſt, and by the kingdoms of Pegu and Ava, towards the north and weſt.

Siam in its full extent, is ſaid to reſemble a creſcent, of which Proper Siam and Laos may be reckoned the body, and Malacca and Cambodia the two horns; but then Malacca, or the weſtern horn, is much the longeſt, extending ſeveral degrees farther ſouthward than Cambodia, or the eaſtern horn.

There are alſo ſeven provinces in Proper or Upper Siam, which receive their names from their reſpective capital cities, viz. Proſelouc, Sanguelouc, Lacontai, Campengpet, Coconrepina, Pechebonna and Pitchia.

Porſelouc includes ten little diſtricts or counties, Sanguelouc eight, Lacontai ſeven, Campengpet ten, Coconrepina five, Pechebonna two, and Pitchia ſeven; and beſides theſe, there are in the Upper or Proper Siam one and twenty other diſtricts or counties, which are not ſubject to the former, but are under the juriſdiction of the capital city and province of Siam.

There are reckoned ſeven provinces in Lower Siam, viz. Jor, Patana, Ligor, Teneſſerim, Chautebonne, Petelong or Bordelonge, and Tchai. The province of Jor contains ſeven counties or diſtricts, Patana eight, Ligor twenty, Teneſſerim twelve, Chautebonne ſeven, Petelong eight, and Tchai two; but geographers do not take upon them to deſcribe the bounds of the reſpective provinces. We ſhall proceed therefore to deſcribe the ſituation and extent of Cambodia and Laos, which, being inconſiderable in themſelves, are included under the general name of Siam.

Cambodia extends from north to ſouth upwards of three hundred miles, and is about two hundred miles broad. It is ſituated on the eaſt ſide of the gulf of Siam, and bounded on the weſt by Cochin-China; by the Indian ocean on the ſouth; and by Laos and the Kemois mountains, on the north. Its chief town is Cambodia, ſituate on the river Mecon, in about the twelfth degree of north latitude; Laweck or Ravecca is ſomething higher up the river Mecon. The poſt towns of Terrana, Langor, and Caiol lie on the ſouth-weſt of Cambodia. The iſland of Pula-Condore lies off the coaſt of Cambodia; it is between four and five leagues long. The natives of this iſland are well ſhaped, and their complexion ſwarthy: they have ſtrait black hair, ſmall eyes, high noſes, thin lips, and white teeth, and go almoſt naked. This iſland, as well as Cambodia, is very fertile; producing various kinds of grain, particularly rice and corn; alſo ſeveral other rich commodities, and precious ſtones; wild elephants, and boars, lions, tygers, wild cattle and buffaloes, horſes, and deer, are very numerous in Cambodia. They worſhip the ſame deities as the Siameſe.

Laos is likewiſe a very plentiful country; being bounded on the eaſt by Cochin-China and Tonquin; on the weſt, by Brama; on the north, by the lake Chamay; and on the ſouth, by Cambodia and Siam Proper; but its boundary towards the north, is not agreed upon. It is about fifty miles in breadth from eaſt to weſt, though it is reckoned to be ten degrees in length from north to ſouth: the capital city is by ſome called Lanchang, and by others Lanjeng. It is a ſovereign ſtate, whoſe king preſerves an unlimited power. He conſiders himſelf as ſuperior to all other ſovereigns; and the characteriſtic, by which he diſtinguiſhes himſelf from other princes, is from the length of his ears, which hang upon his ſhoulders. But to return to Siam.

The vallies which lie at a diſtance from the ſea, are exceſſively hot, and the mountains cool; but that part of the country which lies near the coaſt, is refreſhed great part of the day by the ſea-breezes. The annual rains alſo contribute to cool the air, or this part of the world would be ſcarely habitable.

The Menan and the Mecon are the two chief rivers in Siam; but there is a third, called the Tenaſerin, which falls into the bay of Bengal, forming the iſle of Merguy, which has a moſt excellent harbour. The Menan riſes in Tartary, and, running from north to ſouth, paſſes by the city of Siam, falling into the bay of the ſame name, in thirteen degrees of north latitude. The Mecon alſo riſes in Tartary, and running from north to ſouth, through Laos and Cambodia, diſcharges itſelf into the Indian ocean, in nine degrees of north latitude.

The periodical winds, called the monſoons, prevail here, as well as in the hither India; the rains, which accompany theſe winds, are heavieſt about midſummer. The faireſt ſeaſon is in December, when the ſun is at the greateſt diſtance from them: the moſt ſtormy weather is at the ſhifting of the monſoons, which uſually happens about the equinoxes, or within a month ſooner or later, when the ſhipping runs the hazard of being daſhed to pieces, unleſs it gets into the harbour.

The metropolis or chief city of Siam, ſometimes called Odioa, and by the natives Siyothiya, is in fourteen degrees north latitude, and one hundred and one degrees five minutes longitude. It is ſituate on the river Menan, and is three leagues in circumference, fortified with a wall and towers, and ſurrounded by ſeveral branches of the river Menan, which render it almoſt an iſland, except towards the eaſt, where there is a cauſey to paſs out of the town by land, without croſſing the water: that which is properly the town does not take up above a ſixth part of the ground within the walls. On the reſt of it are built between two and three hundred temples or pagodas, ſurrounded by as many convents of talapoins; alſo their burying places, with pyramids erected over them, which with their ſpires and the towers of the pagodas make a very agreeable proſpect.

The ſtreets are large and ſtrait, and ſome of them paved with brick, and canals cut through them, over which are ſeveral high ill-built bridges, which has occaſioned the comparing this city to Venice. The houſes are moſt of them built of bamboo, or over-grown cane, and ſtand upon pillars of the ſame, thirteen feet above the ground, the lower part underneath the houſe being put to no manner of uſe: the houſes are not contiguous, nor do all the family, if it be large, lodge under one roof, but every man's ground is paled in with bamboo; and within this incloſure are ſeveral little tenements erected on pillars, according to the quality of the perſon and the number of his dependants and ſlaves: their cattle are alſo kept in upper rooms, it is ſaid, to prevent their being carried away in the time of the inundation: there are ſome few houſes in the town built by foreigners with brick; and the king has erected others of the ſame ſort for the uſe of foreign ambaſſadors.

The royal palace at Siam is a mile and a half in circumference; it is a moſt ſplendid edifice; ſituate on an eminence, and, for its extent, reſembles a city. It ſtands on the north ſide of the city of Siam, has ſeveral grand pyramids, towers, &c. and is incompaſſed with three walls, with large courts or ſpaces between the ſeveral walls. The king reſides in the innermoſt court, which is called the Vang, and contains ſpacious gardens, groves, and pieces of water; whoever paſſes in or out of the Vang falls down on his face before the gate. The Siameſe never build above one ſtory high; but then as you paſs from one room to another in the king's palace, both the floor and roof of every room is raiſed: the firſt room is the loweſt, from whence you aſcend by ſeveral ſteps to the ſecond, and ſo on to the third, &c. There are ſeven ſuch rooms in the royal palace, and in the houſes of perſons of diſtinction there are three floors, in paſſing to every one of which we aſcend by ſteps. The grand room where ambaſſadors are entertained, is open on all ſides, for the benefit of the air, and the roof is ſupported by ſlender pillars; it is ſurrounded alſo by water and ſhady groves. There are ſeveral ſuch rooms in the gardens of the palace, where the mandarins, or great officers attend, while they are in waiting. The hall of audience, beyond which foreigners are ſeldom admitted, is wainſcotted, varniſhed, and painted red, with pannels of looking-glaſs in it, and the floor covered with rich carpets. The guards have orders to admit no man into the palace who is armed, or has drank any arrack or ſpirits; the officer therefore ſmells every man's

breath before he ſuffers him to paſs the gate. The ſtables for the king's elephants and horſes are within the firſt enclosure of the palace. In a gallery at the upper end of the hall of audience the king uſually ſhews himſelf to the people.

The apartments of the king and queen are in the innermoſt court of the palace, where there are handſome halls. None but ladies attend his Siameſe majeſty in his bed-chamber, who dreſs and undreſs him, except putting on his night-cap, which he does himſelf, as no body muſt touch his ſacred head. His women alſo dreſs his meat, and wait on him at table: the proviſion is carried in to the eunuchs, and they deliver it to the females; but the king has nevertheleſs gentlemen of the wardrobe, to the moſt diſtinguiſhed of whom the care of his majeſty's golden cup is committed.

Having given an account of the city and palace of Siam, we ſhall next proceed to deſcribe the ſituation of the reſt of the conſiderable towns of this kingdom; and, of theſe, Menangfang lies the moſt northerly of any town in Proper Siam, being ſituated in the twenty-ſecond degree of north latitude, upon the river Menan. 2. Lacontai ſtands upon the ſame river, in about the twenty-firſt degree of north latitude. 3. Proſelouc is ſituated upon the ſame river, latitude twenty. 4. Campengpet about the eighteenth degree. 5. Prabat about the ſixteenth, and 6. Louvo about the latitude of fifteen, thirteen minutes, where the king uſually reſides in the hunting ſeaſon: theſe all, except Louvo, lie upon the ſame river, above the city of Siam. 7. Bancook, which lies about fifty miles below Siam, on the ſame river, and may be accounted the port town to Siam: here all ſhipping receive their permiſſion to trade, and their diſcharges when they leave the country. 8. Martaban, ſituated on the bay of Bengal, in about the ſixteenth degree of north latitude. 9. Teneſſerim, which lies on the ſame bay, at the mouth of the river Teneſſerim, in about the latitude of thirteen north. 10. Ligor, ſituate on the weſt ſide of the gulf of Siam, in the eighth degree of north latitude. 11. Cantebon or Liam is ſituated at the mouth of a river of the ſame name in the twelfth degree of north latitude, on the eaſt ſide of the gulf of Siam. 12. Patane, which lies on the eaſt ſide of the peninſula of Malacca, in ſix degrees thirty minutes north latitude. 13. Queda, lies on the weſtern ſide of Malacca, in about the ſeventh degree of north latitude. 14. The town of Malacca, which gives name to the peninſula, lies in the latitude of two degrees, thirty minutes north. It was taken from the Portugueſe by the Dutch, October, 1640. When it was in the poſſeſſion of the crown of Portugal it was a place of great trade, and frequented more than any other town in India, except Goa, here being the rendezvous of their ſhipping from China, Japan, the Spice iſlands, &c. They built the caſtle, and fortified the town with a wall, and it had five parochial churches, a college of Jeſuits, and was a biſhop's ſee, but the Dutch have let all the churches run to ruin, except one; and the trade is removed to Batavia: it is now inhabited by two or three hundred families of Dutch, Moors, Portugueſe, and Chineſe, with ſome Malays, who live in the ſuburbs, and has a garriſon of two or three hundred ſoldiers. This place is naturally very ſtrong, and by its ſituation commands the ſtreights of Malacca: the Dutch, who are maſters of it, over-awe all the little princes on thoſe coaſts, and compel them to deal with them on their own terms; they look upon themſelves to be lords of that part of the world, and almoſt exclude all other Europeans from any ſhare of the trade, as will be obſerved in treating of the trade of this country. 15. Sincapora is ſituate in the firſt degree of north latitude, at the moſt ſoutherly cape of the continent of Aſia; and gives its name to the eaſtern part of the ſtreights of Malacca. 16. Johr, which lies to the eaſtward of Sincapora in about one degree, thirty minutes. This town, and the province it gives name to, have thrown off their allegiance to the king of Siam; but the Dutch have power to give laws to them when they pleaſe. Cambori and Corozena lie to the north of Siam.

SECT. IV.

Containing a general Account of the King of SIAM, his Queen, Guards, Annual Proceſſions, Army, Navy, Revenues, Nobility, Officers of State and Ambaſſadors.

THE king, when he goes abroad, either rides upon an elephant very richly capariſoned, or is carried in a grand chair. He paſſes through the city once a year, with a numerous train of elephants, and bands of muſic. The people fall proſtrate at the ſight of his majeſty, during the proceſſion, and riſe to gaze at him, after he has paſſed. He alſo once a year ſhews himſelf on the river in a grand balcon or barge covered with a rich canopy.

The queen is attended with great pomp wherever ſhe goes, and has her elephants and batons. She is always in a chair incloſed with curtains, and never ſeen by any body except her female attendants and eunuchs.

Daughters never inherit the throne; nor does the eldeſt ſon of the queen always ſucceed to the crown, but generally the eldeſt ſon of the king by the firſt concubine that brings him a child.

The king is attended by two bodies of horſe-guards, who are natives of Laos and Meen; and a third, compoſed partly of the natives of Chineſe Tartary and Indoſtan. Theſe horſe-guards always accompany his majeſty when he goes abroad.

Every perſon in Siam is enrolled, that none may eſcape the perſonal ſervice he owes his prince ſix months in the year: they are divided firſt into right and left, and theſe bodies are again ſubdivided into bands or companies, which have each their nai or governor. Every commander of a barge has alſo a certain number of rowers or pagayeurs under him, who are marked with a hot iron on their wriſts: theſe their nai or commander diſmiſſes, if he thinks fit, ſix months at a time in every year, or by ſingle months.

The Siameſe armies conſiſt chiefly in elephants, and a naked half-armed infantry. When they go to war, their order of battle and manner of fighting is as follows: They draw up in three lines, each line conſiſting of three ſquare battalions; and the general poſts himſelf in the centre of the middle battalion, which is compoſed of their beſt troops: the reſt of the commanding officers place themſelves in the centre of their reſpective bodies; and where theſe nine battalions are thought too large, each battalion is again ſubdivided into leſſer bodies: each battalion has ſixteen male elephants in the rear, and two ſhe elephants to attend every one of them, without which it would be difficult to govern them. Their artillery is carried in waggons drawn by oxen or buffaloes, having no carriages for it; with theſe the fight begins and uſually ends; if not, they draw ſomething nearer and make uſe of their ſmall ſhot in the manner already obſerved, but hardly ever come to a cloſe fight; and if there is a neceſſity of making a ſtand, they are forced to place officers behind their men, and to threaten them with immediate death if they turn their backs.

The Siameſe do not, like ſome other Indians, take opium to inſpire them with courage; they will run no ſuch hazards, death they think is equally to be dreaded whether drunk or ſober; and he that drinks to raiſe his courage, or rather to commit a raſh extravagant action, is acceſſary to his own death. When their body is broke they fly into the woods, whither the other ſide is ſeldom ſo hardy as to follow them; and as the armies are very numerous, and conſequently find it difficult to ſubſiſt, the conqueror is ſoon forced to retreat, and then the vanquiſhed rally again, and perhaps return his viſit. The elephants are their greateſt ſtrength; but then as they cannot be managed with bit and bridle as a horſe is, when they are wounded they will often turn back upon their maſters, and put the whole army into confuſion; and it is almoſt impoſſible to make them proof againſt wild-fire, though they fire ſhort guns upon their backs, about three feet long, which carry a ball of a pound weight.

The armies of Siam, and indeed all the neighbouring countries who hold the metempſychoſis, are chiefly deſirous of making ſlaves; and their uſual method of making war, is, to invade each others dominions in different parts at the ſame time, and to carry off whole villages into captivity. They are wholly incapable of carrying on ſieges; but they will ſometimes ſtarve a place, or ſurpriſe it when they have a correſpondence with the treacherous inhabitants.

As their religion inſpires them with a horror of blood, they never ſhoot directly at each other, but higher, and never kill their enemy, but when forced to it by neceſſity, or in their own defence, in order to repulſe them; and thoſe who are ſlain, they deem guilty of their own death, by approaching too near.

The navy of the king of Siam conſiſts of but about half a dozen large ſhips, the crews of which are foreigners; however, excluſive of theſe, he has about ſixty ſmall armed gallies, with only one man to an oar, which being very ſhort, he is obliged to row ſtanding, to make it touch the water. He has about one hundred and fifty

royal

royal balons, or pleaſure-barges, which are very magnificent. In his naval expeditions, the king only makes repriſals on ſuch of his neighbours as injure him in his commerce.

The king's treaſury is immenſely rich. His revenues ariſe from cultivated lands, exports and imports, veſſels, gardens, fruits, fines, confiſcations, &c.

In Siam, nobility is conſtituted by the prince's favour, or by opulence, and not by birth. People of the meaneſt extraction are ſometimes ennobled by the king, if they happen to have any particular ſervices to recommend them. He gives to theſe a gold or ſilver bouſſette, to hold their betel, as a mark of diſtinction.

The nobility conſiſt of five degrees; namely, 1. The Oyas, who poſſeſs the higheſt places, and whoſe golden bouſſete or box is much better wrought than thoſe of the inferior claſſes. 2. The Okpras, which are conſiderably more numerous than the Oyas. The king's ambaſſadors extraordinary are choſen from the Okpras. 3. The Oklouans, which have only ſilver bouſſettes, chaſed with feſtoons and branches. The Okkowns and Okmunes are the fourth and fifth orders: their bouſſette is quite unornamented; out of theſe the king chuſes his judges, governors, &c.

The king of Siam has many lords, who are peculiarly attached to his perſon: theſe always live within the palace. Others are employed without, to govern affairs, and preſerve good order among the people.

There are eight great officers of ſtate in Siam, viz. the Maha Ommarat, who is the next to the king in authority, and ſits in his preſence; the Chakri, who regulates the affairs of war and juſtice; the Aahoon, who is generaliſſimo both by land and ſea; the Okya-Vang, who ſuperintends the affairs of the palace: the Okya Prackland, who has the care of foreign affairs and the royal magazines; the Okya Pollatep, who has the charge of the king's revenues; the Okya Jombarat, who is head judge of all criminal matters; and the Okya Pakdi, grand treaſurer. Theſe prime officers, with the king's approbation, diſpoſe of all other poſts of the realm, and are reſponſible for all errors that may be committed in them. All officers of government, reſiding in the capital, muſt daily attend in ſome part of the palace, except they have leave of abſence, on pain of being whipped with ſplit rattans, which make deep inciſions in the body.

It is an eſtabliſhed rule in this kingdom, that no officer preſume to come into his majeſty's preſence without leave; nay, the great officers are not allowed to viſit one another but at weddings and funerals; and then they are obliged to ſpeak aloud, and in the preſence of a third perſon, to prevent all conſultations againſt the ſtate; and every one is obliged to turn informer upon pain of death, if he hears any thing that may endanger the government: numbers of ſpies alſo there are, to inform the prince of what is ſpoken in all companies. On the other hand it is dangerous, being the bringer of ill news, or to let his majeſty know the weakneſs of his government; nor dare any officer tell him, it is impoſſible to execute what he commands, but they do what they can, and endeavour to excuſe the miſcarriages afterwards; and when there is a neceſſity of acquainting the king with ill news, they do it gradually, and in as ſoft terms as poſſible; for he ſeldom fails to puniſh whoever offends him, with the extremeſt rigour; and where the proofs are doubtful, will ſometimes order both the informer and the party accuſed, to be thrown to the tygers in his preſence, and inſult over their dead carcaſes.

At Siam, an ambaſſador is regarded no otherwiſe than as a royal meſſenger; the letter he carries has much greater honour paid it, than his perſon: the French ambaſſadors obſerved, that while their king's letter and preſents were carried in the body barge, with ſeveral others of the ſame claſs to attend it, they themſelves were carried up the river of Siam in ordinary veſſels. The Siameſe never ſend ambaſſadors to reſide at any court, but only to diſpatch ſome particular buſineſs, which uſually relates to trade; and upon theſe occaſions, they ſend three, though the firſt has the direction of the affair, and on his death is ſucceeded by the ſecond, and the ſecond by the third.

On the arrival of a foreign ambaſſador at Siam, he muſt not ſet forwards towards the court, till the king is appriſed of his coming; and if he is accompanied with Siameſe ambaſſadors, as the French were, the Siameſe ambaſſadors go up to court firſt, and acquaint his majeſty with their arrival: the foreign ambaſſadors are lodged and maintained at the king's charge, and are allowed to trade during their ſtay, but they are not ſuffered to enter the city, or tranſact any affairs till they have had their public audience, or to continue there after their audience of leave; and on the evening before, the king demands if they have any thing farther to propoſe: and at the audience of leave, if they are ſatisfied. All public audiences are in the metropolis, when the court appears in all its ſplendor: thoſe audiences which are given at the Louvo and other places, are accounted private audiences, where the guards and attendants are not numerous. Thoſe ambaſſadors who come from the neighbouring ſovereigns, that are dependent on, or connected with the emperor of Siam, are obliged to proſtrate themſelves before him, and advance towards him creeping upon their hands and knees. But the European ambaſſadors are exempted from many of the ceremonials, which the others are obliged to obſerve: they muſt, however, not attempt to open their lips till the emperor has firſt ſpoken; and, when they do ſpeak, are required to be exceeding laconic, a long harangue being deemed an egregious inſult. Ambaſſadors from independent Aſiatic monarchs are alſo treated with ſome degree of reſpect.

SECT. V.

Treating of the Genius and Diſpoſition, Stature, Complexion, Shape, and Dreſs of the SIAMESE: alſo of their Ceremonies, Viſits, Entertainments, Food, Diverſions, &c.

THE people of Siam have a ready and clear conception, and their repartees in converſation are quick and ſmart: it is ſaid they can imitate any thing at ſight, and in one day become tolerable workmen. They are naturally kind and complaiſant, but are apt to be haughty when too much ſubmiſſion is ſhewn them. They abhor drunkenneſs and adultery; and a ſincere affection ſubſiſts between men and their wives, who bring up their offspring to be modeſt, temperate, obliging, and affectionate. They are, however, timorous, and indolent; and have an averſion to ſhedding blood, very ſeldom come to blows, moſt of their quarrels ending in ill language.

When they profeſs the ſincereſt friendſhip, they do it by drinking of the ſame cup. It is obſerved of them, that their minds are as calm as their heaven, which changes but twice a year; and that they have the good fortune to be born philoſophers, having naturally the command of their paſſions.

The Siameſe are of ſmall ſtature, but well proportioned, which is imputed to their not being ſwaddled and bound up in their infancy like our children; and no other inconveniency attends the women's going without ſtays, but their breaſts hanging down to their girdles as the women of Siam do. Their complexions are ſwarthy enough, and the faces both of men and women are of the broadeſt, with high cheek-bones, and their foreheads ſuddenly contract and terminate in a point as well as their chins: they have dark ſmall eyes, not very briſk, their jaws hollow, large mouths and thick pale lips, and their teeth dyed black; their noſes are ſhort and round at the end, and their ears large, which they account a beauty; long nails growing an inch or two beyond their fingers ends is looked upon alſo as an ornament. They have thick lank hair which both men and women cut ſo ſhort that it reaches no lower than their ears, and the women make it ſtand up on their foreheads: the men ſhave their beards, and do not leave ſo much as whiſkers. They bathe themſelves two or three times a day, or oftener, and never make a viſit before they have bathed; ſometimes they go into the water as we do, but at others they have water poured on their heads, which they will continue an hour together; they afterwards perfume their bodies, and uſe a ſweet pomatum which makes their lips look paler than they naturally are.

A perſon of condition wears a piece of callico or ſilk about two ells and a half long, which reaches to his knees; this is called the pagne. He has alſo a muſlin ſhirt without a collar, with a wide ſleeve and no wriſt-bands, and the boſom open. In winter they wear a breadth of ſtuff or painted linen over their ſhoulders like a mantle, and wind it about their arms. The king of Siam wears a veſt of brocaded ſattin with ſtrait ſleeves, which reach down to the wriſt, under ſuch a ſhirt as is deſcribed above, and it is not lawful for any ſubject to wear this veſt, unleſs the king preſents him with it. Slippers are worn with picqued toes turned up; but ſtockings they are ſtrangers to. To the generals the king ſometimes preſents a military veſt, which is buttoned before and reaches to the knees, the ſleeves whereof are wide and come no lower than the elbows: and either in war or hunting the prince and all his retinue are clothed in red. The king wears a cap in the form of a ſugar-loaf ending in a point, with a circle

or coronet of precious ſtones about it; and thoſe of his officers have circles of gold, ſilver or vermilion gilt, to diſtinguiſh their quality, which are faſtened with a ſtay under the chin. Theſe caps are only worn in the king's preſence, or when they preſide in courts of juſtice, and on other extraordinary occaſions; but their ſlippers are always left off when they enter a perſon's houſe for whom they have any reſpect. They have hats alſo for travelling; but very few people will be at the trouble of covering their heads though the ſun ſhines with that ſcorching heat. The women alſo wrap a cloth or pagne about their middles, which hangs down to the calf of their legs; the men bring up the end of this cloth ſtrait between their legs and tuck it into their girdles, which makes it ſomething reſemble a pair of breeches

The inferior people cover no more of their bodies than modeſty requires, and have neither ſhoes nor ſlippers on their feet.

The Siameſe ladies bathe in the rivers, and ſwim as the men do, but never without their pagne about them, and are much commended for their modeſty, as a greater affront cannot be offered them, than the introducing in their hearing lewd ſongs or obſcene converſation, Their pagnes are of fine linen, and make a great ſhow: thoſe made of embroidered ſilk are only worn by ſuch perſons as the prince preſents them to. The women wear as many rings on the three laſt fingers of each hand as they can keep on, and bracelets or rings of gold, &c. upon their wriſts and ancles, with pendants in their ears faſhioned like a pear.

Theſe people are extremely ceremonious, like the Chineſe. The way of ſalutation here, as in moſt Indian nations is the Salam, that is, the lifting up one or both hands to their heads, and bowing their bodies. If any one addreſſes another, who is much his ſuperior, he falls down upon his face before him. To ſtand upright when we attend a great man, is the higheſt piece of inſolence: the uſual poſture is, ſitting on their heels, with their heads a little reclined. They have an uncommon reſpect for their heads and ever for their caps, when they have been authorized by their ſovereign to wear them. The cap is a badge of authority, and ſeldom worn but on public occaſions, or when a magiſtrate ſits in a court of juſtice; and as it is eſteemed the rudeſt thing in the world to touch or ſtroke a man's head, ſo his cap is treated with uncommon reſpect. The ſervant carries it above his head, and puts it on a cane made for that purpoſe.

The principal food of the Siameſe is rice, and fiſh: the ſea affords them good ſmall oyſters, turtles or tortoiſe, and lobſters, and ſeveral other excellent kinds of fiſh, unknown in Europe: they have alſo great plenty of river fiſh, eſpecially eels, but they make no great account of them. Balachaun, which is made of ſmall fiſh, corrupted and reduced to a maſh, has been already deſcribed in Tonquin, and is in much eſteem amongſt them. They chuſe to eat dried ſalt-fiſh, though it ſtinks, rather than freſh; nor will they refuſe rats, mice, locuſts, lizards, or almoſt any inſects, any more than the Chineſe. A pound of rice will ſerve a Siameſe a whole day, which may be bought for a farthing, and with as much ſalt-fiſh as he can purchaſe for a farthing more he is very well ſatisfied, and a pint of arrack or ſpirits is not worth above two-pence; ſo that the meaner ſort of people have but little care to take for a ſubſiſtence, nothing but ſinging is heard in their houſes of an evening. Their ſauces are made only of water, with a little ſpice, garlic and ſweet herbs, or cupi made of decayed ſhell-fiſh, the ſame with the nukemum of Tonquin. Their liquor is river-water, rain-water, and tea.

Mock-fights of elephants is one of the diverſions of the Siameſe. They were formerly very fond of cock-fighting, till their prieſts procured an order againſt that cruel ſport, eſteeming the killing thoſe animals almoſt as wicked as the killing a man. Comedies are another part of their diverſions, and a kind of martial dances, in which they act a battle, being armed and maſked, and in their ſongs repeat part of the hiſtory of their country. Their grand annual feſtival is when the waters retire; then they ſail down the river ſeveral evenings ſucceſſively, their barges being illuminated with painted paper lanterns. They have another feſtival or thankſgiving for the fruits of the earth after harveſt, when their ſtreets as well as their boats are illuminated, and a grand fire-work is played off on the occaſion. Here are races alſo, not of horſes but oxen; and they row races alſo upon their rivers, and are ſo bewitched by the games of chance, that they will not only play away their wives and children, but ſet their own perſons and liberties on the caſt of a die; and become ſlaves, if they loſe. The new and full moon are ſo far from being feſtivals, that they keep a ſtrict faſt, and will admit no manner of diverſions on theſe days; at this time it is they make their offerings to the prieſts in their convents, and give alms to the poor. The offerings are preſented by the prieſt to the idol, and ſome time after the prieſts apply them to their own uſe.

SECT. VI.

Containing an Account of the Trade, Manufactures and Mechanic Arts, Weights, Coins, &c. of the SIAMESE.

NO man learns any particular trade in this country; but every perſon acquires ſome knowledge of all, and they work half a year by turns for the king; when, if any of them ſhould be found perfectly ignorant of the buſineſs he is ſet about, he would undergo the baſtinado: nor does any man endeavour to excel leſt the king ſhould keep them in his ſervice as long as he lives. The tyrannical government they live under, is another great diſcouragement to induſtry, for the king ſeizes on any man's money and effects whenever he pleaſes.

Their carpenters work is faſtened together with wooden pins inſtead of nails: they know how to caſt metals, and cover the hilts of ſwords, and other things with gold, ſilver, or copper: they have not the art of tanning leather, or of making any ſtuffs of ſilk or wool, and weave only cotton cloth. Their painting is rather worſe than that of China, they being very indifferent workmen; which obliges them to give great wages to the European artiſts; for as the Siameſe do not affect finery in their dreſs, and deſpiſe ſuperfluous ornaments, they therefore neglect a great many mechanic arts, which the Europeans are employed in. They appear to be the honeſteſt and faireſt dealers in the world: their weights and meaſures may be depended on: they are the very reverſe of the Chineſe.

The king is the chief merchant in this country; no man may traffic with a foreigner, till the king's factors have had the refuſal of all the goods; and theſe factors deſcend ſo low as to ſell them by retail again. The ſubjects are obliged to buy all their cloathing of them, which is chiefly cotton cloth. He obliges his ſubjects to ſell him all their ivory and arrack at a certain price, which he ſells again to foreigners. In his magazines are ſalt-petre, lead, ſapan-wood, gunpowder, ſulphur, and arms, which his majeſty monopolizes, not ſuffering his ſubjects to deal in theſe articles. The king alſo purchaſes ſkins and furs of the people at his own price, and diſpoſes of them to foreigners; but by theſe practices he has ruined the trade of the country, which was formerly very great.

Their meaſure for grain and liquors is the cocoa-nut ſhell which are very unequal; nor are their weights more certain than their meaſures. They have but one ſort of ſilver coin, called a tycally, which is worth three ſhillings and three half-pence: they are all of the ſame faſhion, and have the ſame ſtamps, but ſome are leſs than others; they have the form of a cylinder, or roll bent both ends together, and have a ſtamp on each ſide, with odd characters upon it. They have no gold or copper-money: gold is reckoned among their merchantable commodities, and is twelve times the value of ſilver.

The ſhells called coris ſerve to buy little matters; they are found chiefly at the Maldive iſlands, to the ſouth of India, and are current in all the countries thereabouts; they differ in their price as they are plentiful or ſcarce; but the value of them at Siam is generally eight hundred for a penny.

The principal trade of the Engliſh in this country is at the port of Malacca, in the poſſeſſion of the Dutch: hither the Engliſh ſend ſeveral country ſhips yearly from the coaſt of Coromandel and bay of Bengal, with callicoes, ſlight ſilks, opium, &c. and make profitable returns in canes, rattans, benjamin, long pepper, ſugar, ſugar-candy, ſapan-wood, and ſometimes gold may be had at a reaſonable rate; but this is a trade prohibited by the Dutch, and carried on by the connivance of the governor, council and fiſcal.

SECT. VII.

Of the Soil, Huſbandry, Gardening, Plants, Animals, Minerals, and Manner of Travelling in SIAM.

THE ſoil of Siam has been gradually formed by the clay and other earth which the floods waſh down from the mountains; they have very little ſtoney ground, and there is hardly a flint to be found in the country. It is

is the mud which the river leaves behind which makes the earth fertile, as far as it extends: all the higher grounds are dried and burnt up by the ſun, ſoon after the rains are over; and though their lands, ſome of them, are naturally fruitful, yet they are ſo ſubject to droughts, inſects, and other inconveniencies, that they are ſometimes deprived of their harveſt ſeveral years together, and ſuch years are generally ſucceeded with peſtilential diſtempers.

Upon the land which the inundation does not reach, they ſometimes ſow wheat, and water it like a garden, by little channels cut through the fields: they have two crops yearly, but not on the ſame ground.

They uſe oxen and buffaloes in plowing, and guide them with a rope run through their noſe. Their plough is plain, and without wheels; they have a ſhare and a ſtaff to hold it by, and it is not much unlike our foot-ploughs in other reſpects, only inſtead of nails, the pieces are faſtened together with thongs and pins.

The chief grain uſed here is rice, which they begin to ſow in the flat country, when the flood has moiſtened the earth, and as the water increaſes the rice grows, and keeps its head above water till the dry ſeaſon approaches, and the ſun has exhaled all the water, and then is the time of their harveſt. Sometimes it is ripe before the waters retire, and then they go in boats to reap it.

Their kitchen-gardens afford them herbs for ſallads, pulſe and roots, and the cucumbers and melons, which the poor people eat in the dry ſeaſon, are eſteemed very innocent food.

The only European fruits almoſt they have, are limes, oranges, and lemons, but they abound in plantains, bananas, mangoes, guavas, jaques, durians, tamarinds, ananas, cocoa nuts, and ſugar canes.

Here are ſome European flowers, as the tuberoſe, gilliflower, and ſome few roſes, jeſſamine, and amaranthus, and other natives of the country valuable for their colours and ſcent: but it is obſerved, that in the heat of the day, they do not ſmell near ſo ſtrong, as they do in the morning and evening; and the European flowers tranſplanted thither do not afford near ſo ſweet a ſmell there, as they do here.

There is plenty of good timber on the hills, of which the bamboo is of great uſe in building; it is a hollow knotted cane, of an enormous ſize, very ſtrong and hard to cut. The cocoa nut, which grows on the low lands by the ſea-ſide, affords them meat, drink and oil; the body of the tree is uſeful in building boats and other veſſels, and of the fibres of the bark and nut they make cordage; the leaves ſerve to write on, and the branches for covering for their houſes. The cotton tree is very common here; it bears a fruit of the bigneſs of a walnut, which opens when it is ripe; within it they find the cotton; from other trees they draw lacque and other gums: they have alſo the ſapan, and other woods, proper for dying, and ſome lignum aloes or aquila.

In this country are tygers, elephants, horſes, oxen, buffaloes, ſheep, and goats; ſome hares, no rabbits, but great plenty of deer. Here are to be found, in great abundance and variety, peacocks, doves, pigeons, partridges, ſnipes, parrots, ſparrows, and various other birds; amongſt which the noktho is a very remarkable one: it is larger than an oſtrich, and hath a bill near three feet in length. They have great quantities of inſects and reptiles, ſuch as lizards, ſnakes, ſcorpions, millepedes, &c. and their white ants and gnats are extremely troubleſome.

This country was antiently rich in mines; and the great number of idols and other caſt-works that are found amongſt them, as well as the old pits that are daily diſcovered here, ſhew that there have been more wrought than there are at preſent. The great quantity of gold with which their images, and the walls and roofs of their temples are adorned, make it evident alſo that a great quantity of that metal has formerly been extracted out of the mines. An European phyſician diſcovered to them a mine of very good ſteel, alſo a mine of cryſtal, one of antimony, and another of emery, with a quarry of white marble. They have alſo tin and lead mines; and near Louvo there is a mountain of load-ſtone, and another in the iſland of Jonſalam on the Malacca coaſt; but the latter ſoon loſes its virtue. In their mountains are alſo found ſome ſapphires, diamonds, and agate; but the people have no encouragement to ſearch for theſe, as things of this nature are always ſeized by the officers for the king's uſe.

Beſides the elephant, they have the ox and buffalo to ride on; but they uſe neither horſes, aſſes or mules; the Moors have ſome camels which are brought from other countries; they uſe the female elephants chiefly for carriage; the males are trained to the war: every one is at liberty to hunt elephants, and take them to uſe, but not to kill them.

The chairs which the Siameſe travel in, are placed on a kind of bier, and carried by four or eight men on their ſhoulders, one or two to each pole, and others run by to be ready to relieve them: thoſe chairs have ſometimes a back and arms like our dreſſing chairs, and ſometimes are only encompaſſed with a rail or balliſter about half a foot high; they are generally open at top, and the Siameſe ſit croſs-legged in them. It is only ſome few of the great men whom the king ſuffers to ride in chairs; and the Europeans are permitted the uſe of palanquins, or couches, carried on men's ſhoulders, with a canopy over them.

SECT. VIII.

Of the Language, Learning, Characters, Hiſtory, and Chronology of the SIAMESE.

THE Siameſe have two languages, namely, the Baly and the Siameſe. In the Baly they have thirty-three letters, and in the Siameſe thirty-ſeven, all conſonants; and there are a great number of vowels in both languages, for which they have particular characters, ſome of which are placed before the conſonant, and ſome after, and others are placed above or underneath. Their pronunciation depends much on the accent, and, like the Chineſe, they ſeem to ſing when they are ſpeaking.

Arithmetic is their favourite ſtudy, in which they uſe ten characters, like the Europeans, and they are pretty ready at accounts.

They have no orators among them; and are ignorant of printing, their books being engraved with an iron pencil. They underſtand nothing of philoſophy; nor do they ſtudy the laws of their country, till they are preferred to ſome poſt, when they have a copy of inſtructions to be obſerved in that office put into their hands. Their aſtronomy is very imperfect; nor do they underſtand any thing of the true ſyſtem of the world; they believe with the Chineſe, that the eclipſes are cauſed by ſome dragon, who ſtands ready to devour the ſun and moon; and make a great noiſe with pans and kettles to drive him away from thoſe planets. But as to aſtrology, no concern of conſequence is ever entered upon till ſome ſecond-ſighted aſtrologer is conſulted. They are very ignorant of phyſic or anatomy: their phyſicians ſeldom let blood or preſcribe emetics, but have a great opinion of ſudorifics, and ſometimes purge their patients: but their beſt recipe ſeems to be conge, or water-gruel made with rice, to which diet they uſually confine the patient till he recovers. If a medicine fails of producing the deſired ſucceſs, the phyſician imputes it to the magic of ſome evil ſpirit, and are very dextrous in deceiving their patients.

They have as little ſkill in muſic as in any other ſcience; for they neither play or ſing by notes; and moſt of their inſtruments are very harſh and ungrateful to the ear: they beat upon little ill-ſounding drums, and have a trumpet ſtill worſe: they have ſome ſhrill hautboys, and a little ugly violin with three ſtrings. They have alſo braſs baſons to beat upon. When the king goes out, or upon other ſolemn occaſions, all theſe ſound together, and no doubt make very delightful harmony.

We cannot depend on any hiſtory of Siam before the year 1500. It is only ſuppoſed to be the golden Cherſoneſe of the antients: and this there ſeems to be but little foundation for, becauſe gold is not the produce of this country. It is ſaid alſo, this and the neighbouring countries of the farther India were formerly tributary to China: and this is pure conjecture; for the Siameſe have no ſuch tradition, much leſs hiſtory. They have had the uſe of letters ſome time, but they do not ſo much as pretend to have any ancient records. When the Portugueſe took the city of Malacca in the year 1511, Mahomet an Arabian was ſovereign of that city, and the territory about it, independent of the king of Siam. For the Arabians and Egyptians had certainly driven the original inhabitants, the Malays, from this coaſt, as they had the natives of Sumatra, Java, Borneo, Macaſſar, the Moluccas, Banda, &c. from the coaſt of the Indian iſlands, and poſſeſſed themſelves of the rich produce of thoſe countries, viz. of the cloves of the Moluccas, the nutmegs and mace of Banda, the camphire of Borneo, the gold of Leuconia and Sumatra, and the gums, perfumes and ſweet woods that were to be found in moſt of theſe countries; and the city of Malacca was the great mart, where this merchandize was to

be met with, when the Portugueſe made themſelves maſters of it. We cannot doubt of the Egyptians and Arabians being poſſeſſed of this trade, till the Portugueſe found the way to India by the Cape of Good Hope; for we find the Grand Signior, who was then ſovereign of Egypt, the coaſt of Arabia, and the Red Sea, fitting out fleets, and engaging the Portugueſe in ſeveral battles in the Indian ſeas, to prevent their ſettling themſelves in India, which, he was ſenſible, would deprive his ſubjects of the rich trade they had enjoyed for many hundred years: and very probably, the Arabians traded in theſe ſpices, before the Iſraelites went down into Egypt; inaſmuch as we find them carried through Arabia into Egypt, when Joſeph was ſold to the Iſhmaelite merchants, who were trading thither with their camels in a caravan: and though the people of Siam and the adjacent countries, have no hiſtories nor records, that give an account of this antient traffic; yet it is ſtrange that the Phœnicians and Arabians have no hiſtories relating to their Indian expeditions; or, if ſuch hiſtories have been deſtroyed, that there are no copies or extracts from them, except what we meet with in the ſcriptures.

With reſpect to their modern hiſtory, we are told that the kingdom of Siam and that of Pegu have frequently been engaged in wars; that ſometimes, Siam has been tributary to Pegu, and at others Pegu has been conquered by Siam; but at preſent they are independent of each other. The Portugueſe were in a manner ſovereigns of Malacca and the coaſts of Siam both north and ſouth, from the year 1511 to the year 1640, when the Dutch took that city, and now remain ſovereigns of it and of the ſea-coaſt, and particularly of the ſtreights of Malacca; and by their men of war ſtationed here and at Batavia, can prevent all other nations trading to China, through the ſtreights of Malacca and Sunda. After the above-mentioned period, namely, in 1688, the general of the Siameſe troops being popular among the ſoldiers, and having the army at his devotion, quarrelled with his ſovereign in order to dethrone him. This he effected, and deprived his maſter of life, as a royal criminal, by pounding him to death in a large iron mortar with a wooden peſtle. The ſecretary of ſtate was kept confined three years with the Siameſe pillory about his neck, and was never, during that time, permitted to quit his dungeon, except when he was taken out to be ſeverely laſhed, in order to make him accuſe ſome of the principal people of having accumulated riches by clandeſtine means, that the uſurper might have ſome pretext to plunder them. This uſurper, however, enjoyed but little ſatisfaction from reigning, being continually tortured with the ſtings of a guilty conſcience, and ſuppoſing his ſecurity depended on the blood of thoſe he ſuſpected would prove his enemies, he daily multiplied his crimes; and became at length a terror to himſelf and all thoſe who were ſubject to his tyranny. This revolution occaſioned the ruin of the factory which the French had erected at Bancock. We ſhall only add in this place, that in 1717 the king of Siam invaded Cambodia by land with fifty thouſand men, and by ſea with twenty thouſand, but was unſucceſsful in his attempt to ſubdue it.

SECT. IX.

Laws of the SIAMESE, and the Puniſhments inflicted by them for Crimes.

BY the laws of Siam, an unlimited obedience to parents and governors is as ſtrictly required as by thoſe of China, and the aged are much reverenced here. Lying is puniſhed, and deemed as great a crime in Siam, as perjury is in this part of the world; and theft is ſo much deteſted, that one who is guilty of it, is at once abandoned by all his friends, none will intercede for him, or give him any aſſiſtance; and an unjuſt poſſeſſor of lands is puniſhed as a robber.

They do not permit any man to proſecute another, either in a civil or criminal cauſe, without giving ſecurity to make the charge good; every man is allowed to plead his own cauſe, or any of his relations may ſpeak for him; but the law is not a profeſſion of a particular ſet of men.

Where the truth of the charge is doubtful, the juſtice of the proſecution is tried various ways. But the proſecutor and the defendant are ſometimes commanded to walk over burning coals, and he that eſcapes by dextrous management, is held to have the right on his ſide. Another method is by diving into deep water; the man that continues longeſt under water is adjudged innocent.

Emetics is a third method of trial. The prieſt gives each of the parties a pill, and the teſtimony of the perſon who keeps the pill in his ſtomach without vomiting, is believed. They throw both the plaintiff and defendant ſometimes to a tyger, and he that comes off unhurt is held to be in the right; and they will frequently offer themſelves to undergo this laſt trial, though they appear to be extremely timorous when they are to engage an enemy. Theſe trials are in the preſence of the king and magiſtrates.

For treaſon and murder criminals are thrown to an elephant and trampled to death; and puniſhments are uſually adapted to the nature of the crime. A perſon convicted of robbing the public has melted metals poured down his throat; they ſew up the liar's mouth, and for little crimes they faſten a ſquare pillory board about the offender's neck; ſome are ſet in the ground up to the ſhoulders, and every one authorized to buffet him, which is the greateſt indignity a Siameſe can ſuffer, eſpecially to have his head buffeted by women. Perſons guilty of rebellion are ripped up alive.

They allow appeals from inferior courts to the ſuperior; the preſident of the tribunal at Siam can reverſe a judgment given in any other province; and there is an appeal from him to the king; ſo that where the parties are rich and able to bear the charge, there is no end of the ſuit; but the poor are condemned with as little formality as they are in Europe; and where they meet with a potent adverſary, innocence is but a very ſlight protection: judgment of death is never executed in any of the provinces, but by the king's ſpecial commiſſion; but the baſtinado and other puniſhments, on which death frequently enſues, are inflicted by every governor: but one thing ſeems peculiar to the Siameſe, that he who unjuſtly poſſeſſes himſelf of another's lands, is deemed no leſs guilty of robbery than he who robs on the highway; and the perſon lawfully convicted does not only reſtore the lands but forfeit the value of them, one half to the party diſpoſſeſſed, and the other to the judge, as all other pains and forfeitures are divided; but then the king has half the governor's moiety, and where there is not an hereditary governor, the king has one entire half, and the party grieved the other. There is an officer of the crown in every province, who ſhould be ſome check upon the governor, and report to the king what paſſes in the province, and particularly in the courts of juſtice; but it ſeems there is ſuch a general connivance among the officers at each others extortions, that the people receive very little benefit from this inſtitution: every officer ſqueezes what he can out of his inferiors, and the nai, or commander of a band, compels thoſe under him to do double duty who have nothing to bribe him with; while others who preſent him handſomely, are entirely excuſed.

Though their greateſt men are ſometimes puniſhed in a very ſevere manner, yet as this is ſaid to be done only for their reformation, they are afterwards reſtored to their poſts, and none are permitted to upbraid the delinquent with his offence, after he has ſuffered the law.

Officers are frequently puniſhed for the faults of thoſe who act under their authority; and parents and maſters of families for the offences of their dependents and children.

SECT. X.

Of the Marriages, Funerals, and Religion of the SIAMESE.

THIS people, like their neighbours, diſpoſe of their daughters in marriage, when very young. A great many preliminaries muſt be adjuſted in Siam, before a contract of marriage is made: an aſtrologer is to be conſulted, and the nativities of the young couple are to be calculated. From this cunning man alſo, they are to learn, whether it is likely to prove a happy match, and whether the family they are about to marry into be rich; it not being eaſy for any man, who is not a conjurer, to know this; all people that have wealth endeavouring to conceal it, leſt the government ſhould borrow it. When the parties have gained the beſt information they can in theſe particulars, and are ſatisfied with them, the lover is permitted to viſit his miſtreſs three times, and the relations being preſent at the third, the portion is paid, and then the marriage is eſteemed complete, without any religious ceremony performed, and it is ſoon after conſummated. The talapoin is prohibited to be preſent on thoſe occaſions; however, he viſits the married couple, in a few days, ſprinkles them with water, and repeats a prayer for their proſperity. The Siameſe are allowed more wives than one, but ſeldom make uſe of this privilege, except their great men, who take theſe liberties in moſt countries, whether their religion or laws prohibit it or not.

They

They have but one wife in reality, who is ſo by contract; the reſt are concubines purchaſed with their money, andmay be ſold again; nor can their children inherit. The fidelity of the Siameſe wives is much applauded, they ſeldom give their huſbands occaſion to be jealous, and are exceeding diligent. They work and maintain the family, when the huſband is in the king's ſervice, as he is obliged to be one half of the year. Divorces are allowed, but thoſe happen very ſeldom, and when they do, the man returns the wife's fortune, and the children are divided between them.

As the women carry on all the trade, there is a neceſſity of allowing them greater liberties than they do in other hot countries, and they are ſo far from abuſing their liberty, that they avoid every thing that may give any occaſion for ſcandal. There have been ſome inſtances of tranſgreſſions, however, among the royal concubines: one of theſe offenders, the king ordered to be covered by a horſe, and then put to death. And Loubiere relates, that another offender being thrown to the tygers, which refuſed to ſeize her, the king offered her a pardon, but ſhe would not accept it, chuſing rather to be torn in pieces, than return to the drudgeries of the palace, the king being preſent at this terrible execution.

When a Siameſe dies, the corpſe is immediately put into a coffin lacquered and gilded; and to prevent any ſtench, it is ſaid, they endeavour to conſume the bowels of the deceaſed with mercury, and have ſometimes leaden coffins: they place the coffin upon a bedſtead or table, and it remains in the houſe till the preparations are made for the funeral, and the head of the family can attend the ſolemnity: in the mean time they burn perfumes before the corps, and ſet up lighted tapers. The talapoins alſo range themſelves round the ſides of the room every night, and entertain the family with hymns and diſcourſes ſuitable to the occaſion; for which they are rewarded with money as well as good proviſion. In the mean time a ſquare ſpot of ground is encloſed with a bamboo pale near ſome temple; round which are hung the painted and gilded papers which the family make, repreſenting houſes, goods, animals, &c. In the middle of the ſquare ſtands the funeral pile, which, beſides other woods, has yellow ſanders, lignum aloes, and other ſweet woods in it, according to the ability of the family; and the pile is built of earth as well as wood to a great height. The corpſe is always carried to the pile in the morning, with the ſound of ſeveral kinds of inſtruments, attended by the family of the deceaſed, both men and women clothed in white, and with white vails, bewailing themſelves all the way, according to cuſtom; after them follow the reſt of his friends and relations, and they chooſe to go in their barges by water towards the burying-place as far as they can.

When the company arrive at the place, they take the body out of the coffin, and lay it on the pile; the talapoins of the convent ſing doleful hymns a quarter of an hour, and then retire; after which, a fire-work is played off. There are always ſhows and plays exhibited on the occaſion, attended with a kind of feſtival, at which the prieſts are forbidden to be preſent. The talapoin's ſervant ſets fire to the pile about noon; which having burnt about two hours, the corpſe is rather ſcorched than conſumed; though it is uſually reported to be burnt to aſhes; this being thought to derive ſome honour on the deceaſed. The poorer ſort do not burn the bodies of their deceaſed relations; but either expoſe them on a ſcaffold in the open field, where they are devoured by birds of prey, or elſe inter them privately.

With reſpect to the religion of the Siameſe, they do not believe the ſoul to be a pure ſpirit, but that it conſiſts of matter ſo ſubtil as to be free from touch, and that after death it retains the human figure, and the ſame ſolid and liquid ſubſtances our bodies are compoſed of; and that if a perſon die by a wound given him it may be ſeen in theſe aërial bodies, with the blood flowing from it, agreeable to the notions of the antient Greeks and Romans; but though the ſoul be material in their opinion, they will not admit that it is periſhable, but that it animates ſome other creature, and knows pain or pleaſure according to its demerits, till it enters a human body again; whoſe circumſtances they hold will be ſuitable to the behaviour of the ſoul in its ſeveral tranſmigrations. They hold alſo, that departed ſouls do not only animate plants and animals, &c. ſucceſſively; but that there are alſo certain ſpaces beyond the viſible world, where they ſhall be rewarded or puniſhed; that the happy aſcend far above the ſtars, while the miſerable are doomed as far beneath; and they uſually aſſign nine different regions both of happineſs and miſery, every one differing in degree, the higheſt and loweſt being moſt exquiſite in their kind. And as they do not imagine that ſouls paſs immediately from one ſtate to another, but are new-born into whatever place they happen to go; ſo they believe they ſtand in need of the ſame things they did in this life; and for that reaſon, as the Pagans did of old, in ſome places they burn their moſt valuable moveables, and even animals and ſlaves with them; their wives alſo in the hither India uſed to offer themſelves to be burnt with their huſbands, in hopes to enjoy them in the other world; and it is ſaid, they have not wanted inſtances there of the huſband burning himſelf with his beloved wife. But Loubiere obſerves, that neither the Chineſe or Siameſe, or any nation beyond the Ganges, ever permitted the wife to burn herſelf with her huſband; and are ſo wiſe, that inſtead of real furniture and treaſure, they burn there only gilded or painted paper reſembling thoſe things; giving out that theſe are converted into real goods, and though the Chineſe burn ſome goods, yet they burn much more in paper. They alſo maintain, that the ſoul reſides in the blood, and therefore deem it improper to open a vein or make any inciſions in the fleſh, to extract the blood.

They pray to their departed friends, and do them all the honours they can contrive at their funerals, eſpecially to the manes of their anceſtors, as high as their great grandfathers; imagining that thoſe beyond have ſuffered ſo many tranſmigrations, that they can hear them no more; but the eaſtern nations do not addreſs their devotions to any but thoſe of their own family, profeſſion, or neighbourhood; nor do they, like ſuperſtitious Europeans, hope or fear any thing from the departed ſpirits of ſtrangers.

The true Indian paradiſe is thus deſcribed: that if a ſoul, after ſeveral tranſmigrations, by the good works done in each new life arrrive at ſuch a degree of merit, that there is not, in any of the worlds, any mortal condition which is worthy of it, then they ſay it enjoys the hireupan; that is, it had diſappeared, and will return no more to any world, but will remain in a ſtate of eternal impaſſability and happineſs.

When a perſon has happily merited heaven, before he is tranſlated thither, (for ſuch a ſoul is ſuppoſed to be incapable of dying any more) they attribute to him an invincible ſtrength of body, and a perfect ſkill in all ſciences, and believe he becomes a moſt powerful preacher of righteouſneſs to mankind: after which he diſappears, or is taken out of their ſight, like a ſpark (as their expreſſion is) which is loſt in air: and to the memory of ſuch as theſe, they dedicate their temples. But the perſon they ſuppoſe has ſurpaſſed all men that ever lived, in holineſs, and whom therefore they worſhip with the higheſt devotion, is Sommona Codom; Sommona ſignifies a talapoin of the woods, Codom was his proper name; and, as has been obſerved already, virtue, according to them, is only to be found in the order of talapoins, and chiefly in the talapoins of the woods.

Sommona Codom's father, the talapoin books relate, was the king of Ceylon, that delicious iſland where the true cinnamon only grows, and is now ſubject to the Dutch. Sommona Codom beſtowed all his eſtate in charity, pulled out his eyes, and killed his wife and children, and gave them to the talapoins to feed on. They relate alſo, that another Sommona Codom will hereafter ariſe; who will alſo kill his children for the talapoins; for which charity he will arrive at the higheſt pitch of virtue.

They believe, that Sommona Codom, before he entered into this ſtate of bliſs, acquired a prodigious ſtrength of body, and had the power of working miracles; that he could enlarge his body to what ſize he pleaſed, and then reduce it to ſo ſmall a point, as perfectly to diſappear.

It is further to be obſerved, that they do not look upon their Sommona Codom as the perſon who firſt inſtituted their religion, or gave them the above-recited precepts; but that he reſtored and re-eſtabliſhed them, after mankind had ſwerved from the rules originally enjoined them.

We ſhall now proceed to give ſome account of the talapoins and talapoineſſes, who as well as the doctrine they profeſs, the people believe to be as ancient as the world itſelf: but they themſelves are ignorant of the founder of their order.

Any learned perſon may become a talapoin, on applying properly for admiſſion. The habit conſiſts of four pieces of cloth; the one is the angſa, a kind of ſhoulder belt, five or ſix inches broad; they wear it on the left ſhoulder, and button it with a ſingle button on the right hip. Over this belt they have another called the paſhivon, reaching to the ground both behind and before, and leaving the two arms, with all the right ſhoulder free. Over this

this is the papat, which reaches low behind, as well as to the middle before, and is generally red. They gird the whole with a piece of yellow cloth called rappakod, which completes the four pieces that compoſe their habit.

There are two ſorts of talapoins; one of the woods, and the other of cities. The education of youth is committed to them, and they are ſerved by their ſcholars. Theſe talapoins are a ſort of begging friars, who live upon the alms of the people, and every one eats what he begs, or has given him, by himſelf, and not in a common room. They are very hoſpitable to all ſtrangers, Chriſtians as well as others, and have lodgings for them on each ſide their gate. Theſe prieſts vow celibacy, and lead very auſtere lives; the penalty of deviating from their rules, is no leſs than burning, which the king takes care ſhall be rigorouſly executed, to prevent too many of his ſubjects turning talapoins, ſince they pay no duties, and contribute nothing to the defence or ſupport of the ſtate. They preach every new and full moon, and during the inundation, every day, from morning till evening, the preacher ſitting croſs-legged on a raiſed floor, and is relieved when he is weary by one of his brethren; the people expreſſing their aſſent to the reaſonableneſs of the doctrine, and bringing their alms to the preacher, by which bounty many of them grow rich. The time of the rains is their annual faſt, when they eat nothing but a little fruit in the evening.

The talapoins are obliged to watch as well as pray, eſpecially after harveſt, when they go into the fields in night-time, and return into the towns in the morning; and though others are apt to think themſelves in danger of wild beaſts when they are abroad in the night-time, the people are made to believe, that a tyger will not touch a talapoin, they are ſo ſanctified a generation.

The people waſh the talapoins at every new and full moon; but at theſe times the ſuperior always ſhaves himſelf, becauſe no man is worthy to touch his head, and the elder always ſhave the younger; but when he is grown too old, a young talapoin is permitted to ſhave him, who aſks pardon firſt, and declares himſelf unworthy of that honour.

They waſh every morning, as ſoon as they can ſee, and not ſooner, for fear they ſhould deſtroy ſome inſect. After waſhing, they perform their devotions in the temple, which they ſing as in choirs, their books cocoa-nut leaves, on which they write, or rather engrave; for they have not yet the art of printing: they ſing their devotions ſitting upon their heels: but both prieſts and people, at their going in and out of the temple, proſtrate themſelves three times before their idols.

After the morning devotion, they go into the city, and ſtanding at the doors of the houſes they expect any thing from, their food is brought them, but they never aſk for it, though there does not ſeem to be much occaſion for theſe alms; for they have lands and gardens appropriated to their convents, and ſlaves to cultivate them, and they are exempt from taxes. The talapoins have ſervants, as well as ſlaves, who wear a white habit, and receive the money given their maſter, it being a ſin for the talapoin to touch money himſelf: the talapoineſſes wear white, and if they are taken with a man, are delivered to their relations to chaſtiſe; for it is againſt their rules for a talapoin to ſtrike any one.

Theſe talapoineſſes who are nuns, live in the ſame convents with the talapoins; the convents are a number of ſingle houſes ſtanding upon bamboo pillars at a ſmall diſtance from each other. Perſons who go to a convent, enter it intirely by their own choice, and are at liberty to quit it whenever they pleaſe.

We ſhall only add here, under this head, that the Indians not being prejudiced againſt any religion, but allowing a univerſal toleration, we may preſume that the reaſonableneſs of the Chriſtian doctrines might have induced them to embrace them, if the ambition, avarice, injuſtice, and tyranny of the European nations, who have ſettled there, had not contradicted the doctrines they taught, and raiſed, in the Indians, an abhorrence of their perſons and practices.

SECT. XI.

Deſcribing the Kingdoms of AVA, PEGU, ARRACAN, TIPRA, ACHAM, and BONTAN, with their Boundaries and Extent, Rivers, Towns, &c. alſo an Account of the Inhabitants, their Genius, Temper, Diet, Food, Religion, &c.

THESE countries may be comprehended under the name of the kingdom of Ava, for the king of Ava and Pegu is ſaid to have reduced all the reſt under his power.

This kingdom or empire of Ava, including the countries aboveſaid, is bounded by Aſem or Acham towards the north, China and Siam towards the eaſt, and the country and bay of Bengal towards the weſt and ſouth; and extends, according to the beſt maps we have of thoſe countries, from the latitude of ſixteen to twenty-ſeven north, ſo that the whole length from north to ſouth, may be reckoned between ſix and ſeven hundred miles, and the breadth about half as much.

The principal rivers in this country, are the Arracan, the Capoumo, the Menam, the Ava, and that of Pegu, which running from north to ſouth almoſt the whole length of the country, and overflowing their banks annually, render it no leſs fruitful than Bengal and Siam, which lie on each ſide of them; and the lake of Chamay is placed in our maps at the north eaſt part of this country.

The chief towns are, Tipra, Ava, Arracan, Lactora, Prom, Mero, Pegu, and Siriam; Tipra is the capital of the kingdom or province of the ſame name, and lies in the latitude of twenty-four degrees north, or thereabout. Arracan ſtands near the mouth of the river of the ſame name, which a little lower falls into the bay of Bengal, it lies in twenty-one degrees of north latitude. Ava lies to the eaſtward of Arracan, upon a river of the ſame name, which a little lower falls into the Menam; and Lactora ſtands between Ava and Arracan upon the river Capoumo. Prom, or Porcom, ſtands on each ſide of the river Menam in the latitude of nineteen degrees, and Mero to the ſouthward of it on the ſame river, latitude ſeventeen north. Siriam lies on the weſt ſide of the river Menam, near the mouth of it, almoſt againſt Martaban. Pegu ſtands about eighty miles up the river of the ſame name, in the latitude of ſeventeen degrees ſome odd minutes; it is divided into the old and new city, which together make the town almoſt ſquare; it is defended by a wall or moat, and has on every ſide five gates; the court and people of condition take up that part which is called the new city, which is ſeparated from the other by a wall and ditch, the ſtreets are ſtrait, and wide enough for fifteen men to ride a-breaſt; and they have trees planted before their houſes for ſhade, as in many other Indian towns. In the middle of the new city ſtands the palace, which is fortified with walls and towers like a caſtle. Travellers tell us it is very magnificent; Le Blanc gives us the following deſcription of it: in one of the courts ſtands the figure of a tall man, all of ſolid gold, with a crown on his head, enriched with rubies of a conſiderable value: round this figure ſtand four other golden ſtatues. In another court is repreſented a giant, all of ſilver, ſitting with a crown of ſilver on his head, ſet with rich jewels; and in other courts are other rich ſtatues, formed of various kinds of metal, with crowns on their heads, adorned with rubies and ſapphires. The king of Ava and Pegu has ſeveral neighbouring ſtates tributary to him.

Pegu, which is within the tropics, is flooded when the ſun is vertical; but the ſlime, left by the waters, gently fertilizes the low grounds. The higher land is parched with intenſe heats after the rains have ceaſed; and the natives are obliged to water their fields by the communication of ſmall channels from reſervoirs or ciſterns.

The hills of Pegu are cloathed with fine wood, and the natives derive great advantage from the bamboos. Their fruits are oranges, lemons, citrons, figs, pomegranates, bananas, durians, mangoes, goyvas, cocoa-nuts, pine-apples, &c.

Rice they have in great plenty, and ſome wheat; alſo garden-ſtuff, which they chiefly live upon. They have alſo various kinds of pulſe, good poultry, and variety of excellent fiſh.

They plough with oxen and buffaloes. They have few horſes or ſheep; but deer are exceedingly numerous. This country alſo abounds in elephants; and produces rubies, ſmall diamonds, and other precious ſtones; alſo iron, tin, lead, ſalipetre, wood-oil, oil of earth, ſugars, &c.

The monſoons, winds and ſeaſons, are the ſame here as they are in Upper Siam, to which it is contiguous: they build their houſes alſo on poſts by the river ſides, like the Siameſe. And as to the genius and temper of this people, their courage and manner of making war, their habits, food, entertainments and ceremonies, their huſbandry, produce of the ſoil, learning, religion, &c. from all that we can collect, there is not any material difference between them and the Siameſe. What our ſailors moſt take notice of is the complaiſance of their women, who will contract with them for as long or as ſhort a time as they pleaſe, and behave themſelves in all reſpects like good wives while their temporary huſbands remain in the

country: nor do their friends look upon this kind of commerce as any diſgrace, but receive them kindly when they return to them again. The Engliſh from Fort St. George drive a profitable trade with Pegu and Arracan, from whence they import rubies, ſapphires, amethyſts, and other precious ſtones: ſkins and furs alſo are another very conſiderable branch of this trade.

The Peguan temples, and the idols in them, are ſuperbly embelliſhed. A temple near Siriam has the name of Kiakiack, or God of gods: in this edifice is a large figure lying as though it were ſleeping, and is pretended to have lain in this poſture ſix thouſand years. There is another temple near Siriam, which they call Dagun; but only the prieſts muſt enter it. The prieſts ſay this idol reſembles nothing human, and refuſe to deſcribe the ſhape or form of it. There is in one of their tempies a ſilver idol, of gigantic ſize, which, as an oracle, anſwered queſtions, and predicted what was to happen. They have alſo an idol called Trokogue, of the ſame ſtature as the former, though of different compoſition: this idol, they pretend, intercedes with Kiakiack for the wicked, and once a week they ſacrifice a hog and three pullets to it. There are ſeveral very ſingular circumſtances attending their ſacrifices. They worſhip dæmons, in order that they may not be afflicted by them. They begin their feſtivals with dancing and muſic; perſons of high rank attend them, cloathed in their richeſt apparel, and adorned with jewels; but they are often changed to doleful lamentations, and conclude with plaintive ſtrains in praiſe of their anceſtors. After which they recruit their ſpirits with mirth and good food and liquors.

They ſtyle the emperor of Ava the ſovereign of the white elephant. He is almoſt worſhipped by his people: he calls himſelf the king of kings, and his ſubjects ſtyle him a god. He is reckoned ſuperior to all other ſovereigns, as being allied to all the planets; the ſun is his brother, and the moon and ſtars his ſiſters. When an ambaſſador approaches this great prince, he is attended by ſound of trumpet, while heralds proclaim aloud the honour and happineſs he is about to receive. The king is at this time attended by all his miniſters, and two hundred guards, ſome with daggers, and others with ſteel bows finely poliſhed.

This monarch holds the reins of government entirely in his own hands, and puniſhes with great rigour ſuch officers as are guilty of mal-practices. When he hears of the commiſſion of any enormous crime, he iſſues his royal mandate for ſuch offence to be tried by judges of his own chuſing; and if the perſon be convicted, he fixes the particular puniſhment to be inflicted, which is, the being trampled to death by elephants, or ſome other cruel mode of puniſhing the delinquent.

A kind of ariſtocratical government prevails in every town of theſe dominions. When a perſon cannot or will not pay the debt for which he is committed to priſon, the creditors may diſpoſe of him for a ſlave.

In caſe of war, the heralds proclaim their ſovereign's will with flaming torches in their hands, and the governors of provinces are obliged to raiſe ſuch a number of troops as the ſtate wants, in addition to the accuſtomed military eſtabliſhment. A troop, perhaps, of one thouſand elephants are ſoon ſeen in full march, the king being ſeated on his throne upon the back of one of the whiteſt, attended by all his nobles, and march to the field of war by the ſound of trumpets and other military muſic.

The kingdom of Arracan is bounded on the eaſt by Ava; on the weſt by the bay and country of Bengal; and on the north by Tipra; it extends about four hundred miles in length, and contains a great number of places, many of which are uninhabited, from the great number of wild beaſts that infeſt it.

The inhabitants of this country are diſtinguiſhed by their broad and flat foreheads, red noſes, and wide noſtrils: they have ſmall eyes, but a very quick ſight. The people are in general very robuſt. The common people generally wear a dark purple habit: but thoſe of diſtinction wear veſtments of white cotton, with an apron before them, and a kind of bag behind their backs formed in plaits. Their hair is divided into locks, each of which is tied, and ornamented with knots of fine cloth. The women are much fairer than the men, but proportionably robuſt. They wear a cotton garment, which is bound ſeveral times round the body, and reaches down to the ancles: they have a kind of handkerchief made of flowered gauze over their necks and ſhoulders. The better ſort wear a ſilk ſcarf on one of their arms, and decorate their hair with a variety of ornaments. They have glaſs rings in their ears, which are ſo large as to hang on the ſhoulders; and their arms and legs are ornamented with bracelets and rings of ſilver, copper, ivory, &c.

Their houſes are made with branches of palm-trees, or canes placed on pillars, and covered with leaves of the cocoa-tree, and are exceeding ſmall; but the better ſort have more ſpacious buildings. They are obliged to dreſs their victuals without doors in earthen pots, as they have no chimnies, or any convenience for firing in their houſes.

They are exceeding temperate in their diet, though they have great plenty of proviſions. Their common drink is made from the leaves of a tree reſembling the palm-tree, which if drank new, is very ſweet, but in a few days will turn ſour. They uſe rice inſtead of bread.

The country produces all kinds of fruits with various ſorts of grain. The climate is very healthful and pleaſant in ſummer, but much otherwiſe in winter, for the inhabitants are ſubject to agues, from the prodigious quantity of rain that falls during that ſeaſon. Here are great numbers of buffaloes and elephants.

The king of Arracan generally reſides at the capital; he is as powerful as any of his neighbours, and has twelve princes under him, whoſe reſidences are in the chief cities of the kingdom; and they are permitted to aſſume the title of kings. The king himſelf is ſtyled, "Emperor of Arracan, poſſeſſor of the white elephant, with the two caniques, rightful heir of Pager and Broma, and lord of the twelve kings, who lay the hair of their heads under the ſoles of his feet," &c. He is ſeen by his ſubjects but once in five years, at which time the palace is ſurrounded with buildings and ſcaffolds erected on the occaſion. The king comes from the palace dreſſed in the moſt ſumptuous manner, ſeated in an elegant tent placed on the back of an elephant richly capariſoned. He is followed by his courtiers riding on elephants, whoſe harneſs and trappings are richly adorned with diamonds and other precious jewels. Then the king, with his attendants, rides through the principal ſtreets of the city; after which, he returns to the great ſquare before his palace, where his ſubjects renew their oath of allegiance to him, and the evening is concluded with the greateſt feſtivity by all ranks of people.

This country abounds with temples and other ſacred places, which are built like ſteeples, and contain many idols worſhipped by them. They hold an annual feaſt in commemoration of the dead, at which time they carry one of their idols in proceſſion, attended by a number of prieſts dreſſed in uniform, conſiſting of a long garment made of yellow ſattin. The idol is placed in a large heavy chariot, and ſuch are the ſuperſtitious notions of the vulgar, that many will throw themſelves under the wheels, and others will tear their fleſh with iron hooks faſtened to the carriage for that purpoſe: they take great pains to colour theſe hooks with their blood; and they are afterwards preſerved and hung up as ſacred relics in their temples.

There are three orders of prieſts among them, the higheſt of which is diſtinguiſhed by wearing a yellow mitre; but the other two always go bare headed: they are all prohibited marrying, on pain of degradation. When any perſons are ill, they ſend for the prieſts, who pray with them, in return for which the patient offers ſacrifices of fowl, &c. according to their ability. If the patient recovers, the cure is attributed to the prayers uſed by the prieſt, but if he dies, the prieſt tells the relations that their ſacrifices are accepted, but God deſigns the deceaſed a greater favour in the other world. The prieſt thinks it charity to drown the patient if he appears incurable.

On the death of a perſon of diſtinction, the body is burned, but the poorer ſort are thrown into the river. They believe in tranſmigration, and therefore ornament their coffins with the figures of ſuch animals as they think the moſt noble.

Every family has ſome peculiar animal, by which they ſwear, and whoſe figure they mark with a hot iron on different parts of their body. Their nuptial ceremonies are performed in the preſence of this animal, and, before they eat, they always offer him part of their proviſions.

The principal people that trade with the inhabitants of this kingdom are the Moors, and the commodities they purchaſe conſiſt of elephants teeth, tin, lead, and timber for building. The ordinary money is ſhells, or ſmall pebbles, eighty of which are valued at nine-pence, but they have a ſilver coin eſtimated at two ſhillings.

The capital of this kingdom, called alſo Arracan, is large and well-fortified: it is ſituated in a valley, and is fifteen miles in circumference. It is incloſed by very high

ſtone walls, and ſurrounded by a ridge of ſteep, craggy mountains, ſo artificially formed as to be almoſt impregnable; beſides which, there is a caſtle within, ſtrongly fortified. The city is well watered by a fine river that paſſes through it in different ſtreams, and at length forms into two channels, which empty themſelves into the bay of Bengal.

It is eſtimated, that the number of inhabitants in this city amount to one hundred and ſixty thouſand, excluſive of foreigners. The houſes in general are ſmall, and built of bamboos; but thoſe of the richer ſort are ſpacious and handſome: there are upwards of ſix hundred idol temples in it, moſt of which are ſpacious buildings, elegantly ornamented. The palace is exceedingly magnificent, being decorated with the moſt coſtly embelliſhments. The apartments are lined with various kinds of wood that yield the moſt agreeable fragrance; and the roofs of thoſe belonging to the king are covered with plates of gold. In the centre of the palace is the grand hall, which contains a canopy ornamented with wedges of ſolid gold, reſembling ſugar-loaves. Here are likewiſe ſeveral idols of the ſame metal, as large as life, and adorned with diamonds and other coſtly jewels. In the centre of the hall is a cabinet of gold, ſupported by a large ſtool of the ſame metal, and overlaid with diamonds and other precious ſtones. This cabinet contains the two caniques, or famous pendants of rubies, by which the king preſerves a ſuperior authority over his vaſſal princes, and which he alſo wears at his coronation.

There are ſpacious ſtables adjoining to the palace, for the king's elephants, tygers, horſes, &c. and there is a conſiderable lake with ſmall iſlands near it, inhabited chiefly by prieſts. This lake is ſo ſituated, as to be a ſecurity to the inhabitants of the city, ſhould they be reduced to the neceſſity of flying from the attack of an enemy; for, by cutting a bank which ſurrounds it, they might overflow the city, and retire to the iſlands adjacent.

This city has very extenſive ſuburbs adjoining to it, and the ſurrounding countries are delightfully pleaſant. The villages, mountains, &c. are beautifully diverſified with fields of different kinds of grain, intermixed with pieces of water. Their flocks of cattle are very numerous.

In the neighbourhood is a factory belonging to the Dutch; and ſome of the richeſt commodities in Aſia are to be purchaſed in many of the ſhops in the city. The Moors often obtain conſiderable poſſeſſions by purchaſing diamonds, rubies, and other coſtly jewels; and indeed they are the principal people that trade here.

There are many other cities of conſiderable note in different parts of this kingdom; as alſo many capital towns remarkable for traffic; the moſt material of which, are,

Orietan. This is one of the twelve capital cities, and is governed by a viceroy, who aſſumes the title of king, and receives a crown from the king himſelf. It is ſituated on a branch of the river, to the ſouth-weſt of the city of Arracan. In the neighbourhood of this city is a large mountain, on which is a fortified place for the confinement of ſtate priſoners, or other diſtinguiſhed criminals. There is another mountain called Pora, on the top of which is placed the principal idol, which is worſhipped by the king himſelf on a certain day once in the year. Between the cities of Arracan and Orietan is a ſpacious river, the banks of which are delightfully ſhaded with tall trees, that form as it were an harbour; the pleaſure of ſailing under which is conſiderably heightened by the multitude of peacocks that are continually moving from one tree to another.

Another city of conſiderable note is Rama; but the paſſage to it either by land or water being dangerous, it is little reſorted to; for the mountains are infeſted with a great number of wild beaſts, and the ſudden tempeſts that ariſe make the getting to it by water very perilous.

The next we ſhall take notice of is Dobazi, which is a large and populous city, but chiefly remarkable for its commodious harbour, and a ſpacious river by which great trade is carried on with the neighbouring places.

Dianga is alſo a large town, ſituated one hundred and twenty miles north of Arracan; the inhabitants are chiefly Portugueſe fugitives, and they have very conſiderable privileges allowed them.

Another town of great trade is Pereom or Prom, which has a very convenient harbour. It is the reſidence of a governor, who exerciſes the abſolute authority of an eaſtern monarch, and keeps a grand court here.

Tipra, or Tipoura is a tributary kingdom, ſubject to the king of Arracan. It is bounded by the empire of Ava, and part of China, to the ſouth and eaſt; by Independent Tartary, to the north; by Arracan, to the ſouth-weſt, and by Indoſtan, to the weſt. It is ſaid to require fifteen days to croſs it. Being under the tropic of Cancer, it is exceedingly hot, the air is nevertheleſs ſalubrious and pure; but the water is ſo bad, that it occaſions the throats of the inhabitants to ſwell to a prodigious ſize.

The ſovereign and the nobility ride upon elephants, or are carried in palanquins; but the common people, when they travel, make uſe of horſes or oxen indiſcriminately. The accommodations for ſtrangers are bad; and the behaviour of the natives rude and unpoliſhed.

The ſubjects of this kingdom pay no taxes, but in lieu thereof labour annually once a week for the king, either in his mine or his ſilk-works, from whence alone he derives his revenues. He exports gold and ſilver to China in ingots, and in return receives ſilver, which is coined into ſpecies of currency of twenty pence and twenty-two pence value each: gold is coined into aſpers, which are worth about five ſhillings a-piece. Geographers ſay, that the river Cuipoumo runs from Chiamay lake through this and ſeveral other kingdoms, till it diſembogues itſelf into Bengal bay.

The kingdom of Acham, Aſem, or Azem, is bounded by China, on the eaſt; Indoſtan on the weſt; Tipra on the ſouth; and Boutan, with part of Independent Tartary, on the north.

This country, in the reign of Aureng-zebe, was conquered by the Moguls, who diſcovered it by navigating the river Lacquia, which has its ſource in the lake Chiamay, and diſcharges itſelf into the Ganges. The above-mentioned celebrated lake lies in twenty-ſix degrees north latitude, and is one hundred and eighteen leagues in circumference.

Beſides being one of the moſt fertile in the univerſe, this country is alſo rich in mines, which produce the nobleſt and moſt uſeful metals, ſuch as gold, ſilver, ſteel, iron, lead, &c. Here is plenty of the moſt delicious animal food, but dog's fleſh is deemed the greateſt dainty. They make no wine, though they have excellent grapes, which, when dried, are uſed in making brandy. The lakes of this country are of a ſaline quality, and they convert into ſalt the ſcum which riſes to their ſurface. Another kind of ſalt is extracted from the leaves of what they call Adam's fig-tree; and a ley is made, which renders their ſilks admirably white.

The king exempts his ſubjects from all kinds of taxes to government, as he contents himſelf with the ſole property of the valuable mines contained in his country; nor are thoſe mines worked by the natives, but by ſlaves which he purchaſes in the neighbouring countries.

In this country, every ſubject hath a houſe allotted him, with a large piece of ground contiguous thereto, and an elephant to carry his wives, of whom he is permitted to have four. Previous to marriage, the Aſchamians inform the women minutely of what they expect them to do. The females being thus previouſly inſtructed in their duty, ſeldom diſoblige their huſbands.

The inhabitants towards the north have good complexions, but thoſe who dwell ſoutherly are rather ſwarthy. All have very large holes bored in their ears, from whence deſcend heavy pendants of gold and ſilver. They wear their hair long, have a cap upon their heads, and go naked except about their middles. They adorn their arms with bracelets, which are buried with them when they die. Their gold is current in ingots, but they have pieces of ſilver coin of two ſhillings each in value. They have great plenty of gum lacque, which they export to China and Japan, to varniſh cabinets, cheſts, and other pieces of furniture.

Kemmerouff, or Guergon, is the metropolis of this kingdom, and the reſidence of the king; it lies in twenty-five degrees thirty-three minutes north latitude, and the city of Azov is the royal burial-place. When any king is buried in the grand temple, his favourite idol is buried alſo; this always being of gold or ſilver, the vaults are filled with immenſe treaſure.

The people imagine, that the righteous have, in the other world, plenty of what they deſire; but that the wicked ſuffer all the miſeries of hunger and thirſt. Full of this notion, and not entertaining any very high idea of the morality or piety of their monarchs, they bury with them all kinds of eatables, great riches, ſeveral of their wives, officers, elephants, ſlaves, &c. leſt they ſhould fare worſe in the other world, than they did in this.

The Chineſe are ſuppoſed to have received the invention of gunpowder from the people of Aſem, though they have not been ingenuous enough to acknowledge it.

The

The following places near the coaſt of Ava are reckoned in the Pegu dominions. 1. The iſland of Dola, which has a good harbour, and where twenty houſes are appropriated to the purpoſe of taming elephants for the uſe of the king of Pegu. 2. Coſmin is a fertile iſland; the houſes of the natives are built on frames of wood, and aſcended to by ladders, on account of the furious tygers with which the country abounds. The inhabitants go from hence to Pegu in boats, in which whole families reſide all the year. This country produces figs, oranges, cocoa-nuts, wild boars, parrots, aſſes, and other animals. 3. Meden, a tolerable town, where a market is kept on the water in boats, the commodities being ſhaded from the ſcorching heat of the ſun by umbrellas. 4. Negrais, a town and cape on the coaſt due weſtward from Pegu, from whence it requires about ten days to ſail. The harbour is good, but a ſhelving bar renders its entrance diſagreeable and dangerous. 5. Diamond iſland, near cape Segrais, is celebrated for two Pagan temples: the one called the temple of the "god of the afflicted;" and the other the temple of the "god of the atoms of the ſun." This iſland is low, barren, and rocky; but the chief eccleſiaſtic of the kingdom reſides here. He is greatly venerated by the people, and takes the right hand of the king; who, on his demiſe, is obliged to attend his funeral with his whole court, and defray all expences incurred thereby.

Martaban, or Martavan, is a province in the kingdom of Pegu, eight miles ſouth of it, and lying in the gulph of Bengal. It is ſituate in ninety-ſeven degrees fifty minutes eaſt longitude, and fifteen degrees thirty-five north latitude. It is three hundred miles long, and one hundred and fifteen broad. The capital town is of the ſame name, and was a rich trading place before they ſunk ſhips at the entrance of the harbour, to choak it up, which it has effectually done. It produces corn, oranges, lemons, figs, pears, cheſnuts, medicinal plants, oil of jeſſamy, gold, ſilver, ſteel, iron, lead, copper, rubies, lacque, benzoin, &c. It was formerly ſo fertile, as to have annually three harveſts, and is bleſſed with a pure and wholſome air; but the whole country has been ruined by the terrible wars between the kings of Pegu and Siam; the former having been taken and killed by a people called Barmais, who conquered the whole kingdom and brought it into ſubjection.

SECT. XII.

Treating of the Peninſula of MALACCA, the Kingdoms of CAMBODIA and LAOS, JOHOR, TIBET, &c.

MALACCA is a large peninſula beyond the Ganges. It is ſituate between the ſecond and eleventh degree of north latitude; and is bounded by Siam, on the north; by the ocean, on the eaſt; and by the ſtreights of Malacca, which ſeparates it from Sumatra, on the ſouth-weſt, being about ſix hundred miles long, and two hundred broad. It is ſeparated into ſeveral ſmall kingdoms; namely Malacca, from which it derives its name, Johor, Patana, Sincapour, Pahan, Trangano, Pera, Queda, and Ligor. Some of theſe are independent ſtates; but the king of Siam has made the others tributary to him. This country is ſaid to have been the Aurea Cherſoneſus of Ptolemy.

The coaſts of the kingdom are flat, marſhy, and unhealthful; and the inland parts of the country conſiſt of ſcarce any thing but barren hills and dreary deſerts; ſo that it produces few commodities for trade, except tin and elephants teeth. The common neceſſaries of life are produced in gardens; and ſmall quantities of peaſe and rice are raiſed in ſuch parts of the mountains as appear to have any tolerable ſoil. The natives have a ſupply of proviſions from Sumatra, Bengal, Java, Siam, and Cambodia. Here is, however, a variety of fruit, particularly the manjoſtain, which is a delicious fruit, in the ſhape of an apple, with a thick and red ſkin. Here are cocoas in abundance, and a great plenty of aloes; and as to pine-apples, thoſe produced here are the beſt in the world. The ramboſtan is of the ſize of a walnut, with a very agreeable pulp; and the durian has a very agreeable taſte, though it is not pleaſant to the ſmell. There is but little corn, and ſheep and bullocks are ſcarce; but pork, poultry, and fiſh, are pretty plentiful. There are many tygers, wolves, and other wild animals in this country.

The inland inhabitants are a ſavage, barbarous people, who take great delight in doing miſchief to their neighbours. The natives, who are called Malays, are of a tawny complexion. The men go naked, except having a piece of cloth round their waiſt. The women, who have their hair very long, and are extremely proud, wear a looſe ſilken garment embroidered with ſilver or gold. Both ſexes have jewels in their ears. Notwithſtanding the natural ferocity of the greater part of theſe people, we muſt in juſtice acknowledge, that ſome of them are poliſhed, well-bred, and humane, who diſtinguiſh themſelves by their talents, and particularly in the uſe of a language, eſteemed the moſt pure, nervous, harmonious, and copious of any ſpoken in the Eaſt Indies; they ſtudy it with great care; and many of them by their elegant poetic compoſitions, do honour to its natural graces. The religion of the natives is a mixture of Mahometaniſm and Paganiſm, and they are greatly addicted to juggling, which ſome miſtake for conjuration.

We ſhall now proceed to give a deſcription of the city or town of Malacca, which is ſaid to have been founded upwards of two hundred years before the arrival of the Portugueſe in 1509. In the year 1511, Alphonſo Albuquerque ſubdued the city, after it had made a moſt vigorous defence; he plundered it of immenſe treaſures, vaſt magazines, and whatever could contribute to the elegancies and conveniencies of life, and then put the prince to death. The king of Siam, however, enraged at this cruelty, being aſſiſted by other princes equally incenſed againſt the murderer, afterwards took the city by ſtorm, and built churches, monaſteries, a caſtle, and a college for the Jeſuits. In 1606 the Dutch, in conjunction with the king of Johor, began to be very troubleſome to the Portugueſe, and, after a ſeries of hoſtilities for the ſpace of thirty-five years, in 1641 intirely wreſted it out of their hands; which they effected in the following manner: finding that conſiderable diſputes had ſubſiſted between the king of Johor and the Portugueſe inhabitants, the Dutch formed a deſign of attacking and reducing the place. Accordingly they fitted out a formidable ſquadron of ſhips at Batavia, and entered into an alliance with the king of Johor, who attacked the city by land, while the Dutch inveſted it by ſea; but the invaders finding there was no poſſibility of reducing it, the Dutch at length by means of a conſiderable bribe, prevailed on the ſordid governor to ſurrender the fort to them. But the baſe and faithleſs bribers, having entered the place, murdered the governor, to ſave the payment of the premium. This city is built on a low level ground cloſe to the ſea-ſide, on the eaſt ſide of the city there is a river, which at a ſpring tide will admit of ſmall veſſels; and on the eaſt ſide of this river ſtands a ſtrong fort, between which and the town, there is a communication by a draw-bridge: this fort is built at the foot of a little ſteep hill, and is of a ſemi-circular form, like the adjacent hill: the walls are founded on a rock, very thick, and are carried up to a conſiderable height: and the lower part of them is waſhed by the ſea at every tide: on the other ſide of the hill, there is a large moat cut from the ſea to the aboveſaid river, which makes it an iſland; and that part next the land is ſtocked with great trees: on the hill ſtands one little church which ſerves the Dutch inhabitants; and it is to be preſumed, the Portugueſe, who are pretty numerous, may have a chapel in the town; but travellers do not mention any temple for the reſt of the inhabitants.

There are between two and three hundred families of Dutch, Portugueſe, Chineſe and Moors, and two or three great Armenian merchants in it. The Chineſe have the beſt ſhops, which are filled with the manufactures and produce of their country, and ſuch other goods as there is any demand for there: the houſes in the town are generally built with ſtone, and the ſtreets are wide and ſtrait, but not paved: the native Malays, who inhabit the ſuburbs, live in poor mean cottages, and are kept in great ſubjection by their haughty Dutch maſters; but it is obſerved, they ſtill retain a deſperate ſullenneſs in their looks; and the Malays of the neighbouring provinces have frequently revenged themſelves on the Dutch, for the tyranny and oppreſſion exerciſed on them, and that reſtraint the Hollanders put upon their trade all along the Malayan coaſt by the guard-ſhips, inſomuch that it is very difficult for this people to trade with any but the Dutch.

The city of Malacca is healthful, conſidering the climate, and is neither ſubject to the hot winds of the coaſt of Coromandel, or thoſe chilling ones in Sumatra. It is not a place of any great trade at this day; but as the Dutch are maſters of the ſtreights of Sundy to the ſouth of Sumatra, and this town gives them the command of the ſtreights, which bear the name of Malacca, to the north, while they are in poſſeſſion of this place, they have in a manner engroſſed to themſelves the whole trade of China and Japan.

There are many ſpacious and handſome ſtreets in this city,

city, which are ſhaded with trees on both ſides; the houſes ſtand pretty cloſe to each other, and are built chiefly of bamboos, though ſome of them are of ſtone. The governor's houſe is large and commodious, and is ſituated on the fort, garriſoned by two hundred Europeans. The harbour is one of the beſt and ſafeſt in that part of the globe, and receives veſſels from moſt parts of the Indies. When poſſeſſed by the Portugueſe, the city was remarkably opulent, being a grand mart for precious ſtones and gold; and before the Dutch made Batavia the chief place of their reſidence, it had all the rich commodities of Pegu, Coromandel, Siam, Banda, and other countries.

The kingdom of Laos is a rich, plentiful country, but little viſited by Europeans. It is bounded on the north by China; on the eaſt, by Tonquin and Cochin-China; on the ſouth, by the kingdom of Cambodia; and on the weſt by the kingdom of Siam. It is ſuppoſed to extend from the fifteenth to the twenty-fifth degree of north latitude.

The produce of this country is benjamin; that which grows here is eſteemed the beſt in the Indies, and brings a conſiderable revenue to the king, who has prohibited the exportation of it. The gardens alſo produce a great variety of fruit, and they have exellent rice in abundance; alſo great plenty of wax, honey, cotton, amber, and muſk. They have a great number of elephants among them, which makes ivory ſo little valued, that their teeth are uſed for making fences to their fields and gardens: beeves and buffaloes are alſo very numerous here; and the rivers abound with all kinds of fiſh, ſome of which are very large. Gold and ſilver duſt is found in the rivers; and mines of iron, tin, and lead, in ſeveral parts of the country; great quantities of ſalt are alſo produced here, part of which they export to foreign parts: this is formed by a white froth left on the rice-fields after harveſt, which the heat of the ſun hardens.

The inhabitants of Laos, who are called Langians, are affable, ſtrictly honeſt, and ſtrangers to avarice. They are well-ſhaped in general, and, though of an olive complexion, yet are much fairer than their neighbours; the women are very modeſt in their carriage. Their food principally conſiſts of rice, the fleſh of the buffalo, and ſeveral ſorts of pulſe. They ſometimes eat fowls, which they dreſs with the feathers on; they kill them by ſtriking them on the head with a ſtick; the ſhedding of blood being conſidered as one of the greateſt crimes. Their employment conſiſts principally in huſbandry and fiſhing; but they are naturally of an indolent diſpoſition.

As the religion, marriage-ceremonies, feſtivals, funerals, cuſtoms, laws, puniſhments, &c. of this people, bear a near reſemblance to thoſe of the Siameſe; we ſhall therefore, for a fuller deſcription of them, refer the reader to our account of Siam; and only add here, that the power of the ſovereign is unlimited, and he is in a manner adored by his ſubjects. His principal officers are ſeven viceroys, who are governors of the ſeven provinces into which the kingdom is divided: he has a militia of horſe and foot, who are maintained at the expence of that province to which they belong. The palace is the moſt diſtinguiſhed edifice in the city, extending, with the offices and other buildings, above two miles in circumference. The architecture is exceeding grand, and the apartments within are furniſhed in the moſt ſumptuous manner: the baſſo-relievo's are very richly gilt. The houſes of the richer ſort are built of wood, and are lofty and handſome; but thoſe of the common people are very low and mean, and chiefly made of dirt and clay. No perſons, except the talapoins, have liberty to build their houſes of brick or ſtone. The houſes of the quality are very elegantly furniſhed: they line the walls with mats beautifully wrought, inſtead of tapeſtry, and ornament them with a great variety of very curious foliage and figures.

The kingdom of Cambodia, or Camboya, is ſituated on the eaſt ſide of the gulf of Siam, being bounded, on the weſt, by Cochin-China; by the Indian ocean on the ſouth; and by the kingdom of Laos and the Kemois mountains, on the north. It extends from north to ſouth upwards of three hundred miles, and is about two hundred and ten miles in breadth. The ſpacious river Mecon runs through it, and falls by two channels into the ſea. Where it firſt riſes, it is called Longmu; after which, it takes the name of Mecon; and, continuing that name for a conſiderable ſpace, at length changes it to Ochequane. This river has an annual ſwell, which begins in the month of June, and continues till Auguſt, when it generally riſes ſo high, as to overflow the neighbouring countries. It runs the ſame way for ſix months together, owing to the ſoutherly winds, which drive the ſands in ſuch ſhoals, that the bar is entirely ſtopped up, and the current is by that means driven back, till the wind ſhifts and removes the ſands, when the current is reſtored.

This country produces various kinds of grain, particularly rice and corn. Here are alſo great variety of fruit-trees, as oranges, citrons, mangoes, cocoas, &c. alſo ſeveral kinds of wood, as the ſandal, aquila, and japan, ſtick-lack and lack for japanning. Rice is exceedingly plentiful and cheap, as are fleſh and fiſh; theſe laſt are the only articles allowed to be purchaſed without a permit from the king. A fine bullock is frequently purchaſed for a dollar; and the common value of rice is one ſhilling and ſix-pence for one hundred and forty pounds weight. Poultry is very ſcarce; becauſe the few that are bred, retire, when young, to the woods, where they ſhift for themſelves, and the people take no pains to bring them back. Several rich commodities are alſo produced here, particularly gold, cambogia of a gold colour or a deep yellow, in rolls, raw ſilk, and elephants teeth; likewiſe ſeveral ſorts of valuable drugs; alſo amethyſts, garnets, ſapphires, cornelians, chryſolites, and blood-ſtones. Wild elephants and boars are exceedingly numerous here, particularly in the woods; alſo tygers and lions, wild cattle and buffaloes, many horſes, and a prodigious number of deer; all of which every perſon has free liberty to kill for themſelves.

The Cambodians are in general well-ſhaped, and the women very handſome. The men wear a long veſt, which reaches from the ſhoulders to the ancles, but their head and feet are bare. The women wear a thin garment, which ſits quite cloſe to the body and arms; and have a kind of petticoat that reaches from the waiſt to the ancles. Both ſexes have long hair, which they diſplay to the greateſt advantage. Their heads have not any covering; but their hair is dreſſed, and curiouſly decorated. Their religion is the ſame as that of the Siameſe, and they worſhip the ſame deities. They believe that all animals, as well as human beings, will be hereafter rewarded or puniſhed. Their prieſts are choſen from among the laity, and are little reſpected by the people in general; their maintenance and ſupport depends intirely on the benevolence of the public.

In different parts of the country, they have manufactories for making callicoes, muſlins, dimities, and other curious pieces, which are ſuperior in quality to thoſe made in Holland and elſewhere. The poorer ſort of people are employed in making beads, ſmall idols, bracelets, necklaces, &c. They alſo weave ſilk, and work curious tapeſtry, with which the chairs and palanquins of the quality are lined.

Cambodia is the chief city in this kingdom, worth notice; it is ſituated on the river Mecon, and built on a riſing ground, in order to avoid the annual overflowings of the river: it principally conſiſts of one large ſtreet. The palace for the reſidence of the ſovereign is ſituate about the centre of it. It is ſurrounded by a kind of wall, with ramparts, on which are ſeveral pieces of artillery; but it is a very inſignificant edifice. The power of this prince is deſpotic, like that of the other eaſtern monarchs.

Johor is about one hundred leagues long, and eighty broad. It is the next country to the north of Malacca, and is waſhed eaſt and weſt by the ocean: it lies in one degree north latitude. The country, which is woody, abounds with tin, pepper, elephants teeth, gold, aquila-wood, canes, citrons, and lemons; deer, cows, wild boars, and buffaloes, are among the quadrupeds.

The inhabitants of this country are reported to be cruel, treacherous, lazy, and laſcivious. The common people wear only a piece of ſtuff round their waiſt; the females in a ſuperior degree of life wear callico garments faſtened with a ſilken girdle: they paint their nails yellow, and the longer they are, the more genteel. The iſlanders live principally upon ſago, fruits, roots, and poultry, but thoſe who reſide on the coaſt ſubſiſt for the moſt part upon fiſh and rice brought from Cambodia, Siam, and Java. The natives, who are a mixture of Mahometans and Pagans, have prieſts ſent to them from Surat.

Among theſe people there are about one thouſand four hundred Chineſe families, who carry on a conſiderable traffic, and are diſtinguiſhed for their induſtry.

Patana is about ſixty miles long, and lies on the eaſtern coaſt of the gulf of Siam: its port had once a conſiderable traffic with Coromandel, Malabar, Goa, China, Tonquin, and Cambodia: but the traders unhappily finding no reſtriction put upon the commiſſion of piracies and murders, were under a neceſſity of withdrawing their commerce, and turning it into another courſe, highly beneficial to Siam, Malacca, and Batavia.

This country abounds with grain and fruits: here are

alſo buffaloes, fowls, and ſome very beautiful doves; tygers, monkies, elephants, &c. are ſome of the wild animals in it.

The king has more veſſels than any of the other neighbouring ſovereigns, and can bring eighteen thouſand troops into the field. The Chineſe bring hither a variety of articles in trade, and take conſiderable returns for them.

The natives are remarkable for their ſobriety, and, though proud, are nevertheleſs kind and obliging.

To the ſouth of Patana lies Pahan, on a river of the ſame name, in which there is much gold duſt found. People of fortune reſide in the capital of Pahan, ſituated about one hundred and fifty miles north-eaſt of Malacca: in the ſtreets of the city, which is but ſmall, there is a great number of cocoa and other trees planted, which gives it the appearance of a garden.

The palace of the king of Pahan is a wooden ſtructure, and the other buildings in general are compoſed of ſtraw and reeds.

The foot of Malacca hill is waſhed by the river here, and pepper is planted along its ſides. The adjacent country is low, woody, and well ſtored with game: aquila and calamba wood, coarſe gold, camphire, nutmegs, &c. are alſo produced here.

Pahan is ſaid to be well peopled, and carries on a conſiderable traffic: but the natives are reported to be the moſt arrant cheats in the world: they conſiſt of Pagans and Mahometans.

Next to Pahan is ſituated Trangano. This is a fine healthy country: its hills produce a greater variety of rich fruits, ſuch as oranges, lemons, limes, darians, mangoſtans, mangoes, &c. and the vallies teem with ſugar-canes and corn: gold and paper are likewiſe produced here; but the Chineſe, who reſide in this country, produce the principal part of the two laſt mentioned articles.

The palace where the ſovereign of this country chiefly reſides, ſtands on the banks of a fine river near the ocean.

Pera is a mountainous, woody country, famous for the quantity of tin it produces, there being more found here, than in any part of India. The capital city, which bears the ſame name, lies at the bottom of a bay about one hundred and fifty miles north-weſt of Malacca. There are ſome hideous deſerts in this country, abounding with elephants, tygers, and other wild animals.

The natives of this country are mere barbarians, and very treacherous and deceitful.

Queda is three hundred miles north of Malacca, near the ſtreight, and one hundred and forty miles from Patna: it lies in ninety-nine degrees fifteen minutes eaſt longitude, and ſix degrees twenty-five minutes north latitude. The principal town, which is of the ſame name, contains about eight thouſand inhabitants, and has a good harbour. When a foreign merchant comes here, the king pays him a viſit in perſon, not to compliment him on his arrival, but to receive preſents from him: the preſents, however, are not made, till the viſit is repaid; and then the king honours the merchant with a ſeat near his royal perſon: his majeſty at the ſame time chews betel, and, putting it out of his mouth on a ſmall golden plate, the merchant takes it with great reſpect, and puts it into his own mouth: this is an eſtabliſhed cuſtom, and muſt always be ſtrictly complied with.

Some of the natives of this place are Mahometans, and others Pagans; they are in general very treacherous and cruel in their diſpoſitions.

This country produces tin, pepper, elephants teeth, canes, and damar: they make pitch and tar of the latter, which is of excellent uſe for that purpoſe.

CHAP. V.

THE NEW AND COMPLETE HISTORY AND DESCRIPTION OF

INDOSTAN.

SECT. I.

Of the Name, Situation, Extent and Boundaries, principal Mountains, Seas and Rivers of INDOSTAN, or the MOGUL Empire.

THIS country alone was known by the name of India to the antients, and is by the natives called Mogulſtain, or the empire of the Great Mogul; though the moderns have given the name of India to all thoſe countries which lie between this and China; and Columbus gave the name of India to America, imagining that the country which lay weſt of the Atlantic ocean, extended as far as India, or rather was a part of it; but when this was found to be a miſtake, the name of Eaſt India was given to this country, and that of Weſt India to the other.

India Proper, or Indoſtan, received its name from the river Indus, or from the Hindowns, the moſt antient inhabitants of the country, and is ſituate between ſixty-ſix and ninety-two degrees of eaſt longitude, and between ſeven and forty degrees of north latitude, being bounded by Uſbeck and Thibethian Tartary on the north; by Acham, Ava, and the bay of Bengal on the eaſt; by the Indian ſea on the ſouth; and by the ſame ſea and Perſia on the weſt, being two thouſand miles long and one thouſand five hundred broad in the broadeſt place.

The chief mountains are thoſe of Caucaſus, which divide India from Uſbeck Tartary on the north; thoſe of Naugracut, which divide India from Tartarian Thibet, and the mountains of Gate or Baligate, being a long chain of mountains which run through the middle of India from north to ſouth, ſo high that they ſtop the periodical wind called the weſtern monſoon, and the rains it brings with it, for a month and more, the fair ſeaſon continuing a month longer on the coaſt of Coromandel, or the eaſtern coaſt, than it does on the Malabar or weſtern coaſt.

The chief bays in the Indian ſeas are the bay of Bengal and that of Cambaya or Guzarat. The principal cape is that of Comorin, the moſt ſouthern promontory of India; and the moſt remarkable ſtrait is that between the ſouth of India and the iſland of Ceylon, called Ramanakoiel.

The chief rivers of Indoſtan are, 1. the Ganges, which riſing in mount Caucaſus runs ſouth-eaſt, and dividing into ſeveral branches falls into the bay of Bengal, the moſt eaſterly branch dividing this country from the farther India. This river is in ſuch eſteem among the Indians, that it is worſhipped as a God, and happy is the man that can procure any of its water to drink before he dies: the common paſſage up this river is by the weſtern, or Huegley branch. This river runs a courſe of about three thouſand miles. 2. The Indus, a river as large as the Ganges, and deep enough for ſhips to ride in, did not the bar at the mouth prevent their entrance; it riſes in the mountains of Caucaſus, and runs to the ſouth-weſt, and falls into the Indian ocean by three channels. 3. The Attock (the Hydaſpes of the antients) which riſes in the ſame mountains with the Indus, and running ſouthward, almoſt parallel to it, unites its water with the Indus, towards the mouth, the united ſtream falling into the Indian ſea, in the province of Tata. 4. The Jemmima, which riſing in the north, runs to the ſouthward, by the royal cities of Delly and Agra; and then, turning eaſtward, falls into the Ganges at Halibas. 5. The Guenga, which riſing in the Baligate mountains, runs eaſtward, diſcharging itſelf into the bay of Bengal, or rather into the weſtern branch of the Ganges, near its mouth. 6. The Guenga, which riſing in the Baligate mountains, runs eaſtward, diſcharging into the bay of Bengal, or rather into the weſtern branch of the Ganges, near its mouth. 7. Chriſtina, which riſing in the Baligate mountains, runs firſt to the ſouthward, and then turning about to the eaſt, falls into the bay of Bengal. 8. The river Tapte, which riſing in the Baligate mountains, runs weſt, and falls into the bay of Cambaya at Surat. There are many other ſmall rivers, and innumerable torrents in the time of the rains, which fall from the Baligate mountains into the ſeas, on the eaſt and weſt of the peninſula, but in the fair ſeaſon moſt of them are dried up.

In the north-eaſt diviſion of India is contained the province of Bengal, as well as Jeſuat, Naugracut, Patna, Necbol, Gor, and Rotas. The north-weſt diviſion extends to the frontiers of Perſia, and contains the provinces of Soret, Jeſſelmere, Sinda, Tatna, Buknor, Maltan, Hercan, and Cabul. Theſe are all ſituated on the river Indus. The ſouth-eaſt coaſt, or coaſt of Coromandel, contains Orixa, Golconda, the eaſt ſide of Biſnagar, or the Carnatic, Madura and Tanjore, Aſme, Jengapour, Caſſimere, Hendowns, Lahor, Agra, Dehli Gualler, Narvar, Catipor, Chitor, Berar, and Landiſh, are ſituated in the center diviſion. The ſouth-weſt coaſt contains Biſnagar or the Carnatic, Guzarat, and Decan.

The winds are periodical, and return to certain points at ſtated times, as in moſt countries within the tropics. The monſoons, out at ſea, blow ſix months one way and ſix months another; namely, from April to October, or thereabouts, they blow from the ſouth-weſt, and from October to April from the north-eaſt, not exactly from thoſe points, but varying ſometimes a point or two on either ſide. At the breaking up of either of theſe monſoons (a little before they ſhift) there are uſually prodigious ſtorms of wind, ſuch as we do not experience in this part of the world once in a great many years. The ſhifting of the monſoons, and conſequently this ſtormy weather, does not come exactly at the ſame time every year but ſometimes a fortnight or three weeks ſooner, and at others a fortnight or three weeks later than the uſual time, which frequently occaſions the loſs of ſhipping; for the merchants, for the ſake of a trifling gain, will remain upon the coaſts in hopes that the ſtorms will keep off a little longer, till the wind grows too ſtrong for them, and they find it impoſſible to bear up againſt it.

Beſides the monſoons, there are two other different winds; 1. The general trade wind. 2. The ſea and land-breezes. The general trade winds, which prevail between the latitudes of thirty degrees north, and thirty degrees ſouth, always blow from the eaſtward to the weſtward over the whole face of the globe; only on the north of the equator they blow, from the north of the eaſt, and ſouth of the equator; and ſouth of the equator, from the ſouth of the eaſt, except within two or three degrees of the equator, and here the winds are variable, and ſometimes we meet with calms near the equator; but we muſt except the winds upon ſeveral coaſts, as upon the coaſt of Guiney, where the wind ſets generally from weſt to eaſt; and upon the coaſt of Peru, where it ſets from the ſouth-weſt to the north-eaſt; but the conſtant trade wind from eaſt-to weſt prevails five hundred miles from land.

The ſea and land-breezes are alſo periodical, changing every twelve hours. The winds blow from the land in the peninſula of the India Proper from about midnight to noon next day, when that wind dies away, and a refreſhing breeze blows from the ſea till late in the evening: it is not more than two months in each year generally that the hot winds are very troubleſome, namely, in April and May, and they do not begin to be very hot till eight or nine in the morning; for the ſun riſing between the tropics uſually about ſix, the ſands are not much heated by it till two or three hours after it is up, and it is the reflection of the heat from the parched country that is the principal occaſion of the hot winds; and there are ſeveral ways of moderating theſe, as by hanging up wet cloaths againſt the wind, and throwing water upon the floors; the people alſo draw water out of their wells, which ſeems colder than well water here; this their ſlaves pour upon their heads to cool them: but the rainy ſeaſon no ſooner returns in June, than the air grows cool, the clouds intercept the ſun, and the country is overflowed. The rainy ſeaſon uſually laſts on the coaſt of Coromandel, being the eaſtern ſide of India, four months, namely, from June to the latter end of October. They do not always begin and end exactly at the ſame time, but ſeldom differ a month. The rains are not very violent at firſt, and there are frequent intervals of fair weather; they decreaſe again by degrees. The heavieſt rains in India are in Auguſt and September, then it rains almoſt perpetually, inſomuch that all the flat country is overflowed, and they have terrible thunder every evening. In the fair ſeaſon they have lightning frequently, without thunder, but this does no hurt. After the rainy ſeaſon they have a bright, ſerene heaven for four or five months, when the ſtars ſhine with ſuch a luſtre, that people eaſily ſee to travel by their light. It is a rule here, and in all other countries between the tropics, that they have the faireſt weather when the ſun is at the greateſt diſtance from them, and the wurſt weather when the ſun is vertical.

This part of the country is generally healthful, and the natives live to as great an age as they do in any part of the world, which may be in part aſcribed to the air, but more to the innocent food and liquors the Indians eat and drink: foreigners, it muſt be admitted, do not find it ſo healthful, eſpecially at their firſt arrival there; and in ſome parts of the country, where our factories happen to lie; particularly at Bombay and Bengal. As to Bombay, it was ſituated on a moraſs, and near the ſea, where noiſome vapours, aſcending from the ſalt ooze and mud, almoſt poiſoned the people that were obliged to reſide there; and this was the caſe at Huegley, on the river Ganges; and ſuch ſituations are unhealthful every where. But Bombay has been drained, and much improved, and is not that unhealthful ſituation it was formerly; and the Engliſh factory is now removed from Huegley to Fort William in Bengal; where, I am informed, the air agrees much better with our people. But it muſt be acknowledged, however, that few foreigners arrive in India, but have a ſeaſoning the year: thoſe that cannot afford good liquors, often fall ſick of the bloody flux; and gentlemen that drink hard, are ſubject to fevers. We certainly loſe ſome men the firſt year; but afterwards there are as few complaints heard of, in regard to health, as there are in England. It muſt be owned, however, that, let people be ever ſo regular and abſtemious, neither the water or the air do agree with them at their firſt coming on ſhore; ſome therefore never drink water, till it has been firſt boiled and ſettled.

SECT. II.

Deſcribing the Situation of the ſeveral Provinces and chief Towns of INDOSTAN, and alſo the Settlements belonging to the ENGLISH, FRENCH, DANES, &c.

HAVING before given a conciſe account of the ſeveral provinces of Indoſtan, by diſtinguiſhing them into the north-eaſt, north-weſt, ſouth-eaſt, and ſouth-weſt diviſions, we ſhall under this head, in order to enable our readers to form a more clear and diſtinct conception of them, and alſo of their capital cities, and the ſeveral towns belonging to them, throw this extenſive empire into three grand diviſions. viz. 1. Thoſe provinces which lie north of the tropic of Cancer. 2. Thoſe that lie under the tropic; or partly north, and partly ſouth of it. And, 3. Thoſe that lie altogether ſouth of the tropic, in the hither peninſula. We ſhall begin with thoſe that lie north of the tropic, of which,

1. Cabul, Caſſimere, and Gor, or Gourite, are the moſt northerly, and their capitals of the ſame name: ſouth of theſe lie Haican, Attock, Pencab, Bankiſh, and Naugracut. The chief town of Attock, alſo, is of the ſame name. The chief town of Pencab, is Temara. The chief town of Bankiſh, is Beiſar; and the chief town of Naugracut, is of the ſame name. The provinces, ſouth of thoſe laſt enumerated, are Multan, Lahor, Jangapour, and Jamba; the capitals whereof are of the ſame name. The provinces further ſouth are, Buckor, the Hindowns country, Delly, Sambal, Mevat, and Patan. The provinces ſouth of the laſt, are, Tata, or Sinda, Jeſſelmere, Aſmer, or Bando, Agra, Gualaor, Halabas, Patna, Jeſuat, and Rajapour; the capitals whereof bear the ſame name as the reſpective provinces do. The provinces ſouth of the former, are Soret, Narvar, and Rotas. The capital of Soret, is Jaganat; of Narvar, is Narvar; and the capital of Rotas is Rotas.

2. The provinces which lie under and about the tropic, are, Guzurat, or Cambaya, Chitor, Malva, and Bengal. The chief towns of Cambaya, are Amadabad, Daman, Surat, Swalley, Barock, and Diu. The capital of Chitor is Chitor. And the chief towns in Bengal are Chatigan, Fort William, Calicuta, Huegley, Daca and Malaa, Rajamahal and Caſſambazar.

3. The provinces which lie ſouth of the tropic are, Candich, Bezar, and Orixa. The chief town of Candich is Medapour. The chief town of Bezar is Brampour. The chief towns of Orixa are, Orixa, Baliſore, and Pipley. The provinces ſouth of the former are, 1. Decan and Viſiapour (in which I include Balagate and Balana). 2. Golconda. The chief towns in Decan are, Carwar, Goa, Rajapour, Dabal, Dundee, Shoule, Bombay, Salſette, and Baſſaim. The chief towns of Balagate, are Doltabad and Auranggabad. The chief towns of Golconda, within land, are, Golconda, Bagnagar, Gain, or Conlar, Raalconda. The port towns of Golconda

will be enumerated in treating of the coaſt of Coromandel. The provinces which lie ſouth of Decan and Golconda, are Biſnagar, Tanjour, and Madura: the chief towns which give name to the three provinces, and lie within land. The ports are Tranquebar, Negapatam, Cultimere, and Tutawrin, on the eaſtern coaſt, and Tegapatan, Anjengo, Cochin, Calicut, Tellicherry, Cananor, Manguclore, and Baſſiloſe, on the weſt or Malabar coaſt.

In our deſcription of the principal cities and towns, we ſhall begin with Dehli, or Delly, which is eſteemed the metropolis of the empire, and is ſituate in the heart of it, in ſeventy-eight degrees eaſt longitude from London, and in twenty-ſix degrees north latitude. It ſtands in the form of a creſcent, on the river Jemma, which divides it, being about ten miles in circumference. There are two long ſpacious ſtreets which croſs each other, and centre in a grand ſquare in the middle of the town, on one ſide whereof ſtands the palace, fortified like a caſtle, before which, and in the firſt court of the palace, the guards are drawn up and relieved, as is mentioned in treating of the palace of Agra: to the durbar, or court before the royal apartment, the people come at the time the mogul gives audience to his ſubjects. In this court are three diviſions, the outermoſt being aſſigned to the inferior people, who reſort hither with their petitions to the ſovereign. The next diviſion has a raiſed floor, where people of better quality wait, and upon a floor raiſed ſomething higher, the omrahs, and thoſe of the firſt quality are ſtationed; when the muſic plays, the emperor approaches, and places himſelf on a magnificent throne, covered almoſt with diamonds, which is ſet in a gallery ſomething higher than the ſtage on which the omrahs are placed. Here the mogul receives petitions from all his ſubjects, and hears cauſes ſeveral hours every day, at leaſt ſome princes have done this: but there have been indolent princes alſo too much addicted to pleaſure to trouble themſelves about redreſſing their ſubjects grievances: in this city, Kouli Kan kept the mogul and his nobility priſoners, till he had extorted from them all the wealth they had, or could procure, amaſſing together the greateſt treaſure, eſpecially in diamonds, that ever any conqueror made himſelf maſter of; which we have taken particular notice of, in our account of Perſia.

The moſt diſtinguiſhed public buildings, beſides the palace, are a grand moſque or Mahometan temple, covered with ſeveral extenſive marble domes, and a caravanſera built by a mogul princeſs for the entertainment of travellers; the tomb of Amayum the great mogul, near which is a ſtone pyramid, ſaid to be erected by Alexander, on the victory he obtained over Porus, the moſt formidable of all the Indian princes he ſubdued.

Their ſaras, or caravanſeras, which ſerve them inſtead of inns for the entertainment of travellers upon the road, are built much in the ſame manner their ſhades are before their houſes, being open on one ſide, and no doors to ſecure them from wild beaſts or robbers; near theſe places is uſually a tanque, or large reſervatory of water, and ſeveral of theſe reſervatories of water they have in every great town, which are filled in the rainy ſeaſon, and ſerve the inhabitants for ſeven or eight months, till the rains return again. They have alſo very large walls encloſed with brick, and are at a prodigious expence in their wells and reſervatories, though they are at ſo little in their houſes. Some of their tanques are above a mile in circumference, and lined with ſquare free-ſtone, with ſteps down to the bottom, on every ſide: in the middle there is often a ſummer-houſe of ſtone, ſurrounded with galleries, from whence you may deſcend by ſtone ſteps into the water, and they are ſo contrived that ſeveral perſons may bathe themſelves at one time, with the greateſt privacy; and there are few people of quality but have their private baths in their gardens. The wives and daughters of inferior people, who have not baths, pour water upon their heads two or three times a day, for half an hour together, and it is one great part of their buſineſs to fetch water morning and evening from the common wells, upon their heads, in great round earthen pots.

The poorer ſort of people have houſes built with clay, and thatched, but they have convenient courts and gardens. There are, beſides theſe, great numbers of ſmall cottages built of clay and ſtraw, which are chiefly occupied by thoſe who deal in proviſions. They are ſo numerous and cloſe together, that fires often break out, and deſtroy much property and many lives.

Their temples, or pagodas, are many of them very magnificent ſtructures, built of ſtone, with lofty ſpires, and a variety of figures carved on the out-ſide as well as within; but the inſide is very diſmal, only one long dark room without windows, extremely hot of itſelf; but as there are a multitude of lamps always burning before their images, the place is ſo ſuffocating that a man is glad to retire, let his curioſity be never ſo great: but there are a great many other little pagadas in the country, open before, which are but juſt big enough to hold the image; and here the people generally ſacrifice, and perform their devotions. The figures, both in one and the other, are very ſhocking and monſtrous, which have occaſioned our people in general to denominate them devils; we ſee perhaps the head of a hog, the body of a man, and the lower part of a lion, in one figure; in another a man with fourteen or fifteen heads, and twice the number of arms, and theſe they believe repreſent a race of people who lived formerly on the earth, and are now a kind of inferior deities or mediators for them in heaven, which is very far from the notion we entertain of devils: but we ſhall enlarge upon this ſubject, when we come to treat of their religion.

The only places worth mentioning are the cities of Dehli and Agra, which are ſituated in the inland provinces of Indoſtan, that bear the ſame name.

Dehli, or Delly, is capital of the province, and in the heart of the empire: it is in ſeventy-eight degrees eaſt longitude from London, and in twenty-ſix degrees north latitude. It ſtands in the form of a creſcent, on the river Gomma, which divides it; and is diſtinguiſhed into three towns, lying within about one hundred and twenty miles north of Legra, in a fine plentiful country, where the air is more cool and ſalubrious than at Agra. The firſt town that was built is ſaid to have had nine caſtles and fifty-two gates. At ſome diſtance is a ſtone bridge, and a delightful plantation of trees, leading to the ſecond town, which was taken from the Indians by the firſt mogul conqueror. This was adorned and enriched by ſeveral magnificent ſepulchres as well as other ſtately monuments, of the Patan princes, which were all demoliſhed by Shah Jchan, father of Aurengzebe; but the latter rebuilt the town, and called it Johanor the city of king Jchan, Abad, transferring the ſeat of the empire hither from Agra, where the heat in the ſummer was too violent. The third town, which was erected cloſe to the ſecond, and formed out of its ruins, was called Dehli by the Indians, inſtead of Jchan Abad, the foundation of which was ſaid to have been laid in blood, as the throats of malefactors were cut, by Jchan's order, "the better (ſaid he) to cement the ſtones:" he ſpared no expence whatever to beautify and adorn the gardens, belonging to the royal palace, which was formed after an Italian model, by an ingenious Venetian.

Dehli is entered by a long ſtreet, with arches on each ſide of it, under which are the ſhops of the tradeſmen. This ſtreet leads ſtrictly to the palace, at the entrance of which are two figures of elephants, on whoſe backs ride two famous rajahs, that repreſent two brothers who loſt their lives in bravely defending certain towns laid ſiege to by Eckbar. The palace wall, which is of hewn ſtones with battlements, every tenth of which has a tower, is not much leſs than two miles in circumference. The ditches encompaſſing the wall are likewiſe faced with hewn ſtone, and are full of water.

The great lords and other grandees enter into the firſt court of the palace mounted on elephants, richly capariſoned. This court has an avenue to a paſſage adorned with brilliant porticoes, underneath which are ſmall apartments for the accommodation of the guards. On each ſide of the paſſage are apartments for ladies, and the halls of juſtice. There is in the centre a fine coral, formed elegantly, at proper diſtances, into leſſer baſons. This grand paſſage leads to a ſecond court, where the omrahs are ſeen mounting guard in perſon. On entering a third court the divan is ſeen in full view; and here the emperor gives audience. This ſtructure which is open on all ſides, and arched at top, is ſupported by about thirty marble pillars, moſt beautifully painted with flowers. It has a grand hall, aſcended by a flight of marble ſteps; and in the centre of this hall is a ſort of alcove, richly ornamented, in which the emperor is ſeated on a ſplendid throne which glitters with diamonds and coſtly jewels.

The city of Dehli has very few mechanics in it, which is not owing to the want of ſkill in the people, but from the ill treatment of the omrahs, who, if they can meet with them, oblige them to work, for which they reward them according to their own diſcretion. The rajahs, and many others of the principal inhabitants, are exceeding wealthy; their moſt eſtimable poſſeſſions are jewels, which they take particular care ſhall be faithfully tranſmitted to their heirs.

Timur, after many revolutions that had happened at Dehli, was placed on the imperial throne in the year 1757.

Agra, the capital of the province of that name, is ſituate in twenty-ſeven degrees odd minutes of northern latitude, and is about ſeven hundred miles north-eaſt of Surat, which journey the caravans uſually perform in thirty-five days; this was but an inconſiderable place, till about one hundred and fifty years ago, when the Mogul Ecbar new built it, and called it after his own name, Ecbarabad. It lies upon the river Jemma, in the midſt of a barren ſandy plain, which adds conſiderably to the heat of the climate: the town itſelf is ſeven or eight miles in length, but not near ſo much in breadth, it is not fortified (except the palace) but there always lies a great army in the place, eſpecially if the mogul be there.

The buildings of the omrahs and great men are of ſtone, and very magnificent, they ſtand upon the banks of the river Jemma, and have large gardens adjoining to them; the reſt of the houſes are but mean, however, the great number of Mahometan moſques, caravanſeras, large ſquares, baths and reſervatories of water, intermixed with trees and gardens, and the river Jemma running the whole length of it, renders the proſpect of the town very agreeable; and the mogul's palace is looked upon to be one of the fineſt pieces of architecture in the eaſt.

There is a large plain between the town and palace; here the rajahs draw up their raſhboots when they mount the mogul's guard, as they do in their turns every week, with fifteen or twenty thouſand men; the palace or mahal, as it is called in the language of the country, lies in the form of a creſcent upon the river Jemma, but from the town appears to be of a round figure: it is three or four miles in circumference, and fortified with a high ſtone wall, mounted with artillery; the mahal may be ſeen at a great diſtance, and as the ſtones it is built with are red, and have a luſtre like poliſhed marble, nothing can look more brilliant than it does when the ſun ſhines; it is ſurrounded with a deep broad moat, over which are drawbridges, and the terraſſes of the gardens ſerve for a rampart.

There is a fine broad ſtone walk, with canals running on the ſide of it, within the firſt gate of the palace, beyond which is a large ſquare, where the Mahometan guards draw up; here the omrahs their generals pitch their tents, ſo that one paſſes through two armies, one on the out-ſide, and the other within the palace, before we come to the royal apartments; beyond this ſquare is another court, where the mogul's muſic, as it is called, ſounds every morning, noon and night, and whenever he goes abroad: this is a compliment inferior governors and magiſtrates have paid them in all the towns in India, though ſurely nothing can be more harſh or diſagreeable, than ſuch a number of large brazen trumpets, and ill-ſounding drums, to thoſe who have ever heard other muſic. Our European governors, therefore, though they will not diſpenſe with this piece of ſtate, yet generally order them to be placed at a convenient diſtance. From this court where the muſic ſtands, we come to the durbar, which is another large court, whither all people reſort at the time of audience; this is divided by rails or baluſtrades, into three parts, at the outward rail ſtand the common people; without the next, which is raiſed on a platform ſomething higher, thoſe of better quality; and within the third, upon a platform or ſtage ſtill more elevated, ſtand the omrahs and great lords of the court: in this manner, all attend the approach of the mogul at the time of audience, who, upon the playing of the muſic, appears in a kind of gallery, above the place where the omrahs are, and ſeats himſelf upon a glorious throne, covered with precious ſtones of an ineſtimable value. Here the emperor receives petitions from all his ſubjects, and ſpends ſeveral hours every day in hearing cauſes.

In 1638, there were ſeventy moſques in this city; and pilgrimages were at this time made to a famous moſque in which there is a ſepulchre of a ſaint, thirty feet long, and near ſixteen broad. It alſo contains eight hundred purifying baths, and near it ſtands that grand piece of architecture the mauſoleum, in building which, twenty thouſand men were employed twenty-two years.

When a man is purſued, in order to be puniſhed for any particular crime he has committed, he flies directly to a moſque, and there finds a certain ſhelter; nor can the emperor himſelf hurt him, after he has taken refuge within its ſacred walls; for the attempt to puniſh, in this caſe, would be a direct violation of that profound reſpect and reverence due to ſuch as have the title of ſaints.

Moſt of the inhabitants of Agra are Mahometans and Pagans. The city in general has but little to boaſt of with regard to commerce; but flouriſhes when honoured with a viſit from the great mogul.

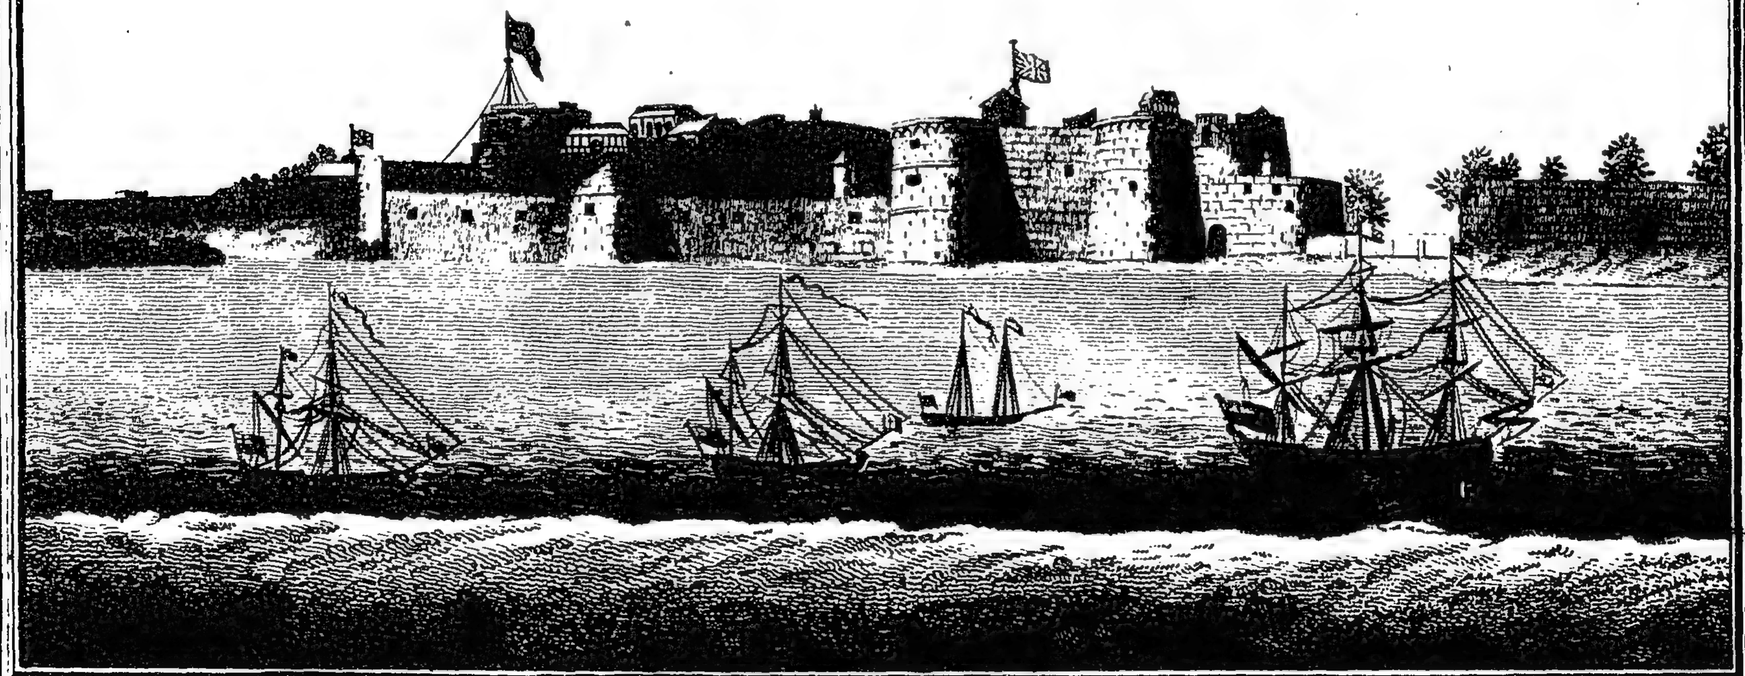
There is a very formidable nation called the Scheiks, on the north of Indoſtan, who can bring ſixty thouſand cavalry into the field. They poſſeſs the whole province of Punjal, the greateſt part of the Moultan, and the Sindi, together with all the country towards Dehli, from Lahor to Serhend. Theſe people have found means to free themſelves from the chains of deſpotiſm, though encompaſſed by nations of ſlaves. During the calamities of the Mogul empire, their number increaſed conſiderably by refugees from different nations. Such is their love of freedom, that nothing more is required, in order to be admitted among them, than to ſwear an utter abhorrence of monarchy. It is affirmed they have a temple with an altar, on which ſtands their code of laws, and next to it a ſceptre and a dagger.

Caſſimere, or Caſhimire, capital of the province of that name, is ſituate in ſeventy-five degrees of eaſtern longitude, and thirty-five degrees of north latitude, on a lake four hundred miles north-weſt of Dehli. The air being more temperate here than in any province of India, the country abounds in corn and fruits, and affords the moſt delightful proſpects imaginable, from whence it is called the paradiſe of India; hither ſeveral of the moguls have retired with their courts in the hot ſeaſon. It is well defended againſt the incurſions of an enemy by the mountains which ſurround it, from whence deſcend a multitude of ſmall rivulets into a fruitful plain, in which moſt of the towns of this province are ſituate.

The natives, who are Mahometans, are induſtrious, lively, ſenſible, and ingenious; they are of European complexion; and the women, who are diſtinguiſhed for their perſonal accompliſhments, are purchaſed by the omrahs on that account.

Lahor ſtands about three hundred miles north-weſt of Dehli, and eight hundred miles north of Surat, in thirty-two degrees north latitude; and here ends that grand avenue or walk of trees, upwards of five hundred miles in length, extending from Agra to this city: Lahor was built by Amayum, who made it the capital of his empire: it is ſtill a large city, though the court be removed to Dehli; and here are ſtill to be ſeen the ruins of ſeveral palaces, moſques, and reſervoirs, which diſcover the magnificence of the mogul princes who reſided here. We ſhall now attend to the chief places on the weſt of India.

The province of Sindy, ſituate on the river Sind, is a very fruitful country. Here is a great plenty of cattle of all ſorts, and numbers of tame and wild fowl. The province abounds in wheat, rice, and pulſe, nor have they ever a dearth, the Indus overflowing all the low ground in April, May, and June, and leaving a fat ſlime that enriches the earth. This country produces ſaltpetre, ſal-ammoniac, borax, lapis-lazuli, lapis-tutiæ, aſſa-fœtida, lignum-dulce, bezoar, opoponax, and raw ſilk. The natives manufacture both ſilk and cotton, as well as chintz, and very handſome counterpanes. They make alſo fine cabinets, lacquered and inlaid with ivory. They export a great deal of butter, which is put in duppas or jars, containing from five to two hundred pounds weight.



The quota of forces furniſhed from hence to the mogul, is, four thouſand horſe, and eight thouſand foot. The eſtabliſhed religion of the people is Mahometiſm; but the Gentoos are ten to one more numerous than the Mahometans.

There is a particular kind of feſtival celebrated here, called the feaſt of Wooly, when both ſexes meet, and dance to the ſound of pipes, drums, and cymbals. The men ſquirt oil at each other, and the women diſtribute ſweetmeats.

The capital city of this province is Tatta, ſituated in a large plain; it is about three miles in length, and about one and a half in breadth. Here is a citadel, and alſo a palace for the nabob. The citizens are celebrated for making very handſome palanquins. At a ſmall diſtance from the city are ſeveral very large and magnificent tombs, which contain the remains of ſome of the antient monarchs of Sindy. The largeſt, which is in the form of a cupola, is about thirty feet in height, and twenty-one diameter. It conſiſts of the moſt beautiful variegated porphyry, poliſhed in the moſt exquiſite manner. The citadel, which ſtands at the weſt end of the town, has barracks and ſtables, capable of accommodating between twenty and thirty thouſand men and horſe.

The province of Guzarat, or Cambaya lies to the ſouth of Sindy: it is rendered a peninſula by the bay of Cambaya, on the ſouth-eaſt, and Sindy bay on the north-weſt. It extends about three hundred miles from north to ſouth, and about four hundred miles from eaſt to weſt.

Amadabad

A PROSPECT *of the Castle of* SURAT, *a great City of* INDOSTAN, *commonly called the Mogul Empire in* INDIA.

Amadabad is the chief city of the province of Cambaya; it is ſituate about one hundred and forty miles to the northward of Surat, in twenty-three degrees north latitude, and ſeventy-two eaſt longitude from London: it is the moſt noted inland town of the Mogul empire. It ſtands on a moſt delightful plain, watered by a little river called Sebremetty. It is ſurrounded by a wall of brick and ſtone, flanked with round towers, forty feet high, and has twelve gates. The town, including its ſuburbs, is about four miles in length; the ſtreets are generally wide, but the principal ſtreet is not more than thirty paces over. The meidan-hah, or king's ſquare, is ſeven hundred paces long, and four hundred broad; and has trees planted on every ſide. On the weſt ſide of this ſquare is the caſtle, and the great caravanſera for lodging ſtrangers ſtands on the ſouth; and there are ſeveral other buildings in it, where the catoual adminiſters juſtice. Near the meidan alſo ſtands one of the mogul's palaces; over the gate is a large balcony, where the country muſic and trumpets ſtand and play morning, noon, and in the evening: the Engliſh factory is in the middle of the town, and the Dutch have another in the great ſtreet, and their warehouſes are uſually filled with rich Indian goods.

In this city, there are a great many moſques, or Mahometan temples, but that called juma meſgid, or the Friday's moſque, whither moſt people reſort on that day, is the nobleſt; it is aſcended by ſeveral large ſteps, and before it is a ſquare cloiſter, of one hundred and forty paces in length, and one hundred and twenty in breadth, adorned with twelve domes, and an open paved ſquare in the middle of it. In the front of the temple are three large arches, and on the ſides two great doors which open into it, over which are very high ſteeples, from whence they call the people to their devotions. The chief dome is ſurrounded with ſeveral other ſmall ones, and two minorets or ſpires. The whole pile is ſupported by forty-four pillars, ſtanding in two rows, and the pavement is of marble. There are abundance of pagodas, or idol temples alſo in Amadabad, but the fineſt of them Aurengzebe converted into a moſque, at which ceremony he ordered a cow to be killed in the temple, being aſſured that the gentiles would never enter it again after it was ſo polluted; and he ordered all the figures of men and beaſts to be defaced, ſo that it has loſt much of its original beauty.

The city is ſo intermixed with groves and gardens, that at a diſtance it looks like a foreſt. The king's garden, which lies without the walls by the river ſide, is filled with all the fruits of India. It conſiſts indeed of ſeveral gardens thrown into the form of an amphitheatre, riſing gradually one above another: and on the higheſt is a terraſs, from whence there is a proſpect of the country villages for ſeveral miles: four or five miles from Amadabad is the village of Serqueech, where are the tombs of the former kings of Guzarat; they are large ſquare buildings with three great arches in each front, and over them a great many leſſer. There is a magnificent dome in the middle, and ſeveral little ones on the ſides of it; and the tomb is always directly under the largeſt dome.

Sick and lame beaſts and birds had formerly hoſpitals provided for them in this city, by the compaſſionate Indians; who imagining the ſouls of their relations or anceſtors might be removed into theſe animals, thought it the greateſt act of charity to adminiſter to their neceſſities: they purchaſed infirm wounded animals frequently of the Chriſtians and Moors, to deliver them from the cruelty of the infidels, as they termed them: and theſe creatures remained in the hoſpital till they died, if they could not be cured; but if they recovered, they were ſold to ſome of their own perſuaſion, that they might not be abuſed again.

The city of Cambaya is about two leagues in circumference, and has very extenſive ſuburbs, excluſive of fine gardens; the ſtreets are ſpacious, and the houſes well built with brick. It is ſituated in twenty-three degrees north latitude, at the bottom of a gulf of the ſame name. The Engliſh and Dutch have factories here, though great part of the trade is removed to Surat; on which account the city is but thinly inhabited. It is ſurrounded by a brick wall, and has ſeveral ſepulchres, beſides a ſtately caſtle for the nabob.

There are great numbers of monkies here, which are very miſchievous, but the Banian inhabitants ſhew a particular indulgence to them. Peacocks are alſo very numerous, which the natives catch after the bird has retired to reſt: the fleſh of the young ones is white, and in taſte reſembles that of a turkey.

The tide in the bay of Cambaya runs with ſuch amazing rapidity, that it is ſaid to exceed the pace of the ſwifteſt animal.

Surat is in the latitude of twenty-one degrees thirty minutes north latitude, longitude ſeventy-two from the meridian of London. It ſtands on the river Tapte, about ten miles diſtant from the ſea; and the town winding with the river, is almoſt in the form of a creſcent. It is defended by a wall and towers, and has a ſquare caſtle; with a tower at each angle on the ſouth-weſt part of it, which commands both the river and the avenues to the town by land. The river runs on one ſide of the caſtle, and there is a moat on the other. The city is between two and three Engliſh miles in circumference, and has ſix or ſeven gates, at which centinels are placed, who require a ſtrict account of ſuch people as paſs them, if they have any ſuſpicion of them. The ſtreets are moſt of them narrow, and the houſes generally low and mean, the ſides being ſplintered with ſplit cane, and the roofs thatched with cajan or palm leaves; but the Europeans, and ſome of the rich Moors have more lofty houſes, built with brick or ſtone, and covered with tiles. The floors, both of the upper and ground rooms, are of terras, which is looked upon to be cooler than boards; and they have no glazing to their windows that the air may have a free paſſage. The city is very populous, being ſuppoſed to contain about two hundred thouſand inhabitants; and the bazar or market-place thronged with Banians and other merchants, who ſtand with their ſilks or ſtuffs upon their heads, or in their hands, to expoſe them to ſale. In the middle of the city, before the caſtle, is a large open place called Caſtle-green, from the neighbourhood of the caſtle; where are laid all ſorts of goods in the open air, both day and night, except during the monſoons; and here the Europeans as well as natives place their bales, and prepare to load their ſhips.

Before the Engliſh Eaſt India company became poſſeſſed of Bombay, the preſident and council managed their affairs at Surat, where a factory, which had been eſtabliſhed there, was ſtill contrived, after the preſidency was removed to Bombay. This factory had received many very valuable immunities from the Mogul government: and Perſians, Moguls, Indians, Arabs, Armenians, Jews, and Europeans, all reſorted to Surat, where money was eaſily obtained, and bills of exchange were to be had for every market in India. Bags of money, ticketed and ſealed, would circulate for years, without being weighed; ſuch was the honeſty of the traders. Fortunes were proportionable to the eaſe and readineſs with which they were to be acquired by commerce: they frequently amounted to two hundred thouſand pounds. Many of the Gentoo inhabitants enjoy places under the Mooriſh government, ſuch as collectors, ſurveyors of the cuſtoms, &c.

In hot weather, the chief inhabitants retire into the country; and the Engliſh Eaſt India company have a very pleaſant garden, kept in the moſt regular order.

At this place there is great plenty of proviſions of all kinds: the ſoil of the country is extremely fertile, and produces the fineſt wheat in India. Here is alſo abundance of wild fowl, great numbers of antelopes and ſome deer.

All religions are tolerated here by the Moors, who have the government intirely in their hands. When they take an European into their ſervice, they never attempt to make him a proſelyte, nor do they make the leaſt enquiry about his religion.

In 1664 Surat was plundered by Rajah Sevagi, who took from thence one million two hundred thouſand pounds. The pillage would have been much more conſiderable, had not the Engliſh and Dutch avoided the depredation, by placing their richeſt commodities in the caſtle, which was out of the rajah's reach; they had, beſides, well fortified their factories; ſo that the invader thought proper to retire, without attempting to attack the place. After the above great loſs, the inhabitants, for their better ſecurity, built walls round the city of Surat, which is at this time in a flouriſhing condition.

A conſiderable part of the produce of the manufactures of Guzarat, which are depoſited in warehouſes, is carried into the inland countries, and the reſt to all parts of the globe. Thoſe moſt commonly known are, blue linens, white linens, blue and white checks, printed callicoes, ſilk and cotton ſtuffs, gauzes, ſhauls, and dutties. Surat receives, in exchange for her exports, great quantities of ſpices from the Dutch; iron, lead, cloth, cochineal, and hard wares from the Engliſh; ſilk from Bengal and Perſia; from Malabar, maſts and pepper; from Arabia, ſlaves and perfumes; from China, teas, ſugars, camphire, quickſilver, and toys; and gums, dried fruits, pearls and copper from Perſia.

The manufacturers here have generally their work be-

ſpoke by the wholeſale merchants, and this being the only ſea-port of any importance in the mogul's dominions that the Europeans do not poſſeſs, the inland trade employs great numbers of caravans for the diſtribution of the articles imported; and a continual intercourſe is preſerved from hence to Bombay, both by ſea and land.

The governor of Surat, who, in the adminiſtration of public juſtice, attends perſonally in the durbar, preſides with great ſtate, and decides on all actions of a civil and criminal nature.

Biſnagar, properly ſo called, is the weſtern ſide of the kingdom of that name, and has Golconda and Viſapour on the north, Coromandel on the eaſt, Gingy on the ſouth, and the mountains of Gate, which ſeparate it from Malabar, on the weſt. The chief towns are, 1. Biſnagar, or Chandegry, ſeated on a high hill in the latitude of fourteen degrees, ſome odd minutes, near the river Nagundi, which falls into the Chriſtena. 2. Narſigna, another conſiderable town, which did alſo give name to the kingdom formerly, lies about thirty miles farther to the northward, upon the ſame river Nagundi. Many incredible things are related by modern writers of theſe two cities, and particularly that Biſnagar alone is able to raiſe a hundred thouſand horſe, when there is hardly a horſe fit for ſervice in the country; and the kingdom has for a conſiderable time been a province of the mogul's empire. They alſo tell us it is an excellent haven for ſhips, though it ſtands in the very heart of the country. No Europeans have the privilege of eſtabliſhing trade in this place, the prince only allowing them to be here in the capacity of travellers or viſitors. The prince has a very ſtately palace.

The chief articles of trade at Biſnagar are, damaſks, ſattins, chints, rich velvets, &c.

SECT. III.

Treating of the ENGLISH Poſſeſſions and Settlements, and thoſe of other EUROPEAN Nations in the EAST INDIES.

BENGAL is the moſt eaſterly province of the mogul's dominions. It is bounded by the provinces of Patna and Jeſuat towards the north, the kingdom of Arracan and Aſem towards the eaſt, the bay of Bengal and the province of Orixa towards the ſouth; and by the province of Malva towards the weſt; it is in length from eaſt to weſt upwards of four hundred miles, and near three hundred in breadth from north to ſouth, and is uſually compared to Egypt for its fruitfulneſs, the river Ganges dividing itſelf into ſeveral branches in this province, and annually overflowing it as the Nile does Egypt.

The chief towns are, 1. Dacca, which lies upon one of the eaſtern branches of the Ganges in the latitude of twenty-four degrees; it is four or five miles in length, but very narrow, winding with the river. This may properly be called the capital, being the ſeat of the viceroy, and here the Engliſh and other Europeans have their agents to take care of their trade, which is very conſiderable in this province. 2. Ragemahal ſituated higher up the Ganges; and is between two and three hundred miles from the mouth of it, in the latitude of twenty-five degrees. Below Ragemahal lies the city of Caſſimbuza, in latitude twenty-four, where the Europeans have their factors, the country affording great quantities of ſilk and muſlins. 3. To the ſouthward of Caſſimbuzar ſtands the city of Hugley, upon an iſland made by the Ganges, in the latitude of twenty-three degrees, about a hundred miles from the mouth of the river: it is a large town, and beſides Moors and other Indians, has ſeveral thouſand Portugueſe Chriſtians in it; moſt European nations who trade to India had their factories here, and particularly the Engliſh; but the unhealthineſs of the ſituation induced them to remove, and the Engliſh have ſince built them a fort a little below near Calcutta, which they named Fort William, from the Prince of Orange who mounted the throne of England about that time. In 1757, the ſubah of Bengal, whoſe indignation had been raiſed by ſome procedures of the company, inveſted Calcutta, which was then in a defenceleſs ſtate. The governor, alarmed at the appearance of a very numerous army, abandoned the fort, and, with many of the principal inhabitants, repaired on board a veſſel in the river. Mr. Holwell, however, who was ſecond in command, aſſiſted by a few intrepid officers, and a weak garriſon, defended the place for ſome time, but was at length obliged to ſurrender; and the inhabitants, with the whole garriſon, were all forced into a dungeon called the black-hole, from which only twenty-three out of one hundred and forty-ſix came out alive, the reſt were either ſuffocated with the extreme heat, or died raving mad with fevers or violent thirſt: there was a lady, one Mrs. Carey, among the number, who ſurvived the calamity. 5. The city of Chatigan lies near the mouth of the moſt eaſterly branch of the Ganges. Here the Portugueſe ſet up for a kind of ſovereignty formerly, and aſſociating with pirates and banditti of all nations, owned no ſubjection to their own prince or the prince of the country, but committed daily robberies by ſea and land, and ſo interrupted all commerce, that the late mogul found it neceſſary to ſend an army againſt them, and extirpate them. 6. Malda, which ſtands a little to the eaſtward of Ragemahal, where the Europeans alſo have their factors.

This province of Bengal is deemed the moſt fertile country in India for a variety of articles, ſuch as ſugar, ſilk, gum-lack, ſalte-petre, rice, opium, pepper, fruits, &c. The greateſt part of the Bengal ſilk is produced in the territory of Caſſimbuzar, where the ſilk-worms are reared and fed in the ſame manner as in other places; but the natural heat of the climate hatches and brings them to perfection at all times of the year. Conſiderable quantities of ſilk and cotton ſtuffs are manufactured here, and circulated through part of Aſia. Bengal is alſo famous for its fine canes, and a ſmall ſort worked into veſſels, which, being glazed within ſide, will hold any liquid. There is alſo an herb here, from which they make very beautiful ſtuffs and tapeſtry.

The forces in the ſervice of the Engliſh company, which are eſtabliſhed at Bengal, are very conſiderable. The power is inveſted in Europeans, though the bulk of the army conſiſts of natives: the whole is divided into three brigades; each conſiſting of one battalion of European infantry, and one regiment of Seapoys; each battalion contains ten companies, and each regiment ten battalions. Every regiment of ſeapoys, or black infantry, is commanded by a jemantadar, or native officer, who is ſubordinate to the Engliſh officers of a much lower rank. The artillery forms one regiment of four companies of Europeans; but the principal drudgery is done by black ſeapoys: every company of artillery is ſtrengthened by four companies of laſcars, containing fifty men in each company, who ſerve as matroſſes; and the brigades have a troop of black cavalry appertaining to each, who are commanded by Engliſh officers.

But, before we quit the province of Bengal, it will be proper to give a further account of the town of Calcutta, ſituated on the banks of the river Hugley, which is an arm of the Ganges. It is tolerably large, but appears very uncouth to the eye, from the great irregularity of its buildings; for every perſon who erects a houſe, pleaſes his own fancy with reſpect to the manner of the edifice, without paying any attention to uniformity, ſize, or elegance.

Bezar is the principal ſtreet in this town: it is inhabited by perſons who keep little ſhops for the ſale of various commodities. The Engliſh ſend their ſervants hither, to buy whatever is wanted, relying on their fidelity; ſo that the place is ſeldom viſited by them.

Near the centre of the town, on the ſide of the river Hugley, is the old fort, in which is the place before-mentioned, called the black-hole, where the unhappy Engliſh ſuffered the moſt wretched puniſhment, by order of the nabob Serajah Dowlah. Some of the apartments in it are uſed occaſionally for the performance of divine ſervice.

By the ſide of the river, about a mile from the town, is the new fort, which is a very ſtrong and handſome building, exceeding ſpacious, and ſurrounded with walls. It contains magazines for ſtores, barracks for ſoldiers, and elegant apartments for the ſeveral officers that reſide at Calcutta, who, as well as the engineers, have houſes in it for their accommodation.

The Portugueſe and Armenians have one part of the town ſet apart for their reſidence, where they exerciſe their own mode of worſhip. There is a church belonging to each; but the former are reſtrained from exhibiting their religious proceſſions without the limits of their own diſtrict. The generality of theſe people perform the moſt menial offices, being employed as ſervants by the wealthier part of the inhabitants. The Armenian women, indeed, are not employed in any kind of buſineſs; but the men collect goods in different parts of India for the merchants. Some of theſe are permitted to trade for themſelves, and obtain very conſiderable poſſeſſions.

The dreſs of the Armenian women much reſembles that of the Mahometans, except the head, which is covered with

with a turban of a prepoſterous ſize. They have likewiſe a ſingular addition to their head-dreſs after marriage; it is called a mouth-piece, and conſiſts of a piece of muſlin, which covers the face from the chin to the under part of the noſtrils, and is placed ſo cloſe to the face, that their breathing is greatly hindered by it.

Calcutta has many elegant buildings about it, which are the country reſidences of Engliſh gentlemen who retire thither, particularly in the hot ſeaſon, to enjoy the benefit of the air, which is cooler and much more wholeſome than in the town. The intenſe heat of the climate renders the inhabitants ſubject to many diſeaſes; but the moſt fatal is that called the pucker fever, which in a very ſhort ſpace of time carries off the perſon ſeized with it. More men are ſaid to die here in proportion than women, becauſe the latter are more abſtemious, and leſs addicted to intemperance than the men.

Patna is one of the largeſt cities in India, and the capital of a territory of the ſame name. It is ſituated to the north of the kingdom of Bengal, where the Engliſh have factories for ſalt-petre, borax, and raw ſilk. It alſo produces large quantities of opium. The town is large, but the houſes are built at a diſtance from each other. It is ſeated in a fertile, pleaſant country, four hundred miles eaſt of Agra, in eighty-five degrees forty minutes eaſt longitude, and twenty-three degrees twenty-five minutes north latitude.

The moſt extenſive city in the kingdom of Bengal is Dacca, which produces the beſt and fineſt embroideries in gold, ſilver, or ſilk. The town is ſituated in twenty-four degrees north latitude; the ſoil is fertile, the ſituation fine, and the richeſt commodities of India and Europe are brought to its market. It receives conſiderable advantages from its cottons, from which are produced ſtriped and worked muſlins, which for the texture, are more valuable than thoſe made in any other part of India.

Madraſs, or Fort St. George, as it is generally called from the Engliſh fort there, ſtands about four miles to the northward of St. Thomas, in thirteen degrees, ſome odd minutes latitude, and eighty degrees of longitude; being near four thouſand eight hundred miles to the caſtward of London, ſo that the ſun viſits them about ſix hours before us, and ſets in that part of the world before we ſit down to dinner in this; for there is ſo little difference in the length of the days there all the year round, that we always reckon it to be ſix o' clock at ſun-riſe and ſun-ſet.

The fort is a regular ſquare, about a hundred yards on each ſide, with four baſtions, built with what they call iron ſtone, being of the colour of unwrought iron, and very rough on the outſide like honeycomb. There is no ditch about the fort, and the walls are arched and hollow within, ſo that they are not cannon proof. It has two gates, one to the eaſt and the other to the weſt. The weſtern gate which looks towards the land is pretty large; and here the main guard is kept, the ſoldiers of the guard lying on the right and left of it, under the wall, which being hollow ſerves them inſtead of a guard-houſe. The eaſt-gate towards the ſea, is but ſmall, and guarded only with a file of muſqueteers. In the middle of the fort ſtands the governor's houſe, in which alſo are apartments for the company's ſervants; it is a handſome, lofty, ſquare ſtone building; the firſt rooms are aſcended by ten or twelve ſteps, and from thence another pair of ſtairs leads to the council chamber and the governor's lodgings. The fort ſtands pretty near the middle of the White-town where the Europeans inhabit. This is an oblong ſquare about a quarter of a mile in length, but not half ſo much in breadth.

To the northward of the fort are three ſtraight handſome ſtreets, and as many to the ſouth. The buildings are of brick; ſeveral of the houſes have one floor above the ground floor. Their roofs are flat, and covered with a plaiſter made of ſea-ſhells, which no rain can penetrate; and being ſecured with battlements they take the freſh air upon them morning and evening. The walls of theſe houſes are very thick, and the rooms lofty. The governor and people of condition have gardens at a little diſtance from the town. Over againſt the weſt gate of the fort is a barrack, or rather one long room where all the company's ſoldiers are obliged to lodge when they are off the guard; and adjoining to it on the north is a very commodious hoſpital, where they are taken care of when they are ſick. At the other end of the ſoldiers barracks is a mint where the company coin gold and ſilver.

On the north ſide of the fort ſtands the Portugueſe church; and to the ſouthward the Engliſh church, which is a pretty elegant building, and moderately large: it has a handſome altar-piece, a gallery of fine carved wood reſembling cedar, and an organ: when the governor comes into church, the organ always plays. The church is floored with black and white marble, the ſeats regular and convenient, and all together it is the moſt airy lightſome temple that is to be found any where, for the windows are large and unglazed to admit the cooling breezes, and if it were otherwiſe, the people muſt ſweat intolerably at their devotions; for though in their own houſes they are as thinly clothed as poſſible, yet when they come to church it is always in the European dreſs; but to avoid theſe inconveniencies as much as poſſible, prayers are appointed at ſeven in the morning, and in the evening they are uſually refreſhed with a ſea breeze. Here is alſo a free ſchool, where children are educated in reading and writing; beſides which there is a library. Theſe are the only public buildings in the White-town, except the town-houſe, where the mayor and his brethren aſſemble; and a court of juſtice is held for civil cauſes.

A river runs cloſe to the buildings, on the weſt part of the town; but on this ſide there is no wall, only one large battery of guns upon the river which commands the plain beyond it. On the eaſt there is a ſlight ſtone wall pretty high, and appears ſomething grand to the ſhipping in the road; but here is very little occaſion for any fortification, the ſea coming up cloſe to the town, and no large veſſels can ride within two miles of the place, the ſea is ſo very ſhallow; nor is there any landing but in the country boats. the ſurf runs ſo high and breaks ſo far from the ſhore. The north and ſouth ends of the town are each of them defended by a ſtone wall moderately thick; but then, like the fort walls, they are hollow within, and would hardly hold out one day's battery. There is a little ſuburb to the ſouthward of the White-town, inhabited only by the black watermen and fiſhermen, and conſiſts of little, low, thatched cottages, which hardly deſerve the name of buildings. Beyond this is an outguard of blacks, who ſerve to give intelligence to the fort: but there is no other fortification on this ſide.

The Black-town adjoins to the White-town, but is much larger, and ſituate to the northward. Here the Portugueſe, Indians, Armenians, and a great variety of other people inhabit. This is built in the form of a ſquare, and is better than a mile and a half in circumference; being ſurrounded with a brick wall ſeventeen feet thick, with baſtions at proper diſtances, after the modern way of fortification: it has alſo a river on the weſt, and the ſea on the caſt; and to the northward a canal is cut from the river to the ſea, which ſerves for a moat on that ſide; ſo that Madraſs, conſidering where it ſtands, might now be reckoned a town of ſtrength if the garriſon was anſwerable to the fortifications; but it conſiſts of no more than three companies of fourſcore or a hundred men each, and one third of theſe topazes or Portugueſe Indians. The company, indeed, entertain two or three hundred of native blacks in their ſervice, and a body of men may be formed out of the inhabitants, who are very numerous; but theſe would be of little ſervice againſt an European enemy, or even againſt the mogul's troops, if there was occaſion for them beyond their own walls.

The ſtreets of the Black-town are wide, and trees planted in ſome of them; and having the ſea on one ſide and a river on the other, there are few towns ſo pleaſantly ſituated or are better ſupplied; but except ſome few brick houſes the reſt are miſerable cottages, built with clay and thatched, and not ſo much as a window to be ſeen on the outſide, or any furniture within, except the mats and carpets they lie on. The houſes of the better ſort of Indians are of the ſame materials, and built uſually in one form, that is, with a little ſquare in the middle, from whence they receive all their light. A ſtranger ſeldom comes farther than the door, before which is erected a little ſhed ſupported by pillars, where they ſit croſs-legged morning and evening to receive their friends or tranſact their buſineſs. The great ſtreets and the bazar, or market-place, are thronged with people; for notwithſtanding the houſes are low and ſmall, they are very well filled, ſix or ſeven people ſleeping in one little room, without any other bed than a mat or cloth ſpread under them; but notwithſtanding all this appearance of poverty abounds among them, the people from the higheſt to the loweſt are extremely neat, waſhing themſelves ſeveral times a day. In this black town there is an Armenian church, and ſeveral little pagodas or Indian temples, to which belong great numbers of female choriſters, who ſpend half the time in ſinging to the idols, and the reſt in intriguing, or chanting in companies before the great men as they paſs along the ſtreets.

The governor of Madras extends his juriſdiction all over the

the coaſt of Coromandel, and the weſtern coaſt of Sumatra. He is likewiſe captain of the firſt company of ſoldiers, the ſecond being commanded by the next in council. The governor lives in great ſtate, though his ſalary is but ſmall; but this is pretty amply compenſated to him by the conſiderable emoluments he reaps from the privilege he has of trading on his own bottom. His uſual guard is three or four hundred black men; and when he goes abroad, on any public occaſion, he is attended by trumpets, fifes, and drums, with ſtreamers flying, accompanied by the council on horſeback, and their ladies in palanquins.

Six perſons compoſe the council, who have annual ſalaries. Beſides whom, there are two ſenior merchants, two junior merchants, five factors, and ten writers; alſo two clergymen, a judge advocate, an attorney-general, two aſſay-maſters of the mint, and a ſurgeon; all of whom have yearly ſtipends, which (as we obſerved with reſpect to the governor) are trifling in compariſon of the advantages and profits they acquire by trading for themſelves.

The Armenians and Jews have ingroſſed the trade of this colony. The articles the Engliſh deal in are diamonds, chints, callicoes, &c.

In 1746, this place ſubmitted to the French, but was reſtored at the peace. General Lally attacked it again in 1758; but the forces under the generals Laurence and Draper repulſed him.

It was computed that ſome years ago the towns and villages belonging to Fort St. George contained eighty thouſand people, of whom five thouſand were Europeans.

The trade carried on from this place extends to all ports eaſtward of the cape of Good Hope; but the largeſt ſhips uſe the Mocha, Perſia, and Surat markets, with Bengal and China commodities, and touch in their voyage on the Malabar coaſt for pepper, cocoa, drugs, &c. The European goods, which fetch the beſt market price here are, wines, beer, ale, cyder, cheeſe, gold and ſilver lace, worſted and thread ſtockings, lead, flint-ware, looking-glaſſes, and a variety of other commodities.

At a little diſtance from Madras the nabob of Arcot has an elegant villa, ſupported by pillars inſtead of walls; the apertures of colonades admit the light, in lieu of windows, and open porticoes ſerve the purpoſe of doors: the ſtyle of architecture there appears elegantly airy and open, and in a climate exceeding ſultry the conſequent coolneſs renders it an agreeable and delightful retreat.

Great and little Gingi or Gingee, are encompaſſed with mountains. They conſiſt of two towns, both of which are ſurrounded by a wall and five lofty rocks; and on the top of each rock is a ſtrong fortreſs. Theſe towns are ſeparated from eaſt to weſt, by a wall fortified with cannon, which one of the rocks defends as a citadel.

Another colony and fort belonging to the Engliſh is Fort St. David, ſituated four or five leagues to the ſouth of Pondicherry. This place was purchaſed in 1686, for the conſideration of ninety thouſand pagodas, by the governor of Fort St. George, for the Eaſt India company: it is eſteemed a ſituation of very great conſequence to the Engliſh. It was taken, in 1758, by the French forces under the command of general Lally, who blew up the fortifications; but the events of war proving afterwards unfavourable to the victors, they were forced to give up moſt of their poſſeſſions to the Engliſh. Great quantities of chints, callicoes, and muſlins, are manufactured here.

Tanjore, the capital of the kingdom of the ſame name lies to the ſouth of Fort St. David. It is ſituated in eleven degrees north latitude; and the kingdom is bounded by the ocean, on the eaſt; by Trichinopoly, on the weſt; by the river Coleroon, on the north; and on the ſouth, by the territories of two great perſonages, ſtyled poligars, or lords. The Engliſh have a fort, with land belonging to it, near the mouth of the Coleroon. In 1748, Monſieur Lally attacked this place, but was repulſed. When that general made his appearance before it, he privately erected batteries at the very time he was pretending to commence a capitulation with the prince, and even fired upon the town; when the inhabitants, inflamed with a juſt reſentment, attacked the French with ſuch ſpirit and vigour, as to drive them intirely away. The fort poſſeſſed by the Engliſh at the mouth of the river Coleroon, and which is named Daverotah, was granted to them by the king of Tanjore.

The town of Trichinopoly ſtands in a plain that was once encompaſſed by numerous plantations of trees and opulent villas, but now wears a much leſs pleaſing aſpect. It is about four miles in circumference, fortified with a double wall, and defended by towers; it has a ditch, near thirty feet wide. There is a rock in this town about thirty feet high, on the ſummit of which is a pagoda. Trichinopoly is the key of Tanjore and Madura, and gives them great influence. It was a principal ſcene of our military operations laſt war.

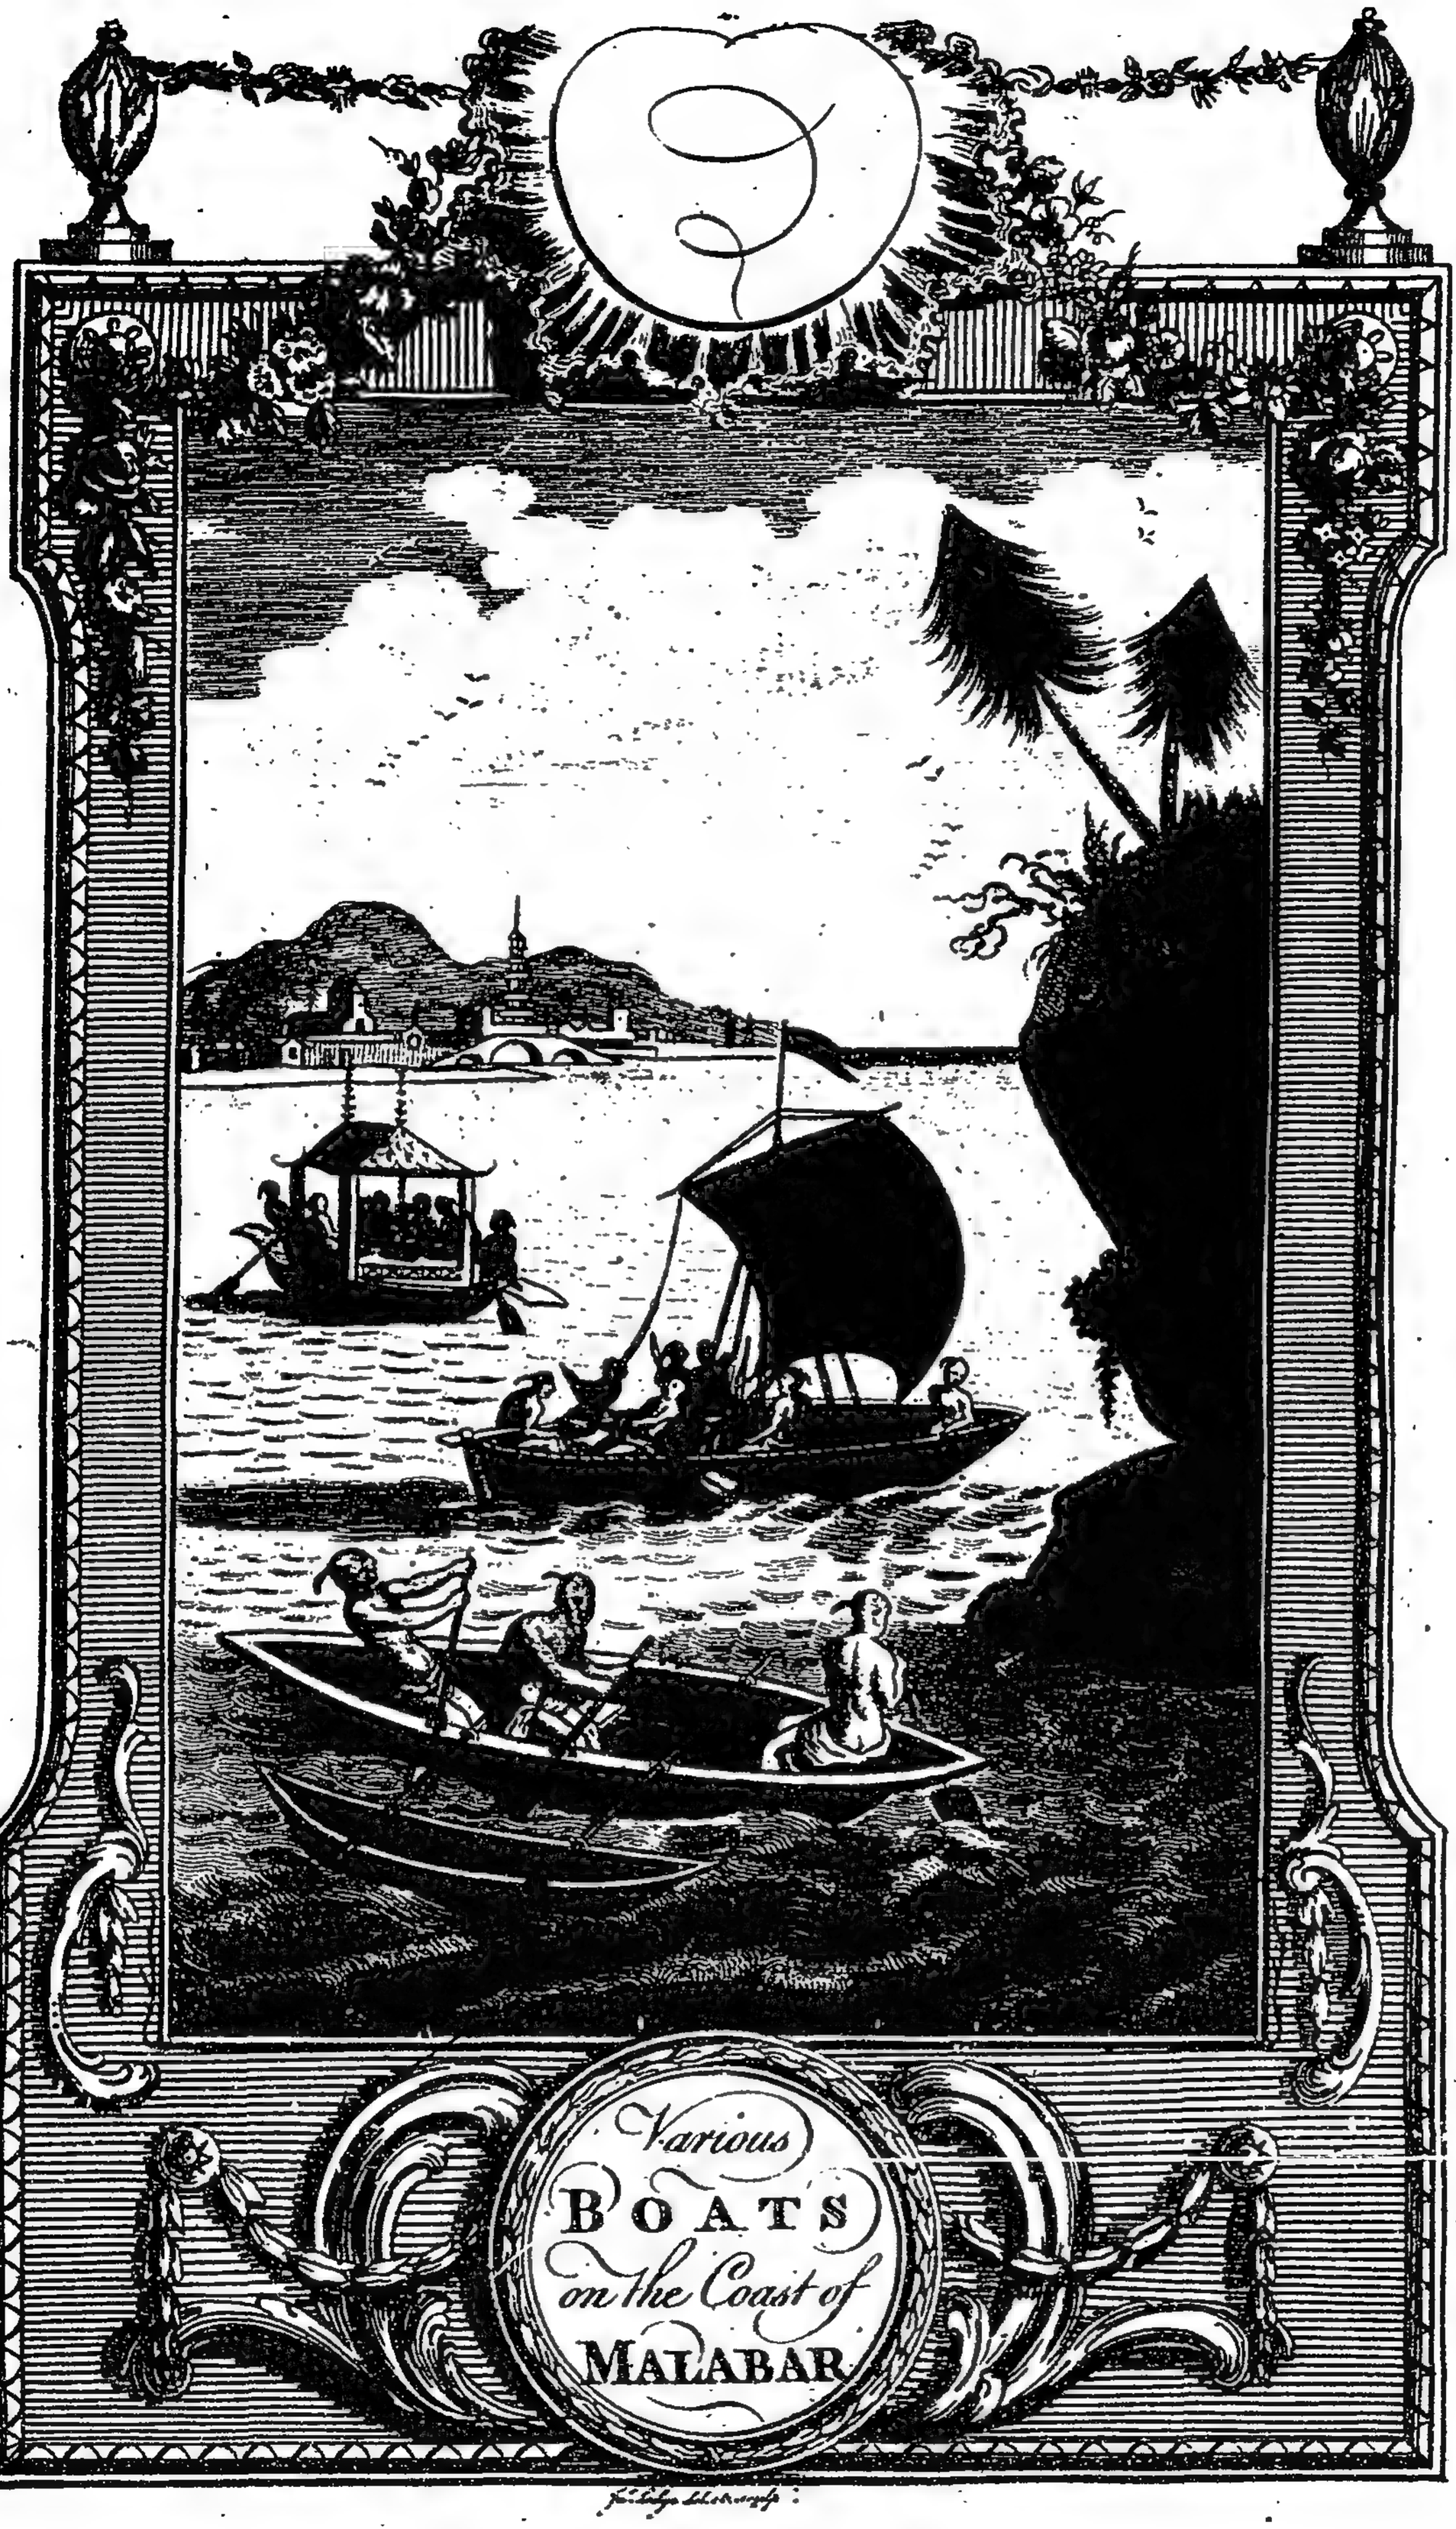
The French, in 1753, made an attempt to take it by ſurprize; and vainly ſurmiſing that firing alone would terrify the garriſon, turned a couple of our twelve pounders on the battery againſt the town, having previouſly ſcaled the outer wall. They were, however, through the exertion of equal judgment and bravery, intirely repulſed, and upwards of three hundred and ſixty were made priſoners.

Madura is the capital of the province of Madura, and is a large fortified town. It was taken by the Engliſh in 1757.

Tellicherry lies ten miles to the ſouth of Cananor: the Engliſh Eaſt India company have a well-defended factory in this town, which ſtands at the back of the fort, and has a ſtone round it. The religion of the place is that of the Gentoos: there are, however, ſome few black Chriſtians, who live protected by the factory. Hereabout a fine deep purple opium is produced.

The Engliſh company have alſo a factory at Anjongo which is farther to the ſouth, with a fort and garriſon. It is ſituated on a ſandy point of land at the mouth of a ſmall river, which is three fourths of the year choaked up with ſand, and not a drop of water fit to be drank can be had within leſs than three miles of the factory. This ſettlement is in general more advantageous to the agents of the company, who purchaſe cinnamon, pepper, and chian on their account, than to the company themſelves, who only trade for linens of no great worth, and about fifty thouſand pounds weight of pepper.

The harbour of Carwan is ſituated about thirty-ſix or thirty-eight miles to the ſouth of Goa. Here is an Engliſh factory, which ſtands on a very commodious bay, facing an iſle that produces every ſpecies of game. The town is ſurrounded by fertile vallies, yielding great plenty of corn and pepper. In the woods on the mountains are deer, elks, wolves, tygers, monkies, with wild peacocks and other birds: they have alſo particularly large bees here.



We ſhall next give ſome account of the French poſſeſſions in India.

The capital of the French ſettlements in India, is Pondicherry, on the Coromandel coaſt. It is a large handſome town, ſituated in eighty degrees thirty minutes eaſt longitude from London, and twelve degrees twenty minnte north latitude. The ſtreets are very regular, and the principal one not leſs than half a league long. The town is ſurrounded by a wall, and has ſix gates, ten or eleven baſtions, and upwards of four hundred cannon mounted, excluſive of mortars, bombs, &c. It ſtands upon a low ground, and veſſels cannot anchor nearer than within about half a league; even the canoes cannot come up to it by a great ſpace; ſo that the blacks convey perſons and mercantile articles to the fleet in flat-bottomed boats.

The principal buildings are, the houſe of the governor, the jeſuit's houſe, and an elegant ſtructure in the company's gardens. The houſes in common conſiſt of one ſtory, as is uſual in moſt of the towns of the province. The Gentoos generally ſleep in their courts, or on the tops of their houſes; theſe people toil hard in their reſpective profeſſions, ſuch as weaving, painting, &c. for about a penny per day, and their uſual food is boiled rice; for the country, notwithſtanding its natural dryneſs, produces great quantities of that neceſſary of life, owing principally to the unwearied induſtry of the Gentoos, who dig wells at proper diſtances in the fields, for refreſhing the ground. The Mahometans, on the other hand, are as indolent and ſlothful as the others are aſſiduous and careful; nor does the laudable ſpirit of induſtry in the Gentoos effect the leaſt change in them.

When the governor is honoured with a viſit from any great perſonage, he is attended by three hundred peons or foot guards; and when he goes out on any public occaſion, he is carried in a palanquin, the canopy of which is embelliſhed with the moſt ſuperb ornaments.

In the year 1693, Pondicherry was taken from the French by the Dutch, and reſtored at the peace of Ryſwick; and in 1751, it was taken by the Engliſh, but reſtored in 1763. Previous, however, to the period of 1751, rear-admiral Boſcawen was ſent out with a ſtrong ſquadron, in order to lay ſiege to Pondicherry, and was joined in India by ſeveral men of war under admiral Griffin. Arriving at Fort St. David in July 1748, on the 10th of Auguſt following the army were in full motion, and preparing for the ſiege. On the 11th, the French made a ſhow of about three hundred infantry and ſome cavalry, at an intrenchment they

Various
BOATS
on the Coast of
MALABAR

they had thrown up, but abandoned it on the approach of the Engliſh forces. The Engliſh attacked the place with their uſual ſpirit and intrepidity, but were conſtrained, through the violence of the periodical winds, to raiſe the ſiege, after ſuſtaining a loſs of ſeven hundred and fifty ſoldiers, upwards of two hundred and ſixty ſeamen, and ſeveral engineers.

Karical lies in ten degrees thirty-four minutes north latitude, about four leagues ſouth of Tranquebar, and twenty-five ſouth of Pondicherry. This is an ancient city and ſettlement belonging to the French, it contains five ſpacious pagodas, nine leſſer ones, four moſques, between ſix and ſeven hundred houſes, and about five or ſix thouſand people. Tironmale Rayan Patuam is under the juriſdiction of Karical, and lies to the ſouth of it. It is a large town, containing four large pagodas, near thirty leſſer ones, four moſques, and about five hundred black houſes, excluſive of twenty-four public inns for accommodation of travellers.

Chandernagore alſo belongs to the French. It is ſurrounded by a wall, and well fortified; but was reduced by Meſſrs. Watſon and Pocock, in conjunction with colonel Clive. This place has the diſadvantage of being rather expoſed on the weſtern ſide; but its harbour is excellent, and the air is as pure as it can be on the banks of the Ganges. Here is a very conſiderable manufacture of handkerchiefs and ſtriped muſlins: this, however, has not made Chandernagore the rival of Calcutta, whoſe immenſe opulence enables it to engage in the moſt extenſive commercial undertakings.

The Portugueſe poſſeſſions in the Indies being now come under our conſideration, it is neceſſary to obſerve that we ſhall poſtpone the deſcription of Goa, the principal of them, and Diu, or Dio, both which are iſlands, till we give a general account of the oriental iſlands.

Meliapour was once the moſt conſiderable place on the Coromandel coaſt: it is about three miles ſouth of Fort St. George. The Portugueſe raiſed it from the verge of ruin, to a ſtate of opulence and magnificence; but were driven from thence by the Moors, when it became ſubject to the king of Golconda, but was reduced by the French in 1666; the Dutch, however, in conjunction with the king of Golconda, about four years after, took it from the French; upon which the fortifications were intirely deſtroyed, and never afterwards repaired. The inhabitants are Portugueſe, Gentoos, and Moors, and others of different nations. The Portugueſe, after ſettling in this place when in its declining ſtate, and beginning to rebuild it gave it the name of St. Thomas, from an opinion that the apoſtle was martyred here; and theſe people, finding ſome bones (which they afterwards enſhrined) concluded they were thoſe of St. Thomas, eſpecially as it was pretended his ſepulchre was on a hill at a little diſtance from the town.

The city of Calicut lies in eleven degrees twenty minutes north latitude. It was, when the Portugueſe arrived here, the greateſt place of trade in India. The Moors did all that was in their power to prevent the Portugueſe ſettling here; whereupon they landed a body of troops, and built a ſtrong fort to defend their poſſeſſion, but were drove out of it again; though others ſay it was demoliſhed by the Portugueſe themſelves, as not thinking it worth maintaining: but however that matter be, the fort is now waſhed away by the ſea, of which part of the ruins may ſtill be ſeen at low water. Several European nations have their factories, and trade hither at this day without reſtraint; and particularly the Engliſh. It is a large ſtraggling town, and the prince's palace, as it is called, is an old irregular building out of repair, which he ſeldom viſits. There are five white tombs a little to the northward of the town, which ſerve as a ſea mark to the ſailors. The ſamorin or king of this country, entered in an alliance and confederacy with the Engliſh againſt the Portugueſe in 1615. Calicut is ſurrounded by a brick wall, and contains about ſix thouſand brick houſes, moſt of which have gardens. This was the firſt place at which the Portugueſe landed in 1498, after their diſcovery of India.

The country of the raja of Sarimpatan lies contiguous to the prince's dominions: it is ſaid, this country was never conquered; the natives are a civilized, juſt and humane people.

Farther to the ſouth is the city of Cochin, a city ſituated in a kingdom of the ſame name; in nine degrees fifty minutes north latitude, and is about eighty miles to the northward of Anjengo. This is a great town of trade, and the beſt ſettlement the Dutch have upon the Malabar coaſt: it was fortified by the Portugueſe in the year 1504, when the two Albuquerques commanded the Portugueſe forces. It is divided by ſome into Old and New Cochin; the Old Cochin lies a league and a half from the ſea, and is called by the Portugueſe Cochin Dacina, or the Higher Cochin, becauſe it lies higher up the river, and by the Dutch Malabar Cochin, for here their king reſided. The other Cochin, commonly called New Cochin, is ſcarce a league diſtant from the ſea upon the ſame river. The Portugueſe built and beautified it with ſeveral fine edifices, churches and monaſteries, to which belonged pleaſant gardens and fine walks. The Jeſuits church and college faced the ſea-ſhore, and had a lofty ſteeple. The cathedral was a noble piece of architecture, adorned with two rows of pillars, and had a lofty ſteeple. The church and convent of the Auſtin friars ſtood upon the banks of the river; and the church of the Dominicans and their convents were two fine pieces of workmanſhip, beautified with a double row of pillars of excellent ſtone: but the Dutch having this city ſurrendered to them in the year 1662, immediately gave orders for demoliſhing great part of the houſes, and all the churches but one, in order to bring it into a narrower compaſs, and render the fortifications more regular; and they have made it almoſt impregnable, conſidering the part of the world it ſtands in, to which the ſtones of the churches they pulled down in a great meaſure contributed. The ſimple Portugueſe had converted them indeed to pious uſes; but the Dutch knew how to employ ſuch materials much better: and it is obſervable, that all over the Indies they think one church ſufficient for the largeſt cities, inſomuch that in Batavia itſelf they had for many years but one Dutch church.

The dominions of the king of Cochin have been repeatedly invaded by the natives of Travancor, a country extending from cape Comorin to the frontiers of Cochin; and he is, from neceſſity obliged to dwell in Gold-town, which is ſituated on a river half a league from the ſea, and has ſeveral pagodas. His revenue is fourteen thouſand four hundred livres, ſtipulated to be paid him by antient capitulations, out of the produce of his cuſtoms.

There is a colony of induſtrious Jews in this town, who are white men, and abſurdly boaſt that their anceſtors were ſettled here at the æra of the Babyloniſh captivity; they have, however, certainly been here a conſiderable time. They have a ſynagogue, in which their records are very carefully preſerved.

Cananor is a very populous and conſiderable town in the kingdom of the ſame name: it is ſituated in twelve degrees north latitude, and has a moſt convenient harbour. The Dutch, who have on all occaſions diſtinguiſhed themſelves by their induſtry and enterpriſing genius, have an extenſive fort here. Cananor was originally poſſeſſed by the Portugueſe, from whom the Dutch took it in 1660. The chief articles in trade here are pepper, ginger, caſſia, ambergris, mirobolans, tamarinds, and precious ſtones. This town is inhabited principally by Mahometan merchants.

There is a large town at the bottom of the bay, which is independent of the Dutch: it is under the juriſdiction of a prince who can bring twenty thouſand men into the field.

The city of Cranganor lies fourteen or fifteen miles to the northward of Cochin, and was alſo the capital of a kingdom of the ſame name. This place was poſſeſſed and fortified by the Portugueſe ſoon after their arrival in India, but taken from them by the Dutch in January 1661-2. The Dutch found here a noble college of Jeſuits, with a ſtately library belonging to it, and it having once been the ſeat of a biſhop, here was a cathedral, and ſix or ſeven other churches, which underwent the fate of thoſe of other places which the Dutch conquered, and have nothing of them remaining but their ruins. Without the walls was the college of Chanote, famous for the reſort of the Chriſtians of St. Thomas hither, who exerciſed their religion here in the Syrian language. They had alſo a Syrian ſchool for the education of youth, and ſeveral maſters and prieſts of their own.

Between Cranganor and Calicut lie the towns of Panane and Tanor; theſe were alſo once poſſeſſed by the Portugueſe. At Panane it was that Vaſca de Gama treated with the Samorin, or king of Calicut, concerning their ſettlement on this coaſt; but being oppoſed by the Moors, they afterwards attacked the place in form and took it. The Dutch ſucceeded the Portugueſe, and have now a factory here. Tanor is a poor ſtraggling place, but the Europeans reſort hither ſometimes on account of the trade: both theſe towns are reckoned to be in the kingdom of Calicut.

Chinſura, more generally known by the name of Dougli, is at the diſtance of about a mile from Chandernagore: the Dutch have a fort here, but no other poſſeſſions whatever, as the territory round it depends on the government of the country.

Hugley is fifty miles to the north of Calcutta: the Engliſh had once a factory here, but removed it to Calcutta. This is a place of very conſiderable traffic, particularly in the article of opium. The Dutch have a factory here, erected in an open place, at a ſmall diſtance from the river. It is defended by a ſtrong fortreſs, and ſurrounded by a very deep ditch.

Saumelpour is celebrated for its precious ſtones, which great numbers of people are employed in ſearching for: theſe are not, as in other places, dug from mines, but found in the ſands of the river. This is a ſmall place.

Bandel was formerly the chief ſeat of the Portugueſe commerce: it is now a factory for the ſale of women to the Moors and Dutch: there are ſome miſerable wretches here, chiefly Portugueſe, who employ themſelves principally in the above ſhocking traffic, and are at the diſtance of about eighty leagues from the mouth of the Ganges.

At Chaligan the Portugueſe once eſtabliſhed a ſort of abſolute or ſovereign power, and formed an alliance with the robbers of different nations who took refuge here, and acknowledged no ſubordination to any prince whatever, not even to their own: the mogul, however, finding them too troubleſome to be borne with, ſent a force againſt them, who totally extirpated them. The town lies in twenty-three degrees north latitude, near the mouth of the moſt eaſterly branch of the Ganges; it has no conſiderable manufacture.

The next ſettlement on the coaſt of Coromandel is Tranquebar, which is claimed by the Danes: it is ſituated in eleven degrees ſixteen minutes north latitude, ſurrounded by a wall, and is about two miles in circumference. It was purchaſed of the king of Tanjore, by the Danes, in 1621.

The ſtreets of this town are wide, and have a brick pavement on the ſides. The houſes of the Danes, and other Europeans, are of brick and ſtone; but with only the ground-floor; thoſe of the Indians are very mean. The Daniſh miſſionaries have a congregation here, which thrives though vigorouſly oppoſed by the Papiſts. They have a ſchool here for youth, who are inſtructed in the Proteſtant faith; alſo a printing-office, and a paper-mill.

The town is ſuppoſed to contain about five thouſand inhabitants; and hath a moſt agreeable proſpect from the ſea. In 1699 it ſtood a ſix months ſiege againſt the king of Tanjore's forces, aſſiſted by the Dutch; but muſt have ſurrendered, had not governor Pitt ſent to its relief a reinforcement of Engliſh from Fort St. George.

The above deſcribed are the chief ſettlements belonging to the Europeans, except the inſular ones, which we ſhall take notice of in our account of the eaſtern iſles: and proceed to give a deſcription of the ſituation and extent of Coromandel, which is bounded by Proper Narſinga on the weſt, Golconda on the north, the bay of Bengal on the eaſt, and Gingi on the ſouth; though Gingi, Tanjore, and Madura are properly enough by ſome reckoned part of the coaſt of Coromandel, theſe making formerly the eaſt part of the kingdom of Biſnagar, and going under the general name of Coromandel before theſe little principalities were erected; and according to this account, the coaſt of Coromandel reaches from cape Comorin, which lies in ſeven degrees, thirty minutes north latitude to Maſſulapatan, the firſt town in Golconda, in ſixteen degrees, thirty minutes, ſo that this coaſt takes up nine degrees of latitude, which allowing for the winding of the ſhores makes a ſea coaſt of at leaſt ſeven hundred miles.

The firſt ſettlements on this coaſt were eſtabliſhed near the ſhore, ſome by dint of force, and others by the conſent of the ſovereigns. The manufactures of Coromandel firſt inſpired the Europeans with the reſolution of ſettling here. Hedges of thorny plants were the firſt boundaries, till, the coloniſts increaſing in power and opulence, fortifications were raiſed for their defence. Almoſt the whole trade of this coaſt is now in the hands of the Europeans; though for ſome time Coromandel was no object of their attention, being ſeparated from Malabar by inacceſſible mountains.

We ſhall conclude this ſection with a particular account of the kingdom of Golconda, which extends two hundred and ſixty miles along the bay of Bengal. It is in the form of a creſcent, and about two hundred miles in the broadeſt part from eaſt to weſt. It has Biſnagar on the ſouth, the mountains of Gata on the weſt, and thoſe of Orixa and Balligate on the north.

This country is famous for its diamond mines, in ſome of which the diamonds lie ſcattered within a few fathoms of the earth's ſurface, and others are diſcovered in a mineral in the rocks more than forty fathoms deep. The workmen dig into the rock, and then, by means of fire, ſoften the ſtone, and ſo proceed till they find the vein, which often runs under the rock two or three furlongs. All the earth is brought out, and, after great care is beſtowed on it, produces ſtones of a conſiderable ſize, and pretty good water, but of different ſhapes.

Near the place where they dig they make a ciſtern about two feet high, and ſix feet over, with a ſmall vent in one of the ſides, about two inches from the bottom, by which it empties itſelf into a little pit made in the earth to receive ſmall ſtones, if by chance any ſhould run through. The vent being ſtopped, they fill the ciſtern they have made with water, ſoaking therein as much of the earth they dig out of the mines, as it can conveniently receive at a time; breaking the clods, picking out the greateſt ſtones, and ſtirring it with ſhovels till the water is all muddy, the gravelly ſtuff falling to the bottom: then they open the vent, letting out the foul water, and ſupplying it with clean, till all the earthy ſubſtance be waſhed away, and none but a gravelly remains at the bottom. Thus they continue waſhing till about ten of the clock before noon, when they take the gravelly ſtuff they have waſhed, and ſpread it on a place made plain and ſmooth like a bowling-alley, for the purpoſe, near the ciſtern; which being ſoon dried by the heat of the ſun, at that time of the day, they very curiouſly look it over, that the ſmalleſt bit of a ſtone can hardly eſcape them. If they find a large ſtone, they deliver it not till they have done work; and then very privately, leſt it ſhould come to the knowledge of the governor of the place, and he require a ſhare, which in the kingdom of Golconda is uſually practiſed, without reſpect to any agreement made with them.

The workmen are obliged to be watched with the utmoſt diligence, leſt they ſhould be tempted to embezzle any of the precious articles which they are employed to ſearch for. One of them was detected in putting a ſmall ſtone into the corner of his eye; and many others have ſwallowed the diamonds.

The principal perſons concerned in this trade, are the Banyan merchants; but both they, and the perſons employed to work the mines are greatly oppreſſed: the firſt affecting to be poor, and the latter being ſo in reality; for the governors do not ſuffer any to be rich, if they know them to be ſo. But in Viſiapour they are more humanely treated.

Thoſe diamonds which exceed the weight of a pagoda, are the king's property; but all of an inferior weight appertain to the merchants. The largeſt diamond ever found was preſented to the mogul, weighing two hundred and ſeventy-nine carats of four grains each.

Maſſulapatan is the chief harbour in the kingdom of Golconda; and the country extends from the gulf Viſiapour: it once formed a part of a very extenſive empire, ſubject to the emperor of Biſnagar, and comprehended nearly the whole of the peninſula, from the northern extremity of Orixa to Cape Comorin.

The city, Golconda, which is about two hundred and thirty-eight miles weſt of Maſſulapatan, and about two hundred north-weſt of Madras, is ſituated in a good ſoil, and ſalubrious air; it has ſtone walls ſurrounded with deep ditches, divided into tombs or ponds of clear water. It has many grand moſques, in which are the tombs of the kings of Golconda. In 1614 about five thouſand houſes were waſhed away, and ſome thouſands of people and cattle periſhed by an inundation.

The town and harbour of Maſſulapatan is ſituated on the north ſide of the river Nagundi, which ſeparates Golconda and Biſnagar, in eighty-one degrees forty minutes eaſt longitude from London, and ſixteen degrees thirty minutes north latitude. Towards the cloſe of the laſt century, it was one of the moſt thriving towns in India, and the moſt advantageous of the Engliſh factories. The Danes, Portugueſe, and Dutch, had alſo factories here, and the cuſtoms amounted to fourteen thouſand pagodas per annum, it being the moſt celebrated mart for callicoes, indigoes, diamonds, and other precious ſtones; and there were about two hundred thouſand inhabitants; it is now, however, only a Dutch factory for chints. It is ſurrounded by a wall and ditch, and over the land ſide is a deep moraſs, with a bridge over it.

The French, under the marquis de Conflans, poſſeſſed themſelves of this city in 1759; but it was taken from them by the Engliſh forces under the command of colonel Forde. The waves, near the bar, are ſo rapid, as to make a noiſe like the cataracts of the Nile, and ſometimes have almoſt as great a fall. The heat here, eſpecially in May, is ſo intenſe, that people dare not ſtir out of their houſes in ſome parts of the day.

Between twenty and thirty miles to the ſouth-weſt of the

the city of Maſſulapatan, is Pettipoly, or Penta-pooli, where the Engliſh have a factory. The printed and dyed ſtuffs of this place are highly eſteemed; and in an iſland oppoſite to it grows a root which makes ſo deep a colour, that it is obliged to be mixed with other colours to make it lively. The Engliſh have alſo a factory about one hundred miles farther ſouth, called Coletore, and the Dutch have a factory called Palicate, ſtill a little farther to the ſouth.

SECT. IV.

Containing an Account of the Genius, Tempers, Perſons, Habits, Food, Diverſions, Roads, &c. of the INDIANS.

THOSE Indians who are Pagans (who are ten times more numerous than the Mahometans their governors) are men of bright parts, and will imitate almoſt any thing at firſt ſight. They are very ſober and abſtemious, never drowning their ſenſes by drunkenneſs and intemperance, extremely obliging, and of a very pretty addreſs, an even compoſed temper, and ſtudiouſly avoiding all manner of contention; but they are generally thought to want courage. I have known ſome of them, however, as brave as the braveſt Europeans; men that would be cut to pieces before they would deſert their poſt, and endure the ſevereſt torture, rather than betray their friend, or the cauſe they were engaged in. But to return to the ingenuity of the Indians: they will copy our pictures ſo nicely, that you can ſcarcely diſtinguiſh the copy from the original. The common people paint thoſe fine chints and callicoes we import from India, and their carpenters will imitate the model of an Engliſh ſhip, as if they had been brought up ſhip-carpenters; and it is amazing to ſee how quick they are at accounts.

They are of a middle ſize, ſeldom corpulent, their features good, but their complexion for the moſt part black; they have long black hair and black eyes; but though the men in the middle of the peninſula are as black as jet, towards the north they are tawny, as well as on the coaſt. The women, in their ſtature, features, ſhape, air and mien, have no rivals; without the advantage of a dancing-maſter, their motion is bewitching, they tread the ground as elegantly as an actreſs does the ſtage. Their cloathing does not prevent their ſhewing the natural ſhape of their bodies; they are neither diſtorted or rendered crooked by ſtrait ſtays, or loſe the true human ſhape in a monſtrous hoop. They have a piece of white callico tied about their waiſts, which reaches to their knees, and the reſt is thrown acroſs their ſhoulders, covering their breaſts, and part of their backs. Their hair is tied up in a roll, and adorned with jewels or toys; they have pendants in their ears and noſes, and ſeveral ſtrings of beads round their necks; they wear bracelets on their wriſts and ancles, and rings on their fingers and toes; they put their bare feet into ſlippers; though the women, in the ſouthern parts, wear neither ſlippers nor ſhoes.

The Indian men wear white veſts, girt about with a ſaſh, in which they have a circe or dagger. Their hair, like the women's, is tied up in a roll, over which they have a ſmall turban. The upper part of their garment is contrived to fit ſo as that the wearer's ſhape may be ſeen. Under this is another ſomewhat ſhorter, and their legs are covered by their breeches: they wear ſlippers piked like women's ſhoes, into which they put their bare feet.

The Moors or Mahometans are well ſhaped: the complexion of theſe in the north is fair; thoſe in the ſouth, tawney; but theſe too have generally black hair and black eyes, and like other Mahometans, ſhave their heads all but one lock on the crown, and wear their beards long: their habit is a veſt and large turban.

The banian caſt, or tribe of Pagans, eat no fleſh or eggs, any more than the bramins (prieſts) antiently called brachmans, but live upon rice, herbs, roots, and fruits. The reſt of the Pagans eat almoſt every thing but beef and fiſh without ſcales. The Moors or Mahometans eat almoſt all fleſh but that of hogs, hares, and ſuch fleſh as the Jews were prohibited to eat. They all ſit croſs-legged, or loll upon mats or carpets at their meals, and waſh before and after. The principal diſh, among both Moors and Pagans, is, pilau, made of fowls or mutton, and rice. The meat, whatever it be, is ſtewed to rags, of which they make a ſtrong ſoup, and ſeaſon it very high. They make a ſtrong ſoup alſo of veniſon, fiſh, and almoſt all manner of fleſh. When the company is ſet down upon a ſopha or raiſed floor, covered with a mat or carpet at the upper end or ſides of the room, a ſervant comes in with a baſon and ewer, and a towel, and every one waſhes his hands; then a large plate, or a leaf of a foot diameter is ſet before every one of the gueſts: after which, other ſervants bring in large brazen or earthen bowls; full of rice, and with a ladle lay a quart or three pints of boiled rice on every man's plate, pouring as much of the ſtrong ſoup upon the rice as will moiſten it, and a little part of the meat is laid on the ſide of the plate. A bottle or cruſe of water, alſo, which is their common liquor, is ſet by every one, of which they drink when they pleaſe, without healths, or taking notice of any of the company. If they are entertained with fiſh, a ſtrong ſoup is made of them, which is called curee, and mixed with the rice. They boil their rice in ſuch a manner, that it is quite dry, not the leaſt drop of water is left in it, and frequently colour it with ſaffron or turmerick. Their ſauces are chiefly pickles, which they call achar, made of green bamboo, or mangoes, and other fruits. And ſoy is another ſauce, which is brought to England, and therefore needs no deſcription here. Abundance of garlic is uſed in all their pickles, eſpecially in their mangoe.

They are remarkably fond of ſmoking tobacco. The poor roll up a leaf of tobacco, about four or five inches long, and, lighting it at one end, ſmoke the other till it is about half exhauſted, and then throw it away.

The Indians have ſeveral kinds of diverſions among them. They ſometimes game for ſmall matters, but not ſo eagerly as the Chineſe, and are ſeldom ſeen out of temper. At a feaſt, the muſic is ſent for, particularly the girls dedicated to the temple, who, having ſung and danced before the company, will retire with any of them, if deſired. Plays are acted by torch-light in the fields, during the fair ſeaſon, when the evening is exceeding ſerene.

Fights of wild beaſts are the diverſion of the court, and the dancing of the cobre capelle, or hooded ſerpents is ſeen in every village. Their keepers bring them in covered baſkets, and beginning to ſing and play on very bad inſtruments, at the uncovering the baſkets ſeven or eight of theſe creatures get up and dance to the ſounds, which hardly deſerve the name of muſic; but if it is diſcontinued ever ſo little, they get out of their baſkets, and hiſs very terribly. However, as ſoon as the muſic begins again, they are reclaimed and fall to dancing as before.

The chief rural ſports of the Indians are hunting and hawking: they ſurround part of the country, and drive the game into a narrow compaſs, and then ſhoot at it: they teach even tygers and leopards, it is ſaid, to take the game, which they do by jumping upon it from buſhes, or other cover, but never run fairly after it. They purchaſe hawks and other birds of prey from Perſia, which are taught to fly at all manner of game, and even at wild beaſts, fixing on the head of the animal, and buffeting him with their wings, while the dogs come up and take him. An ox being taught to ſtand fire, they make the ſame uſe of him as we do of ſtalking horſes, to get near their game. Another diverſion is that of racing; they make the ſame uſe of oxen as we do of horſes.

Having, among other Indian diverſions, mentioned that of the fights of wild beaſts, we ſhall, before we quit the ſubject, deſcribe an entertainment given by the great mogul to foreign ambaſſadors, which is of a very ſingular nature: it conſiſts of wild beaſts of various ſorts fighting with each other, or combated by men, who engage in ſuch dangerous enterprizes in order to obtain the favour of the king. The manner of one of theſe fights, which was exhibited at Agra (when the moguls kept their court there) is thus related.

Two buffaloes were let looſe at each other, and afterwards a lion and a tyger, the two latter of which fought deſperately for ſome time. Theſe being taken away, the governor aroſe, and ſaid, "The great mogul's will and pleaſure is, that if any valiant heroes are diſpoſed to give proofs of their valour, in fighting againſt the wild beaſts with ſhield and ſword, let them come forth; if they conquer, the great mogul will ſhew high favour to them." On this, three perſons entered the liſt, and engaged to undertake the combat; when the governor calling aloud, ſaid, "None muſt fight with any other weapon than ſword and ſhield; thoſe which have a dagger about them, muſt throw it away, and fight fairly." A lion was then driven into the ring, where one of the three ſtood ready to encounter him: the lion immediately ran to him with the greateſt ferocity, but the man defended himſelf a conſiderable time, till his arms growing weary, the lion laid one of his paws on the ſhield, and the other on his arm. The man finding himſelf unable to uſe his ſword, and ſeeing the danger he was in, with his left hand drew out his Indian

dian ſtiletto, and gave the lion ſo violent a ſtab in the th oat, that he immediately let go his hold: after which, he ſevered his body almoſt in two with his ſword, and, purſuing his victory, effectually killed him, when the people ſhouted out, "Thanks be to God, he is conquered." The mogul, however, ſmiling, ſaid to the conqueror, "You are a brave ſoldier, you have fought valiantly; but did not I command you to fight fairly, with ſword and ſhield only? but, like a thief, you have ſtolen the lion's life with a ſtiletto." After this the ſavage tyrant ordered the man's belly to be immediately ripped open, and that his body ſhould be carried on the back of an elephant throughout the city, which ſentence was immediately executed.

Then a tyger was brought to the ring, which was encountered by a very ſtrong man, but the tyger was ſo active, that he ſuddenly leaped on his antagoniſt, and tore him to pieces. A very ſmall perſon then engaged the tyger, and at the firſt encounter cut off both his fore feet, which obliged him to fall; when purſuing his efforts, he ſoon killed him. On this the king, calling to him, aſked his name: to which he anſwered, Geiby. The king hereupon ordered one of his ſervants to carry him a cloth of gold, who, when he delivered it to him, ſaid, "Geiby, receive this coat, which the mogul of his bounty hath ſent." The conqueror received the coat with great humility, kiſſed it ſeven times, and afterwards holding it up, prayed to himſelf for the mogu''s proſperity: which done, he cried aloud, "God grant the mogul to grow as great as Tamerlane, from whom he is derived; may he live ſeven hundred years, and his generation continue for ever!" after he had thus expreſſed himſelf, he was conducted by an eunuch to the king, who, on his going away, ſaid, "Be praiſed, Geiby Chan, for your heroic exploits: this name you ſhall keep for ever; I am your favourable lord, and you my vaſſal."

The Indian roads are not laid out as with us; in the open country, we travel over deep ſands, where there is no track, and through thick woods a way is ſometimes cut; but little or nothing done towards the raiſing or repairing them. At every ten or twelve miles end, however, there is a caravanſera, or choultry, for the convenience of travellers, with a tank, or reſervoir of water, near it, and fire for dreſſing their food; but no inns, inn-keepers, or beds. The traveller takes care to furniſh himſelf with every thing he may have occaſion for on the way, before he ſets out.

A perſon in opulent circumſtances, takes a palanquin, which is a couch covered with an arched canopy, with a mattreſs, quilts, and cuſhions, or pillows to lie on. Then he hires ten cooleys, or chairmen, four of whom carry him at a time; for the palanquin is hung upon a bamboo, or hollow cane, about five or ſix inches diameter, and ten feet long, and is ſo bent in the middle, while it is growing, that it may ſuſtain the arched canopy over it; and a gentleman may ſit upright, or lie at his length, lolling upon the cuſhions, if he pleaſes. As there are but four of the cooleys that carry him at a time, two before, and two behind, laying the ends of the bamboo cane, on which the couch hangs, on their ſhoulders, the reſt are employed in carrying large umbrellas, finely carved and gilded, to ſcreen the ſun from their maſter, morning and evening; (for when the ſun is many degrees above the horizon, the canopy ſcreens him from it); while another cooley bruſhes the flies off his maſter.

In many parts of India where there is any danger of being ſet upon by the mountaineers, they travel in caravans, or large companies of ſeven or eight hundred. For carrying of goods they make uſe of camels, oxen and aſſes; their horſes come from Perſia or Tartary, and are of too great a price to be put to theſe drudgeries, and their own little breed are not very fit for burthens; but what makes the camel of great ſervice in all hot ſandy countries, is, that he will travel ſeveral days without water; oxen are alſo uſed to ride on, as well as for burdens, and they draw both their waggons and hackeries, or coaches with two wheels; inſtead of a ſaddle they lay a ſoft cuſhion on the ox to ſit on, and inſtead of a bridle put a rope through the cartilage which ſeparates the noſtrils, and with this they guide him, they will trot along at a pretty round rate, and ſometimes they run races with them; what they differ from ours in, is, that they have a large bunch of fleſh bigger than a man's double fiſt, that ſtands up between their ſhoulders near ſix inches. The buffalo is as large as the ox, but a more ſluggiſh animal, and therefore uſed only in carrying water from the tanques to their houſes, or to draw in the ſcavengers carts. Their hackeries are ſquare like our coaches, but have no raiſed ſeats to ſit on, however, pillows are laid at the bottom to lean on.

There are no people of any quality but have a ſtable of fine Perſian horſes for their own riding, and our Eaſt-India company keep a ſet of them for the uſe of their factors and ſervants in their principal ſettlements. The mogul and his omrahs have elephants, on which they travel with their women and baggage from place to place; there are not, it is ſaid, leſs than five hundred of theſe that attend the mogul in all marches, beſides a prodigious number of camels and wheel-carriages; their carriages are uſually drawn by eight or ten oxen, and their wheels have no ſpokes, but are only a thick round board.

Travelling in the rainy ſeaſon, is very troubleſome, the flat country being overflowed, and innumerable torrents falling from the mountains, but this does not hinder the common people from taking journies at this time of the year, for they will take water like a ſpaniel, and ſwim with that ſtrength that I never ſaw any of our people able to come near them. I happened to be in the country during the rains, and having two or three broad rivers to croſs which ran very ſwiftly, I truſted myſelf to two of theſe blacks, who took me between them and ſwam croſs the river with one hand with all the eaſe imaginable; and thus the whole company was carried over to the number of twelve or thirteen.

There are no poſts in the country, but all letters and packets over land are diſpatched by meſſengers on purpoſe, who travel on foot with great expedition, and are very reaſonable in their demands.

SECT. V.

Treating of the Natural Hiſtory of INDIA, namely, of the Soil, Produce, Plants, Animals, Minerals, &c.

RICE is the moſt common ſort of grain in that part of India which lies within the tropic of Cancer; further north, they have wheat, barley, peas, and beans. The rice is firſt ſown in beds, where coming up too thick to produce any thing but ſtraw, it is tranſplanted into their fields in June, when the rains begin to fall; for the huſbandman having ploughed and weeded his ground, converts the earth into a kind of hotch-pot with the water as it falls; and the cottagers, with their wives and children, bring the ſpires of rice in baſkets, from the beds where it was firſt ſown, being then about half a foot high, and plant each ſpire or blade of rice in a ſtrait trench, ſupplying it with water as it grows, by little rills or channels, if the rains do not water it for them; but uſually as the rice grows, the floods increaſe in proportion, and the rice is ſupplied with water till near harveſt, which happens in November or December; and by that time the ſun having exhaled all the water, the earth is hardened, the rice is cut, and uſually threſhed out in the field.

This grain grows moſt like oats, the ſtraw is not hollow like that of wheat or barley, but ſtiff and hard, as we may ſee by the whiſks or bruſhes made of it and brought to England. Every grain of rice has a thick brown ſkin upon it, and muſt be well beat in a wooden mortar and ſifted, before it looks of that pure white we ſee it here. And notwithſtanding ſo much pains are taken with it, before it is fit to eat, the price is very low: three-pence will purchaſe enough to feed a family of nine or ten people a whole day, though an Indian will eat three times as much as an European; and this, with a very little fleſh or fiſh, cucumbers, melons, fruit, roots and herbs, are the uſual food the generality of the Indians live upon; they have very little variety, nor do they ſeem to deſire more than they have.

During the rains, and for ſome time after, it is amazing to ſee how faſt all manner of vegetables grow; then green fields, corn, graſs, and flowers, adorn the face of the earth again: the natives rejoice, notwithſtanding the loud thunder they hear every evening, well knowing that the rain it brings with it, is the foundation of all their plenty; but if the rains fail, they have nothing to expect but famine and ſickneſs, having been ſometimes obliged even to ſell ſome of their children to the Eaſt India company, for ſmall quantities of rice; having no other choice, but to part with them to ſave their lives, and preſerve the reſt of the family from periſhing for want of nouriſhment. In this dry ſeaſon the graſs is burnt up, and there is none to be found but ſome rank, ſour ſtuff in the woods. Their fields lie open, except near the towns and villages, where people make ſome little incloſures for their conveniency: and as no man has any property in the land he ſows, the prince's officers take a third, or one half of the crop, or more, as they think fit; and leave the huſbandmen the

reſt. Nor is it left to the huſbandman's choice whether he will ſow or not; for the reſpective governors and generals, having certain towns and villages aſſigned them, to enable them to maintain the quota of troops they are to furniſh, order ſuch a quantity of ground to be marked out for every village to manure, and at harveſt ſend their officers to take as much of the crop as they think fit.

The gardens in India are ſtocked with a great variety of fruit trees; but they are planted in no manner of order, any more than their flowers. Their fruits are mangoes, guavas, pomegranates, ananas or pine-apples, cocoa-nuts, limes, lemons, oranges, and all manner of tropical fruits in the ſouth; and in the north, they have apples, pears, and moſt of the European fruits. Both fruit-trees and foreſt-trees in the ſouth of India are ever-greens, and ſome of their fruit-trees are in bloſſom, and have green and ripe fruit on them at the ſame time. The kitchen garden affords melons, pot-herbs, and roots; pepper grows on the Malabar coaſt, and they have alſo ginger, ſaffron, turmeric, ſugar, cotton and indigo.

The cocoa and cotton-trees are the moſt uſeful in India. The cocoa affords meat, drink, oil, and timber for building; the fibres of the bark make their cordage, the branches cover their houſes, and the leaves ſerve them to write upon; and from the cotton-tree they have their callico, and moſt of their cloathing. The province of Bengal furniſhes them with ſilk and muſlin. The banian tree ſeems peculiar to this country, and deſerves a particular deſcription. The principal body grows to a great bulk, and ſome of its branches ſhoot horizontally from the trunk, and from thoſe branches little twigs ſhoot downwards perpendicularly, and taking root form other bodies, which, like pillars, ſupport the arms they ſprung from; and thus one tree comes to have twenty or thirty bodies, and covers a great ſpace of ground ſufficient to ſhelter a regiment. Neither this, nor any other of the Indian trees are without leaves at any time of the year. It is under theſe trees that the banians and other ſuperſtitious people place their images; and here their hermits voluntarily undergo the ſevereſt penances, condemning themſelves to ſit or lie in one poſture all their lives, rendering themſelves uſeleſs to God and man, by which they hope to merit paradiſe.

The indigo tree or ſhrub, is alſo very valuable: it is about the ſize of a roſe-tree, but has a ſmooth rind. The leaves, when ſtripped off at a proper ſeaſon, are laid together, when a vegetable moiſture exhales from them. They are then immerſed in water, contained in veſſels adapted for the purpoſe. After the water has extracted the blue from the leaves, it is drained off; the ſediment is then expoſed in broad ſhallow veſſels to the ſun-beams, through the heat of which the moiſture evaporates, and the indigo remains in cakes at the bottom of the veſſel.

Oxen are of great uſe, among other Indian animals, either for riding, carrying burthens, or for draft. They are not ſo large but make much more ſpeed than ours, travelling thirty miles a day; and more, chiefly upon a trot; and they have a bunch between their ſhoulders, very convenient for faſtening their pack-ſaddles to; ten thouſand of theſe animals are ſometimes ſeen in a caravan, (which conſiſts of ſeveral hundred or thouſand camels, oxen, or beaſts of burden, loaded with merchandize, and not wheel-carriages) their governors being employed in carrying the proviſions of one province to another, and are ſometimes ſtiled princes, and wear ſtrings of pearl about their necks. The people are divided into four tribes, there being about one hundred thouſand ſouls in each. They live in tents, and have no place they can call their home, encamping on freſh ground almoſt every night, and carrying their wives and children with them. They are attended alſo by their prieſts, and every morning before they ſet out pay their devotion to an idol. One of theſe caravans carries barley, another rice, a third peas and beans, and a fourth ſalt. There are ten or twelve oxen uſually employed in drawing a waggon, and two in drawing a hackery or chaiſe; they feed theſe oxen with barley-dough and graſs when they can get it; but there is little of this to be had in the ſouth of India in the fair ſeaſon, which is the proper time of the year for travelling; camels alſo make part of the caravan, one of which will carry ſeven hundred or eight hundred weight or more; and the dromedaries, which are a ſmaller ſpecies of camels, are as remarkable for their ſwiftneſs as the other for their ſtrength, for they will trot two hundred miles a day. Theſe are alſo fed with balls of barley-dough, or ſome other grain, and are very uſeful in this and other hot countries where water is ſcarce, as they will travel eight or nine days without water; but though they are proper for ſandy deſarts, if they come upon a clay ſoil after any rain is fallen, the caravan is forced to lie ſtill till the ground is dry, the camel having a ſmooth foot, without any hoof, and if he ſlips, he is in danger of being ſpoiled.

There is a great number of elephants produced in India, which being an animal of remarkable ſize and quality, we ſhall here give a particular deſcription of it, as being the largeſt quadruped in the univerſe. It is from twelve to fifteen feet high, and about ſeven broad. Its ſkin, about the belly is ſo tough, that a ſword cannot penetrate it: it is of a darkiſh colour, and very much ſcarified; it has exceeding ſmall eyes, large ears, round and full body, and the back riſes to an arch. On each ſide of its jaws, within the mouth are four teeth, or grinders, and two teeth project outwards: in the male, they bend downwards, and are ſtrongeſt; in the female, they turn upwards and are ſharpeſt; both male and female uſe one which is ſharp, as a defenſive weapon, and the other, which is blunted, to grub up trees and plants for food. The teeth of the male ſometimes grow to the length of ten feet, and have been known to weigh three hundred pounds each. The teeth of the female, though leſs, are the moſt valuable ivory. They naturally ſhed their teeth once in ten years, and bury them carefully in the earth, to prevent, as is imagined, their being found by man. The elephants tongue is ſmall, but broad; their feet are round and ample, the legs have joints which are flexible; the forehead is large, and riſing; the tail reſembles that of a hog; and the blood of this creature is colder than that of any other. But the organ which moſt peculiarly diſtinguiſhes the elephant, is its trunk. This ſingular member is crooked, grilly, and flexible, about ſeven feet in length, and more than three in circumference towards the head: but it gradually diminiſhes to the extremity. At the root, towards the noſe, are two paſſages, the one into the head, the other to the mouth; through the firſt it breathes, and by the latter it receives its proviſions, the trunk ſerving the purpoſes of a hand to feed it and a weapon to defend it. It is ſo ſtrong, that it can lift a prodigious weight; and ſo delicate in the ſenſation of feeling, that it can take the ſmalleſt piece of coin from the ground. They delight much in water, and will ſwim a great way.

The male elephant is ſometimes mad after the female, at which times he is apt to be very miſchievous, and will ſtrike any one he meets with but his keeper, and therefore they are at that ſeaſon chained by the legs to great trees, and if by chance they get looſe, they will overturn any thing in their way; nor is it poſſible to ſtop or divert their rage but by fire-works, which burſting with a loud noiſe will make them ſtand ſtill and tremble: when they are in theſe mad fits they ſweat prodigiouſly, and ſmell much ranker than a goat: it is credibly reported, that an elephant having broke looſe in this rage, and making towards the bazar, or market-place, from whence all people fled as faſt as they could, he came to an herb woman's, that uſed to give him a handful of herbs as he paſſed by, and the woman having run away and left her child upon the ground in her fright, the elephant gently took it up with his trunk, and laid it upon a ſtall, without doing it any hurt, and then proceeded to overturn and do miſchief to every thing that came in his way as before.

The Mogul has five hundred, ſome ſay one thouſand of theſe elephants in his ſervice, which are trained up to war, that will not only ſtand fire, but ſuffer a great gun to be fired off their backs: the gun they carry is about five feet long, and placed upon a ſquare frame of wood, which is faſtened to a broad thick pannel, tied on with ſtrong cords and girths. At the four corners of the frame they plant four ſilk flags, or colours upon little antient-ſtaves. Upon the neck of the elephant ſits the man who guides him, who has an iron rod in his hand about half a yard long, ſharp at the lower end, and a hook turned up, with which he pricks him forward, or pulls him back as he ſees fit. The gunner ſits on the wooden frame, where he has his bullets and ammunition, and all things neceſſary for loading and firing, and the gun carries a ball about as large as a tennis-ball.

Beſides the beaſts of burthen already mentioned, they have buffaloes, and aſſes; the buffaloes differ very little from cows and oxen, but only they are a more ſluggiſh animal, and have a ſmooth thick ſkin, without hair: the female give milk, and the fleſh of them is ſometimes eaten, but it is very coarſe food.

The ſheep they have in the ſouthern parts are thin long legged creatures, and have a reddiſh hair inſtead of wool upon their backs, the fleſh of them is lean and dry, and good for little. But towards Perſia and Tartary they have ver

very fine ſheep with good fleeces, and large tails, weighing ſeveral pounds, and it is obſervable of the Perſian ſheep, which are brought into India, that they have from three to ſeven horns apiece, and ſome of their horns ſtanding upright on their foreheads, the battles of their rams are very bloody. Goats they have here plenty, and the fleſh of their kids are tolerable good eating.

The Indian black hogs, with their bellies down to the ground, are looked upon to be the beſt butchers meat they have in India, eſpecially that of the wild hogs, of which there is great plenty; as there are of deer, antelopes, and hares, in which no body claiming any property, all people are at liberty to kill them as well as other game; for notwithſtanding the Mogul is the proprietor of all the lands in the country, he does not monopolize wild beaſts, and wild fowls, as our great men do here: nay, graſs, and herbs, and trees, and whatever alſo grows ſpontaneouſly in the woods, and wide fields, are enjoyed by the people in common; ſo that though they have no lands they can call their own, the privileges they enjoy in thoſe of the prince are almoſt an equivalent. The lion is the only beaſt of the foreſt, the hunting whereof the Emperor reſerves to himſelf. Their wild beaſts are lions, tygers, leopards, wolves, monkies, and jackalls, which laſt are a kind of wild dogs, of the colour of a fox, and ſomething larger, which run about in companies at midnight, and make a hideous howling, not only in the country, but in the middle of great towns. One or more of theſe, it is ſaid, always attends upon the lion, and hunts his prey for him; the truth is, every creature in the foreſt is ſet in motion by the cries of the jackall, and by their dreadful howling terrify other animals, and make them an eaſy prey to the lion. There are great numbers of them in all parts of the country, as well in thoſe places where there are no lions as where there are: and they will dig a dead corpſe out of the grave, if it be not buried very deep: they are conſtant attendants upon caravans and armies, expecting that death will ſupply them with a feaſt.

Here is great plenty of all kind of poultry, as geeſe, hens, ducks, pigeons, turtle-doves, partridges, quails, peacocks, paroquets, &c. The fleſh of the poultry is generally dry, lean ſtuff, and ſome of them have bones as black as jet, but there is ſcarce any difference in the eating, between thoſe which had white bones and thoſe which had black. The vultures are no where ſo common or ſo tame as in India, which we believe proceeds from the banians feeding them as they do other animals, for the banian tree abovementioned are quite covered with them, nor will they ſtir till a ſhot is fired at them, though the perſon is under the tree; they are conſiderably larger than an eagle, and much of the ſame make. But there is a kite with a white head which the banians have ſtill a greater veneration for, and ſeem to pay it divine honours. It is not an uncommon thing for theſe birds as they are flying at noonday, to be overcome with the intenſe heat of the ſun and drop down in the ſtreets, and upon ſuch an accident our ſoldiers never fail to make ſix-pence or a ſhilling of it, for they carry the kite into the market-place, and threatning to wring his neck off, the ſuperſtitious people croud about him and contribute their half-pence a piece for the bird's liberty. We are informed by a traveller, that they have no great variety of ſinging birds in India, though he was a conſiderable time in the woody part of the country; but there is one leſs than a wren which is exceeding pretty, adorned with the gayeſt plumage, and whoſe notes equal the beſt of ours. The numerous herds of monkeys which haunt the woods in the ſouthern parts of India are terrible enemies to theſe little birds, but nature has taught them to preſerve themſelves and their young ones, by building their neſts at the extremity of the twigs, where they hang like ſmall purſes out of their reach, or in places inacceſſible to their enemies. There are alſo in this country bats almoſt as large as kites.

We may reckon, among other inconveniencies that leſſen the pleaſure of living in this deſirable country, thoſe ſwarms of inſects and reptiles that perpetually diſturb the natives, but much more foreigners, particularly the gnats or muſketoes, as they are called, that are always buzzing about our ears, whoſe ſtings ſwell a man's head and face at his firſt coming a-ſhore, that his friends can hardly know him. The ſtings have not this effect afterwards, indeed, but people can never reſt in quiet for them, unleſs ſome ſlave ſtands by and bruſhes them off, while they ſleep. Bugs are another plague, but theſe may be avoided by tarring the feet of the cot or couch the perſon lies on, for a bug will never crawl over tar, which they have an averſion to, or are ſtopped by their ſticking in it.

Of the ſcorpions there are ſeveral kinds, the wood ſcorpions are ſaid to be black and their ſting mortal. The houſe ſcorpions we cannot well avoid ſeeing often, they are about the length of a man's little finger and as thick, ſhaped almoſt like a lizzard, but carry their tails turned up upon their backs, and at the end of the tail there is a ſting not much bigger than a hornet's, always viſible; a gentleman who had the misfortune to be ſtung, related that for the firſt twelve hours after, the pain was as great as if a red hot iron had been applied to the part, that he run into the ſtreet like a madman, till they laid hold of him and anointed the place with oil of ſcorpion, and that after the firſt twelve hours the pain gradually abated for twelve hours more, till at length it wore quite off.

There is likewiſe a little green ſnake which will dart from tree to tree, where the trees ſtand thick, whence ſome people have given them the appellation of the flying ſerpent.

Snakes alſo will ſometimes get into rooms, or warehouſes, and conceal themſelves, and if you happen to come too near them, will dart themſelves at you and bite. They are dangerous too abroad, if you come near the cover where they conceal themſelves, and few people care to wainſcot, or hang their rooms, leſt this kind of vermin get behind them. Snakes and ſerpents are of various kinds, of which the cobre capelle, or hooded ſerpent, is the moſt beautiful, and his bite is reckoned the moſt dangerous. When he dances to muſic, he opens his head as wide as one's hand, and ſhews a kind of human face. Theſe reptiles are firſt drawn from their holes by means of a muſical inſtrument, ſomewhat like a flagellet; ſo powerfully, as we are well informed, does the muſic operate upon them. The country phyſicians can cure his bite, but they pretend to do it chiefly by a charm; however, they give the patient a medicine and ſing to keep him wake, for, it is ſaid, if he ſleeps, he dies; and the poiſon, we are told, inclines the wounded man to ſleep.

During the rains, frogs and toads do multiply prodigiouſly, and grow to a conſiderable ſize, which has given ſome people occaſion to imagine it rained frogs. Their rats, which they call bandecoots, alſo grow to a very great ſize, three or four times as big as ours, and are ſo impudent that they will hardly give a man the way; but the moſt dangerous of all venomous creatures, are their ſcorpions, centipedes and ſerpents, of which there are various kinds, and as they will harbour and breed in every corner, there is no ſuch thing as being ſecure from them, but by continual ſweeping and bruſhing; and this we preſume is the reaſon that no body has any wainſcot or hangings in their houſes, for here they would certainly make their neſts. The centipede (i. e. hundred feet) takes its name from the great number of legs it has; it is a little creature not much bigger than a gooſe quill, and three or four inches long, but though it is ſo ſmall, its bite is extremely dangerous.

Swarms of ants alſo infeſt many parts of this country; and they are particularly deſtructive to cloaths, furniture, and even buildings.

There is a great variety and quantity of ſea and river-fiſh in India: ſea-fiſh are the cheapeſt food we can eat; among theſe are dolphins, albacores and bonitoes, which are uſually met with a good diſtance from land. The dolphin is much abuſed by our painters, they certainly meant a porpoiſe or ſea-hog, when they drew a dolphin, which is the ſtraiteſt fiſh that ſwims, and has the brighteſt colours, eſpecially while he is alive; but he is dead almoſt as ſoon as he is taken out of the water; however, his colours are then exceeding fine. He may be about a yard long, the fleſh white and well taſted, and ſwims at the rate of eight or nine miles an hour, as does alſo the albacore and bonito. The bonito undoubtedly takes its name from its being highly agreeable to the taſte of the Portugueſe, the firſt Europeans that navigated the Indian ocean, and gave it this name, which in their language, ſignifies delicious. It is a firm, but dry fiſh, and requires a good deal of ſauce to make it palatable. The albacore is nearly of the ſame kind as the bonito, but grows to a much larger ſize; ſome weigh from fifty or ſixty to one hundred pounds, and are ſtill drier eating than the bonito. All theſe purſue the flying fiſh, the latter ſpring out of the water, and fly circularly near half a mile, while their fins, which ſerve them for wings, are dry, and then they drop into the water again, where their enemies, the dolphins, are ready to receive them; they jump out of the water therefore as before, and take another flight as long

as their wings are wet, and this they repeat till they are devoured, or have made their eſcape: whitings, and a fiſh like a bream, but much larger, we eat near the coaſt, and another called the baldpate, having no ſcales on the head or neck. The raven fiſh is alſo good food, which is about a ſpan long, and their rivers and reſervoirs, or ponds, afford carp and eels: The ſhark is the greateſt devourer of any fiſh we meet with at ſea: there are ſome from twelve to twenty feet long. He does not only feed upon fiſh, but will chop off a man's leg at a bite, and is miſchievous when he is taken out of the water. The carpenter therefore ſtands ready with his ax, when he is drawn to the ſide of the ſhip, to cut off his tail, which diſables him from doing hurt. He has ſeveral rows of teeth, according to his age: but as he does not ſwim more than two or three miles an hour, it is eaſy to avoid him. When a bait is thrown out for him, faſtened to a great hook, two or three fiſh, twice the bigneſs of gudgeons, and prettily ſtriped, run before him, and ſmell to the bait, and then return to their maſter again, as if they would inform him if it was proper for him. Then he comes to it, and turning upon his back, takes in the bait, and the motion of the ſhip ſtrikes the hook into his jaws; we may eaſily ſee the whole tranſaction, the ſea being as clear as cryſtal at a diſtance from land. The reaſon he turns upon his back to take the bait, is, that his ſnout, or upper jaw, is ſo much longer than the under jaw, that he cannot take it in without turning upon his back: ſhark's fleſh is very indifferent food, but when beef is wanting, it will go down. The pilot fiſh are looked upon as the niceſt fiſh the ſea produces; they rarely take a hook when in company with a ſhark: but when they part from him, they will ſometimes bite and be caught. Theſe fiſh, which are about a foot and a half in length, are tranſverſely ſtreaked with blue and a kind of yellowiſh brown, which hath a moſt beautiful appearance in the water: they, however, when taken out, loſe much of their luſtre.

There are very good ſhell-fiſh to be met with upon the coaſt of India, ſuch as crabs, oyſters, &c. The oyſters at Fort St. George are much of the ſame ſize as ours in England, and equally good; but there are ſome ſhell-fiſh in thoſe ſeas of a prodigious bulk. There was a ſhell, much of the ſhape of the under ſhell of an oyſter, which ſtood in the fort at Madras, which, when the fiſh was in it, muſt have been a load for a man to carry.

There are amphibious animals, called alligators or crocodiles, in India, eſpecially in the mouth of the Ganges, that are as great devourers of fleſh as the ſharks: they are invited hither by the multitude of dead bodies which are caſt into this river, on which they prey, as they do upon the living when they have an opportunity; it is ſaid they will take in the body of a whole man at once, ſome of them being twenty feet long; they have rather claws than legs, and their backs are armed with impenetrable ſcales. The crocodile will purſue his prey as well by land as water; but then, as his body is of that unreaſonable length, he turns with ſo much difficulty, that a man may eaſily avoid him, if he ſees him. He lies in the ſedge, or other cover by the bank-ſide, and, looking almoſt like an old tree the traveller ſometimes approaches him, not being apprehenſive of his danger, and the monſter jumps upon him and devours him.

There are no mines of gold and ſilver opened in India, though it cannot be ſuppoſed but in ſo vaſt an extent of country there muſt be ſome, though perhaps not worth extracting, eſpecially as there are mines in ſeveral of the neighbouring kingdoms, particularly in Siam, Pegu, &c. Some indeed mention copper, iron, and lead-mines, but if there be ſuch, many of them are not wrought, for lead was formerly one of the beſt commodities the merchants carried to India. The diamond mines are the only remarkable ones: theſe lie chiefly in the provinces of Viſiapour and Golconda, of which notice has been taken already. India has been famous for ſome other valuable jewels, particularly pearls: they fiſh for pearl-oyſters in the ſtreights of Ramanakoiel, between the continent of India and the iſland of Ceylon, which is now in the power of the Dutch.

SECT. VI.

Contains an account of the Indian manufactures, trade, foreign and domeſtic, navigation, ſhipping, &c.

THE Indoſtan merchants, the banians, and ſome others, carry on a prodigious rich trade to Perſia and Arabia, eſpecially from Surat, furniſhing thoſe countries with all the rich merchandize of India, and bringing from thence Perſian carpets, pearl, coffee, and other goods, the produce of thoſe countries, but more treaſure than any thing, which they hire Engliſh and Dutch ſhips to carry to Surat for them, as they are better able to defend theſe rich cargoes againſt pirates than country ſhips are; and this appears to be a conſiderable branch of the company's profits; for they exact an extravagant price for the freight of the goods, as well as paſſengers, which the Indians can afford very well to pay, theſe ſhips being loaden as deep as they can ſwim, their cargoes valued at two hundred thouſand pounds and upwards ſometimes. The company alſo uſually ſend a ſhip upon their own account to Mocha in Arabia, every year, for coffee. Though the Mogul has a ſea-coaſt of two thouſand miles extent, he has ſcarce a ſingle ſea-port, or a ſhip of war to protect the trade of his ſubjects. There are no harbours a ſhip can get into, except Goa, Bombay, and the mouth of the Ganges, which are all poſſeſſed by Europeans. It may truely be ſaid, that though the Mogul's ſubjects are ſome of the richeſt merchants in the world, they have not a ſingle man of war or harbour for their ſecurity, in any part of his dominions. Beſides their traffic by ſea, the Indians having long had a very conſiderable trade by land, by numerous caravans, which travelled to Perſia and Bochara, and from thence to Ruſſia and Tartary, to Trapezond on the Black-ſea, to Aleppo and Smyrna, and to Conſtantinople on the Boſphorus.

The principal manufactories of this kingdom, are ſilk, muſlins, cottons, chints, and callicoes; we import from thence diamonds and other precious ſtones, great quantities of pepper the growth of the Malabar coaſt, ſaltpetre, indigo, cardamums, opium, aſſafœtida, and a great variety of phyſical drugs. The goods carried from Europe thither, are Engliſh broad-cloth, lead, looking-glaſſes, ſword-blades, knives, haberdaſher's wares, gold and ſilver lace, tin-ware, wine, brandy, beer, and ſome other proviſions, taken off chiefly by our own factories; the ſhips alſo frequently take in flints with their ballaſt, for there is not a flint to be found in India, at leaſt in thoſe parts the Europeans have viſited, inſomuch that a bag of gun-flints is almoſt as valuable as money in the inland country, where the people had not an opportunity of being ſupplied by our ſhipping; but it muſt be confeſſed, that all the goods we carry to India are a trifle, compared with the bullion and foreign coin tranſported thither. Our ſhips are in a manner empty of merchandiſe when they go out, though there is hardly any of them carry leſs than three or fourſcore thouſand pounds of treaſure, which has made it a queſtion, whether the India trade be of any advantage to this nation.

Weaving is the principal employment throughout India; but the greateſt manufactory is at Daca in Bengal, where the fineſt callicoes, muſlins, and dimities are made. Thoſe manufactured for the immediate uſe of the Great Mogul and his zanannahs, are of exquiſite workmanſhip, and oftentimes greater value than any that are permitted to be ſold either to natives or foreigners. The filligrane are admirable, the workmanſhip coſting a great deal more than the metal itſelf. It is not perforated as with us, but cut with ſhreds, and joined with ſuch inimitable art, that the niceſt eye cannot perceive the juncture. The embroidery and needle-work are greatly ſuperior to any thing of the kind done in Europe; but it is remarkable, that there are no female embroiderers or ſempſtreſſes, but the men do all the work in theſe branches, and their patience is aſtoniſhing as their ſlowneſs is ſingular. Gold and ſilver ſilks and gauſes are manufactured at Benaras; but their richneſs exceeds their elegance. They are executed without taſte, and make a very dull appearance when finiſhed, being deſtitute of that delightful gloſs, and thoſe vivid colours, which ſo greatly enliven, and give ſuch ſpirit and beauty to the ſilks and gauſes of Europe and other countries.

It has been eſtimated that there have been annually exported three thouſand five hundred bales of callicoes from Coromandel to the ſeveral ſea-ports of India; of theſe the Engliſh carry one thouſand two hundred to Bombay, Malabar, Sumatra, and the Philippine iſles; the French eight hundred to Malabar, Mocha, and the iſle of France; and the Dutch one thouſand five hundred to their ſeveral ſettlements; Coromandel ſupplies Europe with nine thouſand five hundred bales; three thouſand of which are brought by the Engliſh; three thouſand by the Dutch; two thouſand five hundred by the French; and eight hundred by the Danes.

The Indians copy with exactneſs, but have neither genius to invent, nor ingenuity to improve. Hence their works

works are admirably neat, without being pleasingly elegant; and display the most exquisite fineness, without the least delicacy of taste to give them real merit.

They are, at Surat, very skilful in the art of ship-building; though it must be acknowledged, that their naval, as well as their other architecture, is rather awkward and clumsy. Their vessels are made of a wood called beak, which is as durable and as solid as oak, and their masts come from the coast of Malabar. Their ropes are made of the fibres of the cocoa-nut tree, and their sail-cloths from their cotton manufactures. They use the gum of the damar-tree for pitch; and their anchors are for the most part European: the most valuable of their cordage also is the produce of Europe. The small vessels that are used along the coast of Malabar, are made of the above wood, the planks being fastened together with cords; they are flat at the bottom, and have not any rudder.

The Indians use a kind of float (for it can neither be called a boat or vessel), which they find is of great use in carrying anchors, great guns, and other heavy weights on board a ship, and that is nothing more than three rough timber logs tied together called a cattamaran, on which they sometimes set up a sail, and at others paddle along with a flat stick, about as broad as a man's hand. They go out upon these three or four miles to sea a fishing; and one hundred of them are frequently seen on a line. On one of these cattamarans, an English officer, by setting up a sail, has gone one hundred miles along the coast in the fair season; and there seems to be no less danger on these than in in a boat, because the timber will not sink. All the difficulty is, to get through the surf that beats on the shore when the winds blow hard. In such weather the sea has sometimes overset the cattamaran, and consequently beat off the waterman; but he turned his logs, again got upon them, and made his way through the surf to the ship he was sent to, which was at that time in great distress, and to the relief of which he was sent.

SECT. VII.

Treating of the learning, languages, characters, arts and sciences, physicians, diseases, &c. of the Indians.

IT is the general opinion, that the sciences originated in this country, the Greeks having travelled into India for instruction before the time of Pythagoras; however, at present they have not much learning, but have some traditions concerning Aristotle and Avicenna (the latter was born at Samarcand, Tamerlane's capital) and the Moors have some passages of the Old Testament in the Arabian language; the Moors, many of them, being descendants of the Arabians.

The Gentoos, or original Indians, begin the year the first of March, and the Moors the tenth, when it is supposed the sun enters into Aries (the vernal equinox) the year being divided by the Moors into thirteen moons. From the first of March to the tenth, the Moors celebrate a grand festival to introduce the new year, and then every governor and great officer makes a present to his prince, who appoints what posts every man shall hold the following year.

The Indians are better versed in the practice of arithmetic than in any other branch of the mathematics, and will cast up a sum only by the help of their fingers, sooner than an European shall with his pen. The bramins calculate an eclipse pretty exactly, but seem to be very much out in other parts of astronomy, when they imagine the moon to be above the sun, the contrary being easily demonstrated in an eclipse; and what is still more absurd, they believe, when the sun sets, that he hides himself behind some mountain, having no notion of the earth's being spherical. They know the signs of the zodiac, however, and in their language call them by the same names we do. But astrology is their beloved study; none of their princes will undertake any thing of moment, until they have enquired of the astrologer, if the hour be fortunate; and if he be of opinion the time the prince designed to begin the enterprize is not favourable, he waits till the cunning-man directs him to begin it, and sets out that very moment.

Their skill in physic is not very great, understanding nothing of anatomy; however they use simples, and apply them with success, and have secret recipes which they do not communicate. In several distempers abstinence is only prescribed, and they seldom eat any thing but a little congee or gruel made of rice, till they find themselves better.

The mort-de-chin rages sometimes on the coast of Malabar: it proceeds from indigestion, and throws the patient into a violent vomiting and purging, with racking pains, which sometimes carry them off in twenty-four hours, is cured by clapping a red hot iron to the sole of the foot, near the heel; and it is said that the cholic is frequently cured by heating an iron ring red hot, about an inch thick, and an inch and a half diameter, and applying it to the patient's belly, so that the navel may be in the center of it; it may be taken off again immediately, but the sudden revolution it causes in the belly, it is said, will soon ease the patient of his pain.

The Indians are also subject to the bloody flux, which they cure by the prescription of stewed rice. The plague also frequently visits them, for which they seem to have no remedy.

The language of the Moors is different from that of the antient original Indians, but, however, they have borrowed the Indian characters, being destitute of letters themselves, and in all their writings use either the characters of the Pagan Indians, or of the Persians. The court language is the Persian, which is spoke by all the great omrahs, and the polite world in general: the learned language is the Arabian, and is written backwards from the right hand to the left, like the Hebrew, from whence they borrow many words; but this is still to be understood of the Moors; for the antient Indians have a great variety of other languages, very different from those used by the Moors. The bramins, or brachmans, which is the chief sect among the idolators, have a language peculiar to themselves, and in that their records, and books of divinity, and philosophy, and the fables of their priests are written, wherein their ignorance in the creation of the world, and the duration of it, are sufficiently manifest.

Indostan, incorporated with many Persian and Arabic words, is spoken in that and several other parts of India, though the accent and dialect differ in the respective places where it is spoken; the purest is in the province of Agra.

The Pagans generally write on the cocoa-nut or palm-tree leaves, with an iron stile or bodkin. They do not write in a straight line downwards, as the Chinese, but from the left hand, slanting to the right; and though in most places the long narrow palm leaves and bodkin are used, yet the Moors have a thin shining paper, sometimes ten feet in length and a foot broad, and they tack as many sheets together as the writing requires; the pen they write with is the antient calamus, or reed, about the thickness of a goose quill. When they write to a prince, the whole surface of the paper is gilt with gold, and for security of letters of consequence sent to court, they are inclosed in a hollow cane or bamboo, and sealed up, that no wet can hurt them. Upon their seals, or chops as they are called, they have no coat of arms, there being no such thing in the country, but they have their own names engraved upon gold or silver, or perhaps on a cornelian stone.

The antient Indian medals, in such esteem among the Chinese, proves that the arts were cultivated in India even before they were known in China. We owe to them the use of cyphers, which, though imported among us by the Arabians, came originally from India, where also the game of chess was invented.

SECT. VIII.

Of the Mogul's court, forces, revenues, &c. of his civil government, laws and punishments, coins, weights, measures, &c.

AS the Mogul has no council of state to advise with, like other princes, the affairs of the empire are managed by four or five great officers who receive their orders from him, and report the state of the several provinces to him. As the Emperor gives a particular name to every officer he advances, so he always takes a new magnificent title himself on his accession to the throne, as, "the conqueror of the world; the ornament of the throne," and the like. But coronations are not known in this part of the world, nor does the prince ever wear a crown. He sits himself as judge of all criminal matters in the province where the court resides, as his governors do in their respective provinces. The Emperor's sons have the title of sultans, and his daughters of sultanas, and the viceroys that of nabob. The next in degree which answers to our nobility, have the title of chan, or caun, as it is pronounced, and are distinguished by the names they receive upon their advancement, as asaph chan, the rich lord; chan-channa, lord of lords. One of the Moguls, it seems, gave his

Ceremony of WEIGHING *the* GREAT MOGUL

On his Birth Day In the Royal Pavilion.

his chief phyſician the name of mocrib chan, or lord of his health, and theſe names are uſually expreſſive of ſome peculiar excellency, ſuppoſed to be in the perſon preferred. The great military officers are called omrahs, and one who has been general, mirza. The chief eunuchs are treaſurers, ſtewards and comptrollers of the houſhold. His other great officers are the ſecretaries of ſtate, the governors of the elephants, the maſter of the tents, and the keepers of the wardrobe, who are entruſted with the jewels.

The ladies of the haram or ſeraglio, as it is uſually called, are either wives or concubines, princeſſes of the blood, governantes, or ſlaves. Thoſe which are called wives, and are contracted with ceremony, ſeldom exceed four, what the number of the concubines are is uncertain; but it is generally agreed they amount to above a thouſand. The Mogul never matches with the daughter of any foreign prince, but uſually with the daughter of ſome great raja of his own country, notwithſtanding they are idolaters; ſometimes he will advance the meaneſt ſlave to that dignity, if ſhe pleaſe him, and the firſt ſon he has by any of theſe wives, is looked upon to be heir to the empire; though the longeſt ſword uſually carries it, and whoever poſſeſſes himſelf of the throne, immediately deſtroys all his brothers, and their male iſſue. But what is very obſervable, is, that we never hear of above one ſon of any one wife, that ever comes to man's eſtate, which has given occaſion to ſome to conjecture that the reſt are diſpatched as ſoon as they are born. The Emperor always gives ſome fine names to his wives, as he does to his great officers, one was called the light of the world; another the crown of the mahal, &c. Their apartments are ſaid to be extravagantly fine, and their gardens beautiful, ſhades, rivulets, caſcades, and grottos, render thoſe abodes ſo cool and refreſhing, that the heat of the climate is not perceived.

The young ſultans are married when about thirteen or fourteen years of age, and then have a ſeparate court, little inferior to that of the Emperor's; and when they come to age are ſent to diſtant governments, except the heir apparent to the crown, who remains near his father. The young ſultaneſſes are bred up with all the tenderneſs and ſoftneſs imaginable, and are not under ſo ſtrict a reſtraint as the other women, and there do not want inſtances of the Emperor's indulging them in their gallantries, which is the more reaſonable, becauſe the royal blood muſt never match with, and be under the controul of a ſubject. The number of jewels and precious ſtones, which it is ſaid the ladies of the ſeraglio wear, exceeds all belief. Their clothes are as thin and light as poſſible, ſuitable to the heat of the climate. A certain author tells us, that the ſilk they wear is wove ſo very fine, that the whole habit weighs but a few ounces, and that their linen is tranſparent. The governantes of the young princeſſes, and thoſe who are ſpies upon the conduct of the King's women, are a conſiderable body in the ſeraglio; and it is ſaid, have a great ſhare in the government of the empire: if this Prince has any council, it is compoſed of theſe ladies, for it is by their influences the great offices of ſtate, and governments are diſpoſed of, and every one of them have a title anſwerable to ſome great office. One is ſtyled prime miniſter, another ſecretary of ſtate, another viceroy of this or that province; and each lady maintains a correſpondence with the miniſter, whoſe title ſhe bears, and there are eunuchs perpetually carrying letters backwards and forwards between them. By the interpoſition of theſe ladies all buſineſs of conſequence is effected, who have better opportunities of repreſenting things to the Emperor, than his miniſters have without doors. The Mogul is ſerved altogether by women in his retirement; and it is ſaid his perſon is guarded by a number of Tartar women armed with bows and ſcymetars, a multitude of eunuchs alſo guard the gates, and all the avenues to the palace.

The Mogul's forces are computed at about three hundred thouſand in the whole empire; but beſides theſe, there are the forces of the rajahs, or Pagan princes, whom the Mogul has alſo in his pay, which may amount to as many more. But, beſides the troops already mentioned, the Emperor has ſeveral companies and regiments, which may properly be called the body guards or troops of the houſhold; firſt there is a regiment of four thouſand men, called the Emperor's ſlaves, to expreſs their devotion for the perſon of their Prince. This is the moſt honourable body among the Mogul's troops; their captain is called the daroga, who is an officer of great authority, to whom the command of the army is ſometimes committed. Every ſoldier who is admitted into this battalion is marked in the forehead, and out of theſe the menſebdars or ſubaltern officers are taken, who by degrees are preferred to the dignity of omrahs, which anſwers to our general officers. There are alſo the guards of the golden mace, of the ſilver mace, and the iron mace, who carry a club or mace on their ſhoulders, with a large ball or globe at the end plated over; the ſoldiers whereof are differently marked in the forehead; and their pay is proportioned to the metal with which the mace is covered. All theſe bodies are picked men, whom their courage has recommended; and it is neceſſary to have ſerved in one of theſe battalions to be qualified for a poſt in the government.

The arms of a horſeman are a broad ſword bending a little backward, a dagger, a bow and a quiver of arrows, a lance, and ſometimes a ſhort piece like a carbine, and to this is added a great ſhield, ſo that they are really incumbred with arms. A footman carries alſo a ſword and dagger, a ſhield, a bow and arrows, and ſometimes a match-lock muſket, and others of them carry pikes inſtead of muſkets: they have alſo heavy artillery, but are generally obliged to European gunners to manage them; ſome ſhort pieces I have already mentioned, which carry a bullet about as big as a tennis ball, and are fired from the back of an elephant; there are alſo about threeſcore ſmall field pieces which attend the grand army.

Here it may be proper to obſerve the manner in which the Indians encamp and draw up their men when they engage. It has been obſerved already, that the Mogul takes the field during the fair ſeaſon, which laſts ſeveral months, and makes a tour through great part of his dominions, being followed by all ſorts of people; tradeſmen and mechanics, as well as by the ladies, and the reſt of the court, there being ſeldom leſs than one million of ſouls attending him, of which one hundred thouſand are ſoldiers.

The camp is always diſpoſed in a circular form; the Mogul's pavilion being pitched on an eminence in the middle, is ſurrounded by the tents of the court-ladies, about which there is a fence ten feet high, which folds up like a ſcreen. Beyond this incloſure, is another circle of the nobility and great officers of ſtate, and ſo on, the meaneſt people being in that part of the camp, at the greateſt diſtance from the royal pavilion in the center; and there is a market-place well repleniſhed with proviſions in every quarter. In drawing up an army, every general commands his own men, and the moſt honourable place is in the center where the general takes his poſt, that he may be witneſs of the bravery of his troops. They know little of rank and file, or any other order in charging, but every man advances as his natural courage or opium inſpires him. There are not leſs than twenty thouſand or thirty thouſand carriers that conſtantly attend the army, and bring corn, fleſh, ſalt, and all other neceſſaries to the camp. They ſeldom march more than ten miles a day, and always chuſe to pitch their tents, where they may be ſupplied with water. There are a great number of boats alſo laid upon carriages, and drawn after the army for the conveniency of paſſing rivers: leopards, dogs, hawks, and their keepers, make part of the train; theſe expeditions being intended for pleaſure as well as buſineſs. The Mogul ſpends part of his time in hearing and redreſſing the grievances of his ſubjects that live at a diſtance from the capital of his dominions, and the reſt in hawking, hunting, and other ſports; and before the rains begin to fall, this vaſt multitude retire into the towns, which during the fair ſeaſon are almoſt deſerted.

The revenues of the Mogul ariſe from the product of the ground, the labours of the people, the cuſtoms of the ſea-ports, the eſtates of great men which devolve on the crown by their deaths, and preſents from the ſubjects, who never approach their prince or governor empty handed. The viceroy of every province, it is ſaid, is obliged to anſwer the crown ſuch a certain ſum, which he raiſes out of the manufactures and the product of the ſoil: this part of the revenue therefore may eaſily be computed; and Manouchi, who reſided in the Mogul's court forty years, makes theſe alone amount to three hundred eighty ſeven millions one hundred and ninety four thouſand rupees, which he reckons to be of the value of half a crown, but the juſt value is two ſhillings and three-pence, and then the annual revenue of the provinces may be reckoned to be between forty and fifty millions ſterling; and much the greateſt part of the troops being maintained by the reſpective omrahs and rajas, this may be looked upon alſo as a conſiderable addition to the revenue, it ſaving the crown a prodigious expence. The rajas alſo many of them yield a yearly tribute, but then as many of them receive large penſions, one perhaps may balance the other; but the wealth he poſſeſſes himſelf of when any of his viceroys or rich governors die, and the daily preſents he receives from

his ſubjects, muſt amount to an immenſe ſum; the diamond mines alſo are an inexhauſtible treaſure.

So extenſive and deſpotic is the authority of the Great Mogul, that the lives and fortunes of his ſubjects are intirely at his diſpoſal. Civil ſlavery hath here been added to political: and the oppreſſed ſubject has no law to protect him. Here a man ſcarce dare to think; deſpotiſm debars every faculty, and ſtifles every kind ſentiment of the ſoul. The ſubject is neither maſter of his underſtanding, his talents, his life, or property; the will of the Prince being the only law of his ſubjects. When the ſun riſes, the Emperor of Indoſtan ſometimes appears at a window, when all the great men of his court are obliged to attend in his apartments to do him homage. At ſun-ſet he alſo appears at a window, and receives the acclamations of the people. No perſon muſt preſume to enter the imperial palace, except the rajas and great officers, who pay a moſt profound reverence to the Emperor, and proſtrate themſelves when they depart from him.

The principal officers of his empire are, the prime viſir, the firſt ſecretary of ſtate, the treaſurer, the chief of the eunuchs, the general of the elephants, and the maſter of the wardrobe.

When the great Mogul appears in public, no pomp, magnificence, or luxury can be compared to the oſtentatious brilliancy exhibited at that time. He ſits upon a throne of gold glittering with precious ſtones: the throne and monarch are both upon the back of an elephant; which elevation gives the Emperor ſuch an air of grandeur, as muſt ſurpaſs the conception of any European who has not ſeen him. As the elephant moves ſlowly on, the people fall proſtrate before their reverend and mighty Prince. Thus, he ſupports his deſpotic authority, by dazzling the eyes of his ſlaves, and ſtriking them with terror. On his ſhield are diamonds and rubies; on his head a gaudy turban; and on his neck, a rich chain of pearls. Beſides a ſword, he has a quiver of arrows; and on the right and left hand ſide of him hang rubies or diamonds: he holds a ſtaff in his hand, adorned with drilled diamonds. He has rich bracelets on his wriſts, as well as above his elbows; and on his fingers are coſtly rings.

The Mogul, when he marches at the head of his troops, is attended by about one hundred elephants, richly capariſoned, and ten or twelve thouſand men. In the centre either on an elephant, or a fine Perſian horſe, rides the Emperor. He is ſeated in a covered chariot drawn by oxen, when he goes into the country.

The four principal ſecretaries of ſtate are, 1. The bagſchi, who has the care of the army. 2. The adelet who ſuperintends the miniſters. 3. The divan, who divides the land to the officers of provinces, and inſpects their conduct. 4. The caſaumon, or high treaſurer, who every week lays the accounts of the provinces before the Emperor.

The Mogul is above ſending any ambaſſador to a foreign court, looking upon the reſt of the princes of the world to be much inferior to him; neither does he treat ambaſſadors as repreſentatives of their prince, but as common meſſengers. The Mogul's letters and orders are received with as much reverence as if he himſelf was preſent, for the governor to whom they are ſent, having intelligence they are upon the road, rides out with all his officers to meet the pattamar, or meſſenger, who brings them: he no ſooner ſees the packet, but he alights from his horſe and falls down on his face to the earth, then he takes them from the meſſenger and lays them on his head, whereon he binds them faſt, and returning back to the court where he uſually diſpatches buſineſs, he reads them, and returns an anſwer without delay.

The following account will afford ſome idea of the adminiſtration of juſtice in India. When the Great Mogul himſelf holds a divan or public court, he is ſeated on the muſtnud, which is a kind of ſtage elevated to the height of about two feet, covered with a ſuperb cloth, embroidered and fringed with gold. In the centre of the muſtnud is placed an oblong plate of ſilver gilded, turned up at the edges, and reſembling a tea-board, upon which the conqueror of the world (as the Mogul ſtyles himſelf) ſits croſs-legged like a taylor. His officers ſurround him, his courtiers flatter him, and the unfortunate petition him. On the latter occaſion the petitioner is obliged to leave his ſlippers on the outſide of the door, and advance barefooted in token of humility; he then makes three ſalams, or ſalutes, to expreſs his profound veneration, bows his forehead to the ground, and preſents his petition, together with a purſe of gold, as the one would be uſeleſs without the other, for the firſt only contains a detail of grievances, but the latter is filled with the moſt perſuaſive eloquence. The petitioner on giving the paper or purſe, uſually ſays, "Read this my petition; the day will come when all petitions ſhall be read." If the Mogul does not chuſe to receive the petition, he frowns and turns away his head; but if the petitioner finds favour in his ſight, that is, if the bribe is ſufficiently large, and the miniſters have been previouſly well feed, he ſmiles and gives a gracious nod of approbation. The Mogul does not, however, always redreſs the grievance when he receives the memorial and its golden attendant, but is frequently ſo charmed with the rhetoric of the latter, that he puts the object of oppreſſion to the trouble and expence of repeating the former. Such is the equity of this country, where avarice is the leading principle, and the judge himſelf is even a ſtranger to every juſt and tender ſentiment.

There are no written laws in the empire; however certain puniſhments are uſually inflicted on certain crimes, as murder and theft are puniſhed by death, but the manner of the execution is entirely in the breaſt of the prince or his viceroy. They never ſuffer malefactors to lie above a night in priſon, and very often not at all, for if the offender be apprehended in the day time, he is immediately brought before the governor and either acquitted or condemned, and from judgment he is hurried to his execution, which is uſually done in the bazar or market-place; ſome malefactors are hanged, others beheaded, ſome impaled on ſharp ſtakes, ſome torn in pieces by wild beaſts or killed by elephants, and others bitten by ſnakes. If an elephant be commanded to diſpatch a criminal immediately, he ſtamps upon the wretch who lies trembling before him, with his broad round foot, and cruſhes him to death in a moment; if it be intended he ſhould feel his death and die in torture, the elephant breaks firſt the bones of his legs, then his thighs and arms, and leaves him to die by the wounds he has given him. Sir Thomas Roe relates, that when he was at the Mogul's court, a hundred thieves were brought chained before the Mogul with their accuſation, and the Mogul immediately ordered them to be carried away, the chief of them to be torn in pieces by dogs, and the reſt to be put to death in the ordinary way; accordingly the priſoners were divided into ſeveral quarters of the town, the chief of them was torn to pieces by twelve dogs before the ambaſſador's houſe, and thirteen of his fellows at the ſame place, had their heads tied down to their feet, and their necks being chopped half off with a ſword, they were left naked and bloody in the ſtreets, where they became a great annoyance to the neighbourhood.

The Mogul expects preſents not only from all his ſubjects whenever they addreſs him, but from ambaſſadors and foreign miniſters; and ſuitable to their preſents, generally is their reception.

The coins we meet with in this country are the pice or caſh which are copper, and about the value of a half-penny; fanams, a ſilver coin of the value of three-pence; the rupee, another ſilver coin, two ſhillings and three-pence; the gold moor or rupee, which is about the value of fourteen ſilver rupees, and the pagoda, ſo called from having the figure of a pagoda ſtamped upon it, is of the value of nine ſhillings; the laſt are coined chiefly by the rajas or petty princes, they are flat on one ſide and the other is convex. The gold and ſilver coins are finer here than in any other country. Foreigners have their mints, and coin both gold and ſilver, particularly the Engliſh at Fort St. George; foreign coins alſo are current in this country, but there is not much of this; for little matters they ſometimes uſe bitter almonds, or ſea ſhells called black-a-moor's teeth, ſixty whereof are about the value of a half-penny. Whatever foreign coin falls into the hands of the Mogul's governors is melted down into rupees, with the characters of the reigning Emperor, and after his death, it abates in the value a half-penny or penny, on account of wear, as they pretend, and only the new coin paſſes at the full value.

Great ſums are reckoned by lacks, carons, and arabs. A lack is a hundred thouſand rupees. A caron or carol, as ſome call it, is a hundred lacks, and an arab is ten carons. They make a three-fold diviſion of intereſt; one of which is vice, another neither vice nor virtue; and a third virtue; this is their manner of expreſſion. The intereſt that is vice, is four per cent a month; and the intereſt that is virtue, one.

At Surat corn and rice and other commodities which are ſold with us by hollow meaſure, are there ſold by weight, the common weight at Surat is the ſeer, about one thouſand three hundred and three pounds; ſilks and callicoes are ſold by the pieces or by the cobit, which contains twenty-ſeven inches.

The croſs by which they meaſure their roads is alſo very uncertain, near the coaſts it is about an Engliſh mile and an half, but farther up in the country, and particularly about Brampour, it is near two Engliſh miles.

In liquid and dry meaſures, one meaſure is a pint and a half; eight meaſures are one mercall, or twelve pints; and four hundred mercalls are one garſe, or ſix hundred gallons.

SECT. IX.

Contains an account of the religions, profeſſed in the empire of the Great Mogul, and the ſectaries or tribes into which they are divided.

IDOLATRY is the religion of the Pagan inhabitants of Indoſtan, who are much the moſt numerous. Theſe are divided into upwards of ſixty caſts or tribes, that will not marry, or eat and drink with one another; and, as I apprehend, every caſt is of a different trade or profeſſion. The chief of theſe tribes, which is eſteemed the moſt noble, is that of the bramins or brachmans, who are their prieſts; and theſe are divided again, 1. Into thoſe that eat no fleſh. 2. Thoſe that eat ſome kind of fleſh, and refuſe others. 3. Thoſe that marry. 4. Thoſe that vow celibacy, and will not ſo much as look upon a woman; and, 5. The bramins that forbear walking at all, leſt they ſhould deſtroy ſome living creatures; theſe wear a piece of ſilk or muſlin before their mouths, that they may not draw in a fly with their breath. Neither will they burn any wood, leſt they ſhould kill ſome inſect, and carry a bruſh always in their hands to ſweep the place they deſign to ſit on, leſt they ſhould diſlodge the ſoul of ſome animal; and ſome relate they avoid marrying for fear they ſhould deſtroy ſome animal by their embraces. Theſe bramins are prieſts of every ſect, and are eſteemed not only the moſt noble, but the moſt learned of the Indian tribes, having a language peculiar to themſelves, in which their divinity and rule of life is written; and according to their tradition, it was given them by Brama, their lawgiver, great part of which they repeat extempore to their followers. They hold there is but one God infinitely perfect, who has exiſted from all eternity, but that there are three ſubordinate deities, namely, Brama, whom he veſted with the power of creation; Whiſtnow, the preſerver, and Routeren, the enemy and deſtroyer of mankind.

The Indians believe, that the images they worſhip were once holy men upon earth, and are mediators for them to the ſupreme God in heaven; and they have ſome traditions of the creation and of the flood; but theſe are mixed with many fables: As that Brama made a great number of worlds, at leaſt fourteen; that the world we live in has continued ſeveral hundred thouſand years, and that it has ſtill four hundred thouſand years to come: that their god Mahadeu has appeared ſeveral times on earth, under different forms. One of the images of him has four heads, and four arms; another, called Whiſtnow, has the head of a hog with tuſks, and the body of a man; another is part man and part fiſh; a fourth has ten heads and twenty hands, and ſeveral other monſtrous figures we find adored in India.

A pre-exiſtent ſtate ſeems firmly believed by the bramins, and that ſome are rewarded and others puniſhed here for what they have done in another world; they believe alſo that this is a ſtate of trial, and we ſhall be dealt with in another life according to our behaviour here. The bramins adviſe their followers to go in pilgrimage, to certain places eſteemed holy, and eſpecially to the pagodas near the mouths of the Ganges; the waſhing in that river alone will cleanſe them from a multitude of ſins, in the opinion of moſt Indians; but however erroneous their creed may be in ſome reſpects, they are much to be commended for the moral duties they teach, namely, temperance, juſtice, and humanity. A certain Proteſtant divine relates, that a bramin aſſured him, that they acknowledged one ſupreme God; and when they repreſented him as having a thouſand eyes, and as many hands and feet, they only intended to teach their people that he is almighty and omniſcient, to induce them to be very exact in the performance of all moral duties.

The moſt honourable tribe or caſt next to the bramins, is the rajapute, or raſboot; and this is the only fighting tribe, making arms their profeſſion. Theſe have ſome of the ſuperſtitions of the bramins, but are not quite ſo ſcrupulous; they will eat the fleſh of moſt animals, except that of neat cattle, and ſome other beaſts they worſhip. The banians are the third tribe in honour, and the moſt tender of the lives of animals of any of them. They do not only prohibit the killing of them, but ſtudy all ways for their preſervation, which proceeds from their favourite doctrine of tranſmigration, believing that every creature is animated by a human ſoul, and is noble or ignoble, according to their behaviour in a pre-exiſtent ſtate.

The begging friars among the Pagans are called ſaquirs, and of theſe there are great numbers: they make vows of poverty and celibacy; but their vows of poverty are ſo far from depriving them of food, that their profeſſion is the moſt effectual means to be provided for. They are almoſt naked, letting their hair hang down to their middles, powdering it with aſhes; and the relieving them is eſteemed a very meritorious act; but though theſe gentlemen appear to the world to be extremely mortified, they are ſometimes very merry among themſelves. There is alſo an order of mendicant ſtrollers among the Mahometans, who vow poverty and celibacy; but theſe rather command than aſk charity, and if denied, plunder the villages they march through.

Beſides the ſects already mentioned, there is another called gaurs, who fled hither from Perſia, when the Mahometans made themſelves maſters of that country. Theſe are deſcended from the ancient Perſians, who worſhipped the ſun and fire: they adore God the creator of the world, but have a tradition, that Zertooſt, or Zoroaſter, their lawgiver ſome thouſand years ſince, brought fire from heaven and commanded his diſciples to worſhip it. The extinguiſhing the holy fire, which has been kept continually burning ever ſince in their eggarees or temples, is accounted a great ſin; and they do not reckon the putting out any other fire a much leſs crime. The cock is adored by them with as much devotion as the cow is by the banians. They abſtain from eating beef and pork at Surat, in compliance with the cuſtom of the country; the Pagans of India forbearing to kill the one, which they hold ſacred; and the Moors abominating the other, looking on themſelves to be polluted by the touch of any man that has but touched a hog. They ſet a part the firſt day of every month for their public worſhip, and have prayers alſo on ſome other days.

The religion of the Mahometans or Muſſelmen will be treated of in our account of Turky.

The hindoos or gentoos, are diſtinguiſhed into four tribes, or claſſes. 1. The bramins, who received their name from Brinha. This claſs is the moſt noble, as it proceeded from the head of Brinha, when he created the world. It is allegorical of their ſuperiority over the other claſſes. 2. Sittri, or the military. This claſs is ſaid to have proceeded from the heart of Brinha, which derivation is ſaid to be emblematical of the courage neceſſary to warriors. 3. Bice, or the trader. This claſs is figuratively ſaid to have ſprung from the belly, as trade ſupplies mankind with the neceſſaries of life. 4. Sudder, or labourer, which claſs is typified by having ſprung from the feet, pointing out by implication the menial ſituation of thoſe who belong to it. The harri or hellachore claſs, or caſt, are the refuſe of both the Mahometans and gentoos, and their only employ the moſt baſe and ſervile offices. The people of this claſs, being excluded from all ſociety among the Indians of every denomination, are glad to find refuge in the lap of any communion; they therefore become Roman Catholics, and the miſſionaries have few other proſelytes to boaſt of. It is very probable, from hence, that the black Roman Catholics in general are converts more from compulſion than inclination; for if a married woman commits any atrocious crime, or happens to miſtake any man's bed, for that of her huſband, he immediately cuts off her hair, which is the greateſt mark of infamy ſhe can be branded with. After ſuch an ignominy, none will converſe, or be connected with her; ſhe therefore flies to her prieſt, and embraces the Roman Catholic religion, to avoid being totally excluded from ſociety.

Though the hindoos are gentle, patient, temperate, regular in their lives, charitable, and ſtrict obſervers of their religious ceremonies; yet they are at the ſame time ſuperſtitious, effeminate, avaricious, and crafty; deceitful and diſhoneſt in their dealings, void of every principle of honour, generoſity, or gratitude. Gain is the predominant principle; and they can cheat without fearing the anger of their gods; as a part of their gains, which is beſtowed in gifts to their prieſts, or charities to the poor, will procure their pardon for any offence.

It ſeems generally agreed, that Chriſtianity hath been planted here ever ſince the apoſtles times; but however that be, certain it is, that Chriſtians were found here when the Europeans firſt viſited theſe coaſts, who had a tradition among

among them, that Thomas was martyred near Meliapour, on the coaſt of Coromandel, to which town therefore the Portugueſe afterwards gave the name of St. Thomas; this city ſtands about a league to the ſouthward of Fort St. George, and is at this day a biſhop's ſee. The points wherein theſe Indian Chriſtians differed with the Romiſh church, were their adminiſtering the ſacrament in both kinds, but uſing, inſtead of wine, a liquor made with raiſins, there being no wine made in the country. 2. They bid not baptize their children till they were forty days old, unleſs they were in danger of death. 3. They had no images in their churches but the croſs. 4. They allowed their prieſts to marry once. 5. They uſed no extreme unction. And, 6. They did not acknowledge the pope's juriſdiction. But to the laſt, and ſome of the others, the Romiſh miſſionaries have brought them over, and they go to the ſame church the Portugueſe do, at Madraſs; but not at the ſame time.

SECT. X.

Treats of the marriages and funerals of the Indians.

IT is the cuſtom in India, for the Gentoos, or Pagans, to marry their children in their infancy; the conſent of the proper parties is never aſked, but they are always married to one of their own caſt or tribe, and to one of the ſame trade: a carpenter never marries a ſmith, or a weaver with a waterman. At what age ſoever the parents contract for their children, they do not cohabit till the woman is twelve years of age, and the man ſome years older. Before the match is agreed on, the aſtrologer (whom we take to be a bramin or prieſt) is always conſulted, whether it is likely to prove fortunate. An enquiry alſo is made, what hour is likely to prove propitious for the ſolemnization and conſummation of it. And when all things are ſettled, a grand proceſſion is made through the ſtreets for ſeveral nights ſucceſſively by the light of torches; the lady carried in one palanquin on mens ſhoulders, and the bridegroom in another, with muſic playing before them. When the ſhow is over, the little bride and bridegroom are ſet down at her father's houſe, and here a table being placed between them, they join their hands acroſs it, and the prieſt covering both their heads with a cloth, repeats ſome prayers for their happineſs, and gives them his benediction; and having ſprinkled the company with perfumed water coloured with ſaffron, the ceremony is concluded, and an entertainment prepared for their friends and acquaintance. The woman is entirely in the power of her huſband, and conſequently ſhe regards him as her lord: ſhe brings him no other fortune than her cloaths, and a female ſlave or two. On the contrary, the huſband, or his father, if it be a wealthy family, make rich preſents to the wife's relations: no man (except the bramins and banians) is confined to one woman, but takes as many wives and concubines as he pleaſes, and treats them, as the gentoos do all mankind, with great humanity.

The ſtrange cuſtom of one wife being ſubject to ſeveral huſbands, prevails among ſome of the naires, or nobles: the number is not ſo much limited by any ſpecific law, as by a ſort of tacit convention, by which it rarely exceeds half a dozen. The huſbands cohabit with her alternately, according to priority of marriage; and each on going reſpectively to her, leaves his arms at the door, as a ſignal that none of the others muſt preſume to enter till he departs.

The Indians give a name to their children about ten days after their birth; they aſſemble ten or a dozen children, who ſtanding in a ring hold a ſheet in their hands, wherein the bramin or prieſt pours a quantity of rice, upon which he lays the child to be named; the boys who hold the ſheet ſhaking the child and the rice together about a quarter of an hour, when the father's ſiſter advances and names the child, cuſtom having given her this right; but if the aunt be not preſent, then the father or the mother name the child. A month or two afterwards it is carried to the pagoda or temple to be initiated in the banian religion, where a bramin mixes ſome ſhavings of ſandal wood, camphire, cloves, and other ſweets, and puts them upon the child's head, from which time the infant commences a complete banian. The lying-in-woman is looked upon ſo impure, that none muſt touch her for the firſt ten days but her nurſe, and till forty days are paſt ſhe muſt not concern herſelf in dreſſing meat or any other houſhold affairs. They have ſwinging cradles faſtned to the beam of the houſe, which go much quieter and eaſier than ours that ſtand upon the ground, the ſame ſort are uſed in Holland. The Indians never bind or ſwaddle up their children as we do, but let them go perfectly naked both boys and girls, till they are ſix or ſeven years old, and it is not to be imagined how very young they will crawl about the floor. The inhabitants of the ſouthern part of India, who are moſt of them as black as jet, have a rediſh caſt for ſome time after they are born, and turn quite black as they grow up. There are no crooked or miſ-ſhapen people amongſt them, but they are in general ſtrait and well proportioned; which ſome think proceeds from the leaving them to their natural liberty, and not cramping or ſwaddling the children as we do here. But however that may be, the frequent rubbing and waſhing them in cold water, certainly contributes to prevent, as much as any thing, their being weak and rickety.

When a wife, who has more huſbands than one, brings forth a child, ſhe nominates its father, who is at the expence of educating it; but from the impracticability of aſcertaining the real heir, the eſtates of the huſband deſcend to the children of their ſiſters, or others near in blood.

With reſpect to the funerals of theſe people, ſome bury the bodies of the deceaſed, and others burn them on piles; the latter is the moſt cuſtomary. Before they burn their dead, they carry them on a bier to a ſmall diſtance from the town or village where they died, dreſſed in their uſual apparel. Here a pile is erected, and the corpſe is placed upon it; and, as ſoon as the bramin has done praying, one of the corners of the pile is ſet fire to. When the body is conſumed, its relics or aſhes are gathered and thrown into the ſea by the bramin; for the funeral pile is always erected near the ſea, or ſome large piece of water, as the ready road to paradiſe, the Ganges, and other rivers in India, being the objects of their adoration. The perſon who ſets fire to the pile, is always the neareſt male-relation, who walks bare headed, in a coarſe tattered garment (their common mourning) round it three times before he applies the fire ſtick, and when the whole is in a blaze, abundance of ſweet-wood is thrown into the fire; but the perſon who ſet fire to the pile, appears diſtracted with the moſt aſtoniſhing grief.

We ſhall here give ſome account of the gentoo women burning themſelves on the death of their huſbands. But we muſt firſt premiſe, that, as the gentoo laws allow bigamy, the firſt wife has a limited time given her to conſider whether ſhe will burn herſelf or not; if ſhe declines it, the choice is given to the ſecond; if the ſecond declines alſo, then they both lie under the imputation of being remiſs in the genuine principles of honour and eſteem. Some ſay that this cuſtom was inſtituted in order to terrify the women from poiſoning their huſbands, to which they were once addicted; others, that the women propoſed to enjoy a more exquiſite and durable happineſs with her huſband in another life than ſhe had done in this; and there are others that impute it altogether to prieſtcraft; for that the people of quality being to be dreſſed up with rings and jewels to a very great value, and the bramins only having the privilege of meddling with the aſhes, ſometimes poſſeſſed themſelves of great wealth by this means.

Soon after the ſettlement of the Engliſh at Fort St. George, a bramin woman demanded leave of the governor to burn herſelf with her huſband; and not being able to diſſuade her from her reſolution, and ſtrongly ſolicited by the whole caſt, that he would grant them this their antient privilege, he at length conſented to it, it is ſaid; accordingly great preparations were made, and the woman dreſſed to the beſt advantage, as if ſhe were going to her wedding, the muſic played, her friends rejoiced, and the people ſhouted as on ſome glorious occaſion; but the woman, when ſhe ſaw the funeral pile prepared, and the fire about to be kindled, began to repent herſelf, and would fain have withdrawn, but was hurried on to the pit where the fire was made, and there knocked on the head and murdered by the bramins to prevent her eſcape, and afterwards burnt with her huſband's corpſe.

About the year 1743, the widow of the rhaam Chund Pundit, in her ſeventeenth year, ſignified to the bramins her reſolution of burning herſelf, the dreadful pain of the death ſhe ſought was delineated to her in the moſt ſtriking colours; all, however, had no effect; ſhe even put her hand into the fire and held it there ſome time. Her friends finding her ſo inflexibly determined, conſented to a funeral pile being erected, the melancholy hour approached; ſhe took leave of her mother and three children, diveſted herſelf of her ornaments, walked three times round the pile with the bramins, from whom ſhe received a wick of cotton,

ton, and, taking one more tender farewel of her children, &c. aſcended the pile, and ſet fire to it. The above lady's huſband, who was in the twenty-ninth year of his age when he died, was conſumed on the ſame pile with her. She ſeated herſelf by him, looking ſtedfaſtly at him; but, perceiving that the flames blew from her, ſhe, with aſtoniſhing reſolution, ſet fire to it in a freſh place; when the whole was ſoon in a blaze.

We ſhall give but one more deſcription of theſe horrible ſacrifices, as taken from a letter dated from Inglee in Bengal, dated December 30th, 1751, and the horrid deed was committed about fifteen days before the date of the letter, the writer whereof being an eye witneſs of the whole tranſaction. This tragic ſcene was acted at Calcutta in Bengal, when the naked body of a gentoo was laid on a pile of wood, made up in a regular form, and his wife, not above fifteen or ſixteen years of age, walked to the pile, conducted by her friends, her father on one ſide, and her mother on the other. After a great number of previous ceremonies were performed, ſhe walked round the pile ſeven or eight times in a melancholy and devout manner, conducted, as before, by her father and mother: ſhe then ſtepped upon the pile, and quietly laid herſelf down by the corpſe of her huſband, about whoſe neck her hands were faſtened, and her legs tied to his; then both their bodies were anointed with a ſort of unguent called ghee; over them was ſtrewed a ſort of yellow duſt, and they were covered with a cloth, which was kept down by ſome pieces of wood. At laſt, the father of the deceaſed huſband ſet fire to the pile, which ran through it like lightning, by means of the yellow powder. And the fire was ſo fierce, that the ſpectators were obliged to draw backward from the heat. The whole was conſumed to aſhes in about an hour's time.

Theſe ſhocking ſpectacles have been much leſs frequent than formerly, ſince the Moguls became maſters of Indoſtan; for neither the Mahometans or Europeans will now permit the barbarous cuſtom to prevail, where they have any power.

We hinted above, that the mourning uſed here, is a tattered neglected dreſs: to which we may add, that the women ſhave their heads on the death of a huſband; but the men never ſhave their heads, or cut their hair, unleſs it be on the death of a father, or a ſovereign prince. The relations, in order to ſhew their regard for the deceaſed, often viſit the place where the corpſe was burnt, carrying thither rice or other food; which they cannot be ignorant is eaten by beaſts or birds, as ſoon as they are gone.

The Gaurs, the poſterity of the antient Perſians, who fled to India when the Mahometans conquered Perſia, have a repoſitory for their dead about a mile from Surat, where there is a colony of them: they are of opinion that they cannot do their deceaſed friends greater ſervice than by leaving them to be devoured by birds of prey. They therefore erect ſtages or raiſed floors in this repoſitory, which is ſurrounded by a wall twelve feet high, and an hundred in circumference, where may be ſeen great numbers of dead bodies with part of their fleſh torn off by vultures, their eyes dug out and mangled from head to foot, and the vultures ſo glutted with human fleſh, that they can ſcarce raiſe themſelves to fly; ſo different are the cuſtoms of different countries! In moſt places the leaving a corpſe above ground unburied, is eſteemed an act of great impiety, but by the Gaurs it is deemed a piece of barbarity to bury them.

SECT. XI.

Contains the hiſtory of India, from the earlieſt accounts, to the preſent century.

THERE ſeems to have been little more than the name of India known to the antients. Semiramis, ſoon after the commencement of the Aſſyrian empire, is ſaid to have carried her arms thither; and it is conjectured that Bacchus conquered part of this country; but Alexander's invaſion of India, about three hundred years before the birth of Chriſt is not doubted. None of theſe heroes, however, retained any part of their conqueſts if they made any, or reſided there long enough to acquaint themſelves with the ſtate of it, or even to deſcribe the bounds or true ſituation of India: and the Romans never attempted to reduce it under their dominion; conſequently we remain very much in the dark as to theſe people until the reign of Tamerlane, who ſubdued this, and almoſt all the reſt of Aſia, about the year 1400, when it appears to have been divided amongſt a great number of petty ſovereigns.

Tamerlane was the great cham or chief of all the Mogul Tartars. His third ſon Miracha ſucceeded him in the northern provinces of India and Perſia, and in the ſtyle or title of Great Mogul, which title his poſterity, the Emperor of India, enjoy at this day. Miracha made Herat in Perſia the ſeat of his government: but every year, in the fair ſeaſon, made a tour through his Indian dominions, attended by the court and army, and demanded the annual tribute due from thoſe princes, which, it ſeems, was ſometimes denied him; and he found himſelf obliged to make war upon one of thoſe raja's, to compel the payment of it; in which war, he had the misfortune to be taken priſoner, but obtained his liberty from the raja, on condition he would releaſe the tribute, and make no demands of this nature on that victorious prince, or his ſucceſſors for the future. But Miracha, like ſome other princes, remembred his engagements no longer than till he had obtained his liberty; for he no ſooner returned to his dominions, but he levied a more powerful army than he had loſt, invaded that raja's territories again; and, having taken him priſoner, put out his eyes. Hiſtorians relate, that Miracha coming to view his Tartar guard, afterwards, on a day aſſigned for their ſhooting at a mark, and being informed that his priſoner the blind raja, was ſtill a better archer than any of them, he ſent for him, and ordering a bow and arrows to be brought, the raja deſired his Majeſty to give the word of command when he ſhould ſhoot, which he had no ſooner done, but the raja let fly an arrow at the place from whence the voice came, and killed the King out-right.

In the reign of Babar the great grandſon of Miracha, there happened a war between him and another prince of the poſterity of Tamerlane; in which war, Babar loſt the city of Samarcand, and, as I apprehend, he loſt Herat, and the Perſian provinces alſo; whereupon he made Delli in India the capital of his dominions, and invading the Indian princes on the ſouth-eaſt, conquered the kingdom of Patan or Patna, which lies upon the Ganges, and is contiguous to Bengal. Babar died in the year 1530, having reigned thirty-years in India, and was ſucceeded by his ſon Amayum.

A young Patan lord, named Chira, having been educated with Amayum, gained ſuch an aſcendent over him, that he made Chira the commander of his army, and his prime miniſter, who taking all opportunities of ingratiating himſelf with the Tartars and Indians in the Mogul's army, and being extremely concerned to find his native country of Patan treated as a conquered province, he entered into a conſpiracy againſt Amayum, his great benefactor, who having received advice of his treachery, raiſed a body of forces, and gave battle to Chira, but was defeated by him, and obliged to fly into Perſia for protection, and Chira was immediately after proclaimed ſovereign of Indoſtan. Here our hiſtorians furniſh us with ſome omens of Amayum's reſtoration; they tell us, that this prince laying himſelf down to ſleep in his flight to Perſia, an eagle hovered over his head, and ſcreened his face from the ſun: Amayum being well received in the court of Perſia, and promiſed to be aſſiſted in his reſtoration, waited there, however, near nine years without any thing done towards reſtoring him; but at length he received advice from Delli, that Chiri was killed by the burſting of a cannon which he went to ſee fired, and that the Moguls and Patans could not agree upon a ſucceſſor to the throne, but if he returned to Delli, he had now a very fair chance of poſſeſſing the throne of Indoſtan again; and having communicated this advice to the Sophy of Perſia, that prince afforded him a body of troops, at the head of which he marched to India, and joining with ſuch of his ſubjects as were in his intereſt, he was advanced again to the throne without bloodſhed: but notwithſtanding this revolution could never have been effected without Perſian forces, and he had promiſed to cede the province of Candahor to the crown of Perſia (to which the Sophy pretended a right,) he was not as good as his word, but ſtill kept the poſſeſſion of it. So little are the profeſſions of princes, when they are in diſtreſs, to be depended on.

The Indians aſcribe to the Mogul Amayum the building of caravanſeras or houſes for the entertainment of travellers, and the regulating weights and meaſures. This prince, after his reſtoration, built a moſt magnificent tomb for himſelf in India, which is to this day, eſteemed one of the greateſt curioſities in that country. And as he was one day walking over the ſcaffolding, and giving his orders to the workmen, a plank deceived him, and falling from

from a greater height to the ground, he was ſo miſerably bruiſed, that he died immediately, and was buried in his new tomb, which was then nearly finiſhed; but ſome ornaments were afterwards added by Akebar, his ſon and ſucceſſor.

Akebar proved an enterpriſing prince; but having as yet no communication with the ſea coaſt of India, from whence a very rich trade was carried on with the Europeans, particularly from the kingdom of Guzarat and Cambaya, which extends from Surat, ſituate on the river Tapte, to the mouth of the river Indus, he determined to make a conqueſt of it. Sultan Badar, or Bahadar, a Mahometan prince, whoſe anceſtors were Arabians, was then ſovereign of that country, and had been at war with the Portugueſe *for ſome time, who were perpetually encroaching* on his territories, and had lately taken from him the town of Diu, ſituate near the entrance of the gulf of Cambaya, almoſt oppoſite to Surat; but both Sultan Badar and the Portugueſe received advice, that the Mogul was on his march to invade Cambaya, and apprehending that neither of them were able to oppoſe him ſingly, thought it prudent to make a peace, and unite their forces againſt the Mogul; nor were both of them able to ſtop the torrent of his arms. They relied much on the European artillery; but, coming to an engagement, Akebar's numerous army bore down all before them. Sultan Badar retired out of the battle; his children were made priſoners, and put to death by Akebar, who made an intire conqueſt of the kingdom of Guzarat, except Diu, and ſuch other towns as the Portugueſe had fortified and furniſhed with artillery.

Akebar finding Guzarat ſo eaſy a conqueſt bent his arms towards Decan, which lies to the ſouthward of it. This was divided into ſeveral little ſovereignties; Muſtapha, a Mahometan prince, poſſeſſed that part of the country wherein the towns of Brampour and Acer are ſituated, whoſe ſubjects gave him the title of melec, or king. Amadanger, and the territory belonging to it, was ſubject to the Queen of Cande; and Ambar commanded the diſtrict of Doltabad. Theſe princes, though at other times enemies, united their forces againſt Akebar, and gave him battle, but were defeated by him, with very little loſs. The towns of Acer, Brampour, and Amadanger, held the conqueror in play ſome months afterwards; but at length Muſtapha and the Princeſs of Cande, both ſurrendered their capitals upon conditions. Muſtapha afterwards attended the Mogul's court, and was content for ſome time to remain in the rank of an Indian raja: and the *Princeſs of Cande was taken into the number of the* conqueror's wives, and treated in the quality of a ſovereign queen, remaining for a conſiderable time the favourite ſultaneſs: though ſuch was her enmity to Akebar when he beſieged her capital, that deſpairing to hold out, ſhe cauſed all her treaſure to be melted into bullets, and inſcribed with the bittereſt curſes againſt her enemy, ſhot them into the neighbouring woods, to prevent his poſſeſſing it. Some of theſe gold and ſilver bullets were afterwards found by Manouchia, who was a phyſician in the Mogul's court, who relates, that he read the inſcription on them, and that one of the bullets weighed eighteen pounds. As for prince Ambar, he was killed in an engagement during the war, and his territories ſeized by the conqueror.

After this ſucceſs, Akebar invaded Chitor, which lies eaſt of Guzarat, and was then ſubject to the raja Rama, who having entered into a confederacy with ſeveral of the neighbouring powers, ventured to oppoſe the Mogul, but being ſoon obliged to quit the field, he retired into his capital city of Chitor, naturally one of the ſtrongeſt fortreſſes in India, ſtanding on an high mountain in the middle of a plain; the river Nug almoſt ſurrounded it, a rivulet alſo roſe within the walls of the town, and there were fields within its bounds, which produced proviſions ſufficient to ſupport a numerous garriſon. But notwithſtanding the advantage of its ſituation after a two years ſiege the town was taken, and the reſt of the country thereupon ſubmitted to the conqueror.

Being now diſpoſed to reign in peace, Akebar applied himſelf to the building of fine towns, promoting the traffic of his ſubjects, and adorning his palaces. He rebuilt the city of Delli, enlarged that of Agra: and planted the fine avenue of trees, extending from Agra to Lahor, which is near five hundred miles, under the ſhade whereof a traveller may be ſcreened from the ſun in the hotteſt ſeaſon.

Some of his favourite amuſements were, the management of his war-elephants, and the breaking head-ſtrong horſes. The firſt was ſo hazardous an excerciſe, that the friends and relations of the perſons, who are obliged to train them up to the war, put on mourning for them, as men deſtined to deſtruction. The peaſants (by whom I preſume our hiſtorians mean the hindoos, the original inhabitants of the north of India) breaking out into rebellion againſt the Mogul, and retiring into a fortreſs, Akebar commanded the captains of the elephants to break open the gates, which they ſeeming backward to attempt, he put on a common ſoldier's coat, and mounted an elephant himſelf; and advancing to one of the gates, made his elephant break it open, while a ſhower of arrows was diſcharged at him from the walls. This war with the hindoos laſted ſome years, it being a mountainous, woody country, and the people having poſſeſſed themſelves of the paſſes through which an enemy could approach it; and that which perplexed Akebar ſtill *more was the rebellion of his eldeſt ſon, Jehan* Guire, about the ſame time. However, this prince had the good fortune to ſuppreſs that rebellion. And to deter his ſon from ſuch attempts for the future, he carried him into a foreſt after he had pardoned him, and ſhewed him the heads of his aſſociates hanging on the branches of the trees, which had ſuch an effect on him, that he ever after proved a very dutiful ſon.

Theſe wars were no ſooner ended, but he was exerciſed with a rebellion of the Patans, who endeavoured to render their country independent of the Mogul again; and theſe people were ſo fortunate to defeat an army of eighty thouſand men, the Mogul ſent againſt them. Whereupon Akebar, obſerving that the want of people to manage his artillery was the principal occaſion of his ill ſucceſs, invited European gunners into his ſervice; among whom we are told, there was an Engliſhman, whom the Mogul required to live as his people did, without ſtrong liquor, which the gunner made uſe of the following ſtratagem to obtain. Being to ſhoot at his mark before the Mogul, at a time appointed, he ſhot much wider of it than he had done at any time before the prohibition, and being aſked the reaſon, he ſaid his ſight had failed him ever ſince he had been debarred the uſe of wine; whereupon the Mogul ordered him as much as he would drink; and after he had drank pretty plentifully, he made ſome very nice ſhots, and the prohibition againſt his drinking wine was taken off, and it was recorded in their archieves, "That wine was as natural to an European, as water was to a fiſh," which the hiſtorian relates he ſaw himſelf; and that afterwards foreigners were permitted to plant vineyards about Agra, and make what wine they pleaſed.

Akebar, finding that his people were as deficient in moſt other ſciences, as in the art of war, invited thoſe of other profeſſions to reſort to his court, offering them great encouragement, and ſent for the Portugueſe miſſionaries to inſtruct him in the Chriſtian religion, as he pretended, and as the fathers, no doubt, believed; but it is evident from his future conduct, that he wanted them to teach the mathematics to his family; however, the fathers believing him to be in earneſt, prepared to make a convert of him.

The Mogul having at length intirely ſuppreſſed the Patan rebellion, and being at liberty to follow his inclinations without reſtraint, inſtead of favouring the fathers any longer, became the founder of a new religion, which ſhould comprehend all the religions he was acquainted with, and unite his ſubjects in one uniform way of worſhip; in which he choſe to retain the baptiſm of the Chriſtians, the circumciſion of the Mahometans, and the idolatry of the Pagans; but he would never hear of parting with his wives, and confining himſelf to one woman. The miſſionaries aſſert, that after this he was always unfortunate, loſt his beloved ſon, was harreſſed with inſurrections, and loſt ſome of the moſt conſiderable provinces of his empire; and at length, having formed a deſign to poiſon ſeveral great men he ſuſpected were in a conſpiracy againſt him, died by the poiſon he had prepared for others; which happened in the year 1605, and was ſucceeded by his ſon Cha Selim, who, at his acceſſion, took upon him the title of Jehan Guire, or ſovereign of the world.

This emperor, in conſequence of the education he had received in his father's court, was inclined to make the like enquiries into the truth of the ſeveral religions profeſſed in his dominions; and he looked upon the confining men to ſome particular food and liquors, to proceed rather from ſuperſtition than true piety, as it could ſerve no good end or purpoſe whatever; and obſerving that the Chriſtian religion allowed its votaries the greateſt liberties of this kind, he ſent for the Franks, or Europeans, and drank pretty freely with them, which greatly alarmed the Mahometan prieſts, apprehending he would in the end profeſs Chriſtianity. They repreſented to him, therefore, the unlawfulneſs of drinking ſtrong liquors; but ſome of the wiſeſt of them obſerving, that it was rather his love of wine than

any

any inclination to become a Chriſtian, that induced him to take theſe liberties, they declared that the prohibition to drink wine was never deſigned to extend to ſovereign princes, they were at full liberty to eat and drink what they pleaſed; which kind ſolution of their prophet's precepts, gave him entire ſatisfaction, and he never gave any further evidence of his favouring Chriſtianity, unleſs it was by his forbearance to proſecute the Chriſtians, and admitting them to drink with him, which they frequently did till morning. The miſſionaries, it ſeems, looked upon this alſo as an evidence that he deſigned an alteration in religion, as well as the Mahometan prieſts; but they were both deceived; the indulging his appetites being all he meant by theſe practices.

The Mogul having removed the royal ſeat from Agra to Lahor; and there from his terrace ſeeing a moſt beautiful lady; named Nourmahae, in a barge on the river, being ſcreened from the ſun by a canopy over her head, fell deſperately in love with her; but hearing ſhe was married to one of his officers, he ſoon diſpatched his rival out of the way, and then renewed his courtſhip; but the lady, having ſome intimation how treacherouſly her late huſband had been deſtroyed, expreſſed her reſentment with great ſeverity, declaring, ſhe could never think of matching with her huſband's murderer; but when her mourning was ended, and the Mogul continuing to load her with his favours, ſhe was prevailed on to comply with the love-ſick emperor on the following conditions: that ſhe ſhould be ſovereign of the ſeraglio, her father prime miniſter, and her relations preferred to the moſt honourable poſts. The marriage was accordingly ſolemnized by a feſtival of eight days continuance, and her name changed to Nour Jaham, the light of the world. This princeſs had not been a year in the ſeraglio, before ſhe deſtroyed, by poiſon or otherwiſe, five of the emperor's greateſt favourites; and married her only daughter to Sultan Scheriar, the youngeſt of the Mogul's ſons. Whereupon Sultan Coſrou, the eldeſt ſon, not doubting but ſhe deſigned to advance his youngeſt brother to the throne on his father's death, and being informed, that his grandfather Akebar intended that he (Coſrou) ſhould ſucceed to the throne before his father, the preſent emperor, he raiſed an army in order to ſecure his acceſſion to the Indian throne; but being defeated and made priſoner, he was murdered afterwards by the direction of one of the Mogul's miniſters (who had an intereſt to ſerve by his deſtruction) without his father's knowledge. Sultan Chorrom, another of the emperor's ſons, raiſing an inſurrection alſo was defeated, but was ſo fortunate, however, to ſurvive his father, and ſucceed him in the year 1627, though Bolaqui the late Mogul's grandſon, whom he deſigned his ſucceſſor, was firſt proclaimed emperor, and enjoyed that title a little while, but being defeated by Sultan Chorrom, was obliged to return into Perſia; and Chorrom, on his acceſſion, took the title of Shah Jehan, or king of the world. His youngeſt brother, Sultan Scheriar, was at this time a priſoner, in the palace of Agra; he had his eyes put out in the former reign, but Shah Jehan not content with that, ordered him, with his two ſons, to be encloſed between four walls and ſtarved to death; and, thus having deſtroyed all his family, Chorrom remained in poſſeſſion of the throne without a rival.

The ſeat of the government was removed by Shah Jehan, from Agra to Delli, which he vaſtly enlarged and beautified: and here, he propoſed to have ſpent his reign in all the delights a great emperor could command. But as he and his brothers had been engaged in perpetual rebellions againſt their father, he found himſelf ſufficiently puniſhed for his undutifulneſs, by the rebellion of his own children, and the diſaffection of his nobility, occaſioned by his flagrant luſts; for though his ſeraglio, like that of other eaſtern princes, was furniſhed with hundreds of the moſt celebrated beauties in his dominions, he would ſend for the wives of the greateſt omrahs to his bed; which though none of them dared to refuſe openly, they were ſo diſguſted, that many of them at length deſerted his ſervice, and joined one or other of his rebel ſons. His eldeſt ſon Dara or Darius, indeed, always remained faithful to him, and had, in a manner, the adminiſtration of the government put into his hands, which he well deſerved, being a moſt accompliſhed prince, having great natural parts, improved by the European miſſionaries, who inſtructed him in philoſophy, mathematics, and other liberal arts; in return for which, he declared himſelf in their favour, and gave them great encouragement, but this made the zealous Mahometans, his enemies, dread a change in religion, if ever he ſucceeded to the crown. And as his education had rendered him much ſuperior to any of his courtiers and miniſters, it is ſaid he did not treat them ſuitable to their merits, as they apprehended, deſpiſing the cringes and flatteries of the courtiers to obtain his favour: and thus, by ſhewing an indifference to the eſtabliſhed religion, and ſlighting the addreſſes of the great men, he created a general diſguſt to his perſon. In the mean time, his brothers, who reſided at their ſeveral governments, left no means unattempted to render themſelves popular; Sultan Sujah his ſecond brother, being governor of Bengal; Aurengzebe, the third brother, governor of Decan; and Morad the youngeſt, governor of Guzarat or Cambaya.

The Mogul's younger ſons, envying the power they ſaw their eldeſt brother already poſſeſſed of at court, and apprehending their own deſtruction certain, if ever he came to the throne, united their forces and councils to diſtreſs him; which while they were doing, a report prevailed that their father was dead. Whereupon Sultan Sujah, the ſecond ſon, viceroy of Bengal, aſſembled an army, and began his march towards the capital city of Delli. It is related, that when he mounted his elephant, he laid his hand upon his ſword, and ſaid, "Now for a throne or a grave." His pretence for this procedure was that his brother Sultan Dara had poiſoned his father, and that he took up arms to revenge his death; but the Emperor, being reſtored to his health, wrote to Sultan Sujah, to inform him, that he had been indeed indiſpoſed, but that he was now recovered, and that his ſon Dara had not been the occaſion of his diſorder, and therefore commanded him to return to his government; but Sultan Sujah, receiving advice from his friends, that his father was ſtill very ill, thought fit to continue his march; whereupon the court removed from Delli to Agra, being nearer the ſcene of action, and a much ſtronger town than Delli; and Dara ſent an army commanded by two of his ſons, and ſome experienced generals to aſſiſt them, to oppoſe Sultan Sujah's march, whoſe forces being much inferior to thoſe of the royaliſts, Sultan Sujah was defeated, but made his eſcape into his government of Bengal.

Aurengzebe and his brother Morad, in the mean time, having aſſembled their armies, advanced towards the capital. Aurengzebe, who had lived recluſely as an hermit, with his uſual hypocriſy, gave out, that he had no views with reſpect to this world; all he deſired, was, to ſee the true worſhip of God, and the law of his holy prophet, eſtabliſhed in its primitive purity; that he was ſorry to obſerve that their brother Dara was become a proſelyte to Chriſtianity, and Sultan Sujah followed the Perſian hereſy; but he ſhould endeavour, by the help of God, and his holy prophet, to prevent either the apoſtate or the heretic's mounting the throne of their father. And ſince Morad alone retained a true zeal for the Alcoran, he would aſſiſt him with all his power and intereſt to oppoſe them both, deſiring no other return for his ſervices, but that he might ſpend the remainder of his life near the tomb of Mahomet, in acts of mortification and devotion. Sultan Morad was infinitely pleaſed with his brother's pious intentions; and invited him to come and join forces with him, that they might march in a body to Delli. Aurengzebe hereupon, with his friend Mirza Mulla, ſet forwards towards Delli, with an army of veteran troops, who had ſerved in the wars of Viſiapour and Golconda, well provided with all neceſſaries, and a prodigious bank of money, which he had been heaping up for ſeveral years. When the armies came in ſight, Aurengzebe diſmounted and ran to meet his brother, proſtrating himſelf before him as his ſovereign. Morad immediately took his brother up and embraced him, and the higheſt profeſſions of mutual friendſhip paſſed between them; Morad was prevailed upon by this maſter of diſſimulation to take upon him the imperial ſtyle and ſtate, and his brother was pleaſed to receive thoſe orders from him which he firſt adviſed.

When Sultan Dara underſtood the two brothers were joined, he diſpatched a trumpet with a letter from the Emperor to each of them, aſſuring them that he was in health, and that they ſhould retire and diſband their troops on pain of his reſentment. Morad, it is ſaid, was ſhocked to find his father was alive, and was inclined to obey his orders: but Aurengzebe ſhewing him that it was too late to repent, and that there was now no medium between death and conqueſt; and that if ever the armies ſeparated they were infallibly ruined: that though their father might be yet alive, he was ſuperannuated and incapable of regal cares; and in effect, that the prophane Dara had already poſſeſſed himſelf of the ſovereign power, and would infallibly extirpate their holy religion if he was not timely prevented. By theſe ſpecious reaſons he prevailed upon the honeſt Morad to continue his march.

Dara, on the other hand, took the moſt effectual meaſures to defeat the deſigns of his brothers; he poſſeſſed himſelf of the paſſes to the capital city, and encamped in a ſituation where he could be conſtantly ſupplied with proviſions from the neighbouring cities; and his camp was ſo ſtrongly fortified, that it was not poſſible to force it; but notwithſtanding he had taken all the ſteps a prudent general could do, yet by favouring the Chriſtians, and neglecting to cultivate a good correſpondence with the generals and officers of the crown, he became ſo unpopular, that on this critical occaſion moſt of them deſerted him, leaving the paſſes unguarded, and inſtead of oppoſing his enemies, ſome of them actually went over to them. The brothers coming to a battle ſoon after, Sultan Dara was intirely defeated, which was generally aſcribed to the conduct and forces of Aurengzebe; though the forces of Morad were principally engaged; which highly exaſperated the generals of Morad's army, who began now to diſcover the treachery and hypocriſy of Aurengzebe, and they had laid a deſign without their maſter's knowledge to deſtroy him, when he came next to his brother's pavillion; which Aurengzebe being informed of by his ſpies, forebore coming to his brother's tent as uſual, ſtill carrying it fair with him, and ſending his ſon Mahomet every day to enquire after his health.

The Emperor Shah Jehan, obſerving that he was conſtantly betrayed, and imagining that it might be occaſioned by the prejudices the people had entertained of him, abdicated the throne in favour of Sultan Dara his eldeſt ſon, whom he cauſed to be proclaimed emperor; whereupon Dara aſſembled a very numerous and gallant army in appearance; but being betrayed in this, as he was in the former battle, was totally defeated, and with a ſmall body of horſe retreated to Agra, where he did not remain long; but continued his march to Delli, the governor of which city, having received advice of his defeat, would not ſuffer him to enter the gates, whereupon he bent his march towards Lahor.

Aurengzebe and Morad, on the other hand, advanced to Agra, which city was betrayed into their hands, and they poſſeſſed themſelves of the Emperor's perſon, and of thoſe immenſe riches, he had long been heaping up; for though Shah Jehan, in the beginning of his reign, appeared to be a moſt voluptuous prince, and his expences unbounded, he fell afterwards into the oppoſite extreme, and his principal pleaſure ſeemed to be in viſiting the vaſt treaſures of precious ſtones, gold, and ſilver, in the vaults he had built, on purpoſe to ſecure them from accidents.

The army of the two brothers had hitherto treated Sultan Morad as their Emperor; and Aurengzebe ordered preparations to be made for his inauguration, and invited Sultan Morad to his quarters, under pretence of regulating ſome affairs in relation to the proceſſion, which he gave out was to be the next morning; but Morad's officers ſuſpecting that Aurengzebe had ſome treacherous views in this invitation, perſuaded him not to put himſelf in the power of his brother. Morad, however, who is repreſented as a brave generous prince, and having no ſiniſter deſigns himſelf, could not entertain an ill thought of his brother, ventured to go to his brother's tent, attended only by his eunuchs, and ſome other ſervants. An elegant entertainment was brought in, with wine, among other liquors, which was the firſt time, it is ſaid, that Aurengzebe ſuffered any to be brought to his table. The brothers eat together, and great profeſſions of perpetual friendſhip paſſed on both ſides; but while Morad drank plentifully of wine, he fell aſleep. As to the abſtemious Aurengzebe, he taſted nothing but water, and when he found his brother and the reſt of the company intoxicated, he retired to prepare for the next villainous ſcheme; for he returned with his guards towards morning, and commanding his brother to be bound hand and foot before he was well awake, ſent him away priſoner to Agra; which was effected ſo privately, that neither of their armies had any ſuſpicion of the matter. At the ſame time it was reported, that Sultan Morad was ſtill at Aurengzebe's pavillion, and that the proceſſion to his inauguration would begin from thence, and orders were iſſued at the ſame time, that none ſhould appear armed at the ſolemnity but the guards appointed to attend. But Aurengzebe having ſurrounded the place with his army, where the ceremony was to be performed, to the ſurprize of all men that were not in the ſecret, advanced in the imperial robes, and placed himſelf on the throne; at which his army ſhouted and cried out, "Long live the Emperor Aurengzebe," which Morad's army could not oppoſe, as they were all diſarmed; but, on the contrary, when they found themſelves in the power of Aurengzebe, many of them thought fit to come over to his intereſt, and join in the joyful acclamations, in which they were encouraged by ſome of their own generals whom Aurengzebe had corrupted.

This prince's next care was, to prevent Sultan Dara from aſſembling another army; he therefore purſued him with great expedition to Lahor, whereupon the ſmall body of troops which Sultan Dara had with him diſperſed.

Sultan Sujah, the ſecond of Shah Jehan's ſons, underſtanding that Aurengzebe was marched northward, had left his government of Bengal a ſecond time, and advanced towards the wealthy city of Agra, but Aurengzebe returning with a ſurpriſing celerity, prevented that capital from falling into his hands. However, Sultan Sujah had poſted his troops ſo advantageouſly that he was not to be forced in his camp; and kept a communication open with ſeveral towns, from whence he was well ſupplied with proviſions, while his enemies wanted all neceſſaries, and even water, which they were forced to bring to their camp upon the back of camels from the Ganges, which lay at twenty miles diſtance. In this diſtreſs Aurengzebe ordered it to be given out that he would decamp the next morning, and accordingly the tents were ſtruck and the troops actually in motion; which Sultan Sujah obſerving, prepared to fall upon their rear. The troops of Aurengzebe were ordered to give way upon the firſt charge, until they had drawn the advanced guards of Sultan Sujah ſome diſtance from their camp, and then to make a ſtand, which orders were punctually executed; and Sultan Sujah obſerving his men were over-powered, detached ſtill other troops to ſupport them, and the enemy doing the like on the other ſide, it came at length to a general battle. The generals advanced with their bodies under their immediate commands to engage each other; and the battle was fought with great obſtinacy, till Aurengzebe artfully drew his enemy into a field where he had ordered pits to be made the night before and covered over with turf, ſo that they lay unperceived. Here the brave Sultan Sujah was advancing to engage his brother, and perſonally decide the fortune of the day, when his elephant flounced into one of theſe pits prepared for him, from whence the Sultan found it impoſſible to diſengage himſelf ſuddenly; whereupon the army, not ſeeing their general, imagined he was killed, and thought of nothing but making their retreat. Sultan Sujah afterwards mounted a horſe that was brought him, and endeavoured to rally his flying troops, but it was too late, the rout was total; a panic fear had ſeized his forces, and they could never be brought to make a ſtand again; and Sujah, with great difficulty, made his eſcape into the province of Bengal. Here he recruited his ſhattered troops, and having poſted himſelf in an advantageous camp, waited the approach of the enemy; when he underſtood, that Mahomet, the eldeſt ſon of Aurengzebe, was in ſome diſgrace, and ſecretly invited him to come over to his party: which negociation was ſo well managed, that he did not only deſert his father's court himſelf, but brought over with him ſeveral of his beſt officers.

Aurengzebe, who ſucceeded better by creating diviſions among his enemies, than by force, found means to create a jealouſy between the uncle and nephew, and at the ſame time gave his ſon all imaginable encouragement to return to his duty; and by theſe means he prevailed with the young prince to quit the ſervice of Sultan Sujah; but the father had no ſooner got him into his power but he clapped him into the caſtle of Gualleor, and Sujah became ſo weakened by the deſertion of Mahomet and his other officers, that he was in no condition to give Aurengzebe any diſturbance: whereupon that prince made his triumphant entry into the city of Delli, cauſing money, or rather medals, to be ſtruck upon the occaſion, with the following inſcription, "I king Aurengzebe, conqueror of the world, "have cauſed this money to be coined bright as the "ſun."

Sultan Dara arriving in the mean time at Guzarat, and finding that the people in general took compaſſion on him, and abhorred the hypocriſy of his rival brother, altered his reſolution of going to Perſia, and endeavoured to aſſemble another army; but the generals, employed by Aurengzebe in that province, ſo over-awed the people, that a ſtop was ſoon put to his levies, and the few troops he had raiſed were diſperſed, only two thouſand horſe remained with him, and with theſe he retired towards the city of Amadabat, which was garriſoned by his own forces; but his way lying over a vaſt deſart, where no water or proviſions were to be found, and wanting even tents to ſcreen his people from the ſun in the hotteſt ſeaſon of the year, they ſuffered extremely in paſſing it; and what was worſe, when

they

ſea-dog ſometimes jumps into the ſea with ſuch a force, that he pulls the poor fiſherman in after him, the rope being faſtened to his middle. They take rain-deer alſo ſometimes by clothing themſelves with the ſkin of that beaſt; and creeping among the tame deer till they are within the reach of the wild, kill them with their darts.

They purchaſe their wives of their relations for three or four rain-deer, and take as many as they pleaſe, returning them again to their friends if they do not like them; and their loſs is only the rain-deer they gave for them. And in ſome parts of the country they take the liberty of ſelling their wives for ſlaves when they are offended with them. They bury their dead in the clothes they wore when alive, hanging by them on the next tree their bows, quivers, hatches, and other utenſils.

A gentleman who lately travelled in this country acquaints us, that examining one of the Samoieds about their religion, he anſwered, that they believed there was a heaven and a God, whom they ſtiled heyha. That they were convinced nothing could be greater and more powerful than God; and that all things depended on him: that we had one common father, and that good men would go to paradiſe. But notwithſtanding this, they worſhipped the ſun, moon, and planets, together with ſeveral kinds of beaſts and birds, from whom they hoped to receive ſome benefits. Images they alſo worſhipped in human ſhape; but ſo very ill carved and dreſſed, that it was difficult to diſcover what they repreſented. They have prieſts among them, who pretend to the magic art, and to foretel future events: theſe they conſult upon all occaſions, as whether they ſhall recover of a fit of ſickneſs; what ſucceſs they ſhall have in their hunting, fiſhing, &c. When they come to enquire any thing of him, he works himſelf up into a kind of fit, and in this condition delivers his oracles; from whence ſome will have it, that he is poſſeſſed by the devil at theſe times: they give us alſo abundance of inſtances of the tyranny of wicked ſpirits among thoſe poor northern people, which poſſibly, when we come to be better acquainted with them, may appear to have as little foundation as ſome other tales of the like nature.

The Oſtiacks are deſcribed by travellers as a ſavage, vagabond people, very little if at all different from the Samoieds; ſome have made them inhabit the ſame country; but the Samoieds are more generally deſcribed as inhabiting that part of Muſcovite Tartary, which lies towards the weſt, in and next to Europe; and the Oſtiacks the north eaſt part of Muſcovite Tartary neareſt to the Chineſian Tartary, of whom a late writer gives the following account: "You will meet with this people (ſays he) three days journey beyond Tobolſki, the capital city of Siberia: they extend along the river Irtis to the place where it falls into the Oby, from thence you will find them extending themſelves to the northward along the banks of the Oby, and Jeniſea, till they fall into the guba or gulf of Mangaſia, and from the guba to the ſtreights of Waigats, inhabiting on the banks of the many rivers which fall into the Oby and Jeniſea. Narim is their principal town."

When the hunting ſeaſon comes on, theſe people go into the woods with their bows, dogs and nets, killing ſables, foxes and ermines, bears, elks, rain-deer, martens, &c. and of theſe ſkins the Empreſs has a certain ſhare by way of duty, the reſt are ſold to the Ruſſian governors at a ſtated price, and ſometimes they are permitted to diſpoſe of them to private perſons.

Their diet is chiefly fiſh, veniſon, wild fowl and roots, for they have neither rice nor bread. Their drink is for the moſt part fair water, and ſometimes the blood of a rain-deer, or of any another beaſt they take; and, it is ſaid, they can diſpenſe with a draught of train oil. Tobacco they are immoderately fond of, but inſtead of blowing the ſmoke out of their mouths, they hold a little water in their mouths, with which they ſwallow the ſmoke down, which ſo intoxicates them that they ſoon loſe their ſenſes, and throw up the phlegm: this they will repeat ſeveral times in a day, and it is thought to be wholeſome phyſic to an Oſtiack conſtitution. Their winter huts are low in the ground, with a roof of barks or ruſhes; in ſummer, they build on the banks of the rivers, and employ themſelves in fiſhing.

Their religion is nearly the ſame as that of the Samoieds. To which we may ſubjoin, that they have ſmall brazen idols, placed in groves, or on the tops of houſes. When they make offerings, they preſent an animal to the idol, and one of them puts up the petitions of thoſe who brought the ſacrifice; he then pierces the beaſt with an arrow, and they all join in killing him: then the animal is drawn round the idol, and ſome of them ſprinkle the blood upon it; after which, they dreſs the fleſh and eat it, with great ſhouting and merriment.

SECT. II.

Containing a particular deſcription of the chief cities and towns in Siberia; with the genius, manners, religion, mode of living, diverſions, &c. of the Ruſſian inhabitants there.

TOBOLSKI, which, as we before obſerved, is the capital city of Siberia, was built on the ſide of the old city which had then the name of Sibir. It contains about fifteen thouſand inhabitants, almoſt all Ruſſians, or naturalized. There are ſeveral Mahometan Tartars of the latter ſort; the greater part of whom, that they may perform uninterruptedly the ceremonies of their own religion, live without the city.

The larger part of Tobolſki is ſituated on the banks of the Irtis; and the other upon a hill, the top of which is a kind of platform extending to the eaſt of the town. That part on the hill is fortified both on the eaſt and north, by a rampart, baſtions, and a ditch ſix feet broad, bordered with palliſadoes. The lower town is in a plain, between the hill and the river; and both towns taken together, are of a conſiderable circumference. All the fortifications of the upper town, which is called the city, on the flat: the ſouthern part of the city, on account of a deep gorge, is difficult of acceſs; as is alſo the weſtern part, becauſe the river flows at the foot of the hill, which being compoſed of a looſe ſand, cannot be ſcaled but with great danger: large pieces frequently break from the hill, and, falling into the river, bear every thing before them.

There is a governor in Tobolſki, whoſe juriſdiction reaches almoſt all over Siberia: here is alſo a court of equity compoſed of fifteen counſellors, who conduct both civil and military concerns. But as Tobolſki is near eight hundred leagues diſtant from the court; therefore, that the governor may not abuſe the power with which he is inveſted, there is a proctor, who ranks next to the governor, but who is neither dependent on him or the court of equity; ſo that the buſineſs adjudged by the governor, or by the chancery, cannot have a final determination without the proctor's concurrence.

In the upper town, or city, there are three churches and a convent; but theſe are built of wood. In the lower town are ſeven churches and a convent built of ſtone: and there are three different communications from the upper to the lower town. There is an archbiſhop at Tobolſki, whoſe dioceſe extends over the greateſt part of Siberia. The counſellors of chancery, and great numbers of the merchants, live in a very reputable manner.

A conſiderable traffic was once carried on between this city and the Chineſe by means of caravans; but the knavery both of the Chineſe and Ruſſian merchants reduced it in a ſhort time to a very languiſhing ſtate. It has a garriſon conſiſting of two regiments of infantry. Moſt perſons employed here are ſent from Muſcow and Peterſburgh.

At the diſtance of about an Engliſh mile from Tobolſki, the eye is delighted with a moſt beautiful view, from the number of ſmall ſteeples in the city, moſt of which are covered with braſs; but this agreeable ſcene diſappears on entering the town, the houſes of which are all of wood, and very ill built; the governor's and archbiſhop's palaces, the town hall, and a ſort of citadel, are the only buildings formed of brick and ſtone. The ſtreets, both of the upper and lower town are exceſſively dirty; and though, on this account there are footways made by planks in ſome of the ſtreets, they are nevertheleſs kept in very bad condition.

Neiwianſkoi is in the province of Tobolſki, and is ſituated on the river Neiura. It has a fort and about eight hundred houſes. There are made very valuable braſs and copper utenſils, and there are conſiderable iron works in its neighbourhood.

In the abovementioned province, is Catherineburgh, which contains upwards of four hundred houſes excluſive of thoſe in the ſuburbs without the wall. Here are a wooden church, a ſtone building for public officers, an arſenal, an exchange, and a cuſtom-houſe. This city being in the centre of all the Siberian mine-works, the director of the mines takes up his reſidence here: the ſuburbs are partly peopled by ſuch as toil at mines, or by thoſe ſent thither, and deſtined to labour for their offences. Proviſions of all ſorts are very plentiful here, and ſold reaſonably. It is ſituated on the river Iſet, and is well defended.

Tiumen is likewiſe in the province of Toboliki, and ſituated on the river Tura to the ſouthward, over which there is a bridge upwards of eighty fathoms long; at a ſmall diſtance below it there is a ſtone fort, and without this fortification are five hundred houſes, ſix wooden churches, and a convent. The ſuburbs of Tiumen are divided into two parts, the one part containing about two hundred and fifty houſes, three ſtone churches, and a monaſtery; the other part is inhabited by Mahometan Tartars and Bucharians, as well as Ruſſians; the latter have a church, and the former a moſque.

Tomſkoi (whoſe ſituation we deſcribed above) is the capital of a province of that name. It is a ſtrong frontier place, lying in fifty-ſix degrees fifty minutes north latitude, and in eighty degrees thirty-ſix minutes longitude, from London. It contains about two thouſand houſes, and is ſituated on the river Tora. A caſtle built of wood, with fourteen pieces of cannon, ſtands in the higheſt part of the city, in which are alſo a cathedral built of wood, a chancery court, and an arſenal. In the lower part of Tomſkoi there are four churches, beſides a monaſtery and a nunnery. Proviſions of all kinds are in great plenty, and the people carry on a very conſiderable trade..

Narim is the capital of a province of the ſame name. It has a ſtrong fortreſs for its defence, garriſoned by Coſſacks. It is in fifty-eight degrees north latitude, and ſituated on the Oby.

Pohem is ſituated on a river flowing into the Tobol from the north. This town is pretty well peopled, and defended by a fortreſs.

We ſhall take notice of the religion of the Ruſſians, when we come to treat of the Ruſſian dominions in Europe, as the people of this nation profeſs the ſame throughout the whole empire.

With reſpect to the mode of living as practiſed by the inhabitants of Siberia, they ſpend great part of the year in ſloth and idleneſs, ſhut up in their hovels, the filthineſs of which is intolerable to perſons of the leaſt delicacy. The unwholeſomeneſs and inconvenience of their hovels are conſiderably augmented by the inclemency of the weather, which prevents a communication with the freſh air: their windows are generally no more than one foot high, and ſix inches wide; beſides which the inhabitants are almoſt deprived of the light of the ſun during the time it remains in the weſtern conſtellations: in this dark ſeaſon they receive light only from ſplinters of birch, which they call couchines: theſe natives, however, are ſtout, healthy, robuſt, muſcular, and live to a great age: though it muſt be confeſſed an infinite number of children die, eſpecially among the common people, of whoſe families one third part ſeldom ſurvive their infant ſtate: parents who have had ſixteen or eighteen children born, having no more than three or four alive; and the ſmall-pox, ſcurvy, and venereal diſeaſe, concur gradually to thin the country of inhabitants; ſo that unleſs the Ruſſian government adopts ſome meaſure to put a ſtop to this depopulation, there will ſoon be an end of the human ſpecies here.

The women of this country are in general tolerably handſome; and thoſe of all ranks and ages paint.

At Tobolſki, in particular, the women are extremely fair, and their countenances perfectly agreeable: their eyes are black, languiſhing, and down caſt, for they are ſo baſhful that they never look a man full in the face; they wear no caps, but coloured handkerchiefs, which they ſo curiouſly interweave among their hair, generally black and unpowdered, that this kind of head-dreſs gives them a very attractive look. They are unacquainted with that variety of undreſs to which the Europeans are accuſtomed, and change their linen but ſeldom. The age of the Siberian women is diſtinguiſhed by their dreſs: the old are dreſſed in the Ruſſian faſhion, and the young wear a Ruſſian robe, in the manner of the Polanders. They have ſtrait caps, with their hair hanging down from each ſide or behind: the cap is adorned with very indifferent fringes of a ſtuff peculiar to the place, which is bound round in curious circles.

The people of rank at Tobolſki have ſeldom more than two beds in their houſes, one for the huſband and wife, and the other for the children; all other perſons in the houſe lie upon benches or mats. The beds have no curtains; and, inſtead of a bolſter, they have ſeven or eight pillows, one leſs than the other, raiſed up in the form of pyramids. This bed is generally the principal piece of furniture. In 1663, people of quality uſed to lie on bare benches, on which only a ſkin or other covering was ſpread: they have ſcarce any furniture in the houſes, and at meals, very few of their tables were covered with a cloth.

The men of this place are extremely jealous of their wives, who ſeldom go from home, but live wholly ſequeſtered from ſociety, and are given up to indolence and negligence. That ſpecies of refined love, which flows from ſenſibility, and predominates over the human ſoul only, is here unknown and unfelt. A lover never has the ſatisfaction of ſeeing the diſorder and embarraſſment of his miſtreſs, endeavouring, though in vain, to conceal her paſſion. In this barbarous country, men tyrannize over their wives, and treat them as ſlaves, requiring them to perform the moſt ſervile and menial offices: no wonder, then, that the delicacy of ſentiment, which characteriſes the natives of more civilized countries, is ſo rarely to be met with here. But though the men uſe their wives with ſuch ſeverity, they are very indulgent to their daughters: they think married women ſhould be wholly taken up with their huſbands, but that liberty ſhould be given to the unmarried, in order that by that means they may have an opportunity of getting huſbands; and the girls very ſoon avail themſelves of this liberty, without either the conſent of their parents, or the ſanction of the church.

Society is ſcarcely ever enjoyed in this city; nor indeed is it poſſible there ſhould be much under a government, where no individual partakes of that eſſential freedom, by which the happineſs and welfare of the citizen is ſecured. A reciprocal fear prevails among people here, whence ariſe diſtruſt, diſſimulation, and perfidy. Genuine friendſhip, that noble quality which ſo powerfully contributes to the common felicity of human beings, glows not in the breaſt of a Ruſſian. Nor are the people here governed by any principles of morality: the clergy, who are very ignorant, are as libidinous and drunken as any. We do not mean, however, to eſtabliſh an unfavourable opinion of their whole body; ſince there are ſome among them who are of liberal capacities and irreproachable characters. The higher claſſes of people never aſſume the prieſt's office, ſo that there is no intermediate ſtate in the eccleſiaſtic body; it is made up intirely of the common people, or the children of the prieſts, who are often the moſt diſſolute; by which means the depravity and ignorance of the clergy may be imputed to their not having acquired any refinement from education.

Dancing is a common diverſion among the young women of this country. Sometimes ſix or eight couple are ſeen dancing together, and at other times only two, a man and a woman. Moſt of their dances are characteriſtic: a lover expreſſes his paſſion by the moſt wanton and laſcivious movements; his miſtreſs anſwers him with all the graces peculiar to the ſex; which are extremely alluring in theſe girls, as the inactivity of theſe girls gives them a kind of languor very tender, expreſſive, and captivating. Some of their dances are pantomimic, which the young people perform with admirable dexterity; they turn round on one foot, while they are almoſt ſitting: then riſing up inſtantly, they throw themſelves into ſome mimic or groteſque poſture, which they vary every moment, in advancing, retiring, or turning round the room. This dance is generally performed by one couple only. Some of the young women alſo amuſe themſelves in fine weather by ſwinging upon a plank balanced acroſs a beam lying on the ground.

SECT. III.

Treats of the Kuriles, the Koreki, the Tchukotſkoi, the Tunguſi, Jakuti, Bratſki, Kamſki, and Barabinſki; with the manners, cuſtoms, dreſſes, habitations, &c. of theſe ſeveral and diſtinct nations of people.

THE Kuriles are remarkable for their hoſpitality and peaceable diſpoſition, and are more civilized than their neighbours the Kamtſchadales (of whom we ſhall treat in the following ſection): they are alſo more agreeably featured, and both ſexes wear ear-rings of ſilver, with which they are furniſhed by the Japaneſe. They are of ſmall ſtature and round viſage, and pay little regard to uniformity of dreſs, their cloaths being commonly formed of the ſkins of different animals. Their habitations reſemble thoſe of the Kamtſchadales, though kept ſomewhat cleaner, and their proviſions are generally the fleſh of amphibious animals.

The Koreki dwell on the coaſt of the eaſtern ocean, from the river Ukoi to the Anadir, and along the coaſt of the Perchinan ſea. This nation is divided into the ſettled Koreki, and the wandering or rein-deer Koreki. The ſettled Koreki are imitators of the Kamtſchadales in every reſpect. The Koreki differ from each other both in diſ-

poſition

poſition and form, as well as in their dreſs and cuſtoms.

The wandering or rein-deer Koreki are naturally very jealous, and often put their wives to death upon the ſlighteſt ſuſpicions; and if a man and woman be actually detected in criminal connection, both of them are ſure to ſuffer death: the women therefore avoid ſetting off their perſons to advantage, and never waſh their faces, or comb their heads. But this is not the caſe with the ſettled Koreki, who decorate themſelves as much as poſſible, and ſo little does jealouſy prevail among this nation, that when one man viſits another, the wife or daughter of his friend is always at his ſervice. The wandering Koreki are of ſhort ſtature, ſlender ſhape, with oval faces, large mouths, and ſhort noſes. Both the Koreki have black hair; but the former are neither ſo ſhort nor ſlender as the latter.

Marriage, among the Koreki, is only prohibited between father and daughter, mother and ſon: they generally marry into their own family; and pay very little regard to perſonal accompliſhments. Their marriage ceremonies are nearly the ſame as at Kamtſchatka.

The Korekian ſledges are drawn by rein-deer in the winter, who will travel near one hundred miles in a day.

With reſpect to the funeral ceremonies of the Koreki, we muſt obſerve, that they dreſs the deceaſed in his beſt cloaths, and fixing him upon a pile of wood, throw on it his bow and arrow, and then ſet fire to the pile. The corpſe is drawn on a ſledge to this pile by the rein-deer, which are put to death, and thrown into the fire, while the pile is conſuming.

The Koreki live in continual fear of ſpirits, which they think hover in woods and on mountains. They ſometimes fix the head of a dragon upon a ſtake, and turning the animal's face towards the eaſt, cry out, "Take this, and ſend us ſomething better for it."

Near to the Koreki are the Tchukotſkoi, who inhabit the banks of the river Anadir, and extend along the ſhore, to the north and ſouth-eaſt, to ſeventy-four degrees of latitude; and thoſe who live to the north of the Anadir, not being ſubject to the Ruſſians, often impriſon and deſtroy thoſe who are. The habitations of theſe people are more commodious and warm than thoſe of the Koreki; and when a viſitor comes to ſee them, he is always preſented with the maſter of the hut's wife or daughter, who hands to him a baſon of her own wine, with which the viſitor waſhes his mouth, or he is not looked upon as a friend. The dreſs of the Tſchukotſkoi is the ſame as that worn by the Kamtſchadales: their food is the rein-deer and other animals found in the country.

There are various tribes of the Tunguſi, which are ſpread through different parts of Siberia: theſe are of the old Scythian race, and are diſtinguiſhed into the Kenni Tunguſi, or thoſe who uſe horſes; the Oleni Tunguſi, or thoſe who uſe rein-deer; and the Sabatſchi Tunguſi, or thoſe who make uſe of dogs. Both ſexes of theſe latter, who take up their reſidence between the Lena and the Penſchriſka ocean, go naked in ſummer-time, except having a ſmall piece of ſkin round their waiſts. In the winter, they are clothed with deer-ſkins. They believe in an all-ruling providence, but reverence idols of their own conſtructing. They hang their dead upon the branches of trees, the fleſh of which rots off, or is devoured by animals or birds; after which they burn the bones.

Jakuti, or Jakutzk, is a province ſituated to the north. The cold here, and in the northern parts of Siberia, increaſes ſo conſiderably, in a few hours, as to ſtrike men and cattle dead who happen to be at too great a diſtance from any habitation to ſhelter themſelves ſpeedily from it. They uſually rub the frozen part with ſnow, by which the circulation is immediately reſtored. This ſevere weather is ſucceeded by ſo hot a ſummer, that the inhabitants are obliged to go partly naked.

In the moſt northern parts, beyond the ſixtieth degree of latitude, the earth produces neither corn nor fruit: they are, however, ſupplied with theſe neceſſaries from the ſouthern parts. They have great plenty and variety of fiſh, and abundance of tame and wild beaſts; and likewiſe great quantities of fuel. Though they have ſome corn in the country, they pay little regard to it; the hunting of animals being what they chiefly delight in.

Jakutzk, on the river Lena, is the capital of the province, and is about four hundred miles from the Frozen Ocean. The Jakuti form one of the moſt conſiderable and numerous Pagan nations in all the vaſt country of Siberia, and are divided into ten tribes, making in the whole not leſs than thirty or forty thouſand perſons, all under the dominion and taxation of Ruſſia.

The Jakuti believe in a ſupreme being, and have an image of him, which has a very hideous aſpect, having a big head, and large eyes of coral. They place it in a tree, and cover it with furs; once a year they aſſemble together and ſacrifice horſes, &c. to this image, ſticking up the horſes heads all round the tree. Then ſitting down in a circle, they drink of a liquor which they call cumiſes, and are intoxicated with it. They alſo throw ſome of the liquor into the air, and into a fire which they light on the occaſion. This ceremony is performed in the ſpring, and is their new year's offering.

Theſe people eat horſe-fleſh, without regarding whether it be freſh or ſtinking, and ſmoke a great deal of tobacco, which they are ſupplied with by the Ruſſians. The huts in which they dwell, are like thoſe of the neighbouring nations, except that their ſummer hovels, reſembling a ſugar-loaf, are covered with the bark of trees, joined and embroidered very curiouſly with horſe-hair. They generally leave their dead in their huts, ſhutting up the ſame, and ſeeking another habitation.

Beyond the river Jenſeiſka, in the road to China, live the Kamſky Tartars in huts covered with bark, like ſome of thoſe already deſcribed. They are Pagans, and their food is fiſh and veniſon, which they eat raw as well as dreſſed, and roots ſerve them inſtead of bread. More eaſterly lie the Bratſky Tartars, a more ſubſtantial people, where a private man is frequently maſter of four or five hundred horſes, and a proportionable number of other cattle. They live chiefly on veniſon, but value horſe-fleſh much more. They drink mare's milk, and diſtil a ſtrong ſpirit from it, as they do in moſt parts of Siberia, Tartary, and China. They purchaſe their wives, as in ſome other parts of Siberia, with their cattle, and give often an hundred horſes, or oxen, for a virgin they admire, and fifteen or twenty camels, beſides ſheep. The natives are very hoſpitable, and will ſometimes preſent travellers with ſheep as they paſs through their country, reſerving only the guts and entrails to themſelves, which they look upon to be the moſt delicious eating. They are Pagans, and worſhip an idol made of the ſkins of beaſts, which they hang upon their huts. As for temples, there are none in Siberia but what the Ruſſians have lately built.

Both men and women are of a very tawny complexion, but better dreſſed than moſt of their neighbours. The women particularly wear long plaited gowns, and the virgins diſtinguiſh themſelves by adorning their hair with braſs, and other glittering toys.

The vaſt deſart of Baraba lies further to the weſtward: this is inhabited by the Barabinſki, who ſhift their quarters in the ſummer, and repair to the banks of rivers. Their hovels, which are low in the earth, with the roof riſing two or three feet above, are covered with the ſkins of animals, or with ruſhes. As there is no water in the deſart of Baraba, the liquor of theſe people, during their reſidence there, is melted ſnow: they alſo drink mare's-milk, as moſt of the other Tartars do.

There is a nation of Mahometans along the river Irtis, who keep numerous flocks and herds: theſe pay a tribute to Muſcovy, though they are governed by princes of their own. They reſemble the antient Ruſſians in their dreſs, and the women wear rings in their noſes.

SECT. IV.

Treats of the ſituation, extent, climate, &c. and natural hiſtory of the peninſula of Kamtſchatka.

THIS peninſula is bounded on the eaſt by the ocean, which ſeparates it from America; its weſtern boundary is Penſchinſka, commencing near the ſouthern point of the cape of Kamtſchatka, and extending northerly between Oehotſkoy and the weſtern coaſt of Kamtſchatka. The ſouthern part is in fifty-one degrees north latitude, and in one hundred and forty-three degrees longitude, eaſt of London. This peninſula is divided into two parts by a chain of hills running from north to ſouth. Its chief rivers are the Awatſcha, the Kamtſchatka, the Teghil, and what is called the great river. There are many extenſive lakes in it.

Their ſpring and ſummer do not continue more than four months, but the latter is far from being agreeable, for as the adjacent hills are covered with ſnow, the air, even in the middle of ſummer, is ſometimes pretty cold, attended with frequent rains: the winter, however, is not very inclement.

In many places, mines of iron and copper have been diſcovered;

covered: the iron ore hath been found to be compact, of a yellow colour, inclining to red; and, in ſome parts, black metallic particles have been obſerved, more compact than the reſt of the ore. This ore, when crude, could not be attracted by the load-ſtone, but, when calcined, became ſo in a ſmall degree. A ſolid iron ore has alſo been diſcovered here, ſimilar to that found to the ſouth-weſt of Echaterinenburg: its ſurface was found to be covered with a yellow oker, of a reddiſh brown in the breakings of its ſolid parts. The ore, when crude, was not acted upon by the load-ſtone, though, after calcination, ſlightly attracted by it. The copper mines are like ſome of thoſe produced on the Ryphean mountains, having the malachites, in the form of ſtalactites and ſtataguites, in their cavities, very beautiful, and capable of being poliſhed.

There is great choice of timber for a variety of uſes in Kamtſchatka, as well as abundance of ſhrubs of divers kinds; they have alſo ſeveral excellent medicinal plants. Barley, oats, peas, turnips, &c. grow likewiſe here. The graſs ſprings up ſo faſt, that they have three harveſts; and the blades are frequently five feet in height.

This country abounds with tame and wild fowls. The wild animals, are, black and white bears, wolves, lynxes, boars, elks, and a kind of ſtag very much like the fallow-deer. The bear never attacks a man, unleſs they find him aſleep, when they tear the ſcalp off the back part of the head, and ſometimes intirely deſtroy him. Foxes are alſo very numerous, ſome are white, ſome rediſh-yellow; ſome grey, with a black ſtreak on the back; and are much valued; the white ones, however, are alſo valued, as being ſcarcer. There are alſo black-cheſnuts and blue-breaſted foxes; and they are in general too crafty for their purſuers, their ſagacity exceeding that of the other ſpecies. The opulence of the country conſiſts in its ſables and ermines; the ſables which are ſold at a high price, excel thoſe found in any other part of the globe: the natives eat the fleſh, and eſteem it a very fine food.

Here is alſo found the gulo, or glutton; likewiſe other kinds of beaver, as the arıs, rein-deer, and ſayga. The natives collect themſelves in companies to hunt theſe animals; they go at the cloſe of the winter, from the month of March to the end of April, taking proviſions with them. The glutton, which hath a very fine fur, is a terrible enemy to the deer: it will dart itſelf from a tree upon a deer's back, and, fixing between the creature's horns, tears out his eye: the afflicted animal, with exceſs of agony, falls to the ground, when the glutton ſtrips his fleſh from his bones.

Dogs are very numerous in this country: theſe reſemble the European, and live much upon mice and fiſh; they ſcratch up the ground for the former, and ſeize the others from their ſtreams. Theſe dogs are extremely ſerviceable to the natives, in drawing their ſledges over the ſnow: in the moſt dreadful weather, they ſcarce ever loſe their way.

Several ſorts of amphibious animals are alſo in Kamtſchatka. One is the ſea-cow, about thirty feet in length, and weighing ſix or ſeven thouſand pounds, the ſkin of which is ſo hard, that ſcarce an hatchet or ax will penetrate it. The fleſh of a young ſea-cow, when properly boiled, has a good taſte; the lean part is ſomewhat like veal, and the fat part like pork. The method of catching this animal is, by an iron hook ſtruck into it by ſome men in a ſmall veſſel, then by a rope held by people on ſhore, the ſea-cow is drawn gradually to the land, while thoſe in the veſſel cut the creature with inſtruments in ſeveral parts of the body, till it expires. It is not very difficult to take the ſea-cow from its elements, for it ſeldom raiſes its head above the ſurface of the water, though its ſides and back are often ſeen.

Sea-horſes and ſea-cats are alſo met with here: the latter have long hairs ſtanding out on each ſide of their mouths like thoſe of a cat, and they weigh from five to eight thouſand pounds: their eyes are as large as a bull's, and they will fly at people in boats; even if they are blinded by ſtones thrown at them, they will not retire, but gnaw the very ſtones that are thrown; however, when once deprived of ſight, there is no great danger to be apprehended from them. The male and female differ both in form and diſpoſition; ſo much in form, that they might be taken for different animals; and as to diſpoſition, the female is mild, inoffenſive and timid: as a proof of this, when an attempt is made to ſeize a young ſea-cat, and the male, by vigorouſly defending it, affords the female an opportunity of taking it off in its mouth; if, in this caſe, the female ſhould happen to drop it, the male abandons its adverſary, and, flying directly at the female, ſeizes her with all imaginable fury; when the latter, by licking his paws, and ſhewing every kind of ſubmiſſion, endeavours to mitigate his rage. The ſeas alſo abound with ſeals, which are caught by different methods; ſometimes they are taken in the water, and at other times they are killed while ſleeping on the rocks. Here are whales from ſeven to fifteen fathoms long.

Among a variety of fiſh, here is the ſterlet, which is ſo much like the ſturgeon, that there is ſcarce any difference, except that it is ſmaller and more delicate; it is ſo fat, that it may be fried without oil.

Some of the birds of Kamtſchatka are, eagles, hawks, pelicans, ſwans, geeſe, wigeons, ducks, cuckows, magpies, ſnipes, partridges, &c. A bird called the red-neck diver is very curious; it has a beautiful ſpot on the lower part of its neck; beneath this ſpot, there are feathers of a brown colour in the middle, and edged all round with white; the breaſt, belly, and legs, are of a very beautiful white.

Sea-fowl are very numerous on the coaſt of the eaſtern ocean, as peacocks, ſea-pies, green-ſhanks, puffins, &c. Here too are the cormorant, ſea-raven, and urile.

Clouds of dragon-flies, locuſts, and gnats, are ſometimes ſeen in this country. The latter are ſo troubleſome, that the inhabitants are obliged to vail their faces, to avoid them. The dragon-flies, forming columns, fly with incredible ſwiftneſs.

SECT. V.

Contains an account of the Kamtſchadales, their dreſs, habitations, marriages, children, treatment of their dead, &c.

THE natives of Kamtſchatka inhabit the ſouthern part of the peninſula; the northern part is inhabited by the Koreki, and the ſouthern by the Kuriles, of whom we have treated above; but the Ruſſians call the whole country Kamtſchatka, though it has ſeveral names given it from particular circumſtances. The Kamtſchadales are ſhort in ſtature, and reſemble moſt of the other inhabitants of Siberia, except that their faces are ſomewhat ſhorter, their mouths larger, and their cheeks fuller; they have dark hair, hollow eyes, ſharp noſes, and tawny complexions; the latter is ſaid to be principally owing to the influence of the ſun reflected from the ſnow in the ſpring-ſeaſon, when the ſnow lies thick on the ground. Some of the natives, who are obliged to be in the woods, cover their faces with a kind of netting, to prevent the effects of the ſun-beams darting on the ſnow; for the eye-ſight ſuffers by this refraction as well as the complexion.

Theſe people dreſs in deer-ſkins, with the fur outwards; they uſe alſo, for this purpoſe, the ſkins of dogs and other animals. They often wear two coats, the ſleeves of the outer coat reaching down to the knees; they have a hood to it, which in bad weather ſerves to cover the head; and they adorn the back part with ſhreads of ſkins, and ſometimes of ſilks of different colours. The women wear the ſame ſort of garments as the men, though their coat, or rather waiſtcoat, ſits cloſer to their bodies, and is decorated with ſlips of red, blue, and yellow cloth, and ſometimes ribband, or woollen liſt. To this waiſtcoat is joined a ſort of petticoat coming about half way down the leg. The men wear a leather belt round them, and their legs are covered with different coloured ſkins; they wear ſeal-ſkin caps or hats, and ſometimes a cap or hat of birch bark; ſome have caps of braſs plaited. The women let their hair grow much longer than the men; they plait it, and hang braſs trinkets to it: they have fur caps, that are black without, and white within. The men plait their hair, as well as the women.

The natives of this country never waſh themſelves, but live in a moſt beaſtly manner: they neither cut their nails, nor comb their hair. They eat raw fleſh, carrion, ſtale-fiſh, or any thing they can get, how filthy ſoever it be. They live in huts under-ground, covered with graſs or earth, and ſometimes with the ſkins of the animals they have killed in the field, undreſſed, and yielding a noiſome ſtench. They place benches in their hovels, with a fire-place in one corner, and on theſe benches they repoſe themſelves. Some of the huts are covered and lined with mats. Theſe are their winter dwellings; nor are their ſummer retreats much more elegant, except that they are built on the ſurface of the earth, and with rather more regularity. Theſe, it is true, are built high on pillows, with beams thrown acroſs them, on which a floor is fixed, with a roof riſing from each ſide to a centrical point; and, indeed it is neceſſary that their ſummer habitations ſhould be thus high, elſe the inhabitants would be in continual danger from the wild beaſts. They eat out of bowls, or troughs,

troughs, with their dogs, and never waſh them afterwards.

We ſhall now take notice of their marriages. When a man hath met with a young woman that he likes, he engages into the ſervice of her parents, and, after the expiration of a limited time of ſervitude, obtains either permiſſion to marry her, or is diſmiſſed with a requital for his ſervice. If he has leave to marry, the nuptials commences immediately, and the whole ceremony conſiſts in ſtripping the bride naked, whoſe cloaths, however, are ſo faſt bound by ſtraps and girdles, that he finds it no eaſy taſk to accompliſh his purpoſe; at this criſis ſeveral women ſhelter and protect her from him; who, however, ſeeking an opportunity to find her leſs guarded, makes freſh efforts to undreſs her: but if ſhe cries out, and her exclamations bring aſſiſtance, the women who come fall upon the man, ſcratching his face, tearing his hair, and otherwiſe roughly treating him; till the bride, ſhewing ſome concern for his ſituation, and the women becoming leſs violent in their aſſault, the man at length ſucceeds, and then retires from her, who however calls him back, and acknowledges in a ſoft plaintive tone, that he has conquered her. Thus the ceremony ends, and the next day the happy couple repair to the hut of the huſband. In about a week afterwards they make a viſit to the wife's parents, where they celebrate the marriage feaſt with the relations of both parties. Some of the men marry three wives, who in general live in a friendly manner together, and are never jealous.

Notwithſtanding it is deemed a very capital offence in a woman to procure abortion, yet if twins are born, one of them muſt be deſtroyed. The women put their infants in a baſket faſtened to an elaſtic pole, which is eaſily moved with the foot, to rock them. As ſoon as they can ſtand on their legs, their mothers leave them to themſelves, ſuffering them to roll on the ground any where; they are moſt commonly half naked, and begin to walk at a time when a child in Europe would not be able to ſtand.

Theſe people never bury their dead, but often give them to the dogs; and ſay, that as the deceaſed are thus devoured by dogs, they will enſure to themſelves a pleaſant carriage in ſledges drawn by fine dogs in the other world. This abominable cuſtom, however, is not univerſally practiſed; ſome leaving their dead in their hut, and ſeek a new habitation. The apparel of the deceaſed perſon is always thrown away, from a ſuperſtitious notion, that whoever ſhould wear it would meet with ſome dreadful calamity.

They travel on ſledges drawn by dogs; their number is generally four, which are driven by a whip. The perſon in the ſledge is ſeated on the right ſide of it, with his feet hanging over, and is obliged to balance himſelf with great care, leſt the ſledge ſhould overſet. Where the roads are in tolerable condition, they can travel to a great diſtance in a ſhort time, carrying with them proviſions, &c. They ſometimes travel, in this manner, about thirty werſts, that is, upwards of twenty-three miles in a day.

They hunt the bear, among other animals; on which occaſion, they uſe rackets to walk upon the ſnow with, arming themſelves with pikes, and taking dogs with them to provoke the animal. They then wait till he comes out of his incloſure, for they would attack him to great diſadvantage while he remained there; becauſe the ſnow being very firm in that place, the bear would be able to avail himſelf of all his ſtrength; but the inſtant he comes out, he ſinks into the ſnow, and while he is ſtriving to diſengage himſelf, the hunters with their pikes eaſily deſtroy him.

They dreſs their ſeal-ſkins in the following manner; they firſt wet and ſpread out the ſkin, and with ſtones fixed in wood ſcrape off all the fat; then they rub it with caviar, roll it together, and tread on it; they afterwards ſcrape it again, and repeat the firſt part of their proceſs till the ſkin is thoroughly cleaned and ſoft. They prepare in the ſame manner ſkins of beaver, deer, dogs, &c.

When the men are not employed in hunting or fiſhing, they weave nets, and conſtruct ſledges and boats; and in the ſpring and ſummer they procure the neceſſaries of life, and lay up a ſtore for the ſucceeding winter. The women make ſhoes, ſew cloaths, dye ſkins, &c. they alſo make glue of the dried ſkins of fiſhes, and particularly of the whale. They uſe a board of dry wood to light their fires; in this board are ſeveral round holes, into one of which putting the end of a ſmall round ſtick, they roll it backwards and forwards till the wood takes fire by the friction.

The people of this country are arrant cowards, and yet ſeem to deſpiſe life, through an innate kind of ſtupidity. They never attack their enemies openly, unleſs compelled to it; but ſteal privately to their huts, and treat them moſt barbarouſly, cutting them to pieces, and even tearing out their entrails: theſe cruelties are exerciſed with triumph and ſhouts of joy. Whenever they hear of a foe advancing towards them, they retire to ſome mountain, and fortify it as ſtrongly as poſſible: if there be a probability of the enemy getting the better of them, they immediately cut the throats of their wives and children, and then meet their aſſailants with a frantic rage, ſelling their lives as dear as poſſible. Their weapons are bows and arrows, and ſpears.

The religious notions of the Kamtſchadales are pretty ſingular. They erect a ſort of pillar on ſome plain, and cover it with a parcel of rags. Whenever they paſs by this pillar, they throw at it ſome fiſh or fleſh, and avoid killing any bird or beaſt near it. They think that woods and burning mountains are inhabited by evil ſpirits, whom they live in great fear of, and make them offerings; ſome of them have idols in their huts. They have a very imperfect idea of a ſupreme Being, and think he can neither diſpenſe happineſs nor miſery: the name which they have for the Deity, is Kutchu. They reverence ſome particular animals, from which they apprehend danger, and ſometimes offer fires at the holes of foxes; they implore wolves not to hurt them, and beſeech amphibious animals not to overſet their boats. Many of them, however, adopt the Ruſſian manners, and contemn the cuſtoms of their country; they have been inſtructed by Ruſſian miſſionaries in the Chriſtian religion; and ſchools have been erected for their children.

Theſe people ſtrictly obſerve the law of retaliation: if one man kills another, the relations of the perſon killed deſtroy the murderer. They puniſh theft, by burning the fingers of the thief. Before the Ruſſians conquered them, they had ſuch frequent inteſtine broils, that a year rarely paſſed without ſome village being intirely ruined.

Great havock is made in this country by the ſmall-pox. The ſcurvy, with the irregularities of parents, bring a variety of diſeaſes upon their offspring, to cure which, they apply roots, herbs, &c. The manner in which theſe people live in their huts, and their exceſs of debauchery, contribute to make the venereal diſeaſe very frequent among them. They have a diſorder called the ſuſhutoh, which is a ſort of ſcab, to which they apply the raw ſkin of a hare, which cauſes a ſuppuration. They are likewiſe ſubject to the palſy, jaundice, boils, cancers, and other diſorders.

There are three volcanoes in Kamtſchatka, the firſt is that of Awatcha, to the northward of the bay of that name; it is a chain of mountains, the baſe of which is covered with trees, and extends to the bay. The middle forms a kind of amphitheatre, and the various ſummits which are ſpiral cannot be viewed without exciting the moſt awful ideas. They always emit ſmoke, but rarely fire. There was indeed a terrible eruption of ſmoke and cinders in the ſummer of the year 1737, but it only continued one day; many of the cinders weighed almoſt two pounds avoirdupoiſe. This eruption was the forerunner of a terrible earthquake, which happened on the ſixth of the enſuing October, and in a quarter of an hour overturned all the tents and huts of the Kamtſchadales, being accompanied by a ſingular ebbing and flowing of the ſea, which at firſt roſe to the height of twenty feet, then ſunk, and retired to an unuſual diſtance; it ſoon after roſe higher than at firſt, and ſuddenly ſinking again, retired ſo aſtoniſhingly far from the common low-water mark, that it was for a conſiderable time loſt to the eye. At length the earthquake was repeated, the ſea returned once more, and roſe to the height of two hundred feet, overwhelmed the whole coaſt, and then finally retired, after having deſtroyed the goods, cattle, and many of the lives of the inhabitants, and left ſeveral lakes of ſalt-water in the lower grounds and adjacent fields. The ſecond volcanoe iſſues from ſome mountains ſituated between the river of Kamtſchatka and that of Tobolſki. Nothing was ever known to exhale from this but ſmoke, till the year 1739, when it vomited a torrent of flames, which deſtroyed all the neighbouring foreſts. The third volcanoe iſſues from the higheſt mountains in Kamtſchatka, on the banks of the river of that name. It is environed by a cluſter of leſſer mountains, and the head is rent into long crevices on every ſide. Its greateſt eruption began September 25, 1737, and continued a week, which, with an earthquake that followed, did very conſiderable damage.

In the ſouthern extremity of Kamtſchatka there are hot ſprings: they form rivulets, and run almoſt the length of the river Ozernaya which iſſues from the lake Kurilſky, and then join that ſtream; the waters, however, have no very conſiderable degree of heat in them.

There is a mountain near the river Pandia, from whoſe

ſummit a prodigious cataract of boiling waters fall with a terrible noiſe, then running to a conſiderable diſtance, they continue boiling up to the height of a foot, till they loſe themſelves in ſeveral lakes, which contain a great number of iſlands. From this mountain the inhabitants obtain ſome beautiful ſtones, on which they ſet a great value on account of their admirable variegated colours; which are merely the effects of the different powers of heat, humidity, and friction; for theſe ſtones are waſhed from the mountains, and are poliſhed by the above-mentioned hot and impetuous waters.

During the winter, a great quantity of fiſh harbour in the river of Kamtſchatka. In the ſpring, when the ice breaks, they attempt to get to the ſea; but the natives watch the heads of the rivers, and take a great number of them in a kind of nets; ſome they dry in the ſummer and lay by for their winter food, and from others they extract the fat or oil by means of red-hot ſtones, which they carefully reſerve for a great variety of uſes.

The late gallant Captain Cook was killed by the natives at an iſland called O-why-hee, near Kamtſchatka; an account of whoſe death, and diſcoveries in thoſe parts, as contained in his third voyage, will be given towards the concluſion of our work.

CHAP. VII.

THE NEW AND COMPLETE HISTORY AND DESCRIPTION OF CHINESE, MOGULCAN, AND INDEPENDENT TARTARY.

SECT. I.

Contains an account of the Mantcheoux or Mantchew Tartars; with a deſcription of the provinces of Mugden, Kirin-ula, and Tſitſi-kar, their manners and cuſtoms, &c.

THE Mantcheoux or Mantchew Tartars live chiefly in huts on the banks of rivers. Their country is in the north of Lao-tong, the moſt eaſterly of the Chineſe provinces, and is bounded by the river Saghalian-ula on the north; by Corea and Lao-tong, on the ſouth; by the ocean, on the eaſt; and by the Mongol's country, on the weſt. It is divided into three provinces, namely, Mugden, Kirin-ula, and Tſitſi-kar; and from hence that enterpriſing Tartarian ſpirit originated, which triumphed on the imperial throne of China. But we ſhall ſpeak more particularly in this ſection, of theſe provinces, and of the Tartars in general.

The former of theſe provinces (which is about two hundred and ſeventy miles long, and one hundred and twenty in breadth) hath a favourable ſoil, producing wheat, millet, and cotton, as well as plenty of paſture for cattle, and ſeveral ſorts of fruit. This province of Mugden has given name to the capital, in which are ſeveral public buildings, and courts of juſtice, as at Pe-king. But the moſt populous city is Ton-wang-ching, which indeed may be deemed the key of the great peninſula of Corea.

There are two large handſome roads from Mugden all the way to the city of Pe-king, which is about one thouſand one hundred miles diſtant: theſe are kept conſtantly in repair, having been formed with great labour principally for the emperor, whenever it ſhould be his royal pleaſure to viſit his Tartarian dominions. One of theſe roads is for the paſſage of his majeſty to Tartary, and the other for his paſſage to Pe-king back from Tartary.

The ſecond province is Kirin-ula: it has Lao-tong for its boundary on the weſt; the ocean, on the eaſt; Corea, on the ſouth; and the river Saghalian-ula, on the north. This country is a mountainous deſart, upwards of ſeven hundred and forty miles in length, and ſix hundred in breadth. Here is ſcarce any thing to be ſeen but the gloomy tops of mountains, nor is any thing heard but the hideous howlings of wolves and tygers. Very little rice grows here, but plenty of oats. The air is exceedingly bleak and keen.

Some of the Tartars take up their reſidence in huts on the river Uſuri, and ſubſiſt principally on fiſh; theſe are the Yupi's: they imitate the Chineſe in dreſs, and the women decorate their hair with a variety of baubles. The Ke-cheang Tartars live after the ſame manner, on the banks of the Saghalian-ula. Theſe people, when the rivers are frozen over, are drawn in ſledges upon the ice by dogs. They are very ignorant and uncivilized, though peaceable and inoffenſive. The Yupi's have no ſovereign prince, but chuſe ſeveral chiefs. The Mugden provincials have a Tartarian general, who has lieutenant-generals and a great number of ſoldiers under him.

The third province of Chineſe Tartary is Tſitſi-kar. The capital, which has the ſame name, is a place of tolerable trade, and chiefly peopled by Chineſe.

The hunting of fables is an employment for which the ſolar Tartars are famous; the ſkins of theſe creatures being of great utility to them: the women hunt them as well as the men. In the purſuit of this game, they generally meet with tygers, which they are never afraid to engage, and generally get the better of them; however, if any one unfortunately falls at the feet of this animal, the reſt do not decline their purſuit; for their livelihood depends principally upon the furs they get from the ſables they take.

In ſome of the rivers there are ſeveral fine pearl-fiſheries, and the natives ſet a high value on the pearls.

The inhabitants of Tartary have all nearly the ſame language, though they are diſtinguiſhed into different nations, and ſpeak in different dialects. Their origin and cuſtoms are both equally ancient; for the former could never be traced, on account of theſe people having for ſuch a ſeries of years been continually wandering about from place to place. If we examine the moſt remote antiquity, we ſhall diſcover a ſtriking reſemblance of the people of the early ages, and the Tartars of the preſent time; for as their anceſtors lived, ſo live they.

The religion of the Tartars appears, from monuments of undoubted authority, to be of above three thouſand years ſtanding; and is founded on the ſublimeſt principles of morality. They have in general been followers of the grand lama, or immortal father. This religion made a conſiderable progreſs in early ages; and the authority of this chief pontiff is ſo highly revered, that the emperors of China, previous to the ceremonial of their coronation, always implore his protection, and ſend him rich preſents. This worſhip has not, like the Chineſe, been mixed with other ſyſtems; for neither time, nor the influence of man, hath had power to ſhake the authority of the grand lama, who, however, acknowledges that he is no deity, but only a repreſentative of the divinity; and that he is appointed by heaven to decide ultimately upon whatever relates to public worſhip.

His influence extends as fully to temporal as to ſpiritual concerns; but he conſiders all civil matters, held profane by him, as inconſiſtent with his dignity, and therefore commits the care of government to perſons calculated to conduct affairs of that nature.

In Tartary, there are ſeveral worſhippers of the idol Foë, who pay an implicit obedience to their prieſts, making them preſents, and ſtrictly attending to their directions. Many of theſe prieſts migrate from place to place, in the ſervice of religion and themſelves; but they are in general very ignorant.

SECT. II.

Treats of the Mongols; the ſituation, boundaries, and climate of their country; alſo of the natives, animals, &c.

THE Mongol country is ſituated to the north of China; and is bounded, on the eaſt, by the territories of the Mantchews; on the weſt, by the country of Kalkas; on the ſouth, by China; and, on the north, by eaſtern Tartary and the Lalka Tartars. It was about three hundred leagues in length, and two hundred in breadth. This country is not very well known, except that part of it which the caravans paſs in travelling from

Muſcovy to China. The climate is exceedingly ſevere, and ice lies upon the ground eight or nine months together.

The natives (who are of the ſame original as thoſe who accompanied Tamerlane in the conqueſt of India, Perſia, &c.) are in general of a middle ſize, but very ſtrongly made, with broad faces, black eyes, flat noſes, long whiſkers, ſallow complexion, and of a moſt rude behaviour. Their hair is almoſt as thick and ſtrong as horſe-hair, which they cut cloſe to the head, and leave only a tuft at top. They wear large ſhirts, and callico drawers; and their garments, lined with ſheep-ſkin, reach down almoſt to their feet: theſe they faſten on their bodies by ſtrong leather ſtraps. When on horſeback, they wear a ſhort jacket with narrow deer-ſkin ſleeves, having the fur outward; trowſers and hoſe of the ſame kind of ſkin, both of one piece, and light to the limbs. They have on their heads, caps bordered with fur. The women are not quite ſo coarſe featured as the men, but their dreſs is nearly the ſame as theirs.

This country has in it a great variety of animals, ſuch as camels, dromedaries, cows, horſes, ſheep, elks, bears, tygers, wolves, &c. There is alſo every ſpecies of game known in Europe. Rhubarb and other medicinal plants grow here, ſalt and ſalt-petre are alſo found in great plenty.

The Kalka Mongols, who are a race of Tartars, are dependent on China: their perſons, habits, manners, &c. are the ſame as the Mongols: they dwell beyond the Mongols, and take their name from the river Kalka.

In giving a further account of the Mongols, we muſt obſerve, that they live in little moveable huts, formed of wigs covered with matted wool; they have a fire in the entre, with a hole at the top to let out the ſmoke, and boards or benches round the fire to ſit or lie upon. They are filthy both in their dreſs and in their food: they often make uſe of the dung of their cattle for fuel.

It has been a very antient cuſtom among theſe people, to ſupport a war, by ravaging the country. Their tribes are commanded by ſeveral chans or leaders; and they elect a great chan, who claims a paramount power over all: his reſidence is a kind of military moving ſtation, and he can bring from twenty to ſixty or ſeventy thouſand horſemen into the field. The grand chan of Cambalu is ſaid to have controuled the whole mighty power of Tartary in the days of Tamerlane; and ſo much was he puffed up by his authority, opulence and grandeur, that each day it is related, as ſoon as he was ſeated to dinner, a trumpet ſounded, which was intended to give notice to all the other monarchs in the globe, that they might alſo go to dinner.

They are remarkably dexterous in handling their ſabres, and ſhooting with bows and arrows: they are inured to horſemanſhip from their infancy, and will, while on full gallop, ſplit a pole in pieces with an arrow, though at a conſiderable diſtance. But they have the utmoſt contempt for agriculture, looking upon all buſineſs of that kind as the moſt abject ſlavery. When they are angry with any one, they wiſh it may be his fate to work like an European.

It is common, with theſe people, when any of them become very infirm by age, for others of them to make ſmall huts for the aged invalids near a river, and there leave them to take their paſſage into the next world. They think that in this they act in a friendly manner towards them. Thoſe who die in their huts, are thrown into a burning pile, and their bodies conſumed to aſhes, which are afterwards interred on ſome mountain.

The Mongols ſell or exchange their cattle with the Chineſe for ordinary tea, coarſe cloth, &c. They are never troubled with much care or anxiety, for they have nobody to pleaſe, nor any body to fear.

Though theſe roving people are under no very regular form of government, yet their country is divided into diſtricts, each of which have a chan of its own; but the Tartars of one province muſt not migrate to another; they are to continue themſelves to their own nation, where they have full liberty to roam at their pleaſure.

Their marriages are not attended with much ceremony: the men purchaſe their wives with cattle; and when the wife is turned of forty, ſhe is employed by the huſband as a ſlave, and, as ſuch, muſt attend upon the young wife who ſupplies her place.

The people of this country worſhip the idol Foë; they have a high prieſt among them, to whom they do homage, and think that he has the power of obtaining favours for them from Foë. Whenever this prieſt ſignifies his pleaſure to remove to any particular part of the country, the inferior prieſts and a great number of other perſons attend him; and they who reſide on the ſpot to which he is going, meet him on the road in crowds, ſupplicating his bleſſing; which he never fails to beſtow on ſuch as can make him an adequate contribution towards his ſupport; and this he is in no doubt of receiving for his benediction, as he ſuffers none to approach his ſacred perſon but the higher order of people. This high-prieſt is named khutuchtu; and ſome of the deluded people think that the holy Spirit which animates him; immediately on his death paſſes into the body of him who is elected to ſucceed him; which tranſmigration is perfectly conſonant with the doctrine of the metempſychoſis, the eſtabliſhed ſyſtem that prevails in many parts of Aſia. Others think that he grows old with the decline of the moon, and reſumes his youth when the new moon appears. For a further deſcription of theſe people, we beg leave to refer the reader to our account of Chineſe Tartary, Page 56.

SECT. III.

Contains a deſcription of Weſtern Tartary; including the kingdom of Aſtracan, the Calmucks, Circaſſians, Uſbeck, Crim, and Leſgee Tartars.

THE kingdom of Aſtracan is bounded by Ruſſia on the north, Siberia and Calmuck Tartary on the eaſt, the Caſpian ſea on the ſouth, and Circaſſian Tartary on the weſt; and that part of it which lies between the Wolga, the river Jaika, and the Caſpian ſea, is generally called Nagaia; as is alſo that part of the country which lies to the weſtward of Aſtracan, and the natives Nagaian Tartars.

Aſtracan, the capital city of this kingdom, is ſituated on the eaſt ſide of the Wolga, in the latitude of forty-ſeven degrees north, longitude fifty-two from the meridian of London: the moſt fruitful part of the country lies to the eaſtward of the city towards the river Jaika: to the ſouth weſt is a deſart of ſeventy leagues in length. The town is defended by a ſtone wall three miles in circumference, and has a cathedral and ſeveral other Ruſſian churches being the ſee of an archbiſhop, who lately built the cathedral.

The city of Aſtracan, is ſuppoſed to contain one hundred thouſand inhabitants; it has ten gates, ſix whereof look towards the river, and two are in the citadel, which ſerves as a wall to the town on the oppoſite ſide. Within the citadel is the governor's palace, being a large wooden building, and contains a great number of pleaſant apartments, particularly a great hall which has a noble proſpect on all ſides. Both the churches and houſes are built of wood, except the cathedral, the biſhop's palace adjoining to it, and one church more: here are alſo a monaſtery and a nunnery built of wood. Beſides the governor, there are three other great officers of the crown here, the firſt of whom preſides in the council: the ſecond has the government of the public houſes; and the third the direction of the fiſhery. On the oppoſite ſide of the river ſtands a fine ſtone monaſtery, and two others; and ſeveral ſuburbs. The ſoldiers ſuburb lies on the eaſt ſide of the city along the river Kitume, which falls into the Wolga: another of the ſuburbs is called Walga, where the royal ſhipping lies. There are two other ſuburbs inhabited indifferently by all ſorts of people. The Tartarian ſuburb is ſeparated from the reſt, and built of bricks dried in the ſun. The Tartars inhabit it only in the winter, for in ſummer they encamp in the open fields. The country is moderately fruitful except in corn, of which they have none but what comes from Caſan. Fiſh are very plentiful, they have one kind called beluga, which are ſaid to be two fathoms long; but the moſt delicious fiſh in this river, if not in any other (ſay ſome travellers) are the ſterlets, they are an ell long, and yet ſold for two-pence or three-pence a-piece at Aſtracan. In the neighbourhood of this city there live about forty or fifty Armenian families who have their ſhops in the towns: and the Indian merchants have their caravanſera where they carry on their trade. This is a ſpacious building ſurrounded by a wall of ſquare ſtone and ſeveral noble gates, at which there are guards placed every night for the protection of their goods. In the gardens about the town are vines and fruit-trees, ſuch as apples, pears, plums, and apricots; but the fruit is not ſo good as in ſome other places: they let their vines grow to the heighth of a man, but not higher, and then prop them up: the grapes are black and large, thoſe which grow in private gardens are ſold in the market; but all thoſe in the vineyards, which are the Czarina's property, are made into wine. The ground is naturally a ſandy barren ſoil; but they have large wells from whence they convey the

water by pipes or little channels into their grounds. The vineyards lie about two or three werſts from the town, they encreaſe every day. The old city of Aſtracan, ſtood about ſeven werſts (a werſt is three quarters of a yard) to the eaſtward of the new, but there are now ſcarce any remains of it. This city is garriſoned by five regiments of infantry and one of dragoons; many field regiments and Coſſacks, excluſive of the Tartar militia, winter here, beſides the garriſon. The uſe of the regulars is to prevent the incurſions of the wild Tartars.

This country alſo produces reeds, liquorice, kal, geniſta, aculeata, the herb aſtrachania, introria, &c. The inhabitants likewiſe raiſe melons and pompions, which they eat with bread; their garden vegetables are good, but their mulberries are unwholeſome.

They have a great variety of wild animals; ſuch as boars, elks, red and fallow deer, antelopes, hares, wild horſes, &c. The ſame kind of tame animals which abound in Great-Britain, are found here. The antelope is of a light grey colour, of the ſize of a deer, with a head reſembling a cow, but the noſe is without a griſtle. It has fine black eyes, but is purblind: the horns are beautiful, but without branches; they are taper to the top, and have rings at equal diſtances. The fleſh is tender, but ſeems to taſte of muſk. Here are alſo pelicans, corovaikes, ſwans, ducks, &c. The Wolga is replete with a great variety of moſt delicious fiſh; but there are few reptiles. Their camels have two bunches on their backs; their ſheep like thoſe of Perſia, have very fat tails, and their cattle is exceedingly large.

Their commerce conſiſts chiefly in ſilks, brocades, velvets, ſattins, drugs, copper, cotton, Perſian fruits, wines, ſweetmeats, &c. which they import, and in return export meal, fiſh, ſalt, woollen, &c. The inhabitants are prohibited from exporting naval and military ſtores to Perſia. The merchants of Aſtracan have permiſſion to navigate the Caſpian ſea; beſides which they always keep a great number of barks in the Wolga. The pirates who are convicted of robbing on this river are hanged up alive by the ribs upon gibbets fixed on floats, where they are left to expire in the greateſt agonies; and if any perſons relieve them, they are ſentenced to ſuffer the ſame puniſhment.

The Ruſſians, Armenians, Georgians, &c. who inhabit Aſtracan, have the ſame cuſtoms and manners as the people of their reſpective countries. The real natives, or Nagai Tartars, greatly differ from the others in many reſpects. They live in huts formed of canes or bulruſhes. They pay no taxes, but are obliged to ſerve in the Ruſſian wars; and ſome of their chiefs are always left in the caſtle of Aſtracan as hoſtages for the fidelity of the reſt.

The people of Aſtracan have olive complexions, large faces, little eyes, ſmall beards, are low of ſtature, and inclined to corpulency. They ſhave their heads, wear a coarſe grey caſſock, and over it a ſheep-ſkin cloak, with the wool outwards, and a cap of the ſame materials. Their women wear linen, and a cap with Ruſſian coin hanging round. Their perſons and features are tolerable. The males wear a ring in the right ear, and the females in the noſe; the rings worn by the latter are uſually ſet with a piece of coral, a ruby or torquoiſe. The Aſtracans are in general Mahometans, and devote their offspring to God or ſome ſaint. Hunting, fiſhing, and their cattle ſupport them.

They uſe fiſh dried in the ſun inſtead of bread, though they ſometimes make cakes of rice, millet, or meal, which they fry in oil or honey; their drink is water or milk, but they prefer mares milk, and are exceedingly fond of the fleſh of camels and horſes.

The Kalmuck Tartars inhabit a prodigious deſart, which lies between the rivers Don and Wolga. Theſe people like ſome of their neighbours, are continually roving about; in the winter, they uſually reſide on the borders of Circaſſia; they proceed northerly in the ſpring, and return back again at the latter end of autumn. They never cultivate any land, their only riches being their flocks and cattle, on whoſe account they principally roam about in ſearch of freſh paſture. Their temporary or moving habitations are huts, which the poorer kind cover with reeds or ruſhes, and the more opulent with felt.

Theſe people are divided into different hords, each of which hath its chief, but all are ſubject to one ſovereign, who is called chan. This chan has an agent or envoy at Aſtracan.

The Kalmucks always aſſert their independence, but admit that they are happy in the friendſhip and protection of the Ruſſians, who claim them as their ſubjects. A Ruſſian reſident, attended by a guard of three hundred ſoldiers, is always ſtationed in the court, or rather the camp of the chan.

With reſpect to their religion, they believe in one God only, are fond of keeping holidays, and are tolerably decent in their mode of worſhip. However, they keep idols about them, but pretend not to pay them any kind of adoration, but only to treat them with reſpect out of regard to the ſaints they repreſent. On all occaſions they affect to profeſs the Chineſe religion, though they know very little of its principles. They uſe an odd emblem of eternity during the time of their worſhip; which is the neck of a double-gilt ſpear, of about eight feet in length, is encompaſſed with a ring, to which a leather thong with a piece of lead at the end is faſtened; during their devotions, the end of the ſpear is placed on the ground, and one of the congregation, with great dexterity, occaſions the metal to turn round during the whole time; they likewiſe ſing, and make uſe of cymbols, and other muſical inſtruments, which are ſtringed; to theſe they beat time, and look upon notes, which are pricked down the page, from the top to the bottom.

The Kalmucks are allowed but one wife at a time; and adultery is ſeverely puniſhed, for if the wife is caught tripping, ſhe is immediately condemned to death; and the huſband if he thinks proper, may be her executioner. But conjugal infidelity is rarely known among them.

If two young people are diſpoſed to marry, they cohabit together for a twelvemonth; if in that ſpace the woman proves pregnant, the marriage is legal, but if the contrary is the caſe, they are at liberty either to part intirely, or to make another year's trial. The woman's reputation is in no reſpect injured by this procedure. As to the prieſts, they are neither permitted to have money or wives, for theſe two reaſons; firſt, they are allowed to ſupply their neceſſities from the properties of whom they pleaſe; and ſecondly, they have the liberty of paſſing a ſingle night with any married woman they chuſe; and this is ſo far from diſquieting the huſbands, that they take it as a mighty great favour done them.

The Kalmucks had formerly the moſt ſingular, and yet the moſt ſignificant method reſpecting their treatment of the dead, of any perſons in the univerſe. As they conſidered them for many years, they engaged every element in the concerns of their corpſe. In the firſt place, they buried them, that they might return to their original clay; but before it was poſſible for the bodies to corrupt, they took them up again, and threw them into the Wolga, but took care to ſecure them ſo, that they might eaſily be drawn out again. After having been immerſed in water for ſome time, they drew up the bodies, and half-burned or rather roaſted them, to bring them acquainted with the element of fire: then, that they might not omit the fourth element, air, the carcaſes were expoſed upon the banks of the Wolga, to be devoured by birds of prey, or Tartarian dogs. If they were devoured by dogs, it was deemed a lucky omen, for dogs being looked upon in a ſacred light, they ſuppoſed that the ſpirit appertaining to a carcaſe belonging to any perſon devoured by dogs, muſt be in an abſolute ſtate of felicity. This mode of treating the dead, has, however, for ſome years been prohibited by an order from the imperial court of Ruſſia; and the Kalmucks, at preſent, are compelled to bury their dead, in the ſame manner as the Chriſtians of Aſtracan.

The Kalmucks are always quarrelling with their neighbours, though they ſeem neither to be ſwayed by ambition or avarice; and have a particular enmity to the Karacalpaacks. To prevent theſe quarrels, the Ruſſians are under the neceſſity of keeping a military force in the ſummertime upon the banks of the Wolga.

The dogs of this country are exceedingly fierce and very voracious, and will attack any man who gives them the leaſt offence. They will, in bodies, aſſault a number of armed men; but the inhabitants of Aſtracan frequently go out on purpoſe to ſhoot them, ſo that it is ſuppoſed the whole ſpecies will in time be extirpated.

We ſhall proceed next to the deſcription of Circaſſian Tartary; this country is bounded by Aſtracan and the Caſpian ſea towards the eaſt; by Georgia and Dagiſtan towards the ſouth; by the river Don, the Palus Mæotis and the Black ſea towards the weſt; and by Ruſſia towards the north.

The chief city is Kizlaar, which was built by the Ruſſians; the citadel is only formed of earth, but the garriſon conſiſts of about five hundred regulars, and three thouſand Coſſacks, the latter of whom are permitted by the Ruſſian government to erect habitations on the banks of the Terek. Kizlaar is only in forty-four degrees north latitude, conſequently the air is wholſome and ſerene.

The next town is Terki, ſituate on or near the Caſpian

ſea,

ſea, about three or fourſcore miles to the ſouthward of Aſtracan, and frequently miſtaken for Terki, in Dageſtan, a great deal farther ſouthward, and ſubject to the crown of Perſia. Terki is ſituate in a large plain, and defended by a wall of earth with baſtions, after the modern way; and the buildings are for the moſt part of wood. This was the Muſcovite frontier towards Perſia, till very lately, and generally had a numerous garriſon; but they are now advanced much farther ſouthward through Dageſtan and Shirvan, into the Perſian provinces on the ſouth of the Caſpian ſea.

The Circaſſian Tartars generally acknowledge themſelves dependent on the crown of Ruſſia, though there are inſtances where they have not ſhewn the ſubmiſſion of ſubjects, which is not much to be wondered at, ſince they live ſo remote from the ſeat of the government, and are ever rambling from one place to another. Thoſe Circaſſians who lie next to Perſia and Turky, may be reckoned under the dominion of one or other of thoſe crowns: but nothing is more common than to put themſelves ſometimes under the protection of one prince, and ſometimes under another. There is no conſiderable town in this country, except Kizlaar, which is inhabited chiefly by Ruſſians, for the whole nation of Circaſſians live in tents or huts according to the ſeaſon of the year, removing from one place to another, like their neighbours of Aſtracan: nor does the country produce any thing valuable enough to induce foreigners to build or ſettle amongſt them.

We are informed by a gentleman who travelled into theſe parts, that being ſent into Circaſſia by the late Czar, to view the mines of that country, he found they were well furniſhed with ſilver ore, and that the kneeſes (the Tartar lords) produced ſome pieces of ore, which upon aſſay afforded a great deal of ſilver: that he found the people tolerably civilized: that their military men wore armour, with a kind of ſilk veſts or gowns over it. That their arms were bows and arrows, and they were generally very well mounted. That they lived in ſummer under tents like their neighbours, and there was a great variety of beautiful women amongſt them. And from thence it ſeems it is, and from the neighbouring country of Georgia, that the harams or ſeraglios of Iſpahan and Conſtantinople are chiefly ſupplied with virgins.

Though Circaſſia produces very little grain of any ſort, they have large herds of cattle which they drive before them like the other Tartar nations, and ſtay no longer in any place than they can find paſture for them.

A gentleman who travelled through Circaſſia, gives us the following account of that country: nothing, he ſays, can appear more agreeable than the proſpect of it, on account of that variety of mountains, vallies, woods, little lakes, ſprings, and rivers, with which it is every where diverſified. It is fertile beyond imagination, every thing grows there almoſt without ſowing, at leaſt, whatever they ſow, which is uſually barley, oats and cummin, thrives to admiration, after only once ſlightly turning up the earth, which they do but juſt open to receive their grain. Though this account of the ſoil is very different from what other travellers give us, who uſually repreſent Circaſſia as a barren country; yet as they all agree that great herds of cattle are fed here, it muſt certainly produce good herbage, and conſequently would produce plenty of grain if it was well cultivated; but the natives wandering from place to place, ſow no more, it ſeems, than will juſt ſerve for the ſubſiſtence of their families; and if there happens to be a bad crop, they are reduced to great diſtreſs for bread corn, as ſome gentlemen obſerve.

The Circaſſians, both men and women, are of an eaſy ſhape and well proportioned. Their complexions good. Their features juſt, according to the notions we entertain of beauty. Their hair and eyes are generally black, and not a cripple or a crooked perſon ſcarce to be found amongſt them. The women wear no other head-dreſs than a ſilk or ſtuff cap in the houſe, their hair hanging down in two treſſes behind them, but are vailed when they go abroad. The general food of the Circaſſians is mutton, beef, poultry, wild fowl, and veniſon, all which they have in great plenty; but a piece of a young colt is preferred before any of theſe. Their bread is made into thin cakes, either of barley meal, or millet, which they bake on the hearth. They are extremely hoſpitable, and will not ſuffer a traveller to pay any thing for the entertainment of himſelf, his ſervants, or horſes; but will contend frequently who ſhall have the honour of treating him. As for the natives, when they are upon a journey, they carry no proviſions with them, but are as welcome in every houſe they arrive at, as in their own; ſo that if any people may be ſaid to have all things in common, it is the Circaſſians. Their uſual drink is water or mare's milk, like the other Tartars; and perſons of all ages and ſexes ſmoke tobacco. They ſit croſs-legged, and have a carpet or piece of Ruſſian leather ſpread before them, and little wooden tables, at their meals; but neither linen nor plates. They obſerve no regular hours for eating, drinking, or ſleeping; but juſt as they have inclination or opportunity.

The river Terek which flows from eaſt to weſt, produces great variety of fiſh, as ſturgeons, ſalmon, &c. It meanders beautifully through the country, till it diſembogues itſelf into the Caſpian ſea.

Thoſe Circaſſians, who are immediately under the protection of the court of Ruſſia, have chiefs of their own, the principal of whom is ſtiled becovitch; he is a major-general of irregulars in the Ruſſian army: he is however always ordered to remain in Circaſſia, where it is imagined his ſervices can be the moſt uſeful. Though the Circaſſian princes, are exceedingly honoured and reſpected by the ſubjects, yet ſuch is their independency of the people, that they are not obliged to do any thing at their command, but are guided by their own inclination. The princes themſelves are likewiſe independent on each other. Whatever preſents the Empreſs of Ruſſia ſends to the Circaſſian princes, their reſpective ſubjects expect a part. If the things cannot conveniently be diſtributed, they will have an equivalent in ſpecie, or ſuch a commodity as may be eaſily parted among them. The ſpoils taken in war are divided amongſt his troops, the ſovereigns being excluded from any ſhare of them.

Their ſubordination to Ruſſia is only confined to a formal oath of allegiance, in which they ſwear to be ſubmiſſive to a certain number of general laws, as long as their being ſo continues to be eſſential to the good of the Ruſſians and themſelves. The imperial court, for many cogent reaſons, ſeldom interferes with their political, and never with their religious concerns. They have a great veneration for antient houſes; and are extremely tenacious of their family honour, by not intermarrying, even for gain, with an inferior.

The contract for marriage is entered into by the parents or guardians; after which, the young couple are permitted to ſee each other; and after a few viſits, the affair is concluded, and the bride is ſent home to the bridegroom's houſe in a cloſe waggon finely painted, attended by her women. But as the bride's relations give nothing with her but a few ſuits of cloaths, this matter often falls heavy on the bridegroom, who is obliged to make valuable preſents to the bride's relations of horſes, dromedaries, camels, cows, &c.

Polygamy is permitted to ſuch of the Circaſſians as prefer the Mahometan religion.

Theſe people, like the Turks, have harams or ſeraglios for their women, from which all men except the huſband are excluded. Theſe are contiguous to their dwelling-houſes, though ſeparate from them. A remarkable cuſtom in this country is, that when the principal lady of any of their princes is in labour, the firſt Circaſſian who hears of it, let his ſituation be ever ſo menial, runs and places himſelf at the door of the haram, from whence none are authorized to drive him. When the lady is delivered, if it happens to be a boy, he is richly dreſſed with the utmoſt ſpeed, and delivered to the Circaſſian, who immediately takes him home, and, if he is a married man, delivers him to his wife to nurſe: if he is a bachelor, a nurſe muſt be provided, and the child remains under his inſpection and tuition till he is nine years of age, when he is reſtored to his parents, who receive him with great rejoicings, and many public ceremonies. The reaſon they give for this ſingular cuſtom, is that the child may not be ſpoiled in his infancy by the delicacies of a court, or the effeminate treatment which he would receive in the haram; but rendered, by this means, ſo hardy and robuſt as to become in time a buggateer or hero; for perſonal courage and ſtrength are eſteemed as the moſt noble qualifications of a human being by the Circaſſians.

The country abounds with wild ſwine, wolves, and foxes; which they catch in the following manner: after digging a hole in the earth nine feet deep, they drive a ſtake into the middle, which projects from the ſurface of the earth about four feet. Upon the top of the ſtake a moveable cart-wheel is fixed, to which a young pig is faſtened in the evening. The mouth of the pit is then covered with branches of trees in a very ſlight manner, over which graſs is ſcattered. The pig does not fail to ſqueak all night, being irritated by its confinement. When any of the wild animals hear the noiſe, they haſten to viſit the place;

which they no ſooner approach than they fall into the pit, where they remain till morning, being totally unable to diſengage themſelves. The hare is hunted with hounds, as in England. They have great variety of game, particularly pheaſants.

Beyond the independent village Braguſkoi, ſouth of the river Terek, they have a hot ſpring, ſituated upon a hill; water boiling hot iſſues from it, which ſmells ſtrongly of naphtha, and falls into a baſon of about twelve feet diameter, and three feet deep. On the weſt ſide there are ſeveral ſmall ſprings of the ſame kind of water; and on the eaſt ſide there is an acid ſpring. The water of the chief well will boil a fowl in about nine or ten minutes.

Proviſions in general, and meat in particular, are exceedingly ſcarce here.

About the city of Terki there are a great number of ſerpents, which make holes in the ground that are extremely dangerous. They are ſix or ſeven feet long, and about as thick as a man's arm. There are likewiſe mice as large as ſquirrels, which are called jerbuck. Their ears are long, and their fore feet ſhorter than thoſe behind, which prevents their running ſwiftly: but they lay their tails on their back, and leap to a conſiderable height or diſtance.

SECT. IV.

Containing a deſcription of the river Jaik, together with an account of Karakalpaak, Kirgee, Buſkeer, Uſbeck, Crim, and Leſgee Tartars.

AT about three hundred werſts from the ſource of the river Jaik, which runs through a deſart of a prodigious extent, and at length empties itſelf into the Caſpian ſea; there is a ſtrong town built by the Don Coſſacks. This, after the river, is called Jaik, and the Coſſacks have bravely defended it from the attacks of all the different Tartars that ſurround it. There is no inhabited place, except the above-mentioned town, between Aſtracan and Jaik river. This vaſt deſart is, however, infeſted by innumerable hords of wild Tartars.

The Karakalpaaks wander about the Caſpian ſea, to the northward of whom the Kirgee and Baſkeer Tartars take up their abode. The Kalmucks are continually at war with theſe tribes. The Kirgees and Baſkeers profeſs the Mahometan religion; and, being perhaps the moſt ignorant and unpoliſhed of any who profeſs it, they are of courſe the moſt ſuperſtitious.

In the year 1739, during the war between the Ruſſians and Turks, the Kirgees and Baſkeers, conſonant to the notions they had imbibed, thought they could not do a more eſſential ſervice to Mahomet, than by injuring the Ruſſians as much as poſſible. They accordingly fell upon all the defenceleſs towns and villages of the province of Umſimafoſkaga: all who were young and vigorous they carried with them, deſigning either to uſe them as ſlaves, or to ſell them as ſuch. The old, infirm, and very young, fell indiſcriminate victims to their remorſeleſs fury. The governor of Orenburg, however, being informed of theſe cruel depredations, diſpatched a body of five thouſand regulars and three thouſand Coſſacks, who marched with ſuch ſecrecy, that they attacked the Kirgee camp in the night, and deſtroyed the greateſt part of thoſe barbarians, though they were twenty thouſand ſtrong at the time.

The river Jaik was firſt diſcovered by the Coſſacks, who acquired great riches by fiſhing in it; and, after having cured their fiſh, ſelling them to the Aſtracan merchants for the Ruſſian market.

A ſcheme having been entered into by Peter the Great, for turning the Wolga to a political advantage, he gave an excluſive privilege with reſpect to the fiſhing to one Demidioff, advancing at the ſame time twenty thouſand rubles, the better to enable him to carry his deſign into execution. In a few years Demidioff repaid the money, and became exceedingly rich. At length, the fiſheries carried on in the Jaik river exciting the attention of the court of Ruſſia, they determined to tax the fiſheries on that river, as well as thoſe of the Wolga: proper officers were accordingly ſent to enforce the tax, but they were thrown into the river and drowned by the Coſſacks, to whom the very idea of any kind of taxation was odious. Continual expreſſes were ſent from St. Peterſburgh to inquire why the officers had not ſent an account of their proceedings; but the meſſengers were treated exactly as the officers had been. At length the court was informed of the whole affair, but it was thought moſt prudent to wink at the inſult, the Ruſſian miniſtry having too much ſenſe to quarrel with a ſet of people, whoſe ſituation rendered it impoſſible to conquer them, and whoſe ſentiment enſured their independency.

The Uſbecks are generally eſteemed the moſt civilized of all the Mahometan Tartars; nevertheleſs they pillage and rob their neighbours, as well as any other Tartarian tribes. They nearly reſemble the Perſians in their dreſs; but we muſt except their boots, which are uncommonly large. The chiefs wear a plume of feathers in their turbans, and, as well as their chan, pride themſelves much on being the deſcendants of their renowned Tamerlane. Their common food is pilau, or boiled rice; but their greateſt delicacy is horſe-fleſh. They drink a kind of arrac or fermented liquor made of mare's milk. Their language is a mixture of the Turkiſh, Perſian, and Mongol; but they are well acquainted with the Perſian language in its purity. Their arms are like thoſe of the other Tartars, viz. large bows, arrows, darts, and ſabres; which they uſe with admirable addreſs. Of late they have begun to uſe muſkets, and many of their cavalry wear coats of mail, and carry ſmall bucklers.

It is affirmed, that the Tartars of Great Bucharia are the moſt courageous and robuſt of their whole nation. The Perſians, who are not deficient in courage, look upon them with terror. The women themſelves aſpire to military reputation: they are ſtrong and well limbed, but in their features have all the delicacy of Aſiatic beauty. The horſes belonging to theſe Tartars are not handſome, but they are hearty, indefatigable, and exceedingly ſwift; they are the beſt adapted in the world for ſcouring the deſarts, as they can live upon almoſt any thing, and a very ſmall quantity of provender ſeems ſufficient to keep up their ſtrength.

The Uſbeck Tartars are continually at war with the Perſians, the fertile plains of Chorazan exciting them to make frequent excurſions into that rich and plentiful country; but they do not find it quite ſo eaſy to penetrate into the dominions of the Great Mogul, on account of the prodigious mountains which intercept the paſſage.

Thoſe Uſbecks who ſubſiſt upon their cattle, or by plundering their neighbours, live ſometimes in huts, and ſometimes in tents, every tribe forming a camp of its own, and, like other Tartars, they frequently move from place to place, as it ſuits their inclination or conveniency. Others, who cultivate the earth, and are ſomewhat honeſter in their principles than their wandering brethren, form ſocieties, and live in towns and villages; theſe latter are either the real Buchanians, are deſcendants from the Sartes, the antient inhabitants of the country; or the Turkomans, who were ſettled in the country long before the Uſbecks or Tartars, properly ſo called, ſubdued it. The Uſbecks in general, however, deſpiſe the thoughts of cultivation, and deem it meritorious to make excurſions upon and plunder their neighbours.

The capital city is ſurrounded by a mud wall: the houſes are built of wood, but the moſque and caravanſeras are of bricks it is tolerably populous, but not equal to what it was formerly. The chan takes the liberty to ſeize upon the property of any one, which injures commerce, and damps the ſpirit of cultivation.

For a further account of theſe people, the ſituation of their country, rivers, account of Tamerlane, their great leader or chan, &c. we muſt refer our readers to the deſcription given, page 57 of the Chineſian Tartar kingdoms and ſtates; and ſhall cloſe this part of our work with an account of Crim Tartary, which was antiently called Taurica Cherſoneſus.

This country, which is inhabited by the Crim and Leſgee Tartars, is ſurrounded by the Black ſea on the weſt, ſouth, and part of the eaſt; on the north, it has the Palas Mœotis, and Leſſer Tartary joins it, on the north-weſt, by a narrow iſthmus. Its greateſt extent, from north to ſouth, is about one hundred and fifty-five miles; its greateſt breadth, from eaſt to weſt, is near one hundred and forty miles; and its breadth in other places is only about eighty miles. It is ſituated between thirty-three and thirty-ſeven degrees eaſt longitude, and between forty-four and forty-ſix degrees north latitude. The chief cities, if they may be ſo called, are Precop, Crim, Aarabet, Sachingeri, Caffa, Sidagoy, &c.

It is exceedingly fruitful by nature; and, were it properly cultivated, would be a fine country. There are towns and villages; but the houſes are wretched huts. It is ſubject to the Grand Signor, whom the chan is obliged, in time of war, to furniſh with thirty thouſand effective men. Theſe troops, however, never receiving any pay, plunder

plunder and pillage every place they paſs through; on which account every man takes three or four horſes with him, beſides that on which he rides, to load with plunder and captives. Whenever a horſe dies, the owner immediately dreſſes the carcaſe, and invites his comrades to the entertainment.

Theſe people, in time of peace, purchaſe beautiful children in Circaſſia, and ſell them to the Turks, who pay for them in cloathing, arms, coffee, tea, rice, raiſins, &c. They travel in cloſe carts, which contain themſelves, their wives, children, baggage, &c.

When their daughters marry, the only portion they give is, a painted waggon, and a hut covered with white linen, with a painted cloth at the top, tied with red ſtrings, but they expect a handſome preſent from the bridegroom. They bury their dead very deep in the ground; erect a tomb of mud over their graves, and adorn it with a variety of flags, expreſſive of the quality, circumſtances, and actions of the deceaſed.

The Leſgee Tartars are an independent people. Their country extends near an hundred miles in length from north to ſouth, and about fourteen from eaſt to weſt. It is fertile and pleaſant, producing all kinds of grain and cattle. The people are good mechanics, and carry on ſeveral manufactures: they are not only very warlike, but excel in making fire-arms, with which they trade into Perſia. Their chiefs, who are named ſhamkalls, in any common caſe of danger, unite their forces, and are unanimous in their operations.

The natives are active and well-proportioned; their eyes are black and full of fire; their complexion ſwarthy, and their features regular and engaging. They dreſs after the Arabian faſhion, and wear whiſkers: ſome few indeed let their hair grow.

They trade with the Perſians, Ruſſians, and Armenians, giving fire-arms and madder for cloathing and neceſſaries. But though they are fond of commerce, they can rob and plunder as well as any of the other Tartars; however, if they promiſe to protect or conduct any ſtranger they never break their words, or violate the laws of hoſpitality.

Their mode of worſhip is the ſame as that of the Turks, and they imitate the Perſians in their manners; but in one particular they outdo moſt of the oriental nations, for they can drink like Europeans, whether Britiſh or German.

CHAP. VIII.

THE NEW AND COMPLETE HISTORY AND DESCRIPTION OF

ARABIA.

SECT. I.

Of the ſituation, extent, names, ſeas, rivers, mountains, air, winds, and ſeaſons, diviſion of the country, and towns.

ARABIA is ſituate between thirty-five and ſixty degrees of eaſt longitude, and between twelve and thirty degrees of north latitude, being one thouſand three hundred miles long, and one thouſand two hundred broad; and if we include the antient Chaldea or Eyraca Arabick, we may extend it two degrees further north. The boundaries of Arabia, are, Turky, on the north; the gulphs of Perſia or Boſſora and Ormus, on the eaſt; the Indian ocean, on the ſouth; and the Red ſea, and the Iſthmus of Suez, which divide it from Africa, on the weſt.

Arabia is the antient, as well as the modern name, though the people have been long called Saracens, or the inhabitants of the deſarts; Sarra in their language ſignifying a deſart. Some derive the name Arabia from Harabi, a thief or robber, as they have been generally eſteemed by their neighbours, ever ſince they were a nation, to the preſent time: others obſerve, that the word Arab in Hebrew ſignifies black; as the inhabitants of this country, it is ſaid, antiently were, and this country called Ethiopia, as well as Abyſſinia, or the Upper Ethiopia, which is divided from it only by the Red ſea, and the narrow ſtreight of Babmandel.

The ſeas and promontories of Arabia are the Indian ocean, the gulphs of Boſſora and Ormus, the Red ſea, and the ſtreights of Babmandel, in which are the capes of Roſalgate, Muſsleden and Mocho.

The Red ſea, ſometimes called the Arabian gulph, divides Arabia from Egypt and Ethiopia; but if we take it in its largeſt extent, the name of the Red ſea was given antiently to all thoſe ſeas which border upon Arabia and Perſia from Africa to the Eaſt Indies. The reaſon of calling it the Red ſea, ſome imagine the red mountains near it occaſioned it to be called ſo; others, that the red ſand upon the ſhore gave it that name; and others are of opinion, that it had its name from king Erythrus, ſovereign of this country, which Erythrus is ſuppoſed to have been Eſau, whoſe poſterity planted part of Arabia. It is called in ſcripture Yam Souf, the ſea weeds or ruſhes, the banks being covered with them in ſome place; but from whenceſoever the name is derived, no ſea has been more celebrated than this upon various accounts; as, 1. The paſſage of the Iſraelites through it; and, 2. for being the uſual road through which the fine ſpices, and all the rich merchandize of the eaſt were conveyed to Africa and Europe, for three thouſand years and upwards.

No country is more deſtitute of rivers. Chat, Pran, and Nagiran, are the chief, neither of which is navigable; and ſome add the weſtern branch of the Euphrates, which runs near the eaſtern borders of this country.

The mountains are thoſe of Gebel-el-Ared, or the great mountains in the middle of the country, and thoſe of mount Sinai and Horeb in Arabia Petræa.

As to the air and winds, thoſe parts of it which lie within the tropic of cancer, or near it, are exceſſively hot, and have their monſoons and ſea breezes regularly, as in other countries, under the ſame parallels; the vernal monſoon, in the ocean on the ſouthern coaſt of Arabia, blows from the ſouth-weſt from April to September, and then ſhifts or turns about, and blows in the oppoſite direction, the other ſix months. The hot winds are intolerable in April and May; they have generally clear ſerene weather, ſeldom ſkreened from the ſcorching ſun by clouds, or refreſhed with ſhowers.

Arabia is uſually thrown into three grand diviſions, viz. Arabia Petræa, Arabia Deſerta, and Arabia Felix.

Arabia Petræa is the ſmalleſt of the three, and is ſituate in the north-weſt part of this country, between Egypt and Paleſtine, the chief town Suez lying at the bottom of the Arabian gulph or Red ſea, being the port where the Turkiſh gallies uſually lie. Tor, a port town on the Red ſea, ſouth-eaſt of Suez. The iſthmus, which divides the Mediterranean or Levant from the Red ſea, is about one hundred miles, over the moſt mountainous and rocky country of all the Arabia's, which it is impoſſible to cut through, nor has ever any prince attempted it, though it would have much ſhortened the voyage of the Europeans to the Eaſt Indies, if it had been practicable. In the plains of Arabia Petræa there are abundance of acacia trees, from which iſſues a valuable gum, that is gathered in autumn.

Arabia Deſerta is ſo called from the nature of the ſoil, which is generally a barren ſand; however, there are great flocks of ſheep and herds of cattle near the Euphrates, where the land is good. In the deſart, there are great numbers of oſtriches, and there is a fine breed of camels in ſeveral places.

Arabia Felix is ſo called on account of its fertility, with regard to the reſt. Some give it the name of Yemen, but improperly; for that is a kingdom on the ſouth coaſt, whoſe capital is Sanae.

We ſhall next proceed to the deſcription of ſome of the principal towns; and firſt, of Medina, where Mahomet's tomb is: this is called by the Arabians Medina Talmabi: the city of the prophet, being the place Mahomet fled to when he was driven from Mecca, and where he was firſt inveſted with regal power. It lies in the latitude of twenty-four degrees thirty minutes north, about eighty miles to the

the eaſtward of the Red ſea, and two hundred miles to the north of Mecca. It conſiſts of about a thouſand houſes built of brick and ſtone, but not very loſty, having but one floor; there are ſeveral noble moſques in the city, the principal whereof is called Mos a Kibu, or the moſt holy: it ſtands in the middle of the town, and is a ſquare building an hundred paces in length, and fourſcore in breadth, and ſupported by four hundred columns, on which there hang four thouſand lamps. Mahomet's tomb ſtands in a tower in this temple covered with a dome, and encompaſſed with iron rails: the tomb itſelf is ſurrounded by a ſilver grate, and the wall on the inſide is hung with rich ſilks, upon which are abundance of precious ſtones, the gifts of Mahometan princes. The pilgrims never ſee the tomb itſelf, only the tower which it is encloſed in; but when the pilgrims are returned home, and the crowd is leſs, they make no difficulty of ſhewing it to any Mahometan for a piece of money.

Mecca ſtands about two hundred miles ſouth of Medina, in the latitude of twenty-one degrees ſome odd minutes, and is a day's journey to the eaſtward of the Red ſea in a valley almoſt ſurrounded with mountains; it is twice as large as Medina, built of brick, with flat roofs, and balluſters on the top. In the middle of the town ſtands the kaaba or houſe of God, which, according to the Arabian tradition, was built by Abraham, and to which Mahomet obliged all his followers to go in pilgrimage once in their lives. This houſe is not above fifteen feet in length and twelve in breadth, and about five fathoms high; the door is in the corner, on the left hand, about a fathom and a half high and a fathom wide, made of beaten ſilver, and opens with two leaves; they go up to it by a ladder, it being raiſed ſix feet above the ground: the roof is flat, and ſupported by three pillars of aloes wood of an octagonal form; the ſides are hung with red and white ſtuff, with the following words ſeveral times wrought in them, viz. La Illa Illalla, Mahomet reſoul allah, i. e. God is a great God, and Mahomet his prophet.

Sibit is ſituate near the eaſtern ſhore of the Red ſea, in forty-five degrees of eaſtern longitude, and fifteen degrees of north latitude, being the greateſt mart for myrrh, frankincenſe, and other odoriferous gums and drugs in Aſia; but there are no ſpices either here or in any other part of Arabia, though the fine ſpices which are the growth of the Indian iſlands, are frequently called Arabian ſpices, becauſe they were firſt brought by the caravans to Egypt, and other countries on the Levant ſea through Arabia.

Mocho, or Moco, is ſituate on the eaſtern ſhore of the Red ſea, juſt within the ſtreights of Babel Mandel, about one hundred miles ſouth of Sibit, in forty-five degrees of eaſtern longitude, and thirteen degrees of north latitude. It ſtands in a barren ſandy plain, and has the greateſt plantations of coffee in the world, in the adjacent country; and from hence coffee was firſt brought to Europe by the Turks, though there are ſeveral iſlands in the Eaſt and Weſt Indies at preſent, that produce coffee; however Moco has ſtill a great trade in that commodity. The town is large and populous, the houſes well built with brick and ſtone, the roofs flat and terraſſed, the ſhops furniſhed with all manner of eaſtern merchandize; and here the ſeveral Eaſt India companies of Europe barter the produce of India for their coffee, frankincenſe, &c. the produce of Arabia.

Aden is ſituate without the ſtreights of Babel-mandel, about one hundred and twenty miles eaſt of Moco, being a port town on the Indian or Arabian ocean, in forty-ſix degrees of eaſtern longitude, and twelve degrees of north latitude.

Muſcat is a port town, ſituate on the weſtern ſhore of the gulf of Ormus, about one hundred and fifty miles north-eaſt of cape Roſalgate, in fifty-eight degrees of eaſtern longitude, and twenty-three degrees of north latitude. It lies in a bottom, ſurrounded by three rocks, which ſecure the harbour, and render it of difficult acceſs to foreigners. It was once poſſeſſed by the Portugueſe, but is now capital of a large territory, ſubject to an Arabian prince, called the king of Muſcat, or Oman, who is the only naval power on the coaſt of Arabia, except the Turks, who are maſters of the navigation of the Red ſea; of which we ſhall be more particular, when we come to treat of the forces of the Arabian princes.

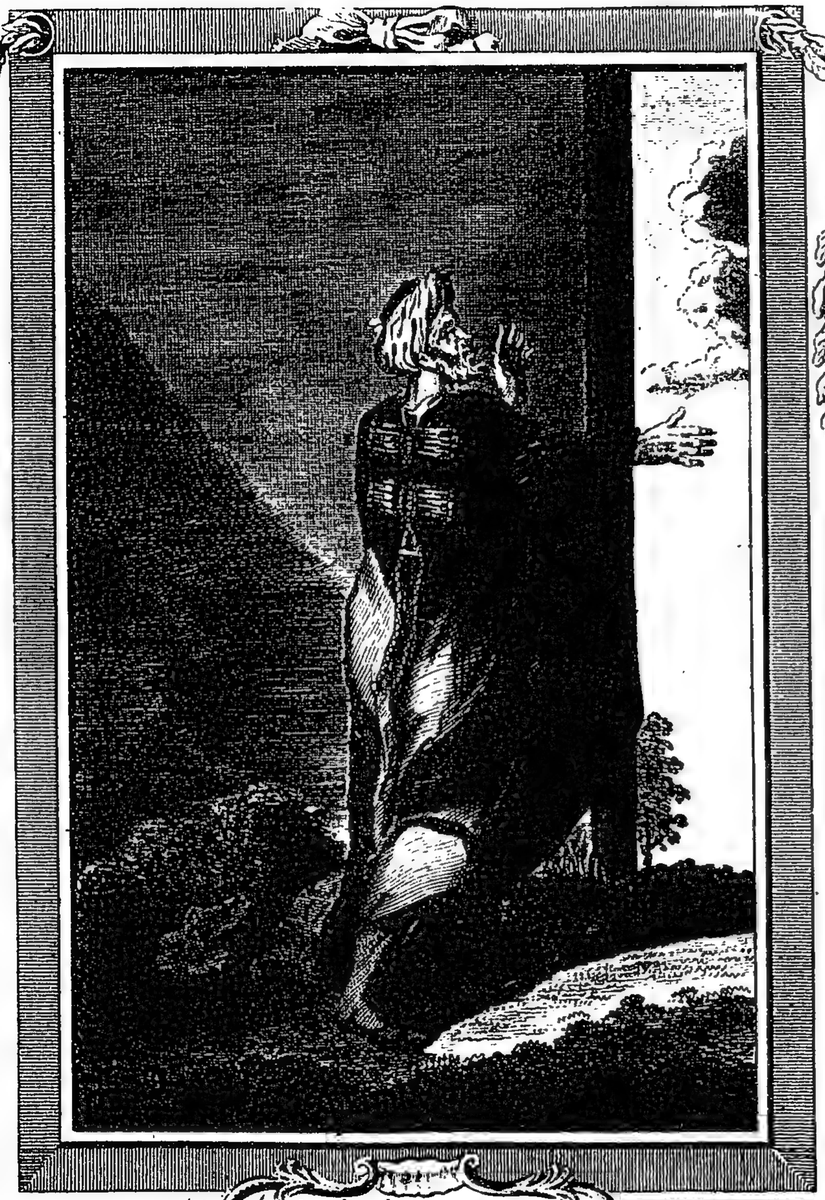
Eleatif is the laſt town we ſhall mention: it is ſituated to the northward of Muſcat, higher up the Perſian gulf, in the latitude of twenty-ſeven degrees north. This was formerly a place of great trade, and much reſorted to when the pearl-fiſhery near it was in repute; but is at preſent on the decline, the king of Muſcat or Oman having brought all this coaſt under his ſubjection.

The Arabs who live in towns are a very inconſiderable number, compared with thoſe who live in tents, and are called Bedouins: theſe people have no fixed habitation, but being poſſeſſed of large flocks and herds of camels, ſheep, and goats, rove from one part of the country to another, where they can find paſture and water for their cattle; and when they have deſtroyed all the forage, they load their goods and baggage on their camels, with their wives and children, and march on in ſearch of freſh paſture. Their tents being made of black or dark-coloured goat's-hair, make a very indifferent appearance when they encamp.

SECT. II.

Treats of the perſons, habits, genius, food, ſalutations, roads, and way of travelling, &c. of the Arabians.

THE natives of Arabia are of low ſtature, ſlender bodies, and ſwarthy complexions: their voices are ſhrill and effeminate, their hair is of a dark brown, and their eyes are black and ſparkling; they wear long beards, as a mark of gravity and conſequence; being ſerious and reſerved, they ſpeak little, uſe no geſture, make no pauſes, and never interrupt each other.



Their apparel is a looſe diſorderly kind of dreſs, five or ſix yards long, and not leſs broad: this they wrap round them, and are forced to gird it with a ſaſh; at night it ſerves them for a bed and coverlid. Their upper garment is generally wove in one piece; it has a cap for the head, is tight about the neck, and grows wide towards the bottom; this garment is only worn in cold and rainy weather; under this, and the garb that wraps intirely over the whole, ſome of them wear a long cloſe-bodied waiſtcoat without ſleeves; their ſaſh or girdle is of worſted, and in it they ſtick their poinards, their ink-horns, or badges of their calling. The women wear a kind of ſhort waiſtcoat and drawers; but ſometimes they have only a towel wrapped round their loins. When they go out, they are ſo wrapped up, that nothing can be ſeen but their faces: for the male Arabs are extremely jealous. Some of the men go almoſt naked in hot weather; others wear drawers and ſlippers, but they have no ſtockings on their legs.

Though this people are not more taken notice of for rambling than they are for thieving both by ſea and land, and that not in ſmall parties only, but by public authority in a manner, with their princes at the head of them; there are notwithſtanding ſome modern travellers who cry up the Arabians for their juſtice, humanity, temperance, and other virtues at a very great rate; but this ſeems contrary to univerſal experience, or they muſt mean that juſtice which they exerciſe among themſelves, for certainly foreigners very often ſuffer by their rapine: we ſhall take the liberty of repeating, however, what Captain Say relates of the juſtice and other virtues of thoſe Arabians who inhabit near Muſcat: he ſays "they are very courteous in their behaviour, extremely civil to ſtrangers, and offer no violence or affront to any, and though they have the higheſt veneration for their religion, never endeavour to force it upon others; that a man may travel hundreds of miles in their country, and not ſo much as meet with abuſive language, and if the traveller has a charge of money, he needs no arms to defend it, he may ſleep with it ſafely in his hand by the highway ſide."

Their food is rice, beef, mutton, goat's fleſh, veniſon, and camel's fleſh, which they eſteem more than any other, but they eat no hog's fleſh; and they make thin cakes of flour and water inſtead of bread: but many of them chooſe dried dates before them; they eat alſo moſt ſorts of fiſh, except ſuch as have no ſcales: but whatſoever animals they eat, they are very careful to have all the blood well drained out. Thoſe about Muſcat do not only abſtain from wine, as other Mahometans do, but deny themſelves even tea and coffee, and other innocent liquors: nor do they indulge themſelves in ſmoaking tobacco: water is their ordinary drink, or a ſherbet made of oranges, water and ſugar. They dreſs their victuals by digging holes in the earth, and then making a fire with whatever they can get, or with the dried dung of their camels: they carry water with them, loading their camels with that neceſſary article.

People of the higheſt character among them think it no diſgrace to be employed in the moſt menial offices; nor is the greateſt prince or chief of theſe countries aſhamed to turn drover or butcher, by bringing a lamb from his herd, and killing it; while his lady or miſtreſs makes a fire, and puts on a kettle to dreſs it.

Upon

A Principal Person of Barbary

Morris sculp.

An ARAB of the DESERTS

Upon meeting one another, they ſtill uſe the primitive ſalutation of, "Peace be unto you." Before the Mahometan conqueſts, the expreſſion was, "God prolong your life." The inferiors, out of reſpect and deference, kiſs the feet, knees, or garments of their ſuperiors; whilſt children and other kindred pay the ſame reſpect to parents and relations. The poſture they obſerve in giving one another the ſalute, or aſſemah, is laying the right hand upon the breaſt; while others, who are perhaps more intimately acquainted, or of equal age and dignity, kiſs the hand, head, or ſhoulder of each other. At the feaſt of their byram, and other great ſolemnities, the wife compliments her huſband by kiſſing his hand.

There are no roads laid out in this country, but the caravans travel over ſandy deſarts, where there is no manner of track; guiding themſelves by a compaſs, as at ſea, or elſe by the ſtars, for they travel chiefly in the night on account of the heats. People chooſe to travel with the caravans, in which are frequently two or three hundred men, attended by a great number of camels and dromedaries, for conveying their neceſſaries and proviſions. The camels will carry ſix or ſeven hundred weight; and the dromedaries, which are a ſpecies of camels, but leſs, about five hundred weight: both lie down to take up their burthens, and will travel through this parched country eight or nine days without water.

As there are no caravanſeras or houſes of entertainment for travellers to call at in the deſart part of the country, travellers provide themſelves with tents, which are ſet up in bad weather; but when the weather is fine, as it moſt commonly is, they lie down upon a carpet or matraſs in the open field; and as they are obliged alſo to carry their proviſion along with them, the ſlaves and ſervants who belong to the caravan get ready their maſters meat when it is thought convenient to halt. Their way of dreſſing meat, is to make a little hole in the ground, and ſet a pot over it, and if there be no brakes or fuel to be met with, they make a charcoal fire; and as they ſometimes meet with no water in ſeveral days journey, they carry water with them in ſkins, with which they load ſome of their camels. The Arabs obſerve, that wherever there are trees, there ſeldom fails to be water; and one would think the camels were ſenſible of this as well as their maſters, for when they come within ſight of ſuch places, they are not to be reſtrained from ſetting up their great trot to come at it, eſpecially when they have had none for ſome time: the natives imagine theſe creatures ſmell the water at a great diſtance.

The people of the caravan, before they begin their march, elect an officer, called the caravan baſha, who is in a manner their leader, and directs all their motions, and where they ſhall reſt, and to whom all differences which happen upon the road are referred; he compounds alſo for the ſeveral duties demanded of the caravan, by the governors of the countries through which they paſs.

The merchants who travel with the caravan, ride upon horſes or mules, and ſometimes upon aſſes, which travel faſt enough for the loaded camels, who ſeldom go above a foot-pace; and the Chriſtians or Franks, as they are called, are obliged to provide themſelves with mules or pack-horſes to carry their wine; for the camel-drivers being diſciples of Mahomet, will not ſuffer that animal to be loaded with ſtrong liquor, the camel being conſecrated to Mahomet, who ſtrictly forbad the uſe of wine, and all intoxicating liquors: the wine as well as water is put into goat-ſkins with the hair inwards, for they ſoon prove leaky if the hair is off.

Every merchant and his ſervants ride near the camels, which carry their goods, to preſerve them from thieves; for as they frequently travel early in the morning, and late in the evening, theſe pilferers, ſometimes, cut the ſtrings by which the camels are tied together, and lead off ſome of them without being perceived.

There are ſome poor people who conſtantly attend the caravan, who ſerve as watchmen when they are encamped. They walk about, continually crying, "God is one, God is merciful," adding frequently, "Have a care of yourſelves." They give notice alſo to the caravan baſha when it is time to riſe, who orders the watchmen to cry, "Saddle your horſes," and a little after, "Load your goods:" whereupon they all appear ready for the march in an inſtant. When the march happens to be long, the merchants will halt by themſelves, and while the caravan marches on, open their wallets, which every man carries upon his horſe, and dine upon a carpet.

Travellers are adviſed to dreſs themſelves in an Arabian veſt and cap, or they will be liable to inſults from the zealous Arabs, and perhaps ſtopped at ſome of the towns they paſs through. Boots made of a kind of glove-leather, which are no hindrance to walking, muſt be had alſo; but they never wear ſpurs, the ſtirrup having a ſharp ſpike fixed to it, with which they prick their horſes.

There being but very few rivers, the water they meet with, is uſually found in wells or ciſterns, where no more than two or three people can draw water at a time, ſo that a traveller muſt wait ſeveral hours ſometimes, before he can get a draught of water; the camel-drivers will have their cattle firſt ſerved. They are a bruiſh ſort of people, and ſo numerous, that there is no contending with them.

SECT. III.

Of the nature of the ſoil, huſbandry, gardening, plants, animals, &c. of Arabia.

THIS country, even that part of it which goes under the name of Hyaman, or the Happy, conſiſts for the moſt part in ſandy deſarts, or dry barren mountains; but there being ſome parts of ſouth Arabia tolerably fruitful, and abounding in corn and herbage, as well as aromatic gums, it is, compared with the other parts of Arabia, a happy country.

They never endeavour to cultivate their hills, being for the moſt part a rocky ſoil, and ſcarce capable of improvement: their vallies ſeem equally barren when water is wanting, and bear ſcarce any herbage; but where they can bring water into them, they produce corn, herbs, flowers, and all manner of garden ſtuff; and no country in the world affords a more agreeable proſpect. They draw water in large ſkins out of their wells morning and evening with oxen, conveying the water along little canals, by the ſides of which their trees and plants are ſet: they cut alſo little channels through their corn fields, by which they let the water into them as there is occaſion, for rain they have very ſeldom any.

There is a great variety of excellent fruits in Arabia, ſuch as oranges, lemons, grapes, peaches and apricots; but what this country is moſt famous for, is their dates and their coffee, with which abundance of ſhips for Europe and India are loaden every year, beſides vaſt quantities that are ſent to Turky. Dates are ſcarcely found any where elſe but in this country and Perſia.

The coffee ſhrub grows eight or ten feet high, and has a gray ſmooth bark, the wood is white, and has not much pith; the twigs riſe by pairs oppoſite to each other, and the leaves on the twigs in the ſame manner, one pair about two inches diſtance from another. The leaves have foot ſtalks a quarter of an inch in length, and are about four inches long, and two broad in the middle, from whence they decreaſe to both extremities, ending in a point. They are ſmooth, whole and without any inciſures on the edges, and near the form of a bay leaf; the fruit comes ex alis foliorum hanging to the twig by a foot ſtalk, ſometimes one, two or more in the ſame place. Theſe ſhrubs are planted in a rich ground, and watered by artificial channels, as their other vegetables are, and after three or four years bearing, the natives plant new ſhrubs, becauſe then the old ones begin to decline. They dry the berries in the ſun, and afterwards take off the outward huſk with hand-mills; and the Arabians in the hotteſt ſeaſon makes uſe of the huſks roaſted in the room of coffee berries, eſteeming the liquor made of them more cooling.

Coffee has been in uſe about two hundred years in Aſia. In the year 1652, Mr. Edwards, a Turky merchant, brought a Greek ſervant into England to make coffee, and this ſervant of his, named Paſqua, was the firſt, it is ſaid, who kept a coffee-houſe here.

The beſt coffee berry is large and plump, with a greeniſh caſt, and has a tranſparency on the thineſt parts: the other has a yellowiſh caſt and is more opaque; but when they are roaſted, it is difficult to diſtinguiſh them. The beſt way of keeping the berries when they are roaſted is, in ſome warm place, where they may not imbibe any moiſture, for this palls it, and takes off the briſkneſs of the taſte; and it is beſt to grind it as it is uſed. It is obſerved that coffee diſtilled yields double as much oil as beans, and almoſt treble as much as wheat.

Arabia alſo abounds in myrrh, manna, caſſia, incenſe, aloes, olibanum, balm and frankincenſe, beſides ſome other valuable drugs: among their plants, nothing is more wanted than timber trees, and indeed they have very little wood of any kind in the country.

Of their animals, thoſe that are moſt uſeful and excellent in their kind are camels and horſes: their camels are

extremely proper for this ſandy country, and the largeſt of them will carry a vaſt burthen; ſome ſay, near eight hundred weight, and with this burthen will travel at the rate of about two miles and an half in an hour; having for many days together only a few dates, ſome balls of bean or barley-meal, or perhaps only the miſerable thorns found in the ſandy deſart. It has four ſtomachs, like other animals that chew the cud; and a fifth, as a reſervoir to hold more water than it has occaſion for, where it remains without corrupting or adulterating. It throws up a quantity of this water, by a contraction of the muſcles, into the other ſtomachs, to macerate the food.

The Arab trains his faithful camel, from its tender ſtage, to all the hardſhips it is to undergo through the whole courſe of its life; he accuſtoms it to travel far and eat little, to paſs its days without drinking, and its nights without ſleep; to kneel down to be loaded, and to riſe the moment it finds the burden equal to its ſtrength, beyond which it will not ſuffer an ounce to be laid on its back. Its feet are adapted to the ſands it is to paſs over, their toughneſs and ſpongy ſoftneſs preventing them from cracking. The Arabian free-booter qualifies his camel for expedition, by matches, in which the horſe runs againſt him. The camel, though leſs active and nimble, tires out his rival in a long courſe. With theſe animals the Arabian robber forms a ſociety, for the purpoſe of carrying on his trade of plunder, in which the man is to have all the profit, while the camel, who carries off the booty, is to have all the fatigue.

Their breed of horſes are only fit for the ſaddle, and are never uſed either for draught or burthen: the fineſt horſes we ſee in the Perſian court are brought from hence, and are admired for their make as well as for their high mettle and ſwiftneſs. The common food both of camels and horſes is barley or barley meal made into dough; but in ſome parts of Arabia, they feed them with camel's milk, butter and wheat; and ſometimes with camel's fleſh dried in the ſun. And a more modern author tells us, they feed their cattle at Muſcat with fiſh, not when they are freſh taken, but they dig a little pit, and having thrown a large quantity of fiſh in it, they let them lie till they are rotten and turned to a kind of earth, after which it is taken up and boiled in water, which they let ſtand till it is cool, and then give it to the cattle; this makes them very fat, nor does their fleſh taſte amiſs by living on this kind of diet. They have oxen, buffaloes, goats and veniſon here, but their beef and buffaloes fleſh is very coarſe. As to hogs they never breed any, being all Mahometans who abhor the ſight of this animal. Fiſh and fowl they have in great plenty on their coaſts; but the inland parts are indifferently ſtocked with either, there being neither wood nor water to be found in ſeveral days journey. Lions, bears, tygers, wolves, jackals and other wild beaſts alſo are found in ſome parts of Arabia, but not in ſuch great numbers as elſewhere, there being but little cover for them.

An Arabian has no reliſh for domeſtic pleaſure, and ſeldom converſes with his wife or children; he values nothing ſo much as his horſe, being ſeldom ſo well pleaſed as when he is hunting, at which diverſion they are very expert; for moſt of them will hunt down a wild boar with aſtoniſhing expedition. After they have rouſed the boar from its place of retirement, into ſome neighbouring plain, they endeavour there by frequent overtaking and turning to tire and perplex it; then watching a proper opportunity either to tranſfix it with their lances from ſome diſtance, or elſe, coming cloſe by its ſide, fix their ſpears in its body.

When the Arabians hunt the lion, great numbers of people aſſemble for that purpoſe, who forming themſelves into a circle, incloſe a large piece of ground, of three, four or five miles compaſs; then the people on foot, advancing firſt, ruſh into the thickets with their dogs and ſpears, to rouſe the game, whilſt the horſemen, keeping a little behind, are always ready to charge upon the firſt ſally of the beaſt; in this manner they proceed, ſtill contracting the circle, till they at laſt either cloſe together, or meet with game to divert them. Sometimes the ſeveral ſorts of animals, ſuch as hyænas, hares, jackals, &c. that happen to lie within the circle, being driven together afford excellent diverſion. The firſt perſon againſt whom the lion flies receives him on his ſpear, which furniſhes the others with an opportunity of attacking him behind; and the lion finding himſelf wounded in the rear, turns that way, which gives the firſt man time to recover. Thus being attacked on all ſides, they diſable and diſpatch him.

A favourite diverſion among the Arabs, is fowling: they do not ſpring the game with dogs, but ſhade themſelves and with a piece of painted cloth, ſtretched upon two reds, walk thus covered through the ſeveral brakes and avenues where they expect to find game. In this painted cloth are ſeveral holes for the fowler to look through, in order to obſerve what paſſes before him. The ſportſman, on ſight of the game, reſts his ſhade upon the ground, and, directing the muzzle of his gun through one of the holes, thus diſcharges it.

We do not find that there are any mines of gold or other metal open at preſent in this country. The King of Muſcat is ſaid to have the command of the pearl fiſhery in the gulf of Perſia; but though they are very good, no great advantage accrues from it, pearls being as dear here as in other parts of Aſia.

SECT. IV.

Contains an account of the trade, weights, meaſures, coin, government, forces, and ſhipping of the Arabs.

WE do not find that the Arabians carry on any conſiderable manufacture at preſent; but they trade with all Mahometan countries, to which they do not only ſend the produce of their own country, and receive the product of others in return; but lying between Perſia and India on the eaſt, and Europe and Africa on the weſt, there are caravans of merchants perpetually going and returning through their country, either belonging to the natives or ſtrangers; and they profit conſiderably by the toll they take of foreigners, as well as by the proviſions they ſell to the caravans. It was by the caravans of Arabia, that Europe, and the weſtern part of our continent, were firſt ſupplied with ſpices and other produce of India, ſo long ſince as Joſeph was ſold to the Iſhmaelites, or Arabian merchants, who were then going down to Egypt with them; and how long before they were engaged in this traffic, (which continues to this day) is uncertain. In proceſs of time, they began to traffic by ſea with India, and brought the fine ſpices up the gulf of Perſia and the Red ſea; and thoſe that came up the Perſian gulf being landed at Boſſora in Chaldea, or Eyraca Arabick, were loaded on the backs of camels, and brought through Arabia to Egypt, and the ſhores of the Levant, and from thence diſperſed by the Phœnicians all over Europe; and the Phœnicians, Egyptians, Ethiopians, and Jews afterwards ſent their fleets to India, whither they carried the produce of the weſt, and brought back the ſpices, and other merchandize of the eaſt in return. The Venetians, Genoeſe, and other ſtates, ſituate in the Mediterranean, afterwards grew vaſtly rich and powerful, by bartering the produce of Europe for the merchandize of India, which they received from Alexandria and the ports of the Levant, and diſperſed all over Europe: but this trade ceaſed when the Portugueſe found the way to India round the Cape of Good Hope, and brought home the ſame merchandize all the way by water-carriage.

But there is ſtill another branch of traffic that remains to be conſidered, and that is, the trade the Mahometan pilgrims carry on when they reſort to Mecca; for theſe expeditions are performed as well on the account of trade as religion. The pilgrims who come from Morocco and the coaſt of Barbary, the whole length of Africa, carry the produce of the weſt with them, which they barter at Mecca for the produce of Perſia and India. The pilgrims of Turky, who meet the Africans in Egypt, from whence they are both convoyed by the Grand Seignior's forces to Mecca, do the ſame. The pilgrims of India moſt commonly go by ſea, as the Perſians do ſometimes, when the Arabs are troubleſome; and all theſe are trading voyages; intereſt, as well as devotion, carries them to Mecca. Mocho is the principal port reſorted to by the Turkiſh gallies, which bring the coffee, and other produce of Arabia, to Suez, at the bottom of the Red Sea, and from thence it is carried to Egypt, and the ports of the Levant, where the Engliſh and other Europeans meet with it: the Engliſh, Dutch, and other Eaſt-India ſhips alſo reſort to Mocho, directly, for coffee and other goods, which they bring to Europe round the Cape of Good Hope.

Their weights at Mocho are, the bahar, which is four hundred and twenty pounds Engliſh: the fraſſel, or twenty-eight pounds, whereof fifteen go to a bahar: the maun, of which ten go to a fraſſel: the ſakea, of which forty go to a maun; and the coffila, of which ten go to a ſakea.

Their dry meaſures are the medeeda, which is three pints Engliſh; and they meaſure cloth and ſilk by the cubit, which is twenty-four inches.

The coins which are current at Mocho, the principal port in the Red ſea, are dollars of all kinds, but they

abate five per cent. on the pillar dollars, becauſe they are reckoned not to be the pureſt ſilver, and the dollar weight with them is ſeventeen drams, fourteen grains. All their coins are taken by weight, and valued according to their fineneſs. The gold coins current here, are ducats of Venice, Germany, Turky, Egypt, &c. The comaſſees are a ſmall coin, which are taken at ſuch a price as the government ſets upon them, and they keep their accounts in an imaginary coin of cabees, of which eighty go to a dollar.

The Arabian kingdoms which lie upon the coaſt, (the boundaries whereof are already deſcribed) appeared ſome of them to be of a very great extent, and their monarchs are frequently ſtiled Xerifs, as the Xerif of Mecca, and others we find called imans; but both one and the other we perceive, ſignify the office of prieſt as well as king, as the califs of the Saracens, the ſucceſſors of Mahomet were, till conquered by the Turks, whoſe emperors do not indeed pretend to the prieſthood, but govern and controul the eccleſiaſtical juriſdiction however, as they pleaſe, and give laws to the mufti or high prieſt, as will appear when we come to treat of Turky. As to the form of the Arabian government and laws, what we can learn of them is, that their monarchs are abſolute both in ſpirituals and temporals, and the ſucceſſion hereditary; that they have no other laws than what are to be found in the alcoran and the comments upon it, which we ſhall enquire into when we come to the head of religion.

We do not find that they have any ſtanding regular militia by land, but their kings command both the purſes and perſons of their ſubjects whenever they ſee fit: the moſt potent monarch by ſea, is the King of Oman or Muſcat, who is indeed become very formidable, not only to the Aſiaticks, but to the Europeans themſelves: they are always at war with the Portugueſe and Danes, and if an Engliſh veſſel come in their way, if ſhe be not a ſhip of force, they will not ſcruple making a prize of her. Mr. Lockhart who travelled to theſe parts, informs us, there were no leſs than fourteen ſail of men of war in the mole at Muſcat when he was there, beſides twenty merchant men. That one of their men of war carried ſeventy guns, and none of them leſs than twenty, but the biggeſt of them would not have made an Engliſh fourth rate, their ports being as cloſe as they can well ſet their guns by one another. There were at the ſame time fifteen or ſixteen ſail of their men of war cruiſing abroad, which were expected home in the ſouth weſt monſoon, when it uſually blows hard; for though they are always full of men they cannot endure bad weather. Their colours are red, which they diſplay in ſtreamers and pendants at every yard-arm, and maſt-head, and other remarkable parts of the ſhip, which make their fleets look exceeding fine.

SECT. V.

Treats of the preſent ſtate of the ſciences, learning, languages and religion in Arabia; alſo an account of the temple at Mecca, and the Mahometan pilgrimage thither.

AN able writer, (ſpeaking of the time when the Arabians threw off the yoke of the califs) ſays, "With regard to the ſciences, it muſt be confeſſed that the Arabians made a moſt amazing progreſs therein: it was however late ere they began to cultivate them, though the fire and vivacity of their genius rendered them very apt for the purpoſe. The truth is, the firſt califs were utterly ignorant of every thing except the koran and the art of war; but under the government of the deſcendants of Abbas, a taſte for the ſciences prevailed throughout the whole nation, and men of learning appeared on every ſide, who, being favoured and protected by the princes, were improving arts and ſciences, and compoſing works in different kinds of literature." But, whatever progreſs they may have formerly made in the ſciences, they are at preſent in Arabia at a very low ebb; the Arabs affording no monument of genius, no productions of induſtry, that intitle them to any rank in the hiſtory of the human mind. Phyſic, philoſophy, aſtronomy, and the mathematics, for which they were once famous, are ſo loſt among them, that ſcarcely the traces of them are remaining: we muſt ſay, however, that the preſent Arabs have ſtrong intellects, and that nature has in general given them a genius: but application and inclination are both wanting to improve it.

They frequently uſe charms and incantations to remove a diſorder, or leave it to contend with nature. They pour hot freſh butter into ſimple and gun-ſhot wounds, and this remedy ſometimes ſucceeds: an application of the prickly pear, roaſted in aſhes, is ſucceſsfully made in ſuppurations.

In theſe countries time is meaſured by hour glaſſes, and in ſome parts of Arabia Petræa, they have calendars that were left them by their anceſtors, which are rather curious, and, in which the ſun's place, the ſemidiurnal and nocturnal arch, the length of the twilight, and the hours of prayer, are inſerted in their proper columns, and calculated to a moment.

Algebra, or numerical arithmetic, they are intirely ignorant of, though their anceſtors furniſhed us with the characters of the one, and with the name at leaſt of the other; yet they have a way of reckoning, by putting their hands into each others ſleeves, and touching one another with a centum joint or finger ſo expreſſively, that without ever moving their lips they can conclude bargains or contracts. But it is ſaid there are ſome wiſe men among them, who, if you believe them, are ſo ſkilled in figures, as to be able by a certain combination of numbers, to form even the moſt wonderful calculations.

It is a diſpute among learned men, which is the moſt antient language, the Hebrew or the Arabic, but they are ſuppoſed by ſome to have been originally the ſame: they are, however, both of them dead languages at this day, neither of them being ſpoken in any country in their original purity. The Arabeſk, a very corrupt Arabic, is at preſent the language of theſe people. The pure Arabic is only underſtood by ſome of the ſettled natives on the ſea-coaſts, and is taught in the ſchools, as well as read in places of worſhip.

The antient religion of the Arabs was Sabeiſm, even previous to their acquaintance with the people of Upper Aſia: they had at an early period conceived ſome very elevated notions of God; they paid adoration to the ſtars, or luminaries enlivened and beautified by heavenly ſpirits; but there was alſo a religion in Arabia Deſerta, not quite ſo rational, part of which conſiſted in offering up human ſacrifices to the ſun.

It has been obſerved by a writer of credit, that "Chriſtianity was planted in Arabia by St. Paul and his diſciples, ſo that it received the light of the goſpel very early; but, in many parts of it, that religion was much clouded, if not totally eclipſed, long before the grand impoſtor Mahomet their countryman made his appearance; and, upon their being ſubdued by the Turks, they embraced his religion.

So addicted are many of the modern Arabs to ſuperſtition, that they carry about with them a paragraph of the Koran, which they place upon their breaſts, or ſow under their caps, to prevent faſcination. They have a great veneration for the Marabbats, who are deemed ſaints, and are perſons of a rigid and auſtere life, continually employing themſelves in counting over their beads, or elſe in prayer and meditation. The above ſainthip goes by ſucceſſion, and the ſon is intitled to the ſame reverence as the father, provided he can keep up an equal gravity and decorum. Some of them have the reputation of being bleſſed with heavenly viſions, and converſing with the godhead; while others, who are ſuppoſed to work miracles, pretend they are endowed with gifts which Mahomet durſt not pretend to.

There are four fundamental points of religious practice required by the koran; namely, prayer, giving of alms, faſting, and the making a pilgrimage to Mecca. Under prayer are comprehended thoſe legal waſhings and purifications which are preparatory thereto; of which there are two degrees, the one called Ghoſt, being a total immerſion in the water; and the other Wodu, which is the waſhing of their faces, hands, and feet. The firſt is required in ſome extraordinary caſes only; the other is the ordinary ablution in common caſes, and before prayer, and muſt neceſſarily be uſed by every perſon before he can enter upon that duty. Some of the Muſſulmen pretend that theſe purifications were obſerved in the days of Abraham, who, they add, was enjoined by God to practiſe them, and was ſhewed the manner of making the ablution by the angel Gabriel, in the form of a beautiful youth. Others carry the cuſtom ſtill higher, and ſay theſe religious ceremonies were taught our firſt parents by the angels.

In the fifth chapter of the koran, there is another purification enjoined, which is performed by defrication. It is called al taya mon, denoting properly the action of taking any thing from the ſurface, as fine ſand from the earth's ſurface; where the parts of the body are ſometimes rubbed with fine ſand, inſtead of being waſhed with water. The words of the koran are, "If ye be ſick, or on a journey;

or

or if ye have touched women, and ye find no water, take fine clean ſand and rub yourſelves therewith."

There is alſo, beſides theſe purifying ceremonies, the ceremony of circumciſion; which, though not directly required in the koran, is yet held by the Mahometans to have been originally of divine inſtitution, and is exerciſed on children as ſoon as they are able to pronounce the profeſſion of their faith. Combing the hair, paring the nails, and plucking out the hair of the arm-pits, being all points of cleanlineſs, are eſſentially neceſſary to internal purification; and therefore are looked upon as indiſpenſable duties by the Muſſulmen.

In conſequence of the divine command pretended to have been given to Mahomet for that purpoſe, every ſtrict and conſcious Muſſulman performs public prayers five times a day: this he does either in a moſque, or in ſome other place that is clean, after a preſcribed form, and with a certain number of praiſes or ejaculations; and whenever they pray, they muſt turn their faces towards the temple of Mecca. They do not attend the public worſhip in elegant apparel, but dreſs themſelves only in a becoming and decent garb.

The women are not ſuffered by ſome of the Mahometans to attend the moſque; and the illiterate think that the female ſex have no claim to the joys of heaven, as having no ſouls to be ſaved; but the more enlightened, generous, and candid, allow that women are as well intitled to heaven as the men; and many Mahometans think that there is a manſion in heaven ſet apart intirely for the ſouls of good women.

Thoſe who profeſs the Mahometan religion are for the moſt part predeſtinarians: for one article of faith in the koran is, God's abſolute decree and predeſtination of both good and evil; that whatever hath or ſhall come to paſs, whether good or bad, proceeded, and will proceed from the divine will alone; though the ſect called the Motazalites contradict this doctrine, as tending to make God the author of ſin, and deſtroy man's free agency.

We ſhall now give an account of the annual, moſt numerous and ſolemn pilgrimage of the Mahometans to the Masjad Al Haran, or ſacred temple of Mecca, which pilgrimage was inſtituted by Mahomet. A prodigious concourſe of people reſort to this holy temple, in the antient city of Mecca. The temple ſtands in the centre of the town, and hath a famous caaba, or ſquare ſtructure, peculiarly hallowed and ſet apart for worſhip: its door is of ſilver, and a golden ſpout carries off the water from the roof. This caaba, from north to ſouth, is twenty-four cubits long; twenty-three broad from eaſt to weſt, and its height is twenty-ſeven cubits. The ſilver door, which is on the eaſt ſide, ſtands about four cubits from the ground, and is aſcended to by a flight of ſteps. In the corner next to this door is a famous black ſtone, ſaid to have been brought down from heaven by Gabriel, at the creation of the world, and which was originally white, but contracted the blackneſs that now appears on it from the ſins of mankind. On the north ſide of the caaba, within a ſemicircular incloſure fifty cubits in length, ſtands a celebrated white ſtone, ſaid to be the ſepulchre of Iſhmael, which reſerves the water that falls from the golden ſpout. The caaba has a double roof, ſupported within by octangular pillars of aloes wood: between which, on iron bars, hang ſilver lamps: the outſide is covered with rich black damaſk, adorned with an embroidered band of gold, which is changed every year, being provided by the Grand Seignior. At a ſmall diſtance from the caaba, on the eaſt ſide, is the ſtation or place of Abraham, where is another ſtone which is in high eſteem with the Mahometans, and on which they pretend to ſhew his footſteps, aſſerting, that he ſtood on this ſtone when he built the caaba. Not far from hence the caaba is neatly ſurrounded by pillars, joined towards the bottom by a low baluſtrade, and towards the top by ſilver bars. Juſt without this incloſure, on the ſouth, north, and weſt ſide of the caaba, are three buildings, in which three particular ſects aſſemble to perform their devotion. Towards the ſouth-eaſt is an edifice covering the famous well zemzem; alſo the treaſury, and the cupola of Al-Abbas. We muſt not omit to obſerve here, that this celebrated well is ſaid to have been the ſame that Hagar ſat near to when comforted by the angel; the pilgrims drink of its water, and attribute many virtues to it. The whole of theſe buildings are ſurrounded by a grand piazza, which ſome writers make to conſiſt of upwards of four hundred and forty pillars, and there are thirty-eight gates to the buildings, which are covered with ſmall domes or cupolas, from the four corners of which riſe four gilded ſteeples.

The caaba made no very ſplendid appearance in the days of Mahomet, nor even in the reigns of his two immediate ſucceſſors Abubeker and Omar; but the ſtructure has been raiſed, by the munificence of ſucceeding princes and great men, to its preſent magnificent ſtate; though its primitive or original form has not undergone any material change ſince the year of the Hegira 74. The Mahometans pretend that this caaba is nearly coeval with the creation; and aſſert, that Adam, after his expulſion from paradiſe, obtained permiſſion of the Almighty to erect it; that however it was deſtroyed by the deluge, and that Abraham rebuilt it on the ſame ſpot and after the ſame model.

The pilgrims reſort annually in prodigious numbers to the above antique and celebrated edifice, when there is a fair held for all ſort of merchandize, &c. people in crouds, from different nations, aſſembling, to the amount generally of two hundred thouſand, at which time even the very vaults of moſques, and the caves of neighbouring mountains, are ſtored with rich commodities. The holy temple is opened four times in the year, but the greateſt multitudes aſſemble at the ſolemn feaſt of the bayram or eaſter, when they purchaſe relics of the old black damaſk covering, previous to its being ſucceeded by a new one from the Grand Seignior.

Many abſurd religious ceremonies are performed by the pilgrims. At a place called Labbock, they ſtrip themſelves almoſt naked, having only a napkin round their middle, and another round their neck: in this condition they enter Mecca, but neither buy nor ſell any thing for eight days. The pilgrims generally wear a ſort of black cloak, with a caul; the people of Barbary wear them white; it is faſtened about the neck with a long loop, and hangs looſe behind. The camels are ornamented, eſpecially the leading one of every company, which hath on its head a plume of feathers.

Many Turks go this journey often; but it is obſerved that they are rather worſe after it than before, and it is a common ſaying among the Chriſtians and Jews, "If a man has been once at Mecca, take care of him; if he has been twice there, have nothing to do with him; but if he has been three times at Mecca, remove from his neighbourhood;" and one who went to Mecca on pilgrimage, affirms, that there is as much debauchery practiſed at that place as in almoſt any part of the univerſe.

Having entered the city, the pilgrims moved to the holy temple, and walk round it ſeven times, the three firſt times with a very quick pace, to manifeſt their readineſs to fight for (what they deem) the true worſhip of God. They accompany their prayers with many ſtrange geſtures of the body, imitating the hamirag, or high-prieſt; and, after having made a ſacrifice of ſheep, repair to the vale of Mirſa, and throw ſtones at the devil's head, who they ſay tempted Abraham in this vale, when he was about to ſacrifice his ſon Iſhmael, not Iſaac; for the intended victim, they ſay, was Iſhmael. They pretend, that on the mountain of Mirſa, which conſtitutes the vale, Adam and Eve wandered upwards of two hundred years without ſeeing each other, after their expulſion from Paradiſe, till they happened by meer chance to meet together at the top of this mountain, when Eve threw ſtones at the devil's head, for his having held up to her a glaſs, and telling her, that the image ſhe then ſaw was another woman with whom Adam was enamoured. From this mountain the prieſts deliver their pious harangues, and afterwards in the vale make freſh ſacrifices of ſheep, the fleſh of which is given to the poor.

An eminent writer aſſerts, that when he was in this part of the globe, upwards of ſix thouſand perſons belonging to one of the caravans died in the road between Cairo and Mecca; and that the effects of ſuch as die devolve to the prieſts. The northern Arabs, who are ſubject to the Turks, receive conſiderable gratuities from the Grand Seignior for preventing the pilgrims from the robberies of their countrymen.

SECT. VI.

The hiſtory of Mahomet, founder of the Mahometan ſuperſtition, and his ſucceſſors.

MAHOMET, or Mohammed, as ſtiled by the Arabians, was of the tribe of Koreis, one of the moſt honourable in Arabia: he was born at Mecca, A. D. 571, in the reign of Juſtinian II. emperor of Conſtantinople; and, though illiterate and of a mean birth, poſſeſſed a moſt ſhrewd underſtanding. His father dying when he was two years old, and leaving him little or nothing to ſubſiſt on, his

his grandfather Abdole Matallah took him into his family, and, dying the year following, recommended him to his uncle Abutaleb, a great merchant, who having inſtructed him in his buſineſs when he grew up, ſent him as his factor, with a caravan, into Syria and Paleſtine, where he became acquainted both with Chriſtians and Jews. He continued in his uncle's ſervice till he was twenty-five years of age, and then left him, and became factor to a rich widow named Cadigha, whoſe affairs he managed, trading to Damaſcus, Egypt, and other places, about three years, when Mahomet and the widow entered into the ſtate of matrimony, ſhe being then about forty years of age; but what ſhe wanted in youth, ſhe made up in fortune. Mahomet was now eſteemed one of the richeſt men in Mecca, and from this time, it is ſaid, he began to form ſchemes to obtain ſovereign power. His anceſtors, he was informed, had been chiefs of their tribe for ſeveral generations; and he was deſcended from the eldeſt branch, and conſequently ought to have ſucceeded to the power which others had uſurped; and the readieſt way to recover this, he imagined, was to turn reformer, and become the head of a new religion: As he well knew the genius of his countrymen, he entertained the moſt ſanguine hopes of ſucceſs: he was aware that the Arabians were fond of novelty, and that they were addicted to illuſions and enthuſiaſm. The times alſo proved to be very favourable for him, as the Chriſtians of the eaſt were quarrelling with one another, and appeared to be very looſe and diſſolute in their morals. He pretended, therefore, to revive the primitive way of worſhip and purity of the antient patriarchs, and that he might ſucceed the better, he did not profeſs himſelf an enemy to any religion then in being, but propoſed to unite Chriſtians, Jews, and Pagans in one profeſſion, that he might meet with the leſs oppoſition; but having been hitherto been an idolater, and remarkably vicious, he thought it would appear very odd to ſee him on a ſudden take upon himſelf the character of a prophet and preacher of righteouſneſs. It ſeemed neceſſary therefore, if he expected to meet with ſucceſs, to reform himſelf firſt. He went every morning therefore to the cave of Hira, near Mecca, where he gave out he ſpent his time in prayers, faſting, and divine meditations; and here it is ſuppoſed he met with ſome Jews and Chriſtians that aſſiſted him in compoſing his koran; he had a monk alſo that reſided conſtantly in his houſe, who had a great ſhare in the framing of it, as is ſuppoſed. When Mahomet returned to Mecca every evening, he uſed to entertain his family with a relation of the viſions he had ſeen, and particularly his intimate converſation with the angel Gabriel, which when his wife ſeemed to doubt of, the monk aſſured her ſhe might give entire credit to it: it was all true that Mahomet had related, and ſhe thereupon became his firſt convert.

Mahomet having acted the part of a hermit for ſome years, and acquired ſome reputation for his piety and virtue, he declared himſelf a prophet ſent from God among his friends, being then about forty years of age: three or four years after he avowed his miſſion publicly. One of his firſt converts was his couſin Haly, who uſed to ſtile himſelf, "The firſt of believers;" his ſlave Zaid became another of his diſciples; whereupon he gave him his liberty, and made a law, that every ſlave that profeſſed himſelf a Mahometan ſhould have his liberty, which is obſerved to this day by the Turks. His fourth diſciple was Abubeker, a man in great reputation for his wiſdom, as well as wealth. After which Oſman, and ſeveral others, men of figure in Mecca, who were afterwards generals in his army, profeſſed themſelves believers. Being thus ſupported, he proceeded to publiſh his new doctrines to the people, and declare he was ſent from God to reclaim the Arabians from their idolatry. He taught them that there is but one God; that thoſe who teach that God has ſons, or daughters, or companions, ought to be abhorred, condemning the doctrines of the trinity and incarnation; he forbid alſo the worſhip of images, and of ſeveral female deities, which the Arabians adored as the daughters of God.

Mahomet affirmed, that this was the religion which God gave to Adam, and reſtored or revealed to Abram, who taught it Iſhmael, the great anceſtor of the Arabians, which being corrupted, he now came to reſtore. He did not deny the miſſion of Moſes or of Jeſus Chriſt, or the authority of the ſcriptures, but accuſed both Jews and Chriſtians with corrupting them. The angel Gabriel, he affirmed, was ſent from God to communicate his will to him; he fell into a trance, he pretended, when the angel delivered the divine meſſages to him; and being ſubject to the falling ſickneſs, this gave ſome countenance to what he aſſerted. He publiſhed his pretended revelations by chapters, ſome of them at Mecca before he was driven from thence, and the reſt at Medina. He uſed to dictate every new chapter to his amanuenſis, who read it to his diſciples till they had it by heart, after which it was laid up in a cheſt, called the "Cheſt of his apoſtleſhip," which he left in the cuſtody of his wife Hapha, from whence the koran was compiled by Abubeker, his immediate ſucceſſor, who ſupplied the want of ſeveral paſſages that were loſt from the memory of thoſe people, who had learnt them by heart, and new modelled the book ſo, as it might beſt ſerve the ends he had in view; and many abſurdities ſtill remaining, Oſman, while he was calif, called in all the copies which had been given out, under pretence of correcting them by the original, cauſed them to be burnt, and, in a manner, compoſed a new koran, in the twenty-third year of the Hegira, A. D. 652, being about twenty years after Mahomet's death. What proof there is of ſuch alterations, does not appear.

Great oppoſition aroſe againſt Mahomet at Mecca; ſome derided, and others threatened him; but ſtill he proceeded in making converts; and being a man of great wit and winning addreſs, flattering the rich and relieving the poor, he became exceedingly popular, inſomuch that the government began to apprehend that he was aiming at ſovereign power; and as he was already become too great to be brought before a court of juſtice, they had determined to take him off privately; of which receiving advice, he fled to Medina. As he confeſſed he had not the power of working miracles, many of his diſciples left him; which occaſioned him to obſerve to the citizens of Medina, that God had indeed ſent Moſes and Jeſus, and had given them the power of working miracles, and yet the world was not reclaimed by them; therefore God had now ſent him laſt to reduce them to obedience by the ſword. He commanded his diſciples, therefore, not to enter into diſputes about religion, but maintain it by force; and deſtroy all thoſe that refuſed to obey him, promiſing great rewards to thoſe who took up arms in this cauſe, and eternal happineſs to ſuch as happened to die in the defence of it.

In his twelfth year, Mahomet gave out that he was carried up to heaven by the angel Gabriel, who had ſeventy pair of wings, whiter than ſnow, and clearer than cryſtal; that he ſet him on the beaſt alborack, leſs than a mule, which in a moment carried him to Jeruſalem, where he left the beaſt, and mounted by a ladder of light to heaven, and from one heaven to another, till he came to the throne of God, which was in the ſeventh or higheſt heaven; he adds, that the ſeven heavens were five hundred years journey aſunder, and that he ſaw a gigantic angel in one of them, whoſe eyes were ſeventy thouſand days journey aſunder; and this journey of Mahomet's, he aſſured his diſciples, was performed in the tenth part of a night, which the Mahometans believe as firmly as any article of faith, though it was for ſome time diſputed whether all this was not a viſion; but the doctors at length reſolved that it was a real journey, and all his ſayings have ever ſince been regarded as ſacred truths brought down from heaven, which having been reduced to writing after his death, make up theſe volumes of tradition which the Mahometans call the Sonorah.

About this time, the Jews and Chriſtians of Arabia perſecuting one another with great fury, one of the parties, to ſtrengthen themſelves, it is ſaid, entered into an alliance with Mahomet; and it is generally thought it was the Chriſtians, from his kind uſage of them, and his cruelty to the Jews.

After the arrival of Mahomet at Medina, he married his daughter Fatima, whom he had by his wife Cadigha, to his couſin Haly, Fatima being the only child by that wife which ſurvived him, and from her all thoſe derive their right who pretend to be of the family of Mahomet. He held Cadigha, to be the moſt perfect of women; for he was uſed to obſerve, that there never were but four good women in the world, namely, 1. This Cadigha, that made his fortune; 2. Aſiah, the wife of one of the Pharaoh's 3. The virgin Mary; and, 4. His daughter Fatima. Having brought over moſt of the people of Medina to his intereſt, he began to make incurſions on the neighbouring ſtates, and particularly on the ſubjects of Mecca, from whence he was expelled; and to diſtreſs that city, intercepted their caravans that went from thence to Syria and Paleſtine, killing thoſe who refuſed to embrace his doctrine; and enriching his diſciples with the plunder; which induced many of the thieviſh Arabs to join him, eſpecially as the robberies they committed were denominated acts of

religion, and the cauſe (that is, the deſtroying all that differed from them) the cauſe of God.

He at firſt directed his diſciples to turn their faces towards Jeruſalem when they prayed; but looking upon the Jews afterwards as his mortal enemies, and obſerving that his countrymen had ſtill a great veneration for the caaba or temple of Mecca, which had for ſome ages been the place where they performed their devotions, he ordered them to direct their devotions to Mecca, and go in pilgrimage thither, as they uſed to do, and many of their idolatrous rites to be retained. It is obſerved to have been one of the moſt ſucceſsful ſtratagems Mahomet uſed, ſo to frame his new religion as to make it moſt agreeable to the humour, intereſt, and appetites of thoſe he hoped to delude, and bring over to his party.

The Jews having provoked him by taking part with his enemies, or ſome other affront he had received from them, he fell upon ſeveral tribes of the Jewiſh Arabs, and having taken great numbers of priſoners, ſold them for ſlaves, and divided the plunder among his diſciples, which ſtill increaſed the number of his followers; but receiving a defeat afterwards at mount Ohad, the people began to ſuſpect he was not a true prophet; and ſome, that had loſt their relations in the battle, began to murmur; whereupon he told them, that it was their ſins, that had occaſioned the defeat, and as to thoſe that fell in battle, they would have died, if they had remained at home, the period of every man's life being fixed by God, beyond which it could not be prolonged; and as they had died in defence of their faith, they had obtained their crown of martyrdom, and were now alive with God in Paradiſe, in a ſtate of everlaſting bliſs; which doctrines, he found, gave great courage and reſolution to his people, and therefore continued to inculcate theſe doctrines, as his ſucceſſors do to this day.

Having gained a ſecond victory over the Jewiſh Arabs, he put them every one to the ſword, perhaps becauſe they made ſuch a brave reſiſtance, as had like to have put an end to his uſurped dominion; for they had ſurprized his army when a great many of them were drunk and engaged in play; and it was with the utmoſt hazard and difficulty that he wreſted the victory out of their hands, which was the reaſon of his prohibiting the drinking of ſtrong liquors and gaming.

The citizens of Mecca, in the mean time, finding him grow very formidable, entered into a confederacy with ſome of the neighbouring tribes, and marched with a powerful army to give him battle, which Mahomet declined, apprehending he was not ſtrong enough to engage them in the open field: he made choice of a very ſtrong camp, therefore, which he entrenched and fortified, and the enemy lying pretty near him, he found means to corrupt ſome of their principal officers, who adviſing a retreat, delivered him from his fears; and having increaſed his army he marched towards Mecca, and a battle being fought between that city, and Sidin or Judda, in which neither party had much reaſon to boaſt of their ſucceſs, a truce was concluded between them; in which it was agreed, that Mahomet's friends in Mecca ſhould be at liberty to join him; and thoſe in his army who deſired it, might return to Mecca. Mahomet now looking upon his authority to be ſufficiently eſtabliſhed, cauſed himſelf to be proclaimed king at his return to Medina; this being the ſixth year of the Hegira, or Mahometan æra, A. D. 627. But ſtill he retained the office of high prieſt, and his ſucceſſors, the caliſs, enjoyed both offices until the 325th year of the Hegira, when the governors of the ſeveral provinces of the Saracen empire aſſumed an independent authority with the title of ſultans, leaving the califfs poſſeſſed only of the eccleſiaſtical authority. The Mahometan princes afterwards proceeded to conſtitute a pontiff in their reſpective dominions, who is called the ſedre in Perſia, and mufti in Turky, who interpoſe only in eccleſiaſtical matters, except that they ſit as judges in the ſupreme court of juſtice: the reaſon whereof is, that the Mahometan laws are only the laws and precepts of the koran, and the comments upon them, of which the high prieſt and his clergy are ſtill eſteemed the ſole interpreters; but then, if the mufti does not determine as the Grand Seignor would have him, he is depoſed, and another advanced to that poſt; ſo that he, the mufti or chief prieſt, is, in effect, no more than the tool of the miniſtry in every Mahometan country, as the chief prieſts of a better religion too often are. But to proceed with our hiſtory.

Mahomet ſtill continued to preach and pray, and perform the office of high-prieſt as before; only, inſtead of leaning on the ſtump of a palm-tree, before his advancement to the royal dignity, he cauſed a magnificent temple to be built at Medina, and harangued the people from a pulpit; and the Mahometans have a tradition, that the forſaken ſtump of the palm-tree groaned, when it found itſelf deſerted by Mahomet, and had no longer the honour to ſuſtain his weight.

The Jewiſh Arabs having become the objects of this uſurper's implacable hatred, he continued to make war upon them: they were extremely obnoxious to him in the latter end of his reign, though he had courted their favour in the beginning. He took one of their cities; and being afterwards at ſupper at the houſe of Hareth, one of the principal citizens, one of his officers dropped down dead, poiſoned by a ſhoulder of mutton, which a daughter of the family had prepared for Mahomet, it is ſaid; and he taſted ſo much of it that he never was well afterwards, though he ſurvived it ſeveral years. His diſciples conſtrued his eſcape at this time a miracle, for they have a tradition amongſt them, that the ſhoulder of mutton ſpoke to Mahomet, and warned him of his danger.

After Mahomet's death, it was diſcovered that the meat was poiſoned by Zainab, the daughter of Hareth, on this principle, that if he was the great prophet he pretended to be, the poiſon could have no effect upon him.

Having very little regard for the truce he had made with Mecca, he privately aſſembled a body of ten thouſand men, and ſurpriſed that city, maſſacreing all thoſe that durſt oppoſe him: thus he proceeded in his pretended reformation of religion, broke down the images in the caaba, conſecrated that temple to his new religion, and commanded his diſciples to go in pilgrimage thither once in their lives. The principal images he expelled the caaba were thoſe of Abram and Iſhmael, and the images of ſome departed ſaints; which the Arabians worſhipped as mediators to the ſupreme God. For the Arabians always held that there was but one God, the creator of heaven and earth, whom they ſtiled Alla Tael, or the God of gods; and as they imagined he was too great to be addreſſed without a mediator, they implored the interceſſion of holy men, that were gone to heaven, to recommend them to his favour; and this ſeems to have been the religion of moſt nations antiently, as it is at this day: it is not to the image, but to the ſaint the image repreſents, as the Roman Catholics ſay, that they gave this inferior kind of worſhip.

Moſt of the Arab tribes, reſenting the inſult put upon their religion by breaking down their images, united againſt Mahomet, whom they defeated in a general battle, and compelled him to retire under the walls of Mecca; but he being victorious in a ſecond battle, compelled them to acknowledge him their ſovereign, and to profeſs the religion he had forged as a revelation of the deity; and to ſet them an example, he undertook a pilgrimage in perſon to Mecca, attended by a multitude of people from all parts of Arabia; and now finding himſelf to be in a bad ſtate of health, occaſioned by the poiſon the Jeweſs had given him in the ſhoulder of mutton, as before related, he became delirious, complaining of the pain he had ſuffered ever ſince he had eat the fatal morſel, and at length expired in great agonies in 629, being juſt ſixty three years old on the day he died. His diſciples were in great confuſion after his death, many of them having been of opinion that he could not die, or if he did appear to be dead, he would ſoon come to life again. Omar, one of his generals was of this opinion, and, drawing his ſword, ſwore he would cut any man to pieces that ſhould ſay he was dead. Abubeker thereupon demanded, if they worſhipped Mahomet, or the God of Mahomet? if you worſhip the God of Mahomet, ſaid he, he is immortal, and lives forever; but as to Mahomet, he is certainly dead; and that he muſt die, he obſerved, was plain from ſeveral paſſages in the koran; with which Omar and his party were ſatisfied. Another diſpute aroſe about the place of his burial, ſome were for having him buried at Medina; others at Mecca; and a third party would have him buried among the prophets at Jeruſalem; but Abubeker declaring he heard Mahomet ſay, that a prophet ſhould be buried in the place where he died, they all acquieſced in this, and a grave being made under the bed where he lay, there he was interred, and over the grave a chapel was built which ſtands at one of the corners of the great moſque at Medina, which was founded by Mahomet himſelf.

Mahomet took no other wife as long as Cadigha lived; but afterwards he had fifteen, ſome ſay, twenty, moſt of them cohabiting with him at the ſame time. Of theſe, five died before him, and he divorced ſix: Ayeſha, the daughter of Abubeker, was the greateſt favourite, though

ſhe was charged with being falſe to his bed, which he pretended not to believe, and added one chapter to the koran, to declare her innocence. His wife Haphſa, the daughter of Omar, was the moſt reſpected next, with whom he truſted the cheſt of his apoſtleſhip already mentioned, where the original writings relating to his pretended revelations were depoſited. His wife Zeida he was ſoon weary of, and was about to part with her; but upon her conſenting to reſign her turn to Ayeſha, he permitted her to retain the honour of being one among the number of his wives: he took alſo Zaidah, the wife of Zaid his enfranchiſed ſlave, at which his diſciples were much offended; he compoſed a chapter of his koran, therefore, wherein he introduced God approving of the match; and this lady uſed to boaſt, that he received his other wives from their relations, but ſhe was married to him by God himſelf.

Beſides his wives, he had ſeveral concubines, and particularly an Egyptian in his old age, of whom he was extremely fond, and was upbraided with it, by his wives, Haphſa and Ayeſha, repreſenting how unjuſt and indecent it was in a holy man and a prophet, to prove falſe to their bed, and purſue his luſts in his declining age; which occaſioned another revelation, wherein he makes God permit him and his diſciples to lie with their female ſlaves, as is practiſed by the Mahometans at this day; and in ſome, if not in all Mahometan countries, the children of ſuch ſlaves are deemed legitimate, and ſhare their fathers eſtate, with the iſſue of their wives.

The having ſeveral wives alive at once, was practiſed by the Arabs from the earlieſt ages, but was limited by Mahomet to four: and as the taking their ſlaves to their bed, Abram, the father of Iſhmael their grand anceſtor, did the ſame; and Jacob, we find, had ſons, by two of his ſlaves, and made no diſtinction between them and the iſſue he had by his wives; they were all ſtiled patriarchs, and the promiſed land was divided equally among the poſterity of Jacob's wives and ſlaves.

One of the laws of Mahomet ſeems equitable enough, namely, that a man ſhould make no difference in the cloathing or diet of his wives, but they ſhould all fare alike: and the ſame in the duties of the bed: and if a wife complains of her huſband's being partial in any of theſe reſpects, the magiſtrate will relieve her, or grant a divorce if ſhe deſires it: and the keeping of boys for their bedfellows is allowed to be another ſufficient reaſon for a divorce; and yet this is what the Turks frequently practiſe. He alſo gave his diſciples a table containing the degrees of marriage, as that they ſhould not marry their mothers-in-law, ſiſters, or ſiſters-in-law, or their daughters; that they ſhould not marry the daughter of any woman they had lain with, or another man's wife: he had, himſelf, indeed, married the wife of his ſervant Zaid; but in another chapter of the koran, he brings in God, forbidding him to take another man's wife for the future; and though he allowed himſelf great liberties, he forbids all men entering into any converſation with his wives, or the wives of other men; and commands all wives to forbear ſpeaking to any man, but with their faces veiled; that they ſhould remain widows after their huſbands death, and that no man ſhould touch them; but whatever he requires ſhould be done, he always repreſents heaven approving it, and compoſes a chapter in the koran to countenance the practice.

Mahomet had appointed Hali, the huſband of his eldeſt daughter Fatima to be his ſucceſſor; but Abubeker, his father-in-law, and one of his moſt celebrated generals, aſſumed the title of calif, or ſovereign of the Saracens, both in ſpirituals and temporals. He enjoyed this honour ten years, and was ſucceeded by Omar, another general of the Saracen army, who made the ſwifteſt conqueſts of any prince we read of; for he added Perſia, Syria, Paleſtine, Meſopotamia, and Egypt, to his dominions. To him ſucceeded Othman, another of Mahomet's generals, who added all the north of Africa as far as the pillars of Hercules (the ſtraights of Gibraltar) to the Saracen empire. But the faction of Hali prevailing againſt him, he became his own executioner, threw himſelf upon his ſword, and died in the eighty-ſeventh year of his age, and the tenth of his reign, though ſome have aſſerted, that he was aſſaſſinated; and his ſucceſſor Hali was aſſaſſinated, before he had reigned three years, by Mahuvias.

Hali left two ſons, on the eldeſt of whom, named Haſſan, the Arabians beſtowed the crown. After reigning about ſix months, he abdicated his throne in favour of Moawiyah, who had been a continual terror to him; ſo that Moawiyah, who had formerly excited a revolt in Syria againſt Hali, now became ſole poſſeſſor of the throne, was acknowledged by all muſſulmen as the true and lawful calif, being the firſt of the dynaſty of the Ommiyans, ſo called from Ommiyah, the head of the prince's family.

As ſoon as this prince was firmly ſeated on the throne, his firſt grand object was to augment his glory: he proſecuted ſuch enterprizes as former califs had begun againſt the Greeks; he drove them out of Armenia and Anatolia, and adopted meaſures to render the dignity of calif hereditary, which had been before elective, and ſucceeded in his deſign; his crown deſcended to his ſon, and afterwards to the reſt of his poſterity. That dynaſty of princes maintained themſelves with great glory for fourteen ſucceſſions, though not always in a right line; for brothers often aſcended the throne to the prejudice of their nephews, when the latter were not of due age, or there were any other reaſons that artifice could aſſign; but the ſucceſſion was always in the houſe of Ommiyah till the time of Merwan the ſecond. The houſe of Ommiyah, however, was not deſtroyed by the Abbaſſians, princes ſo denoted from their being deſcended from Abbas, uncle of Mahomet. They took up arms againſt the Ommiyans, under pretence of revenging the death of Hali, who, they alledged, had been murdered by them, Abul Abbas was accordingly proclaimed calif.

Abdallah, who was the uncle of Abul Abbas, cauſed an act of grace to be publiſhed, in the calif's name, for all the Ommiyans who ſhould appear before him, and take the oaths of allegiance to the new calif. A day was fixed for a meeting of the chiefs or princes, and Abdallah attended them; but while he was preparing to tender the oaths, a party of ſoldiers, appointed for the purpoſe, drew up behind them, and deſtroyed them all on the ſpot, except one, who eſcaped and fled to Spain. Immediately after this barbarous deed, the ſoldiers put to the ſword a great number of muſſulmen known to be devoted to the houſe of Ommiyah; and Obdalla, having put an end to the ſlaughter, completed his bloody tranſaction with a moſt horrid entertainment. The above infernal monſter cauſed the bodies of the Ommiyans, who had been ſlaughtered by the ſoldiers, to be placed cloſe to one another, and covered with boards, over which he ordered carpets to be laid, and upon this flooring, formed by dead carcaſes, he gave a ſumptuous feaſt to the officers of the army. "Perhaps, ſaid he, all of them may not be quite dead; in that caſe, we ſhall have the happineſs to hear them groan." Such was the beginning of the reign of Abul Abbas, who however was not accuſed of having any ſhare in the above maſſacre; nor did he enjoy the throne long, for he died at the age of eighteen, of the ſmall-pox.

Abul Abbas was ſucceeded by his brother Abu Giaffer, ſurnamed Almanzor, or Victorious; and ſoon after he aſſumed the diadem, his uncle, the infamous Abdallah, was cruſhed to death, with ſeveral others, by the ſuddenly falling-in of the floor of a chamber in which they were ſitting. Almanzor built the city of Bagdat, which was the capital of the empire till the race of Abbas became extinct: on which account the Abbaſſians have been commonly called califs of Syria, on account of their conſtant abode in that country. The Abbaſſians, who ſtiled themſelves the true children of the houſe of the great prophet, poſſeſſed the diadem, under the thirty ſeven princes, for upwards of five hundred years.

The unlimited authority with which the houſe of Ommiyah entruſted the governors of provinces, was the ſole cauſe of their ruin: the deſcendants of Abbas fell into the ſame error: this however ſupported their dynaſty longer than was that of the Ommiyans, but with leſs ſplendor with regard to the extent of their authority. During their reigns, part of their empire was at ſeveral times granted away; and the territories, thus diſmembered, were erected into as many dynaſties; of theſe were the Thaherians, and the Soffarides, who reigned in Perſia, Tranſoxtana, and Turkeſtan; as alſo the Tholanides, and Aſchidians, who ruled Egypt under the title of ſultans, though at the ſame time they acknowledged the ſupremacy of the calif of Bagdat. But the Aſchidians were ſucceeded by the Fatimites, who pretending to be the true and rightful ſucceſſors of Mahomet, as deſcended from Hali by Fatima, aſſumed the title of calif in Egypt: thence the name of the califs of Bagdat was ſuppreſſed in the public prayers throughout the whole extent of their dominions.

The new dynaſty poſſeſſed the full and intire ſovereignty for almoſt three hundred years, when, however the Egyptian Fatimites were at length totally ruined by the califs of Bagdat, who recovered the poſſeſſion of Egypt and Syria, owing to the maſterly conduct of Salaheddin or Saladin; to whom, on conſideration of his ſervices, the calif Naſſer ſolemnly confirmed the ſultanſhip of Egypt

and

and Syria; and in the beſtowal of this grand act of favour Naſſer acquired a conſtant protector: and while the muſſulmen of Egypt and Syria were fighting, under the banners of Saladin againſt the Chriſtian armies, Naſſer quietly enjoyed at Bagdat all the honours due to the califat, being acknowledged ſovereign in all countries then inhabited by muſſulmen.

A new dynaſty, called Genghiſkanians, from their founder Genghiz Khan, aroſe after the extinction of the Fatimites. This prince, who became highly renowned for the rapidity of his exploits, put himſelf at the head of an army of Moguls and Tartars, and ſoon conquered an immenſe tract of land, his ſucceſſors, who inherited his bravery, as well as his antipathy to muſſulmen, added to their crown almoſt all the ſtates which had been ſeized by the princes of the other dynaſties; and at length made themſelves maſters of Bagdat, maſſacred the calif and his children, and by their death put a final end to the illuſtrious houſe of Abbas, which had ſat on the throne upwards of five hundred years.

At this period the hiſtory of the califs properly concludes; for we cannot include, among the califs, Ahmed, who was three years afterwards proclaimed calif by the Mamlucks of Egypt, under the name of Moſtanzer Billah. They called him the ſon of Daher ben Naſſer the Abbaſſian; and Biban, who was then ſultan of the Mamlucks, cauſed him to be recognized in Egypt; ſo that a ſecond dynaſty of Abbaſſians was formed, if the name of dynaſty can be allowed to a race of princes who were only looked upon as the head of the church. This pretended dynaſty ſubſiſted till the end of the Mamlucks, in the 933d year of the Hegira and 1517th of the Chriſtian æra; when Selim, the firſt emperor of the Ottoman Turks, annexed all Egypt to his empire.

To ſum up the whole, Abubeker, the immediate ſucceſſor of Mahomet, began his califat, in the eleventh year of the Hegira, and 633d of the Chriſtian æra. In the 41ſt of the Hegira, and A. D. 661. Moawiyah began to reign: he was the firſt of the dynaſty of Ommiyans, of which Merwan II. Hegira 127. A. D. 744, was the laſt: Abul Abbas, the firſt of the houſe of Abbas, began to reign, Hegira 134. A. D. 752. and Moſtazem was the 56th and laſt grand Abbaſſian calif, who began to reign in the 64th year of the Hegira, and in the 1242d of the Chriſtian æra. So that from Abubeker, the firſt calif to that of Moſtazem, is included a ſpace of 610 years. It is remarkable of Motaſſon, who began to reign, A. D. 833, that he was born in the eighth month in the year, was the eighth prince of this race, the eighth Abbaſſian calif, aſcended his throne in the 218th year of the Hegira, commanded his troops eight times in perſon, reigned eight years eight months and eight days, died in the forty-eighth year of his age, had eight ſons and eight daughters, and left exactly eight millions of gold in his treaſury.

SECT. VII.

Treats of the antiquities of the Arabians; and alſo contains an account of Palmyra or Tadmor.

WE ſhall here take ſome notice of the moſt antient and celebrated places of antiquity, beginning with the Red ſea, or Arabian gulf, which flows from the Indian ocean, runs eaſtward as far as the iſthmus of Africa, to the town of Suez. It has its name, according to ſome authors, from an orient brightneſs peculiar to its waters, being tinged with a red mineral earth; and it has a red ſand on its ſhores, which is frequently repugnant to its quality and nature, mixed with the water by the flux and reflux of the ſea, which is ſo violent in this gulf, as to toſs it to and fro like aſhes, and prevent its ſubſiding to the bottom by a perpetual vehement agitation. Seafaring people have confidently aſſerted that the ſand, thus borne and agitated by the turbulent waters, appears as red as blood: but that, if put into ſtill water, it will ſink to the bottom. Some writers derive its name from the Greek word erythros, ſignifying red, eſpecially as Erythros was the name of a king who reigned on the coaſt. But from whatever its name be really derived, no ſea has been more juſtly celebrated: the paſſage of the Iſraelites through it, and its conveyance of all the rich merchandize of the eaſt for upwards of three thouſand years, have given it an immortal name.

Mount Sinai deſerves a particular deſcription. It has two ſummits, and is called by the Arabs the mountain of Moſes, becauſe many remarkable things happened here to that prophet. Here, they ſay, the almighty appeared to him in a burning buſh; and the fathers ſhew a bramble, which they affirm is of the ſame kind. Here he likewiſe fed the flock of his father-in-law Jethro; and not far off he ſtruck the rock, out of which the water inſtantly guſhed. There is a convent at mount Sinai, founded by the empreſs Helena, and dedicated to the celebrated St. Catherine: it ſtands at the bottom of the mountain, and is an irregular, aukward building of unburnt brick, walled round and ſtopped up at every entrance to prevent the incurſions of the roving Arabs. The only free entrance is by a window that is upwards of thirty feet from the ground, and to which people are drawn up in a machine by a windlas. Within the walls, which are two hundred and fifty-five feet long from eaſt to weſt, and fifty-five feet broad from north to ſouth, are mills, bake-houſes, ſtore-houſes, and every office neceſſary to a ſequeſtered ſociety. Here is the ſhrine of St. Catherine, the relics are depoſited in a marble cheſt, whereon are carved ſeveral pieces of foliage in baſſo relievo.

Another mountain, called mount St. Catherine, is ſituated near mount Sinai: to the former place the body of St. Catherine was brought, after her martyrdom under the tyrant Maxentius. It overtops mount Sinai, and its ſoil is a ſpecies of ſpeckled marble, in which are ſeen beautiful configurations of trees, and other repreſentations of the like nature in the vegetable world.

With reſpect to the magnificent remains of Palmyra, an able writer obſerves, that "Nothing but ocular proof could convince any man that ſo ſuperb a city, formerly ten miles in circumference, could exiſt in the midſt of barren, uninhabitable ſands. Nothing, however, is more certain, than that Palmyra was formerly the capital of a great kingdom; that it was the pride as well as the emporium of the eaſtern world; and that its merchants dealt with the Romans and the weſtern nations for the merchandizes and luxuries of India and Arabia. Its preſent altered ſituation, therefore, can be accouted for only by natural cauſes, which have turned the moſt fertile tracts into barren deſarts."

There is no part of a tour through the eaſt ſo difficult as a journey to Palmyra, it being ſituated in a dreary deſart, at a diſtance from any common road, and beyond the Grand Seignor's protection. We ſhall now proceed to a deſcription of the ruins of this place, than which no proſpect can be conceived more romantic, more melancholy or more grand. Here are innumerable piles of Corinthian pillars, without any intervening building, or wall of the leaſt ſolidity. A traveller, who with ſeveral others ſtaid fifteen days at this place, remarks as follows: "The walls of this antient and ſtupendous city, were flanked with ſquare towers in many parts, particularly in the ſouth-eaſt, but nothing of them exiſts; and from the beſt computation of them, I imagine their circuit could not have been leſs than three Engliſh miles, provided they include the great temple." He further obſerves, "We have but little information from hiſtory, of either Balbec or Palmyra: what knowledge we have is chiefly from inſcriptions. Does not this defect convey inſtruction, and convince us of the inſtability of human grandeur? the fate of theſe two cities differs from each other: we have no teſtimonies of what they were, but their own noble fragments." Palmyra (continues he) in the deſarts of Arabia, or, as by the ſcripture ſtyled Tadmor in the wilderneſs, is a moſt awful ſpectacle. As you approach, the firſt object which preſents itſelf is a grand ruinated caſtle, on the north ſide of the city. From it you deſcry Tadmor, incloſed on three ſides by long ridges of mountains; ſouthward of it is a vaſt plain extending far beyond the ſight. The city muſt have been of large extent, from the ſpace now taken up by its ruins; among which live about thirty or forty miſerable families, in tents of dirt, within a ſpacious court which once incloſed a magnificent temple. This court hath a ſtately high wall of large ſquare ſtone, adorned by pilaſters both within and without: there are about ſixty in each ſide. The beautiful cornices have been beaten down by the Turks. Towards the centre are the remains of a caſtle, ſhrouding the fragments of a temple of exquiſite beauty, as appears by what is ſtill ſtanding of its entrance, namely, two ſtones thirty-five feet long, carved with vines and cluſters of grapes. In the great court are the remains of two rows of very noble marble pillars thirty-ſeven feet high, with capitals finely carved, and the cornices muſt have been of equal elegance; fifty-eight of theſe pillars are intire: there muſt have been many more, as it appears they went quite round the court, ſupporting a moſt ſpacious double piazza. The walks on the weſt

A General Perspective VIEW of the RUINS of the celebrated TEMPLE of PALMIRA, in Arabia

Ledge sculp.

ſide of the piazza, which face the front of the temple, ſeem to have been grand and ſpacious; and at each end are two niches for ſtatues at length, with pedeſtals, borders, ſupporters, canopies, &c. carved with inimitable art. The ſpace within this once beautiful incloſure is (or rather was) encompaſſed by another row of pillars of a different order, fifty feet high, ſixteen of which are yet ſtanding. The temple was ninety feet long, and about forty broad; its grand entrance on the weſt appears, by what remains of it, to have been the moſt magnificent in the world. Over a doorway in the remaining wiles you trace a ſpread eagle; as at Balbec; and here are the fragments of cupids, as well as of eagles, moſt finely imitating nature, on large ſtones mouldering on the earth. Nothing of the temple ſtands but the walls, the window places of which are narrow at top, but richly adorned with ſculpture. In the middle is a cupola, all one ſolid piece. Leaving this court and temple, your eyes are ſaluted with a great number of pillars of marble ſcattered for near a mile. To the north you have a ſtately obeliſk before you, conſiſting of ſeven large ſtones beſides its capital, grandly ſculptured: it is more than fifty feet high, and is twelve feet and a half in circumference juſt above the pedeſtal; and it is imagined a ſtatue once ſtood upon it. Eaſt and weſt of this, at the diſtance of about a quarter of a mile, is another obeliſk, that ſeems to have correſponded with the firſt mentioned, and, according to the fragments of a third, it ſhould ſeem that there was a continued range of them. On one of them, which is about forty feet high, there is a Greek inſcription commemorating two patriots; and about one hundred paces from it is a large and lofty entrance, leading to a grand piazza, adorned with marble pillars, on moſt of which there are inſcriptions. A little farther onwards to the left, are the remains of a ſtately pile of remarkably fine marble, ſeventy-two feet long. On the weſt ſide of the piazza are ſeveral openings for gates; two of them appear to have been the moſt ſuperb that ever captivated the eye, both in point of grandeur of work in general, and the beautiful porphyry pillars with which they were adorned. Eaſtward of the piazza are a great number of ſcattered marble pillars, moſt of which have been deprived of their elegant capitals. A little ruined temple lies mouldering at a ſhort diſtance, which appears to have been a very curious ſtructure. But of all the venerable remains, none more attract the imagination than the magnificent ſepulchre towards the north of the city, extending a mile and more, and which at a diſtance have the appearance of the tops of decayed churches, or baſtions of ruined fortifications."

It is evident that Palmyra was uſed as a place of ſtrength, from alterations which have been made in the caſtle on the hill, and the temple of the ſun, which muſt have been intended for defence, and are not more than five or ſix hundred years old. The moſt perfect piece of antiquity is a mauſoleum, upwards of one thouſand ſeven hundred years old, with the flooring intire, and an inſcription ſtill legible, informing you that it was built by Jambliceus, ſon of Mocimus, as a burial place for himſelf and family, in the year 314, which anſwers to the third year of the Chriſtian æra. We ſhall only add, on this head, that the magnificent city of Palmyra is mentioned, in the Arabic tranſlation of the Chronicles, as ſubſiſting before the days of Solomon; but John of Antioch ſurnamed Malala, ſays it was built by Solomon, on the very ſpot where his father ſlew the philiſtine chief; and he affirms, that in commemoration of that extraordinary event the city was built.

On the ſummit of a rocky hill, north-weſt of the ruins of Palmyra, ſtands an antique caſtle, the aſcent to which is very ſteep and rugged: it is a mean ſtructure not ſo old as the time of Juſtinian. It hath a ditch round it, which cannot be paſſed without ſome difficulty, the draw-bridge being broken down. There is one building here, the remains of which are extremely grand; and this is affirmed to have been the temple of the ſun, which being much injured by the Roman ſoldiers, when Aurelian took the place, the emperor ordered for the purpoſe of repairing it, three hundred pounds weight of gold, taken from the treaſures of Zonobia; and one thouſand eight hundred pounds weight of ſilver, levied upon the people; beſides the jewels of the crown. The height and ſolidity of the walls of its court tempted the Turks to convert it into a place of ſtrength, and then on the north-eaſt and ſouth they ſtopped up the windows, dug a ditch to the weſt, and demoliſhed the portico of the grand entrance; building in its place a ſquare tower, to flank that ſide. To the eaſt and ſouth of this temple are ſome plantations of olives, and ſome ſmall fields of corn, ſurrounded by mud walls, and watered by two ſtreams, which, though hot and ſulphurous, are by the inhabitants deemed very wholeſome. One of theſe ſtreams riſes weſt of the ruins, in a grotto nearly high enough to admit of a man's ſtanding upright; the whole bottom is a baſon of clear water, about two feet deep; and the place on account of the heats being continued, is uſed as a bath. By an old inſcription found here, on an altar ſacred to Jupiter, we learn that this ſtream was never eſteemed while Palmyra flouriſhed, and was under the care of certain people elected by ballot for that purpoſe.

Three or four miles ſouth-eaſt of Palmyra, in the deſert, lies the valley of ſalt, whence Damaſcus and the neighbouring towns are ſupplied with that commodity. On this place, it is ſuppoſed, David ſmote the Syrians, as mentioned, 2 Sam. viii. 13. The ground is impregnated with ſalt to a conſiderable depth, and here they have a method of hollowing the ground to about a foot deep, and a fine white ſalt is gathered from the rain water that lodges in it.

CHAP. VIII.

THE NEW AND COMPLETE HISTORY AND DESCRIPTION OF

ASIATIC TURKY.

SECT. I.

Treats of the name, ſituation and extent of Turky; alſo the mountains, ſeas, rivers and lakes, contained in it.

TURKY in Aſia forms a grand diviſion of the Turkiſh empire, the whole being nearly ſquare and extending about two thouſand miles each way. It abounds not only with the neceſſaries, but with all the luxuries of life, and contains ſome of the moſt fertile and delightful provinces in the univerſe, which are in the poſſeſſion of the moſt indolent people exiſting.

The Turcœ, who were the progenitors of the Turks, were a Scythian nation, which reſided, for the moſt part, near the banks of the Palus Mœotis, in the country now denominated Koban Tartary, but led rambling lives, removing their habitations, or rather camps, as the ſeaſons changed, and they could find paſture for their cattle.

This country is ſituated between twenty-five and forty-eight degrees of north latitude, and twenty-ſeven and forty-five degrees of eaſt longitude. It is divided by ſome into eaſtern, weſtern, and ſouthern, and by others into eaſtern and weſtern: the latter comprehending Syria, Paleſtine and Anatolia, or the Leſſer Aſia; and the former Diarbeck, Turcomania, and Georgia. It is bounded by Circaſſia and the Black ſea, on the north; by Perſia, on the eaſt; by Arabia and the Levant on the ſouth, and on the weſt, by the Helleſpont, the Ægean ſea or Archipelago, which ſeparate it from Europe.

The principal mountains are thoſe of Olympus, Ida, Taurus, Anti-Taurus, and thoſe of Caramania or Ciliciа, all of them ſituate in Natolia, or the Leſſer Aſia; Mount Caucaſus, now called the mountains of Dagiſtan: the mountains of Armenia, among which is mount Ararat, where the ark reſted, the mountains of Curdeſtan, or Aſſyria, which lie between Perſia and Turky, and the mountains of Paleſtine, particularly mount Hermon and mount Lebanon.

The ſeas bordering on this country are, the Euxine or Black ſea; the Boſphorus, or ſea of Conſtantinople; the Propontis, or ſea of Marmora; the Helleſpont, and the Ægean or Archipelago, which divide Aſia from Europe;

and the Levant or White sea, as the Turks call it, being the east end of the Mediterranean; to which may be added, the gulph of Persia or Bassora: these seas, and the Red sea, which divides Asia from Africa, make a part of the Grand Signor's titles, who stiles himself "Lord of the black, white, and red seas." Never was a country more advantageously situated for navigation and foreign traffic than this; all the merchandize of China and India being brought up the Red sea and the gulph of Persia, and by the other seas distributed to all the maritime countries of Europe and Africa. Another advantage is, that they want no timber or naval stores in their own territories; besides what has been mentioned already, their happy situation in the middle of our continent between the extremes of east and west; and yet they apply themselves very little to foreign traffic; neither their ships of war nor merchant-ships make any figure, compared with other maritime countries.

The chief rivers are, the Euphrates, Tigris, Orontes, Meander, Sarabat, Halis, Kara, and Jordan. The Euphrates and Tigris rise in the north, and taking their course south-east, inclose that fine plain in Mesopotamia (now Diarbeck) which is by some supposed to be the seat of Paradise. Certain it is the city of Babylon, the first, the largest, and the most beautiful town, that ever stood upon the earth since the flood, was situated here, upon both banks of the Euphrates, the river running through the middle of it. The Euphrates and Tigris unite their streams below Babylon, and then, dividing again, fall into the Persian gulf by several channels below Bassora, from whence that sea is often called the gulf of Bassora: the city of Nineveh, little inferior to Babylon, stood upon the Tigris, which, from its rapid stream, obtained that name.

The river Orontes rises in mount Hermon, and running north-west through Syrophœnicia, falls into the Levant sea, a little below Antioch, which city stands upon it. The river Meander (now Madre) rises in mount Taurus, and running to the westward in a winding course, falls into the Archipelago or Ægean sea, below Ephesus. From this river, all serpentine or winding streams are called meanders to this day. The river Sarabat rises in Natolia, and running south-west, falls into the Archipelago, north of Smyrna: as to the little river Granicus, where Alexander obtained his first victory over the Persians, it is so small a stream, that we seldom see it in any map: but from the concurrent relation of most writers, it falls into the Hellespont to the eastward of Abydos or the Dardinelles. The river Halis rises in Cappadocia, (Aladulia) and running north, falls into the Euxine sea, between Sinope and Trabizond. The river Kara rises in Natolia Proper, and running almost due east, falls into the Euphrates. Jordan, so named from two little streams, Jor and Dan, which rises at the foot of the Anti-Libanus, and after a course of about twenty miles, unite in one: it is not a river of any great length, depth or breadth, equal to its fame; its whole course till it falls into the Dead sea, being not above one hundred and fifty miles, its breadth not above twenty yards, and its depth not sufficient for navigation: in its passage it makes two lakes, the first called Merom, of small extent, and dry in summer; the second called the sea of Galilee, or the lake of Tiberias, or lake of Gennezereth, of one hundred furlongs in length, and forty in breadth. The Dead sea, as it is called from a false opinion, that it killed even the birds that flew over it, is, by experience, known to deserve no such terrible name; it is, indeed, extremely salt, and the water thereby so strong, that it will hardly admit a human body to sink, and has a bituminous stench: it is said to entertain no fish, or other living creature: but in regard that fish-shells are found on its shores, there is reason to doubt the truth of that opinion. Its extent is seventy miles from north to south, and sixteen from east to west, and was formerly a plain, wherein stood the cities of Sodom, Gomorrah, Admah, and Zeboim, destroyed by fire from heaven. The other rivers are Kidron, Chison, and some other small streams, which fall into the Mediterranean sea, and Jaboc and Arnon, which fall into Jordan and the Dead sea.

SECT. II.

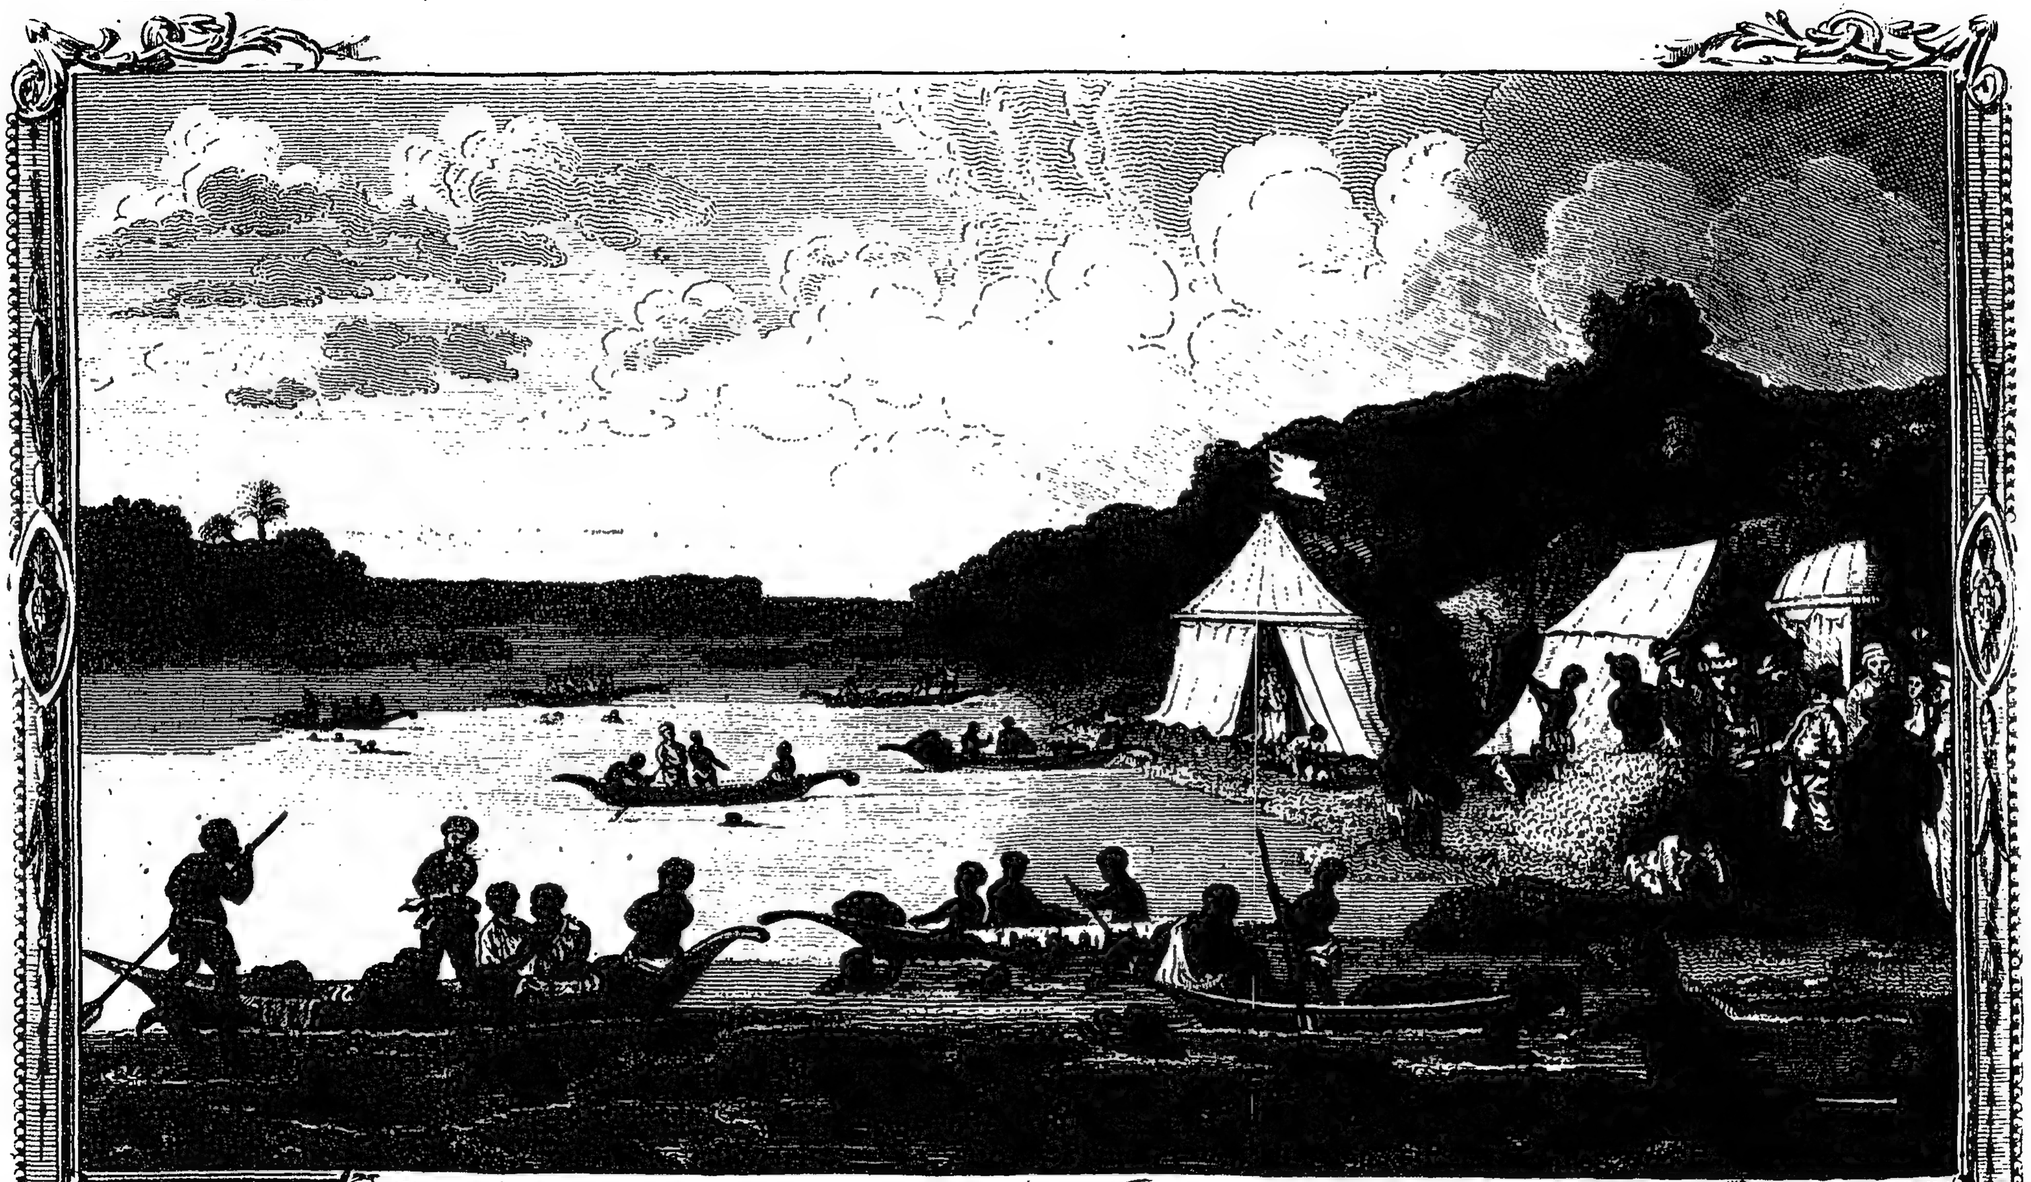
Contains a discription of the divisions, provinces and towns of Asiatic Turky; and treats of the eastern division, namely, Eyraca Arabic, Diarbeck, Curdestan, Turcomania, and Georgia, with their towns.

ASIATIC Turky may be divided into three parts; 1. The eastern division; 2. The western division; and, 3. The southern division.

I. The eastern division contains, 1. The provinces of Eyraca Arabic, Irack-Arabia, or Chaldea. 2. Diarbeck, or Mesopotamia. 3. Curdestan, or Assyria. 4. Turcomania, or Armenia; and, 5. Georgia, comprehending Mengrelia, Imuretta, and part of Circassia.

II. The Western Division contains Natolia, or the Lesser Asia, divided into, 1. Natolia Proper. 2. Amasia. 3. Aladulia; and, 4. Caramania.

III. The Southern Division contains Syria, and Palestine, or the Holy Land.



I. Eyraca Arabic was antiently called Chaldea, and sometimes reckoned a part of Babylonia; at others, a province of Arabia. It lies between thirty and forty degrees north latitude, on both sides the rivers Euphrates and Tigris, having Persia on the east, and Arabia Deserta on the west. The chief towns are Bagdat and Bassora; and the ruins of Babylon and Seleucia.

Bagdat, the capital, is situate in forty-three degrees of eastern longitude, and thirty-three degrees twenty minutes north latitude, upon the river Tigris. It was built by Mahomet II. calif of the Saracens, on the western side of the river; and about the year 1100, another town was built on the east side of the river, and both united by a bridge. It continued the capital of the Saracen empire, till it was taken by the Tartars, in the middle of the thirteenth century, when a period was put to the Saracen empire; but though they lost their country, they propagated their religion so successfully, that the Tartars became Mahometans, and continue so to this day. This town lying upon the frontiers of Turky and Persia, has been much contended for by both these powers, and taken and retaken several times: but the Turks have been in possession of it ever since the year 1689; and here the beglerbeg or viceroy of the province constantly resides. The town is near two miles long, and one broad, defended by a wall and towers, almost in the form of bastions, and the moat wide and deep, and a strong castle upon the river. It is the grand emporium of the Ottoman empire towards the Persian side; and is frequented by innumerable merchants and passengers travelling to and from Persia into Syria, Palestine, Egypt, Natolia, &c. besides Mahometans, many Christians, who are publickly tolerated, and some Jews, reside here. The principal buildings are, the palace of the beglerbeg, the mosques, of which there are five, and the cloysters which surround the bazars or market places, and their bagnios, all which were built by the Persians, when they were in the possession of Bagdat. The Cadi, who is the principal ecclesiastic, and consequently, the chief judge, has a very great authority in this province. The testerdar or treasurer, who collects the public revenue, has a considerable influence in their council, and the reis effendi or secretary, who is sometimes stiled chancellor, is an officer of great consequence; and they are all of the viceroy's council, and a check on his administration, over whom he has no authority: they are accountable only to the divan at Constantinople. The garrison of the place usually consists of four thousand or five thousand men, horse and foot.

Bassora, Basrah, or Balsarra, is situate in forty-nine degrees ten minutes of east longitude, and thirty degrees seventeen minutes of north latitude, about three miles from the western shore of Chatal-Arab, or the united stream of the Euphrates and Tigris, with which it has a communication by a deep canal, the tide flowing up between forty and fifty miles higher than the town, which is a great advantage to their navigation and foreign traffic. The walls of this town are twelve miles in circumference, within which are many void spaces, fields, and gardens; but the buildings have nothing extraordinary in them, the houses being only two stories high, built with bricks dried in the sun, and flat on the tops. The city is founded on a stony soil, and the environs are barren; but the circumjacent country is so exceedingly fertile and delightful, that it is deemed by the Arabians one of the four paradises of the east. The inhabitants are supplied with water from the Euphrates, by a canal which is capable of carrying vessels of fifty tons burden; there is a fortress at the mouth of it, which is about forty-five miles distance from the sea.

The whole country lies so low, that it would be subject to continual inundations, if a stout dyke or embankment did not prevent calamities of that kind; but the hot winds are very troublesome, and bring clouds of sand from the neighbouring deserts.

It is a place of great trade, and swarms with vessels from most of the kingdoms of Asia and Europe. The English and Dutch have very considerable factories here, maintained

A VIEW of the PEARL-FISHERY.

Ledge sculp.

tained by the companies for the better carrying on their commerce with China and other eaſtern parts, their diſpatches being forwarded to England and Holland by the way of Damaſcus and Aleppo, by means of Arabian couriers, who are all exceedingly expeditious. The Dutch trade here with ſpices, and the Engliſh with pepper, cloves, &c. The principal commercial affairs are managed by Armenian, Indian, and Perſian merchants; and all the richeſt commodities of India and Europe are ſold in this city, through which the caravans to Mecca paſs, which is another ſource of wealth: the duties on goods are about five per cent. The inhabitants conſiſt of Mahometans, Jews, Jacobites, Neſtrians, Catholic, and Chaldæan Chriſtians, or Chriſtians of St. John, who are pretty numerous. There is a famous college here, called the academy of Nezam, from its founder Nezam al Monk, the grand vizir of Shah Malar, the ſultan of Iran. At preſent this city is a flouriſhing ſeat of literature, though it hath fewer colleges than Damaſcus or Cairo. The horſes which are bought here are very valuable, on account of their being able to travel with great expedition, and to undergo incredible fatigue: they ſell for from one thouſand two thouſand crowns.

Baſſora is ſubject to an Arabian prince, who is tributury to the Grand Signor. His revenue ariſes from the exchange of money for horſes and camels ſold here, but chiefly from his palm-trees, of which he hath a plantation of ninety miles in length. The manner of ſowing the palms is as follow: About three hundred kernels are buried in the ground in the form of a pyramid, with the points of the kernels upwards, till the whole ends in a ſingle kernel. The earth is then preſſed cloſe round it, and upon it. It is aſſerted by ſome, that if the male and female palm are not placed cloſe to each other, they will bear no fruit; while others affirm, that it may be made to bear by taking the bloſſoms from the male, and inoculating the female therewith at the top of the ſtem.

The income of the prince is ſo great from money, horſes, camels, and dates, as to enable him to lay by annually three million of livres, after all the expences of government, and his tributary loan are defrayed. The prince gives liberty to perſons of all nations to trade here; and the police is ſo well managed, that the people are ſafe in the ſtreets at all hours in the night: the garriſon conſiſts of about three thouſand janiſaries. It is affirmed, that the plague ſwept away eighty thouſand of the inhabitants, when the city was viſited with that dreadful calamity in 1690.

Curſa is ſituated in thirty-one degrees, thirty-eight minutes north latitude, about ſixty miles to the ſouthward of Bagdat, and on the weſt ſide of the Euphrates; it was formerly a city of importance, being the reſidence of the caliſs, after they had quitted Damaſcus, and before they built Bagdat, but is now intirely deſolated.

Traxt, on the Tigris, is a ſtrong and well fortified town, having two caſtles: it is about forty-two leagues beyond Bagdat. The Chaldæan Apamea, is ſuppoſed to have formerly ſtood on this ſpot.

II. The province of Diarbeck comprehends the antient Meſopotamia, Chaldea, Babylonia, and Aſſyria; it is ſituate north of Eyraca Arabic or Chaldæa, ſurrounded by the rivers Euphrates and Tigris, the chief town whereof is Diarbeck, ſituate in forty degrees fifty minutes of eaſtern longitude, and thirty-ſeven degrees thirty-five minutes north latitude, on the river Tigris, and not far from its ſource, about two hundred miles eaſt of Aleppo; the Turkiſh name is Caremit: it is built on an eminence, the deſcent from thence to the river very ſteep; the town is ſurrounded by a double wall: on the outward wall are ſixty antique towers: in this city is a magnificent moſque, formerly a Chriſtian church, and contains twenty thouſand Chriſtian inhabitants, whereof two thirds are Armenians, beſides a great number of Mahometans; it is the ſeat of the beglerbeg, or viceroy, who has ſeveral ſangiacſhips, or governments ſubject to him. The ſoil is very good in the neighbourhood of the town, abounding in corn, wine, cattle, wild fowl, and all manner of proviſions; the meat, bread, and wine are admirable, and the fruits excellent. The principal manufacture is that of Turky leather, or maroquins, which employs a fourth part of the natives; galls and tobacco alſo are the produce of this province, of which great quantities are exported. This city is ſupplied with water from the Tigris, by means of an artificial canal, and embelliſhed with many noble piazzas or market-places, and other elegant buildings: on the ſides of the river are ſeveral caravanſera's, or inns; and near the town is a chapel, in which the Turks affirm that Job was buried. The air of the whole province is exceeding temperate and ſerene, unſcorched by exceſſive heats, and not incommoded by ſevere froſts.

Bir, or Beer, another conſiderable town in this province, is ſituate on the ſide of a hill, to the eaſt of the Euphrates, in thirty-eight degrees fifteen minutes of eaſtern longitude, and thirty-ſeven degrees fifteen minutes north latitude, ſeventy miles ſouth-eaſt of Aleppo, and is a great thoroughfare to Perſia: it has two large caſtles, for its defence, one on the land ſide, and the other on the banks of the river, and a garriſon of about two hundred janiſaries, and four hundred ſpahis, commanded by a ſangiac: two ſmall rivulets run through the town. The Euphrates would be navigable as high as the city, if there were not ſome cataracts and rocks in it, which hinder the tranſporting their merchandize to Baſſora. Here are all kinds of proviſions in plenty, particularly bread, wine, and fiſh. The neighbouring territory is pleaſant, fertile, and well cultivated, except to the eaſtward, where it is rough, hilly, and rather ſterile. Caravans are not allowed to enter this city.

Orſa, or Orpha, ſuppoſed to be the ancient Ediſſa, is another very conſiderable town, ſituate on the Euphrates, in forty degrees of eaſtern longitude, and thirty-ſix degrees forty minutes of north latitude: where the caravans, travelling from Turky to Perſia, uſually reſt eight or ten days: for here live the people that let the horſes and mules for the abovementioned journey. Orſa, is the capital city of Meſopotamia, and, according to tradition, ſtands in the place where Abraham dwelt. The firſt thing they ſhew foreigners is a large fountain, the ſprings whereof are under the foundations of the principal moſque in the city.

The Chriſtians have a tradition here, that this was the place where Abraham prayed before he went to ſacrifice his ſon Iſaac; and that two ſprings of water aroſe from the place where he kneeled. Theſe feed the large fountain abovementioned, and they will not ſuffer any perſon to enter the grotto, where theſe ſprings riſe, without pulling off his ſhoes, and it is with difficulty that a Chriſtian is permitted to ſee it. The inhabitants are many of them Armenian Chriſtians, and are permitted to perform divine ſervice in their churches. Here are alſo to be ſeen ſeveral antient tombs of the Chriſtians, in grottos, on the neighbouring mountains.

The walls of the city of Orſa are of free-ſtone, with towers at convenient diſtances; but the town is meanly built, and ſeveral void places in it without inhabitants. It is governed by a baſſa, and has a garriſon of ſix or ſeven hundred ſpahis, and about two hundred janiſaries, there being much more occaſion for horſe than foot, to oppoſe the incurſions of the Arabs, who frequently croſs the Euphrates, in hopes of plunder. There are ſeveral pleaſant gardens near the walls, watered by artificial channels, and the ſoil produces good wine: but what Orſa is moſt remarkable for, is the manufacture of yellow maroquins, or Turky leather, as we call it; the red is made at Diarbeck, and the blue at Tocat.

The city of Neſbin, or Naſbin, ſituate about thirty-five miles from the Tigris, is the reſidence of a Turkiſh ſangiac. It is divided into two wards, each on an eminence, with a large tract of plowed land between. This gives it a pretty appearance at a diſtance, though both wards in reality are ſcarcely worthy the name of a ſmall village: however, arches, gates, and the remains of a noble church are ſtill viſible, which evince that its antient ſituation was far ſuperior to its preſent. The ſoil is fertile; and, as the chief buſineſs of the inhabitants is agriculture, the land is well cultivated, and the inhabitants plentifully ſupplied with corn, wine, fruits, &c.

Five or ſix days journey to the eaſtward of Neſbin, ſtands the city of Moſul, or Mouſſul, on the weſtern bank of the river Tigris (over-againſt the place where Nineveh is ſuppoſed to have ſtood) in thirty-ſix degrees odd minutes, northern latitude: the walls of this city make a good appearance without, being built of free ſtone, and three miles in circumference; there is a little caſtle on the Tigris where the baſſa reſides, but the houſes are very mean within, and many of them lie in ruins; it is however a place of good trade, being the ordinary road for the caravans from Aleppo to Perſia, and has a communication with Bagdat, and the gulf of Perſia, by means of the Tigris. It is chiefly inhabited by Greeks, Chriſtians, Armenians, Neſtorians, and Maronites, but thoſe of the eſtabliſhment are Mahometans; and the garriſon uſually conſiſts of three or four thouſand horſe and foot. There is a great trade for galls here, being the produce of the neighbouring countries. A bridge of boats is laid over the river

river at this place, by which it has a communication with Aſſyria or Curdeſtan. The ſoil on this ſide of the river is exceedingly barren, but on the oppoſite it is very fertile. The heat is ſo exceſſive in ſummer, that none go out of doors from two hours after ſun-riſe till an hour after ſun-ſet. There is likewiſe a malignant and dangerous wind called ſamiel, which prevails from hence to Surat, and is ſuppoſed to be the ſame eaſt wind mentioned by Job. It is impregnated with little ſtreaks of fire as ſmall as hairs, which immediately kill thoſe who breathe or inhale them, and turn them as black as a coal. When the people perceive them coming, they fall flat on their faces, and ſometimes eſcape. This wind is felt chiefly on the banks of the river, but not on the water, and is deemed to proceed from ſulphureous vapours, which are kindled by agitation. Independent of this wind, the hot air is often dangerous and injures the lungs, inflames the blood, and parches the ſkin, or raiſes it into bliſters, and occaſions it to peel off. On this account travellers wear a kind of maſk made of a ſoft black crape to preſerve their eyes. But if, after all their precaution, they become inflamed, the afflicted perſon anoints them with a ſalve made of a mixture of ſugar and long pepper ſifted very fine.

Merdin or Mardin, is ſituated on the weſt ſide of the Tigris, between Moſul and Bagdat, and about twenty-five miles from Diarbeck, in thirty-ſeven degrees fifteen minutes north latitude, and forty degrees eaſt longitude. It is about five miles in circumference, ſurrounded by a ſtrong wall, and defended by an excellent caſtle of about a mile in compaſs, which is ſituated upon an almoſt inacceſſible rock. The caſtle abounds in fine ſprings, and even contains corn-fields. It is the reſidence of a ſangiac, and has a garriſon of four hundred janiſaries and two hundred ſpahis. It is ſo ſtrongly fortified, that Tamerlane the great was obliged to abandon it, after having inveſted it for near three years. The city is well built, adorned with many noble houſes and a fine fountain, the waters of which come from the citadel. The manufactures are ſilk, cotton, and gold and ſilver ſtuffs. Many Chriſtians inhabit the city, who have an archbiſhop ſubject to the patriarch of Antioch. The air it temperate and ſerene; the territory rich and fruitful.

There are a few other leſs conſiderable cities and towns in Diarbeck, namely, Gezira, in thirty-ſeven degrees thirty minutes north latitude, and thirty-nine degrees ten minutes eaſt longitude. It is ſituated in an iſland in the Tigris, the word Gezira, in the Arabic language, ſignifying an iſland. It is a ſmall, but rich commercial city, where a great number of merchants meet to carry on a trade in tobacco and gall-nuts, which are plentifully produced in the mountains of Tauris. The city is governed by a bey. They make no wine, but dry all their grapes for raiſins.

Amadia, or Amad, is about ſeventy-two miles eaſt from Gezira, and the ſame weſt from Moſul.

Zibin, in the mid-way between Orſa and Moſul, is a tolerable town ſituated on an aſcent. It is ſurrounded with good walls and ditches, well ſupplied with ſprings and fountains, and furniſhed with a good ſtock of proviſions.

III. We ſhall now proceed to give a deſcription of Turkiſh Curdeſtan, or Aſſyria, for the moſt eaſterly part of Curdeſtan is under the dominion of the Perſians. This province has Armenia or Turcomania on the north: Perſian Curdeſtan on the eaſt: Chaldea on the ſouth: and Diarbeck or Meſopotamia on the weſt: and is ſaid to receive its name from Aſſur the ſon of Shem. In this country the famous city of Ninevah once ſtood, on the eaſtern bank of the river Tigris, oppoſite to the place where Mouſſul now ſtands. This town was ſixty miles in compaſs, or three days journey according to Jonah: twenty miles being an ordinary day's journey for a man on foot. The walls of it are ſaid to have been one hundred feet high, and to have had eleven hundred and fifty towers upon it, each of them two hundred feet in height. The houſes did not ſtand contiguous, but there were large gardens and ſpaces between them, as in Babylon. It was under the dominion of the ſame prince, who uſed to reſide part of the year at one of theſe cities, and the other part at the other. It is ſaid to be built by Nimrod, or according to others by Ninus, from whom, it is conjectured, it received its name. It was beſieged by Arbaces three years, when the river overflowed twenty furlongs of the wall; whereupon Sardanapalus, the prince, retired into his palace, and having collected all his wealth, which, according to tradition, amounted to upwards of twenty thouſand millions of pounds, ſet fire to the whole, and threw himſelf into the flames. This city was afterwards intirely deſtroyed by Aſtyages, the eldeſt ſon of Cyaxares, the eighth king of the Medes, after Arbaces. There is nothing now to be ſeen but heaps of rubbiſh, almoſt a league along the river Tigris, over againſt Mouſſul, which people imagine to be the remains of this vaſt city. Half a league from the Tigris alſo is a little hill, on the top whereof ſtands a moſque, over the place where, according to the tradition of the country, Jonah was buried. And for this place the Turks have ſo great a veneration, that they will ſcarce ſuffer any Chriſtian to enter the moſque. In the middle of the temple ſtands a tomb covered with a pall of tiſſue, and at the four corners great wax candles, beſides ſeveral lamps, which hang down from the roof, and here ſome derviſes or Turkiſh monks are employed in reading the alcoran.

The province of Curdeſtan is a very pleaſant fruitful ſoil, diverſified with hills and vallies. The hills are cloathed with the fineſt oaks, and a great variety of other timber and fruit trees. The vallies are well watered, and bear excellent grain where they are cultivated, but being under the dominion of the ſlothful Turk, or rather, a frontier country between Turky and Perſia, there is very little of it manured. However there are vaſt flocks and herds fed in this country, the owners living in tents, like the Arabs. The governing part of the country are Mahometans, but the common people are ſaid to be a kind of Chriſtians, at leaſt they go under that denomination; but according to the accounts travellers give us of them, they have the moſt abſurd notions imaginable of Chriſtianity; and the chief object of worſhip is the devil, of whom they are greatly afraid: we are alſo told, that there are not a more brutiſh people upon the face of the earth, and that they are not leſs addicted to thieving and plundering the caravans than the Arabians; but this is not to be wondered at upon the frontiers of two great kingdoms, enemies to each other, where people will take greater liberties than in other places. Galls and tobacco are the principal produce of the ſoil at preſent, but it ſeems fit for any thing, it being very deep, as travellers complain who paſs through it: and though the country in general is pleaſant, it ſeems the roads are not. There are ſcarce any towns and villages, but the houſes lie diſperſed at the diſtance of a muſket ſhot from one another, and ſcarce a houſe which has not a vineyard; however they make no wine, but dry their grapes.

The capital city of Curdeſtan at this time is Sheraſoul, which lies to the eaſtward of Ninevah, in the thirty-ſixth degree of north latitude. It is the ſeat of the beglerbeg, or viceroy of the province, who hath ſeveral ſangiackſhips or governments under him. The town is not large but built after a particular manner, the houſes being hewed out of a rock on the ſide of a hill for a quarter of a league together; and you go up to them by fifteen or twenty ſtone ſteps, and ſometimes more.

In this province, between Ninevah and Bagdat, are ſeveral hills of ſulphur, to which ſome travellers impute the pernicious qualities of the hot winds, or ſaniel, abovementioned. There are likewiſe ſome ſulphureous hot baths at a village called Alchamam, which is about a day's journey from Moſul; and at Attendach's there is a hill from which the Arabs dig gold. In the ſame territory tamariſts, liquorice, and ſrunach are produced in great plenty; the latter, together with ſalt, being infuſed in water, gives it a red tinge, and renders it cool, ſweet, and ſalubrious: taken in broth it is a remedy for the bloody flux.

This part of the country is greatly infeſted by wild beaſts, particularly lions, jackalls, ceracoulacks or wild cats, which are remarkable for having large black ears of half a foot in length. Thoſe who navigate the river in boats always go well armed on account of the lions, who will plunge into the water, and with great fury attack the paſſengers.

The Tigris waſhes the weſtern ſkirts of this province; and the Lycus, Caprus, and Gorgus flow through it at almoſt equal diſtances: the firſt derives its name from a wolf, the ſecond from a goat, and the third is the Zeſben of Pliny.

The Curds, in fine weather, drive their herds and flocks about, in ſearch of paſture, and while the huſbands look out for plunder, the women manage the cattle, and make butter and cheeſe. Their drink is either milk or water. The men ride upon very fine ſwift horſes, their only weapon being a lance. Their tents are large, and made of coarſe brown cloth, that ſerves likewiſe for a covering to their portable houſes, which are ſquare, and made of cane hurdles. The floor is covered with mats, and ſerves both for the purpoſe of bed and table. When they remove, they

they load their oxen with wives, children, and houſes, which are taken to pieces for the purpoſe. Theſe people are very diſagreeable to look at, having ſmall eyes, dark complexions, wide mouths, black hair, and ferocious aſpects; nevertheleſs they are very ſtout and nimble, and, while children, uſually go naked, which renders them extremely hardy. The Curds acknowledge no ſubjection either to Turks or Ruſſians.

The public revenue of this province is computed to amount to ſix hundred purſes annually, beſides three hundred more levied on the Armenian and Greek Chriſtians, and beſides what is levied on the merchandize of the caravans, which is reckoned to amount, in the whole to nine per cent.

Arbela lies on the frontiers of Perſia, in thirty-ſix degrees north latitude, and forty-four degrees twenty minutes of eaſtern longitude, and on the river Lycus, which runs through a fine plain thirty or forty miles over, in the middle whereof is a little hill, named Nicatorius by Alexander, and the ruins of a caſtle, where it is conjectured Darius ſtood to ſee the laſt fatal battle between his troops and the Grecians, commanded by Alexander, which put a period to the Perſian empire.

Betlis is ſituate near the ſouth ſhore of the lake of Van, in forty-three degrees thirty minutes of eaſtern longitude, and thirty-ſeven degrees fifty-five minutes north latitude. The bey or ſovereign of this town, and the territory about it, is ſtill independent, it is ſaid, and his country lying on the confines of Perſia, and Turky, refuſes to own himſelf ſubject to either. It is a mountainous tract, almoſt inacceſſible; and he can, by taking the paſſes, cut off the communication between both kingdoms: the Turks and Perſians, therefore, think it their intereſt to keep fair with him.

As you approach Betlis, you muſt travel a whole day among high ſteep mountains, from whence there fall prodigious torrents in the wet ſeaſon. The way up to the city is cut through a rock, where there is but juſt room for a camel to paſs. It is built round the hill in form of a ſugar loaf, and ſtands at an equal diſtance from two other mountains. There is no getting up to it, but by wheeling and winding round the mountain. On the top there is a plain where the caſtle ſtands. And here the bey alſo has his palace. It is ſaid he can raiſe twenty-five thouſand horſe, and a good body of foot out of the ſhepherds of his country.

Harpel is ſituated on the river Caprus, and is ſurrounded by a mud wall; the houſes are miſerably built: it is, however, a large town, and the reſidence of a ſangiac.

Holwan is ſituated between the mountains that divide the Perſian Irak, Curdeſtan, and Chaldæ, it lies in thirty-five degrees north latitude, and forty-ſeven degrees ten minutes eaſt longitude. The Mahometans, who believe that Elijah is ſtill alive, affirm that he lives in one of the mountains near this town.

IV. The province of Turcomania, the ancient Armenia, is ſituate north of Diarbeck and Curdeſtan, having Media or Aderbeitzen on the eaſt, and Anatolia on the weſt. The chief towns are Erzerum and Kars.

The names of the rivers in this country are the Cyrus, Lycus, Phaſis, Araxis, Tigris, and Euphrates. The mountains are, Ararat, the Paryada, Maruſius, Anti-taurus, Niphates, Moſchiſk, and Gordian mountains.

The city of Erzerum, the capital, is ſituate at the foot of a mountain, in forty-one degrees of eaſt longitude, one hundred and fifty miles ſouth of Trapezond and the Black ſea. It is about two miles in circumference, ſurrounded by a double wall. The inhabitants conſiſt of near twenty thouſand Turks, and ſix thouſand Armenian Chriſtians. The Armenian merchants manage all the trade of the Levant, and are in fact the greateſt merchants in the univerſe. Many of them are to be found in Italy, France, Germany, Holland, England, &c. and in the dominions of the Great Mogul; all over the Turkiſh and Perſian territories, in Siam, Java, the Philippine iſlands, and all parts of the eaſt, China excepted; they are in general men of probity and politeneſs.

Moſt of the Turks are called janiſaries, giving a ſum of money to the aga to purchaſe that privilege; but the greateſt part of them are ordinary tradeſmen: the name of janiſary gives them great authority, as they are liable to be called to account by none but their aga, and can inſult their fellow ſubjects with impunity. People of figure are often obliged to enrol themſelves in this body, to prevent their being expoſed to the violences theſe people commit; but though they are very valiant at home in raiſing riots and abuſing their neighbours, they never take the field, or concern themſelves in any wars the country is engaged in; neither do they receive any pay. The government pay of a janiſary is from about two-pence half-penny to ten-pence per day.

The Armenians and Greek Chriſtians have two churches and ſeveral monaſteries, and each of them their biſhop here. They are moſt of them artificers, employed in the leather and copper manufacture, the neighbouring mountains being rich in copper-ore, and ſome ſilver. The mountains are uſually covered with ſnow, till midſummer; the air exceſſively cold in winter, and their vallies are as much too hot in ſummer; the weather frequently changes on a ſudden, from ſcorching heat to the contrary extreme, which is the more unſupportable, as they have ſcarce any fuel in the country; there is neither tree or buſh to be ſeen for many miles; their firing therefore is cow-dung, and other ſtinking materials, which taints the air, and ſpoils the food they dreſs with it. They trade pretty much in furs, and have a briſk foreign trade, the caravans paſſing through this city in their way to Trabizond, on the Black ſea, and ſo on to Conſtantinople frequently, whereby they avoid the Arabs, and other pilferers, which they are in danger of encountering when they proceed in the direct road to Aleppo. At Erzerum, the cuſtom-houſe officers collect the Grand Signor's duties on all merchandize that paſſes through the country: they ſeldom enter into particulars, but charge them in the lump according to their weight: for inſtance, they pay twenty pounds ſterling for every camel's load, which is uſually about eight hundred weight here; ſometimes they pay five per cent. for all the merchandize exported, and every traveller five crowns a head.

There is a little village called Elija, about ſix miles from the above city which contains only a few ſmall houſes built with mud; but is famous for an excellent bath, which is a neat octagonal building. The baſon is of the ſame form, and throws out two ſtreams of water as thick as a man's body. The Turks are continually flocking hither from Erzerum to bathe.

The city Van or Wan is ſituated on a lake of the ſame name, which is one of the largeſt in Aſia, in thirty-eight degrees twelve minutes north latitude, and forty-four degrees fifty-five minutes eaſt longitude: it is large, and ſtands at the foot of a high craggy mountain, on which there is a fortreſs deemed impregnable, that commands the town and country, and has a ſtrong Turkiſh garriſon. The lake produces a variety of fine fiſh, particularly one of the pilchard kind, great quantities of which are exported to many diſtinct places, as well as conſumed at home, being uſed in ſauces, and eaten in the ſame manner as anchovies. The lake is one hundred and fifty miles in circumference, receives many rivers into its boſom, and contains ſeveral iſlands, two of which, viz. Lindaſi and Adareton, are conſiderable, each having little villages and a monaſtery of Armenian monks on it.

The next conſiderable city to Erzerum abovementioned is Cars, or Kars, five or ſix days journey to the north-eaſt, in forty-two degrees odd minutes north latitude; and gives name to a river on which it ſtands. This place is the laſt frontier town of Turky towards Perſia. It is of an oblong figure, and has a double wall about it two miles in compaſs; but the place is very thinly inhabited: the caſtle ſtands on an inacceſſible rock next to the river; the houſes are very mean, more like dens than habitations for men; but there is a numerous garriſon in it, commanded by a baſſa. The river Arpagi joins the Cars a little below the city, and afterwards going by the name of Arpigi, falls into the Araxes, or Arras. The Turkiſh officers at Cars exact intolerably on travellers, but eſpecially on the Franks, who find great difficulties in paſſing through this town into Perſia.

The country about it, though naturally fertile, is but very little cultivated, through the indolence of the inhabitants.

The town of Irvan, Eriyan, or Chirvan, is ſituated in forty degrees ten minutes north latitude, and forty-five degrees thirty minutes eaſt longitude. It is about one hundred and eighty miles eaſt of Erzerum, and has been alternately poſſeſſed by the Turks and Perſians a great many times, and in 1635 it was ceded to the Perſians. It was a ſpacious place, but ill built, and very dirty. The town is watered by two rivers, and the neighbouring country is extremely fertile. The caſtle is of no importance, and the fortifications are made of mud. Over one of the rivers called Zengeric, there is a fine bridge of four arches. Here proviſions are exceedingly cheap: particularly game, and the fruits and wine are admirable. The

public ſquare, or piazza is handſome; and the bazar or market capacious. The public buildings are elegant and large. The river Zengeric iſſues from the lake of Erivan, which is about twenty-five miles in circumference, and contains an iſland, with an Armenian monaſtery, the monks of which lead a life uncommonly auſtere, never ſpeaking to each other but four times a year. Though the lake which ſurrounds them is plentifully ſupplied with the moſt excellent fiſh, and their little iſland abounds with a variety of delicious fruits, they muſt touch neither, except on the four times when they are permitted to ſpeak to each other. All the reſt of the year they are obliged to live upon herbs and roots, and even thoſe muſt not be obtained by cultivation, but ſuch as are the ſpontaneous produce of nature are to be ſelected. Near Erivan is another famous monaſtery called the three churches, which is the reſidence of the great patriarch of the Armenians, under whom are forty-ſeven archbiſhops, who have each four or five ſuffragans. The archbiſhops and ſuffragans uſually reſide in the ſame monaſtery. Every Armenian, above the age of fifteen, is obliged to pay five-pence annually to the great patriarch, whoſe revenue amounts to about ſix hundred thouſand crowns, out of which he pays a conſiderable tribute to the Porte.

About ſeven leagues from the Araxes ſtands Nackſiſan. It was formerly called Artaxata, and was the reſidence of the antient Armenian kings. It is built upon a plain which Hannibal gave to king Artaras, who then made it the captial of all Armenia. The celebrated battle between Lucullus and Mithridates was ſought near it. This city contains many bazars, caravanſeras, public baths, coffee-houſes, handſome ſtreets, &c. It is in thirty-nine degrees north latitude, ſeventy-five degrees fifty-five minutes eaſt longitude, and ſtands about ſixty-three miles ſouth of Erivan, which in 1635 was ceded by the Turks to the Perſians.

On the Araxes ſtands Zulpha, or Old Zulpha, to diſtinguiſh it from the New, near Iſpahan in Perſia: the above river begins to be navigable about ſix miles below this town. Shah Abbas carried ſeventy-ſeven thouſand families from this province, to help to repeople ſome of the depopulated parts of his own kingdom. About Zulpha are ſeveral Armenian monaſteries, the monks of which are Roman Catholics of the Dominican order; many young Armenians are ſent to Rome to be educated, who on their return fill the vacancies that may have happened in the monaſteries. The diſtrict of Zulpha contains about ſix thouſand ſouls, who are all Roman Catholics, and do not in the leaſt differ in their worſhip from thoſe of Europe, except that maſs is celebrated in the Armenian inſtead of the Latin tongue. At the foot of a high mountain near Zulpha are ſome medicinal ſprings, which are celebrated for many virtues, but more particularly for curing thoſe that are bit by any venomous creature.

Though Armenia Minor was formerly very conſiderable, it is at preſent of no great importance: on the eaſt, it is bounded by the Euphrates; on the ſouth, by mount Tauris; and on the weſt and north, by a long chain of mountains called Antitauris, Amanus, &c. It is in general a mountainous country, but in ſome places there are fruitful vallies, abounding with olives, vines, &c. The manners, cuſtoms, &c. of the people always were, and ſtill are, the ſame as thoſe of Armenia Major. It is imagined that Armenia was firſt peopled by the immediate deſcendants of Noah; it then became a kingdom, and remained ſo till it was ſubdued by the Perſians, it was afterwards poſſeſſed by the immediate ſucceſſors of Alexander the Great, and afterwards conquered by the Romans. About the year 687 the Saracens made themſelves maſters of it, and kept poſſeſſion till they were driven out by the Turks and Tartars, from whom it had the name of Turcomania. The ark of Noah reſted on mount Ararat in Armenia; the aſcent to which is not only difficult and tedious, but even dangerous through the ruggedneſs of ſome parts, and deep ſands of others; not to mention the danger from the beaſts of prey, the horrid precipices are beheld with horror even by the guides themſelves.

V. The laſt province in the eaſtern diviſion of Aſiatic Turky is the county of Georgia, called alſo Gurgiſtan (the termination "tan," from the Celtic, ſignifying country); in treating of which, we ſhall comprehend Mingrelia, Imaretta, Abcaſſia, and Corrania. This province is bounded on the north, by Circaſſia; on the ſouth, by Armenia; on the eaſt, by Dagheſtan; and, on the weſt, by the Euxine, or Black ſea: it includes Colchis, Iberia, and Albania. It is partly ſubject to the Turks, and partly to the Perſians; but there is no dependence upon them; ſo that the ſovereignty of thoſe two powers over them is rather nominal than real; for as they are a hardy, warlike people, and can eaſily retire to and defend the paſſes of their mountains, it would be dangerous to quarrel with them, as no army could ſubdue them; and, from the nature of their country; they might become exceeding troubleſome by making excurſions into the neighbouring Turkiſh and Perſian provinces.

This country abounds with mountains and woods, which are interſperſed with a variety of beautiful vales and fertile plains. It has a dry air, cold in winter, and hot in ſummer; produces all kinds of fruits, which are excellent, and the bread is hardly to be paralleled. There is plenty of fine cattle: the pork is extremely fine, the wild and tame fowl are excellent; and the fiſh, both in ſea and river, equal any in the univerſe. The country likewiſe produces great quantities of excellent ſilk. The inhabitants have better wine, and drink more of that liquor, than any other people in the world. A horſe-load of the beſt (about three hundred weight) ſells for only eight ſhillings.

The Georgians are robuſt, valiant, and of a ſocial temper, very truſty and faithful, endowed with good natural parts, but for want of education, vicious. The women are generally very comely, and their features and complexion the moſt admired of any people in the eaſt, as well as their parts and genius: for hence it is, that the Turks and Perſians repleniſh their harams or ſeraglios: but ſome of the Georgians, who have more decency and conſcience than their neighbours, follow the Armenian cuſtom of marrying their daughters when infants, to prevent their being ſold for ſlaves, or taken away by the great lords for concubines.

They chuſe the moſt ſprightly and ingenious lads to be educated in their academies at Conſtantinople and Iſpahan, obliging them to apply themſelves to ſuch ſtudies and arts, as they find they have a genius for; and out of theſe, are all their beglerbegs or viceroys, beys, baſſas, and governors taken, when they are of an age proper to be employed in any commands or buſineſs.

From hence, alſo, are moſt of the young beauties collected, which furniſh and adorn their ſeraglios. The Jews of Conſtantinople and other great towns, are the factors for this unnatural kind of merchandize: they purchaſe them of their parents or maſters, when they are very young, diſpoſing of them again, either in the royal ſeraglios, or to the baſſas and great men; and to that end, give them ſuch an education, as may render them moſt agreeable to their maſters. As to the male ſlaves that are ſold, it is no wonder their maſters make money of them, it being the moſt ready road to their advancement, both in the Ottoman and Perſian courts.

The Georgians are poſſeſſed of many qualities: they are great liars, implacable in their hatred, and unforgiving to thoſe who have offended them. They do not deem drunkenneſs, luxury, or libertiniſm crimes, or even follies. The clergy in general are worſe than the laity, and the women are as vicious as either: they impair their beauty with paint, and their minds by the moſt licentious behaviour. They are all uſurers, and affect a grand deportment. Many individuals of the ſurrounding nations reſide here, and the Armenians in particular are more numerous than the Georgians themſelves. They are likewiſe richer, and occupy the principal places of truſt and power. All religions are tolerated in Georgia, every one being at liberty to think, pray, and ſpeak as he pleaſes.

They imitate the Perſians in eating, ſitting, lying, &c. they have buttons and loops to their veſts, and wear them open at their breaſts. The habits of the women are entirely Perſian; the men's covering for the legs and feet is in the Perſian faſhion, but their bonnets or hats reſemble thoſe of the Polanders. Their houſes are all built after the Perſian model.

The prince of Georgia is a Mahometan, but the generality of the people pretend to be Chriſtians, for they are ſo extremely ignorant, that they ſcarcely underſtand the meaning of what they profeſs. They build their churches upon high and almoſt inacceſſible places, where they are abandoned to the injuries of the weather, and ſuffered to be the habitations of birds. From their ſituation the Georgians can ſee them at a great diſtance, when they never fail to ſalute them with great reſpect, but take care ſeldom or never to enter them. In ſome of the towns, however, the churches are kept pretty decently. Beſides the patriarch, there are ſeveral biſhops, and a great number of inferior clergy.

Teflis, Gory, Caket, Zagan Suram, and Aly, are the only conſiderable and fortified towns in Georgia; and the

principal

principal rivers are the Kur or Cyrus and the Aragus; the firſt riſes in the Moſchian mountains, and diſcharges itſelf into the Caſpian ſea, the latter ſprings from the mountains which ſeparate Iberia from Colchis, and falls into the Cyrus.

The capital city Teflis, is ſituated in forty-two degrees, forty-ſeven minutes noth latitude, and forty-ſeven degrees five minutes eaſt longitude, and is one of the beſt in Aſia: it is watered by the river Kur. The walls are ſtrong and handſome: it contains fourteen churches, ſix belong to the Georgians, and eight to the Armenians: the cathedral, called Sian, is a ſtone edifice, built near the river. A large dome ſupported by four maſſy pillars, riſes in the middle: the inſide is filled with miſerable Greek paintings, and the biſhop's palace adjoins to it. The inhabitants of this city are thought to amount to twenty thouſand.

There is a large fortreſs on the declivity of the mountain, containing an arſenal, a market, and a public ſquare. There is not a ſingle moſque; which is remarkable, as the city belongs to the Perſians, and the prince himſelf hath uſually been a Mahometan; but prince Heraclius, who is ſuppoſed to reign in Georgia at preſent, hath attempted to throw off both the Turkiſh and Perſian yoke, and to prevent the inhabitants from ſelling their progeny as ſlaves: it is hoped his laudable endeavours herein will prove ſucceſsful.

Their ſtaple commodity is furs: but great quantities of raw ſilk are ſent to various places, as the Georgians know nothing of weaving. The bazan, caravanſeras, and ſome of the houſes are built of ſtone, but the generality are only erected with mud and brick and are low and dark. The ſtreets are very badly paved, and conſequently diſagreeable either in wet or dry weather. The palace of the prince is a ſuperb building; it is adorned with extenſive and beautiful gardens, aviaries, falconries, &c. and before it there is a large ſquare ſurrounded by ſhops. Many tolerable houſes and fine gardens render the environs very pleaſant for ſeveral miles round. The grand viſir's houſe is the fineſt in the city, and the capuchin's monaſtery is pleaſant.

The Georgians deal by way of barter; travellers have therefore an opportunity of procuring the moſt excellent proviſions in great quantities, in exchange for necklaces, rings, bracelets, knives, pins, needles, &c. They uſe no weights or meaſures; and are ſuch bad arithmeticians, that they cannot count an hundred. The Italian fathers receive from Rome but twenty-five crowns each annually to maintain them; but are permitted to practice phyſic, of which they know very little. If the patient dies, they receive no pay, and if he recovers, ſlaves, wine, cows, ſheep, &c. are ſent to the convent, by way of gratuity.

A merchant in Georgia, is leſs reſpected than a mechanic: and a mechanic leſs than a huſbandman. The principal merchants and traders are Armenians, whom the Georgians naturally hate, and look upon them in the ſame deſpicable light, as Jews are conſidered in Europe. One of the moſt reſpectable employments in Georgia is that of a public executioner: the profeſſion is honourable, and the profeſſors become rich: if any man can trace a hangman amongſt his anceſtors, he is extremely proud of it, and never fails to mention it frequently with exultation; at the ſame time obſerving, that nothing is ſo noble as executing juſtice, and that the ſafety of the ſtate depends on the extermination of criminals.

When a war happens between Turky and Perſia, this country (like Flanders in Europe) is uſually the ſeat of it. In 1578, the Turkiſh forces, under the command of Muſtapha Baſſa, took Teflis; but the Perſians coming to the aſſiſtance of the Georgians, the Turkiſh troops were defeated and ſeventy thouſand of them ſlain. In 1583 hoſtilities were recommenced, but the Perſians were again victorious.

Beſides what is uſually allowed to the prince of Georgia, by the Perſian monarch, he has the cuſtoms of Teflis, the duties upon brandy and melons, and one ſheep for every fire-hearth in the whole country, amounting to forty thouſand; the crown eſtates ſupply him with wine, butter, wax, grain of all kinds, vegetables, fruits, &c. A great deal of gunpowder is made in Georgia, particularly at Teflis, the mountains near that city producing large quantities of nitre. The people eat and burn a great deal of linſeed oil, which they have in great plenty; but they value only the ſeed, as they have no idea of beating the ſtalk for ſpinning.

On the death of a Georgian, a biſhop ſays maſs over the corpſe, for which his pay is one hundred crowns. If the deceaſed has not left money ſufficient to diſcharge this exorbitant demand, ſome of his quondam friends very obligingly ſell his wife and children for ſlaves, to raiſe the money; for the clergy muſt not go unpaid; the biſhop then ſays maſs, and afterwards lays a letter upon the breaſt of the corpſe, which is only a complimentary card to St. Peter, to inform him, that the funeral expences have been honeſtly paid; and to intreat him therefore to be ſo obliging as to open the gates of paradiſe to the departed ſoul; the body is then wrapt up in linen, and buried. The ſame abſurd cuſtom of ſending a note by the dead to Mahomet, is practiſed by his diſciples.

The men in Georgia are generally more ignorant than the women, who receive ſome education in the monaſteries. Their language is remarkable for its beautiful ſimplicity. And with reſpect to the country in general, that ingenious traveller Mr. Tournefort obſerves, that "Paradiſe muſt undoubtedly have been in the way between Erzerum and Teflis, if it be allowed to take the Phaſis for Piſon, and Araxes for Gihon; and then, not to remove paradiſe too far from the heads of theſe rivers; it muſt of neceſſity be placed in the beautiful vales of Georgia."

Mingrelia, known to the antients by the appellation of Colchis, lies in the weſtern parts of Iberia or Georgia, and is bounded on the eaſt by Georgia properly ſo called; on the weſt, by the Euxine ſea; on the north, by mount Caucaſus; and on the ſouth by Armenia and part of Pontus. It is watered by many rivers, namely the Corax, Hippus Cyancus, Chanſtus, Abſarus, Ciſſa, Ophir, and Phaſis, where the Argonauts landed. All the above rivers empty themſelves into the Euxine ſea, but none of them are conſiderable, except the Pharis, which riſes in mount Caucaſus. The inhabitants of this celebrated mountain are ſaid, by the moſt credible writers, to have little beſides ſpeech, which can intitle them to humanity: they are tall and well-made, their looks are fierce, and indicate the ſavage diſpoſition of their minds. They are the moſt daring, ferocious, and determined robbers in the world.

This country is in many parts extremely woody, very uneven, full of hills, and but little cultivated; the ſoil is bad and ſterile; and the fruits ill-taſted and unwholeſome, except the grapes, which might be converted into ſome of the beſt wine in the univerſe, if the natives knew how to make it. The rains and humid vapours, which mingle with the hot exhalations frequent here, occaſion peſtilences, and a variety of other diſeaſes. The earth is ſo moiſt, that the few who turn their thoughts to agriculture, ſow their wheat and barley without plowing; and for their other ſeeds they turn up the land with little wooden ploughs, which are ſufficiently ſtrong to make the furrows in ſo ſoft a ſoil.

Colchis was ſaid by the antients to be exceedingly pleaſant and fertile, and even to abound in mines of gold, which gave riſe to the celebrated fable of the golden fleece, and the Argonautic expedition; for the inhabitants uſed to catch the gold duſt, which was brought down by the torrents from mount Caucaſus, by ſetting fleeces of wool acroſs ſome of the narrow paſſages of thoſe torrents. They have plenty of beeves, hogs, wild boars, ſtags, and other veniſon: likewiſe partridges, pheaſants, quails, &c. On mount Caucaſus, falcons, eagles, pelicans, tygers, lions, leopards, wolves, and jackalls breed.

They make their bread of a ſmall grain called gomm, it is agreeable to the taſte, ſalubrious, cooling and laxative; but the people of quality eat wheaten bread. The principal food is beef and pork, the latter being excellent. The nobility ſpend a great deal of time in killing and catching game, ſuch as pheaſants, water fowl, &c. but their favourite diverſion is flying the falcon at the heron; which is no ſooner taken, than they cut the beautiful tuft of feathers from its head and let it go again. They have a great number of excellent horſes, which are never ſhod nor fed with corn.

The houſes are every where interſperſed over the country; but there are no towns except two little ones by the ſea-ſide. With reſpect to caſtles, there are about ten in number, in the principal of which, named Rues, the prince keeps his court. Their caſtles are built of ſtone, to the height of about fifty feet, in the midſt of a wood. Here their treaſures are depoſited, though the garriſon conſiſts only of about ſixty perſons: near the caſtle are ſeveral magazines for proviſions, built of wood, which likewiſe ſerve for places of retreat upon emergencies. They have many huts made of branches of trees, canes, and reeds; and are ſo ſecure in theſe retreats, that none can come at them, but by one winding narrow paſſage, which is always ſtopped up when they are in danger of an attack from an enemy.

They

They build their houſes of wood, but never raiſe them above two ſtories. They have neither windows nor chimnies, but are furniſhed with beds and couches. The whole family, with the cattle, all lie in one room at night.

With reſpect to the natives of Mingrelia; the men are well-proportioned, and the women pretty, but they paint their faces and eyebrows; they wear their hair in curled ringlets, are witty and polite, but vain, luxurious, treacherous, and ferocious; dextrous thieves, and glory in the practice. They think it prudent as well as lawful to have many wives, becauſe they bring them many children, whom they can ſell for money, or barter for neceſſaries: when children, however, come too quick, they murder them without the leaſt remorſe; as they alſo do the ſick and aged, which they deem an act of benevolence. Adultery is thought but a trifle: when a man detects another in familiarity with his wife, he obliges him to pay a hog, which being immediately dreſſed, all three ſit down very lovingly to feaſt upon it together.

The peaſants are compelled to maintain the lords, who ſell them and their whole families whenever they think proper. They are the umpires in all diſputes between their vaſſals; but when there is a quarrel between any of their great lords, they have recourſe to arms. Bows and arrows, ſwords and lances, are their hoſtile weapons.

The laity ſuffer very little of their beard to grow, but thoſe of the eccleſiaſtics are very long. They ſhave the head, leaving only a little hair upon the forehead and round the ears. Their bonnet is made of felt, and in winter is lined with fur, but is not of much uſe to them, for when it rains they put it in their pocket, and go bareheaded to ſave it. They are ſo poor, that the common people go almoſt naked, and have only a covering of a triangular form, which they turn againſt the wind or rain. They wear a ſhirt, but have ſeldom more than one at a time; and that they only waſh three times in the year. The ſhirt is tucked into a pair of breeches, and on the feet they wear ſandals made of the untanned hide of a buffalo, which are faſtened with thongs of the ſame. They wear ſnow ſhoes in the winter.

Both ſexes of every claſs eat together. Thus grooms and ſcullions dine daily with the king and queen. On holidays they eat veniſon, beef and pork, but at other times the maſters have fiſh and pulſe, and the inferiors nothing but gomms. Both ſexes uſually get drunk at their entertainments, when the men boaſt of their theſts, and the women of their amours. If the weather will permit, they dine in the open court.

The revenues of the prince are eſtimated at about twenty thouſand crowns per annum, which are raiſed by fines, impoſitions, the ſale of ſlaves, and duties on all imports and exports; he ſpends very little of this money, for his crown lands are more than ſufficient to maintain him, and the people are obliged to work for him for nothing. His forces are principally cavalry, and do not amount to above four thouſand effective men. Every lord leads his own battle, but they are very badly diſciplined. They have money which bears the Perſian ſtamp, but is coined in Georgia, the value of which is always fluctuating. All commerce is carried on by barter.

Though the Mingrelians profeſs to be Chriſtians, they are extremely ignorant in all religious matters; few of the clergy can either write or read, but they greatly impoſe upon the people, by pretending to divination. When a perſon is ſick, the prieſt is ſent for, not to pray by him, but to predict whether he will live or die. Having opened a book, he gravely looks in it, though he is unable to read a line; then ſhutting the book ſuddenly, he declares that the patient will inevitably die, unleſs a very handſome preſent is made to himſelf. The ſick perſon being greatly terrified, intreats the prieſt to take what he pleaſes. The conſcientious clergyman does not want twice bidding, but packs up whatever he can lay his hands upon, and drives away all the poor man's cattle into the bargain: thus do the ignorant clergy plunder theſe ſuperſtitious people.

The governor allows the catholics four hundred vaſſals, who are obliged to work for him, that he may be ſupplied with whatever he wants. In return for their labour, he does not give them any pay, but takes away their wives, and ſells their children for ſlaves. Sometimes he makes a tour through his whole dioceſe, which extends not only over all Mingrelia, but throughout Imaretta, Gruiel, Abca, and Mount Caucaſus. In theſe excurſions, he does not attempt to regulate the paſtors, or inſtruct the people, but plunders and robs both clergy and laity of all he can find. The Catholicus has ſix biſhops immediately under him; and they make the whole Chriſtian religion to conſiſt in the abſtaining from fleſh. They neither preach nor pray; their moſt important buſineſs being to get drunk daily: it is therefore no wonder that theſe people have been deemed by travellers ſome of the moſt abandoned wretches upon the face of the earth.

After baptizing a child, which is done by immerſion, prieſt, parents, godfathers and gueſts indulge themſelves in gluttony and intoxication to the greateſt exceſs. When a man wants a wife, he muſt buy her: a tolerable good price is given for a virgin, leſs for a widow, and leaſt of all for a woman who has been divorced. They may divorce their wives either for barrenneſs or ill-nature. They keep their dead forty days above-ground, during which time they mourn; but after the body is buried, they get drunk in order to forget the deceaſed. A burial is frequently the ruin of the whole family, as the prieſt who ſays maſs lays claim to all that belonged to the deceaſed.

Beſides Mingrelia, there are two principalities in Weſtern Georgia, viz. Imaretta and Abaſſia. They lie to the ſouthward of Mingrelia, along the Euxine ſea: the princes of both are tributary to the Grand Signor. Imaretta is about one hundred and twenty miles in length, and ſixty in breadth: it contains many hills and woods, but the plains produce corn, cattle, pulſe, &c. They have ſome excellent iron mines, carry on a great deal of commerce, and coin money. The principal towns are Cotatis and Akalziki. Cotatis is now the reſidence of a Turkiſh baſſa. It is ſituated at the foot of a mountain, on the top of which there is a ſtrong caſtle to command and defend it: it is watered by the Phaſis. The town has no walls, and contains only about two hundred houſes. It lies open on all ſides, except where the rivers and mountain ſurround it. On the oppoſite ſide of the river there is a citadel on an eminence, which has a double wall, and is flanked with high towers. It lies in forty-two degrees twenty-three minutes north latitude, and forty-three degrees fifty-four minutes eaſt longitude. Akalziki is likewiſe the reſidence of a Turkiſh baſſa. It is ſituated in a hole, ſurrounded by about twenty hills, in forty-one degrees fifteen minutes north latitude, and forty-four degrees fifty five minutes eaſt longitude; the river Kar flows very near it. The town contains about four hundred houſes; the inhabitants are a mixture of Georgians, Armenians, Jews, Turks, Greeks, &c. who have ſeveral churches and a ſynagogue. The walls and fortifications are old and ruinous, and the houſes are built of wood.

The northernmoſt of theſe countries is Abcaſſia, having the Euxine ſea to the ſouth; Circaſſia on the weſt, and mount Caucaſus on the north and eaſt. The principal traffic is in ſlaves: the inhabitants, however, deal in the ſkins of tygers, deer, &c. box wood, honey, wax, and thread, which they exchange with the merchants for other goods. They go almoſt naked, and live in little mean low huts. They were once Chriſtians, but now little better than ſavages.

It is proper to obſerve here, that the Mamlucks, who were once ſo celebrated in Aſia and Egypt, and contended ſo long with the Ottomans for ſuperiority, were originally Georgian children, who being brought up to a military life, became ſo powerful as to revolt againſt their maſters, and uſurp the throne of Egypt.

Comaniaci by moſt geographers is included in Georgia: it is bounded by the Caſpian ſea on the eaſt: by a ridge of mountains which part it from Circaſſia, to the weſt; by Aſiatic Muſcovy, to the north; and by Georgia, to the ſouth: the country is thinly inhabited, and badly cultivated; but the ſoil is flat, low, and fertile. It is watered by ſeveral rivers, which deſcend from the mountains about Caucaſus. The climate is rather cold, and pretty much ſubject to rains. The inhabitants, who are called Comani, or Kamouche, live principally by plunder. They wear Perſian linen and ſilks, but dreſs like the natives of Little Tartary: the men wear ſhort jackets and drawers, and the women long looſe gowns which reſemble ſhifts. They have nothing that can be called a town, but their little hamlets conſiſt of about ſixty huts. Their food is milk, game, the fleſh of their cattle, honey, ſuch fruits as their country ſpontaneouſly produces, and rice, which they have from the Perſians.

Guriel is too little known to admit of a deſcription: it is a ſmall diſtrict belonging to Mingrelia, and the manners of the people are ſaid to reſemble thoſe of that country.

The Dageſtan mountaineers are accounted ſome of the moſt ferocious of all the Aſiatics, and are deemed the deſcendants of the antient Parthians. Their country is

bounded

HABITS of DAGESTAN TARTARS of TARCU,

on the borders of Persia!

Goodnight scalp.

bounded on the eaſt by the Caſpian ſea; on the weſt, by mount Caucaſus; on the ſouth, by part of Perſia; and on the north, by Circaſſia. Theſe people extend themſelves from the capital of Circaſſia, for about forty leagues along the coaſt of the Caſpian ſea.

The Dageſtans circumciſe their children, and uſe ſome other Mahometan ceremonials, but are ſtupidly ignorant of religion in general. They wear coats of mail, carry helmets and bucklers, and uſe bows, arrows, darts, lances, and broad ſwords. Their faces are very ugly and tawny, and their hair black and diſhevelled: their dreſs is a long looſe gown made of a dark coarſe cloth, and over this they throw a cloak made of the ſkin of ſheep or ſome other animal. Their caps, which hang down to their eye-brows, are made of various ſlips of cloth or fur. Their ſhoes conſiſt of only one piece of ſkin, and are ſewed about the ancles in a clumſy manner. Their food is the fleſh of their numerous herds, and milk.

Theſe Tartars of the mountain ſpare neither age, ſex, or condition, but rob all alike, and even plunder their very neareſt relations, whoſe children they ſell without the leaſt remorſe. They oblige all merchants to pay them tribute, and, if ſtrong enough, rob them of every thing, which occaſion the caravans always to have a powerful eſcort.

There are as many petty lords, called myrſas, as towns: from them a chief is ſelected, called ſhemkal. On the death of the ſhemkal, the myrſas aſſemble in a ring, in the middle of which ſtands the prieſt, who throws a golden ball among them at random, and he that firſt touches it is duly elected. His power, however, is limited by the others, nor is he much reſpected. Theſe Tartars are ſometimes confounded with the Leſgee, who are a different people, though near neighbours. Tarchu, the capital of this country, is ſituated on the weſtern coaſt of the Caſpian ſea, about forty miles north of Derbent: it conſiſts of about one thouſand wooden houſes, built after the Perſian manner, but with leſs elegance.

Between the Euxine and Caſpian ſeas ſtands mount Caucaſus: this is one of the higheſt mountains, or rather chain of mountains, in the univerſe; innumerable firtrees are found upon it. It is full of terrible rocks, hideous precipices, diſmal caves, &c. Paths have been cut through it with immenſe labour for the convenience of paſſengers, but by reaſon of the ſteepneſs they are difficult to paſs even in ſummer, but in winter much more ſo, on account of the vaſt quantities of ice and ſnow. The higheſt parts are covered with ſnow all the year, which makes the paſſage exceedingly dangerous in windy weather; for the clouds of ſnow, when driven by a hurricane, have been known to overwhelm whole companies of men and horſes. The paſſage quite acroſs the mountain is about one hundred and twenty miles in extent; by the way are ſeveral villages, well ſupplied with proviſions; for the ſoil of theſe aſtoniſhing mountains is fruitful, and produces plenty of corn, grapes, fruits, honey, cattle, &c. which is principally attributed to the richneſs of the manure yielded by the ſnow. The inhabitants have ſtore of poultry, eggs, pulſe, bread, &c. They breed hogs, whoſe fleſh is very fat and delicious. They call themſelves Chriſtians, but are in reality little entitled to that epithet: they are ſubject to the Ottomans.

The antients deemed the Euxine ſea only a lake. It has been uſually denominated the Black ſea, not from the colour of its water, or of its ſand, but from the furious tempeſts ſaid to rage here; though it has not more frequent nor more violent ſtorms than other ſeas. It extends about nine hundred miles from eaſt to weſt, and about three hundred and eighty from north to ſouth, in ſome parts, but is leſs in breadth in others. It is encompaſſed by Crim Tartary and Circaſſia, on the north; Turky in Europe, on the weſt; Georgia, on the eaſt; and Anatolia, or Aſia Minor on the ſouth. None but the Turks are permitted to navigate this ſea, though infinite advantages would redound to the Porte, if it was open to the Franks, or Europeans, as the Ottomans are very unſkilful mariners, know little of navigation, are without charts, and do not underſtand the compaſs. As this ſea hath no communication with the Mediterranean, and receives many large rivers into its boſom, its waters are freſher and clearer than thoſe of moſt other ſeas. The principal rivers which fall into it, are the Danube, the Don or Tanais, the Nieper, the Phaſis, and the Nieſter. The Euxine ſea joins to the Palus Mœotis, or ſea of Azoph, by the ſtraights of Caffa, which were termed the Boſphorus Cimmerius by the antients.

SECT. III.

Containing a deſcription of the weſtern diviſion of Aſiatic Turky; comprehending Natolia, or Leſſer Aſia, divided into, 1. Natolia, or Anatolia Proper; 2. Amaſia; 3. Aladulia; 4. Caramania.

I. ASIA Minor, or Anatolia, is bounded on the north by the Euxine ſea; on the north-weſt, by the Archipelago, the Helleſpont, the Propontis or ſea of Marmora, and the Thracian Boſphorus, or ſtraight of Conſtantinople; on the ſouth, by the Levant ſea, Syria, and the Euphrates; and on the eaſt, by the Mediterranean. It lies between thirty-ſeven and forty-one degrees, thirty minutes of north latitude, and twenty-ſeven and forty degrees of eaſt longitude, extending in length about ſix hundred miles from eaſt to weſt, and in breadth about three hundred and twenty from north to ſouth. Modern geographers divide it into Anatolia, properly ſo called, Amaſia, Aladulia, and Caramania. Theſe provinces antiently included Galatia, Paphlagonia, Pontus, Bithinia, Myna, Phrygia, Lydia, Moenia, Ionia, Æolis, Caria, Doris, Pamphylia, Piſidia, Cappadocia, Lycia, Lycaonia, and Cilicia. Anatolia is under the government of a viceroy or beglerbeg, to whom ſeveral baſſas, and a great number of ſangiacs are ſubordinate.

This country naturally is, and always hath been deemed one of the fineſt in the univerſe; yet ſuch is the miſerable policy of the Turkiſh government, and the indolence of the people, that it hath been ſuffered to become a mere wilderneſs; and, though uncommonly rich, fertile, and well-watered, they have permitted it to be over-run with weeds, briars, and brambles. The air is exceedingly ſerene and temperate, and would doubtleſs become ſtill more ſalubrious, if the lands were properly cultivated; for the inhabitants are not incommoded by exceſſive heats, nor chilled by intenſe froſts. The few cultivated parts produce, with little labour, plenty of various ſorts of corn, exquiſite grapes, oranges, lemons, citrons, olives, figs, dates, &c. beſides abundance of coffee, rhubarb, opium, baliam, galls, and many other valuable drugs, gums, &c. The principal rivers are thoſe known by the name of Xanthus, Cydnus, Mæander, Granicus, Scamander, Cayſter, Hermus, Pactotus, and Caicus, which diſcharge themſelves into the Mediterranean and Euxine ſeas, the Archipelago and the Euphrates. Its principal lake is Guol-Bug-Shaw, fifty miles long and twenty-two broad.

Anatolia Proper is the neareſt to Europe, and the largeſt of the four provinces into which Aſia Minor is divided. It extends almoſt from twenty-ſix to thirty-five degrees of eaſt longitude, and from thirty-ſeven to forty-one degrees of north latitude, being bounded by the Archipelago and Propontis to the weſt; by the Euxine ſea, to the north; by Caramania, on the ſouth; and by Amaria and Aladulia, on the eaſt. This province is governed by a beglerbeg, who has ſubordinate to him five ſangiacs, two hundred and forty-five zaims, and ſeven thouſand ſeven hundred and forty trinars; the number of troops are ſixty thouſand; the annual revenue of the beglerbeg is one million of aſpers. It contains the provinces of Bithynia, Myſia, the Leſſer Phrygia, Galatia, and Paphlagonia. Bithynia is ſeparated from Europe only by the Thracian Boſphorus: the ſoil is naturally rich, but is greatly neglected by the indolent Turks.

The capital of Bithynia is Pruſa, or Burſa, as the Turks call it: this city was the metropolis of the whole Ottoman empire before the Turks poſſeſſed themſelves of Conſtantinople. It lies in forty degrees ſixteen minutes north latitude, and twenty-nine degrees thirty-five minutes eaſt longitude. It is ſituate at the foot of mount Olympus, twenty miles from the ſea of Marmora, and fifty-eight ſouth of Conſtantinople: it is exceedingly well built, and deemed one of the beſt paved cities in all the Turkiſh empire; the ſtreets are ſpacious, the caravanſeras noble and convenient, and the moſques magnificient; the latter are adorned with cupolas covered with lead, and computed at about three hundred in number: in one of the moſques, the tombs of many of the antient Turkiſh ſovereigns are to be ſeen. This city is a place of conſiderable traffic. In the bezeſtine, all kinds of commodities of home manufacture, and others from the Levant, are expoſed to ſale: it is a large edifice, well built, and contains many excellent ſhops and warehouſes: the workmen here manufacture the beſt ſilks, hangings, carpets, tapeſtries, &c. in Turky. The city is about three miles in circumference, but the walls are falling to decay. It is computed to contain forty thouſand Turks. The ſuburbs, which are more

ſpacious and handſome than the city itſelf, are inhabited by four thouſand Jews, five hundred Armenians, and three hundred Greek families, beſides many foreigners. The fine orchards, gardens, plantations of mulberry, plantain, and other trees, &c. afford ſome of the moſt delightful and ſhady walks that imagination can conceive. All the neceſſaries and even luxuries of life, are excellent in their kinds, very plentiful, and quite reaſonable.

There is a caſtle on a hill, in the middle of the city; it was once the ſultan's palace; but is now going to decay. The ſeraglio, built by Mahomet IV. is a noble edifice. The city is governed by a baſſa, a cady or moula, and a janiſary aga, who has about two hundred and thirty janiſaries under him: the Greeks have three handſome churches in the ſuburbs, the Armenians one, and the Jews four ſynagogues. In the city are ſome excellent hot baths, and about a mile from it the baths of Calypſo, which are handſome ſtructures covered with domes, and much frequented on account of the great reputation the waters have obtained for their uncommon medicinal virtues.

About thirty miles from Conſtantinople, ſtands Nice, or as the Turks call it Nickor, in forty degrees thirty-two minutes north latitude, and twenty-nine degrees forty minutes eaſt longitude, being ſituated near a gulf of the ſea of Marmora, called Aſcanioor Aſcu: it contains about ten thouſand inhabitants, Turks, Greeks, Armenians, and Jews, whoſe commerce is very great in corn, fruit, tapeſtries, fine cloths, and other merchandize brought from the Levant: there is a ſeraglio in the higheſt part of the town. The ſtreets are large, and the houſes well built. This city was celebrated for being the ſeat of the firſt general council convened by Conſtantine, A. D. 325, to conſider the doctrine of the Arians, of which heterodox opinion great part of the Chriſtian world then were.

The city of Nicomedia received its name from Nicomedes, king of Bithynia, who made it his metropolis, reſided in it, and enlarged and embelliſhed it. The appellation which the Turks gave it is Iſuria, or Iſurigimid. It is large, handſome, and populous; and is ſituated at the end of a gulf of its own name, forty miles north eaſt from Burſa: in point of ſituation, it exceeds all the cities in the Turkiſh territories, Conſtantinople excepted: the inhabitants, compoſed of Turks, Greeks, Armenians and Jews, are ſaid to amount to thirty thouſand, who carry on a conſiderable traffic in ſilks, cotton, woollen, and linen cloths, earthen ware, and glaſs: it is alſo the principal place belonging to the Turks for building ſhips. Several curious antient inſcriptions in Greek and Latin are ſtill viſible in many parts of the city. To the weſtward is a fountain of mineral waters, much admired for its medicinal qualities, and a little beyond there is a mole, ſuppoſed to have been formerly made for the ſecurity of the ſhipping in the harbour, which is about a quarter of a league long, and twelve yards broad. The gulf, which receives its name from this city, is very long and deep, but only about a mile and a half broad.

The city of Chalcedon, which was once very opulent, is now an inconſiderable village; its ſituation is on the iſthmus of a peninſula, about ſeventeen miles to the eaſtward of Conſtantinople, on the oppoſite ſhore of the Boſphorus. This town has a tolerable harbour, and the river Chalcedon flows to the eaſtward of it: there was antiently in it a temple of Venus, and an oracle of Apollo. The once opulent city of Lybyſſa, famous for the death of Hannibal, ſtands between Nicomedia and Chalcedon; but it is now dwindled to a very poor and mean village.

Geographers uſually deſcribe Myſia and the Leſſer Phrygia together, as the exact limits are not aſcertained: in conjunction, they are bounded on the north, by the Propontis; on the ſouth, by Lydia and the Archipelago; on the eaſt, by Phrygia Major; and by the Helleſpont on the weſt. The famed mount Olympus, or rather the double chain of mountains ſo denominated, is ſituated in this country. Theſe are thought to be the higheſt mountains in the eaſt, particularly the central part, or the celebrated mount Ida of the antients: they are continually covered with ſnow, and the ſides abound with pine and other trees, with wild thyme and other ſhrubs, more particularly the laudanum ciſtos with broad leaves. About the beginning of the dog-days the air of mount Ida is ſo ſerene, that not a ſingle breath of air appears ſtirring, and at night the ſun's rays appear to dart all round the horizon, which make it appear as if on fire.

Among the principal rivers in this part of the country, we may reckon the Granicus and Æopus, which diſcharge themſelves into the ſea of Marmora; and the Simois and Xanthus, which empty themſelves into the Helleſpont: the Caicus, with the Pergamus, and Cayſter, flow through Myſia, which contains the following places.

Cizicus or Cyzium, (which is now Chizillo, and Spiga,) though antiently a magnificent city, is at preſent but an inconſiderable town, ſituated about thirty miles weſtward of Burſa, on the ſouth-eaſt coaſt of the ſea of Marmora: Oppoſite to this town, in the Propontis are ſeveral ſmall iſlands, which are called the Marble iſlands, from the great number of marble quarries in them: they likewiſe abound in corn, fruits, cattle, cotton, wine, &c.

The city of Lampſacus, or Lampſaco, hath loſt much of its antient ſplendor: it is but a ſmall place at preſent, thinly inhabited by a few Greeks and Turks: but its port is convenient. It is ſituated at the mouth of the Helleſpont, oppoſite to Gallipoli in Europe. The neighbouring country is exceedingly fruitful in vines and pomegranates: the former even the indolent Turks cultivate, and make excellent wine and brandy to mix with their ſherbet. It is related, that Alexander, having vowed the deſtruction of this place, and hearing that the inhabitants were coming to implore his mercy, he ſwore he would reject their petition; which the citizens being acquainted with they addreſſed him to deſtroy their city, and were ſaved by this ſtratagem, the young hero thinking his oath might not be diſpenſed with.

Abydos ſtands in forty degrees ſixteen minutes north latitude, and twenty-ſeven degrees ſixteen minutes eaſt longitude, upon the ſtraight that divides Aſia from Europe, which is three miles over. It is now called Avido or Avio, and was formerly eſteemed the key of Aſia. Here Xerxes began his famous bridge, which was ſo well completed in a week, that one hundred and ſeventy thouſand foot and eighty thouſand horſe, incluſive of carriages and camels, marched over it. About the year 1235 a mine of gold was found near this city, which enabled Priam king of Troy, to carry on many uſeful and magnificent public works. Philip of Macedon laid ſiege to this city, and took it by ſtorm; but the citizens ſooner than be carried into ſlavery by the conqueror, ſet fire to the city, and then murdered their wives, children, and themſelves. Abydos was an epiſcopal ſee, Hermias, the biſhop thereof, having aſſiſted at the council of Chalcedon. In A. D. 1330 it was betrayed to the Turks by the treachery of the governor's daughter; and Avido is at preſent one of their caſtles upon the Dardanelles.

The following are the principal places in Leſſer Phrygia; Aſſos, formerly a conſiderable ſea-port town on the ſouth coaſt, now an inconſiderable village. Antandros, now called St. Demitri, is ſituated further eaſt of the foot of mount Ida. Though it was formerly a place of importance, it now ſcarcely deſerves mentioning. Adramy Hum, or Endromic, as the Turks call it, ſtands at the mouth of the gulf to which it gives name, oppoſite the iſland of Leſbos. At preſent, like the laſt mentioned places, it is not of the leaſt importance, though formerly it was a place of note, and is mentioned in the Acts of the Apoſtles. Pergamus, which was formerly the metropolis of a kingdom, and is now dwindled to a ſmall village, is ſituated ſixty miles north of Smyrna, on the banks of the Caicus. Here ſtood one of the ſeven churches mentioned in the Revelations: here alſo the celebrated phyſician Galen was born, and parchment invented: ſome affirm that tapeſtry was likewiſe invented at this place. A ſtately temple of Æſculapius once embelliſhed this town. The Turks have a moſque, and the Greeks a church in this town.

Troy, or Ilium, at leaſt the ruins of that once celebrated city, is ſituate near the coaſt of the Ægean ſea or Archipelago, in twenty-ſeven degrees of eaſtern longitude, and thirty-nine degrees thirty minutes north latitude, twenty miles ſouth of the Helleſpont, oppoſite to the iſland of Tenedos, rendered memorable by Homer, Virgil, and other poets, for the ten years ſiege it ſuſtained againſt the united power of the Greeks; the magnificent ruins of which town ſtill remain. This ſiege is ſuppoſed to have happened about the year of the world 2816, before Chriſt 1184 years. The Turks have lately diſcovered a rich ſilver mine near theſe ruins.

Ionia and Eolis being uſually laid together are a long tract of land upon the coaſt of the Ægean ſea or Archipelago, extending from north to ſouth, oppoſite to the iſland of Leſbos. The chief towns are, 1. Elea, ſituate on a bay of the ſea, at the mouth of the river Caicus, the port town to Pergamus. 2. Cuma, antiently the capital of Eolis, from whence one of the ſybils obtained her name. 3. Phocea, ſituate on the ſame coaſt, to the ſouthward of Cuma.

Smyrna,

Smyrna, or Ismir, is situate on the bottom of a fine bay in that part of this division called Ionia, in twenty-seven degrees of eastern longitude, and thirty-seven degrees thirty minutes north latitude, one hundred miles north of the island of Rhodes, and opposite to the island of Scio. It has a large commodious harbour, and a very great foreign trade, consuls from many of the European nations residing here; besides the Turkish inhabitants, which are very numerous, there are several thousands of Greek and Armenian Christians, and abundance of Jews; there are also some hundreds of Franks or Latin Christians, several Popish convents, an archbishop of the Greek church, and a Roman Catholic bishop. The gardens, vineyards, olive-yards and groves about Smyrna, render it exceeding pleasant. The town is about four miles in circumference; the river Melus runs through it, on the banks whereof they have a tradition that Homer was born; but many other places contend with them for that honour. A castle stands at the entrance of the harbour, which commands the shipping going in and out: though the situation of Smyrna is exceeding pleasant, yet few people would chuse to reside there, unless drawn thither in hopes of gain, it being great part of the year excessive hot, unhealthy, and very subject to earthquakes. The town is scarce free from them two years together, and they have continued sometimes forty days without intermission; in a terrible one which disappeared in 1688, the earth opened, the castle and great part of the town were swallowed up, with some thousands of the inhabitants.

This town is plentifully supplied with provisions: the tails of the sheep weigh ten pounds, and are deemed a great dainty. The fish taken in the bay are excellent; wild hogs, hares, and all other kinds of game, fowls, &c. may be had in abundance: the wine, olives, fruits, &c. are all admirable. The musquitos, as well as a much smaller fly, common here, are extremely troublesome, especially to strangers; lemon juice is the best remedy for the fiery tumors which ensue. The European merchants bring hither a great variety of goods from Europe, the East and West-Indies, &c. export fine and coarse wool, silk, cotton, mohair, wax, rhubarb, gall-nuts, opium, aloes, scammony, tutty, galbanum, tacamahac, gum-tragacanth, ammoniac, and Arabic myrrh, frankincense, &c. The Jews generally manage most of the commercial affairs here and in other parts of Turky. This city was the seat of one of the seven Asiatick churches mentioned in the Apocalypse. In the environs, Roman medals have been frequently found: near it are the remains of an antient Roman circus, theatre, and other ruins, &c. In the neighbourhood, a kind of earth is found, which, being boiled with oil, makes excellent soap. The whole country is exceedingly rich and fertile.

The Turks bury without the town, and place either grave-stones or pillars, at the head and feet of the graves, which in general are shaded with cypress trees. In their cemeteries, as well as those of the Christians and Jews, many antiquities in architecture are found: the burying-ground belonging to the English is walled in, and contains some curious monuments, the sculpture of which is admirable. They were, however, not executed at Smyrna, but brought from Italy: one in particular is to the memory of Mr. Bouvrie, who died at Magnesia.

Near Smyrna are several places which are greatly dwindled from their antient splendor; the first we shall mention is, Clazomene, situated on the Ionian peninsula, twenty-eight miles to the South-west of Smyrna: it was one of the twelve antient cities of Asia, and famed as the birth-place of Anaxagoras. It is now called Urla or Vourla, was a city of importance in the time of the Romans, but is now a despicable village. 2. Erythræa, like the last-mentioned place, was formerly a considerable city, but is now only a mean village: it is on the Ionian coast, between Teos and Clazomene. 3. Teos, the birth place of Anacreon, was antiently a good sea-port, but scarce retains any vestige of what it formerly was. 4. Lebidus, or Lebidos, is now a poor sea-port, near the isthmus of the peninsula, though it was formerly one of the twelve capital cities of Asia, and was famed for the games of Bacchus, which were celebrated there. 5. The city of Colophon, about thirty miles south of Smyrna, is one of those which laid claim to the birth of Homer: it had a temple and an oracle, but at present is very inconsiderable. There are scarce any vestiges left of the antient cities of Heraclea, Lathiatum Beryglia, Mylassa, Mnyzon, Alabanda, Stratonice, and Alinda. From the instability of human glory, and the mouldering remains of the strongest and the most magnificent structures we may be taught to reflect on our own approaching mortality, the vanity of life, and the general dissolution which must await all sublunary things.

Ephesus, situate fifty miles south of Smyrna, near the mouth of the river Caistrus, now a poor village of twenty or thirty houses: it is in thirty-eight degrees sixteen minutes north latitude, and twenty-seven degrees three minutes east longitude. It was pleasantly seated near a fine haven, and under the Romans was the metropolis of Asia. It was antiently famous for the temple of Diana, esteemed one of the wonders of the world. This structure, it is said, was four hundred and twenty-five feet long, and two hundred and twenty broad, supported by one hundred and twenty-seven marble pillars, seventy feet in height, destroyed by Erostratus, to eternalize his name, who set it on fire the same night Alexander the Great was born. St. Timothy was the first bishop of this city: and St. Paul honoured them with an excellent epistle, which is part of our canon; but the inhabitants are so exceedingly ignorant that none of them are able to read it. And the third general council was held here. There are still the vestige of a Roman theatre, circus and aqueduct; and heaps of stately ruins, which some suppose to be the remains of Diana's temple; for there was a second temple, it seems, built to the honour of that goddess, after the destruction of the first, not at all inferior to the former in magnificence. The Greeks call this city Efeso, and the Turks have given it the name of Ajasalouch. There is yet standing a church dedicated to St. John the Evangelist, who was buried here: it was erected by the primitive Christians, but is at present converted into a Turkish mosque. The celebrated painter Parrhasius and the weeping philosopher Heraclitus were natives of this place.

An ingenious modern writer observes, that "the Ephesians are now a few Greek peasants, living in extreme wretchedness, dependence, and insensibility: the representatives of an illustrious people, and inhabiting the wreck of their greatness." With respect to the state of religion, the same author says, that the glorious pomp of its heathen worship is no longer remembered; and Christianity, which was there planted and nursed by the apostles, and fostered by general councils, till it increased to fullness of stature, barely lingers on in an existence hardly visible. Such are the present citizens of Ephesus, and such is the condition to which that renowned city has been gradually reduced.

Caria and Doris are usually thrown together, and now called Adinelli, being bounded by the sea on the south and west; and by the river Meander on the north. The chief town in Caria Proper is, Miletus or Miletum, now Palatschia, situate on the south side of the river Meander, near the sea. It was antiently a large city, and had a magnificent temple dedicated to Apollo, once the seat of the oracle. It was also famous for being the place of Thales's nativity. It is now only an inconsiderable village, consisting of shepherds cots, though the ruins of the antient city are very large. Near this place is the mountain Latmus, where the poets feign the moon made her visits to Endymion, with whom she was enamoured.

In Doris, which is the southern part of Caria, the chief towns are, 1. Mindus, a sea-port, situate on a small bay called Iasicus Sinus, and is the seat of a Turkish bassa, or sangiac. 2. Halicarnassus, situate to the southward of Mindus, once the capital of Caria, but now a heap of ruins, famous heretofore for the tomb built by queen Artemisia, in honour of her husband Mausolus, being so noble a structure that it was esteemed one of the wonders of the world. And in this city those two celebrated historians Herodotus and Dyonisius were born. Ceramus, Cyndus, and Cressa on this coast, were once good towns, and famous for their harbours, but have now nothing that renders them remarkable.

Lydia, or Mœnia, is bounded by Phrygia Major, on the east; Cari, on the south; and by Æolis and Mysia on the west. It was a fruitful country, being well watered by some considerable rivers, particularly the Caicus, Hermus, Caistratus, and Pactolus, which run through it from east to west. Of this country the wealthy Crœsus formerly was sovereign. The chief towns are, 1. Sardis, antiently the capital city, and the seat of Crœsus, but now a poor village on the river Pactolus, about forty-eight miles to the eastward of Smyrna. It was a bishop's see, and one of the seven churches of Asia, demolished by an earthquake, and there are still some noble ruins to be seen where the city stood. It contains, however, a large caravansera for the accommodation of travellers and caravans, who pass through it from Smyrna and Aleppo in their way to Persia. 2. Philadelphia, or Alla-Scheller, the seat of the metropolitan, and another of the seven churches. It is situate in a fruitful plain, on the north side of the mountain Molus,

Molus, but fallen much from its primitive grandeur: however, ſome travellers relate, it ſtill contains about ſeven thouſand inhabitants, are principally Greeks, and have four churches in the place. As the neighbouring country is very fertile, proviſions are pretty plenty. 3. Thyatira, a biſhop's ſee, and another of the ſeven churches, now called Akhiſar, is ſituate about thirty miles to the north-weſt of Philadelphia, near the ſouth bank of the river Hermus, where are ſeen the ruins of antient marble ſtructures, but the preſent buildings have no better than clay walls. It is however ſaid to be a place of ſome trade for corn and cotton. It contains about five thouſand inhabitants, who are chiefly Turks. 4. Magneſia, now Siphylum, ſituate on the river Meander, about fifty miles ſouth of Sardis, was antiently a conſiderable city, as appears by its ruins, and is ſtill a pretty large walled town, trading to Smyrna with cotton-yarn. The inhabitants are compoſed of Turks and Jews, the latter having three ſynagogues. 5. Laodicea, or Eſkihiſar, ſituate on the eaſtern boundaries of this province, and has been reckoned part of Phrygia. It was antiently one of the ſeven churches, and a very large city, as appears by the ruins; among which are three theatres of white marble, almoſt entire, and a ſtately circus: but the place is perfectly uninhabited at preſent.

Phrygia Major, called by the Turks, Germian, is an inland province, having Bithynia on the north, Pamphylia on the ſouth, Myſia on the weſt, and Galatia on the eaſt. The rivers Hermus, Meander, Marſias, and Sangarius, riſe in this province, which with proper cultivation would be exceedingly fruitful. The chief towns are, 1. Cotyœum, or Kutahia, or the river Sangar, about ſeventy-three miles ſouth-eaſt of Buſſa. It was a very conſiderable city antiently, and is ſtill a very flouriſhing and populous town; is at preſent the ſeat of a beglerbeg, and was formerly the Turkiſh emperor's place of reſidence, prior to the taking of Conſtantinople. 2. Mideum, or Middæum, antiently the royal ſeat of the celebrated King Midas. The antient geographers placed this town near the north-eaſt limits of Phrygia, on the river Sangarius; but there are no veſtiges of it at preſent to be ſeen. 3. Gordium, once the reſidence of Gordius king of Phrygia, who tied the knot in Apollo's temple, which Alexander cut with his ſword. 4. Apamea, ſituate on the river Meander; this was once one of the moſt conſiderable cities of Aſia, but is now quite run to decay. 5. Coloſſa, Coloſſus, or Chonos, was ſituated on the ſouth ſide of the river Meander. St. Paul's epiſtle to the Coloſſians was addreſſed to the inhabitants of this city.

Scarce any traces are now to be found of Hierapolis, Synnada, Eucarpia, Prymneſia, Tiberiopolis, Hipſos, &c. except the hot ſpring and ſuperb ruins of Hierapolis. Apamea is alſo now quite run to decay, though it was once one of the moſt conſiderable cities of Aſia: this city was ſituated on the river Meander, a little above where the Marcias falls into it, and aroſe out of the ruins of the antient Celene, whoſe inhabitants were tranſplanted into it by Seleucas, who named it after his wife Apamea.

Galatia, called at preſent by the Turks Chiagare, is bounded, on the north, by Paphlagonia; on the ſouth, by Pamphylia; on the eaſt, by Cappadocia; and on the weſt, by Phrygia Major. It received its name from a colony of Gauls, who paſſed through Greece into Aſia, and ſettled in it. A great number of Greeks afterwards mingled with them, whence it was called Gallo Græcia: it was always a fine fertile country, and was formerly well cultivated, but at preſent lies neglected like other places, through Turkiſh indolence. St. Paul addreſſed his epiſtle to the Chriſtian inhabitants of this city.

The city of Ancyra, or as the Turks call it, Angouri, or Angora, is in forty degrees north latitude, and thirty-two degrees fifty-eight minutes eaſt longitude, two hundred and fifty miles eaſt of Smyrna. It is the reſidence of a ſangiac, and a very populous trading place. The inhabitants are eſtimated at forty thouſand Turks, five thouſand Armenians, and one thouſand Greeks. The chief manufacture was camlets: the evidences of its primitive grandeur are innumerable; the ſtreets, piazzas, &c. being full of ſtately remains, columns, &c. of the fineſt marble, porphyry, red jaſper, and other beautiful ſtones elegantly wrought; the modern buildings, however, are mean, low, and formed only of mud and turf. A great variety of inſcriptions in ſeveral languages appear upon the gates. In the caſtle there is an ancient, little, dark Armenian church, built one thouſand two hundred years ago. It has only one window, which is not glazed, but hath its vacancy filled by a tranſparent marble, through which the light penetrates into the church, but receives a reddiſh tinge from the nature of the ſtone. This city was once an archbiſhop's ſee, with ſix ſuffragans under him. The ſheep bred here are ſome of the fineſt, and the goats the moſt beautiful in the univerſe; the hair of the latter is of a dazzling whiteneſs, as fine as ſilk, it is curled naturally into locks of eight or nine inches long, which make the fineſt camlets. This hair is ſpun in the country, and manufactured in Angora. Theſe goats are only to be ſeen within a few miles of this city, as the breed degenerates, if they are removed to other places.

Belli is the metropolis of the province, and the reſidence of the fifteen ſangiacs under the beglerbeg of Anatolia Proper. The other places are Andres, ſituated a little to the eaſt of Ancyra; Thormæ, ſo called from its hot baths; Germaſte, formerly Germia, on the Sangarius; Ophium, a dirty, ill-built town which receives its name from the opium made in and about it, its environs being covered with poppies, from which the Turks extract their opium.

Pontus and Paphlagonia or Pender are bounded by the Euxine ſea on the north, Cappadocia on the eaſt, Galatia on the ſouth, and Bithynia on the weſt: the name of Pontus extended formerly to all the coaſt of the Euxine ſea, then called Mare Ponticum. This, which we treat of with Paphlagonia, is but a ſmall part of it: the chief towns whereof are, 1. Heraclea Ponti, now Penderachi, a ſea-port in the north-weſt part of this country. It was once celebrated for being the reſidence of the Comneni family, the founders of the Trebizond empire. The houſes are ſmall, mean, and ill-built, 2. Amaſtris, now Semaſtro, alſo a ſea-port, ſituate at the mouth of the river Parthenius. 3. Claudianopolis or Bithynium now Caſtromena, is a very ſmall town though once an epiſcopal ſee. 4. Tewthramia, now Tripoli, is ſtill a good town on a bay of the Euxine ſea; but it muſt be obſerved that there is a town of the ſame name in Anatolia, ſituated on the Meander.

Amaſus, now Amid; Gangara, now Zagyra; Junopolis, now Cinopolis; and Pompeiopolis, or Cimolis, though formerly conſiderable, are now either totally deſerted, or nearly in ruins.

Sinope is the moſt conſiderable city in this part: it was antiently the metropolis of the kingdom of Pontus, and the birth and burial place of the celebrated king Mithridates. It is ſituated in forty-one degrees fourteen minutes north latitude, and thirty-four degrees fifty-two minutes eaſt longitude, and is at preſent a good trading town. In Strabo's time moſt of the ſtately walls, edifices, and the caſtle were ſtanding. The walls which now ſurround it, were built by the Greek emperors. They have double ramparts, and are flanked with pentagonal and triangular towers. On the land ſide, however, it is commanded by eminences which would greatly expoſe it to an enemy, but by ſea it would require two fleets to beſiege it. The caſtle is now decayed, and there are but few janiſaries in it; yet the Turks are ſo jealous of it, that they ſuffer no Jew to live in it, and confine the Greeks to a certain ſuburb. Here is a profitable fiſhery, and a great deal of trade carried on. Many magnificent antique remains are to be ſeen, and the new buildings are intermixed with innumerable noble fragments of the old. Diogenes, the celebrated cynic philoſopher, was a native of this place. The water here is excellent, and the country fertile; abounding with walnut, olive and maple-trees; and a fine ſort of wormwood.

II. The province of Amaſia which contains the whole or the principal part of the antient provinces of Pontus Cappadocia, Pontus Galaticus, and Pontus Ptolemoniacus, has the Euxine ſea on the north, Caramania and Aladulia on the ſouth, Anatolia Proper on the weſt, and Armenia and Georgia on the eaſt. The chief towns are, 1. Amaſia. 2. Themiſcyra; and, 3. Comana. 1. Amaſia, which the Turks call Amnaſan, is ſituate near the banks of the river Iris, in thirty-ſix degrees of eaſtern longitude, and forty-two degrees of north latitude, ſeventy miles north-weſt of Tocat, and ſeventy miles ſouth of the Euxine ſea. It was antiently the reſidence of the kings of Cappadocia, and ſometimes of the beglerbeg or Turkiſh viceroy: it is pleaſantly ſituated on an eminence, from whence there is a proſpect over an extenſive plain on the ſouth. The buildings are mean, nor is it a place of any great trade; but there are ſome magnificent ruins, where the palaces of their ancient princes ſtood. The Greek Chriſtians have an archbiſhop here: Selim the firſt emperor of the Turks, and Strabo the geographer were natives of this place. 2. Themiſcyra, now Lerio, ſtands

on the Euxine ſea, ſixty miles north-eaſt of Amaſia. 3. Comana, eight miles to the eaſt of Amaſia, formerly a biſhop's ſee; but it is now dwindled to a village. 4. Tocat is ſituate at the foot of a mountain, in thirty-ſeven degrees of eaſtern longitude, and forty-one degrees thirty minutes north latitude, about one hundred miles ſouth of Sinope and the Black ſea, a populous city, inhabited by Turks, Armenians, Grecians, and Jews. It is large, ſtrong, and well-built: on the top of two marble rocks are two old caſtles: every houſe hath a fountain of freſh water in it. It is governed by a cadi, a wayvode, and a janiſary aga. The Armenians are moſt of them mechanics, working in copper and other hard-ware; and there is a good manufacture of Turky leather. It is a great thoroughfare of the caravans bound from Turky to Perſia, Arabia, and India. The Chriſtians make excellent wine here, and the adjacent country abounds in good fruit; there is no part of Turky that produces more ſaffron. When the caravans ſet out, either eaſt or weſt, from hence, they pay a duty of half a crown for every camel loaden with merchandize, and half as much for other beaſts of burthen, but nothing for the beaſts that carry proviſions or paſſengers; and the government raiſe or lower theſe duties as they ſee fit.

Sivas, formerly Sebaſte, lies about two days journey ſouth of Tocat, where the beglerbeg ſometimes reſides. The Amazons, if ever there were any ſuch people, are ſuppoſed to have reſided in this part of the country. The environs are extremely fertile; ſome excellent plants are produced, and curious foſſils found, particularly many ſubterraneous vegetations of admirable beauty. Like our flints, they are incloſed in matrices, which when broken diſplays ſome of the fineſt of cryſtallines imaginable, ſome are like petrified mother of pearl, and others appear like candied lemon and orange peal. This city is governed by a cadi or wayvode, and a janiſary aga. The garriſon conſiſts of about one thouſand janiſaries and ſpatins. It has twelve moſques, ſeven Armenian churches, and a Greek chapel.

Trebizond is ſituate at the foot of a mountain, on the ſhore of the Euxine ſea, in forty-two degrees twenty minutes eaſtern longitude, and forty-two degrees twenty-ſix minutes north latitude. It is a large, populous city, pretty well built, and within the walls are groves and gardens, intermixed with the houſes. It had a ſtrong caſtle founded on a rock for its defence, but now much decayed, and the harbour, which lies eaſt of the city, was formerly eſteemed a very good one; but is now ſo landed up, that great ſhips cannot enter it. The ſuburbs, which are inhabited by Greek and Armenian Chriſtians, are larger than the city: the country about it is very fruitful, but their trade is much declined: the fineſt foreſt lies about twenty-five miles ſouth of the city, in the midſt of which ſtand the famous convent of St. John, built all of wood, upon a large rock, and ſurrounded by one of the moſt romontic wilderneſſes in the univerſe. A great deal of rock honey is found in the neighbourhood of that city, which is ſo exceedingly luſcious, as to render the eating much of it dangerous. It was ſubject to the Roman and Grecian emperors: and David Comnenus, a French gentleman, uſurped the dominion of it, with the title of duke, about the year 1209. His ſucceſſor, John Comnenus, aſſumed the title of emperor, and his ſucceſſors were ſovereigns of this city and the neighbouring country, till the year 1462, when Mahomet II. took it, and having put to death all the remains of the Comneni family, added it to the Turkiſh empire.

The town of Phamacia is about forty-four miles weſt of Trebizond, and ſituated near the coaſt of the Euxine ſea, the Turks call it Keriſan; it is a large and populous place, but its harbour is only fit to receive thoſe ſmall veſſels called ſaics. It is generally thought to be the antient Ceraſunta, and to have been ſo denominated on account of the great number of cherry-trees with which its environs abound.

III. The third diviſion of Aſia Minor is Aladulia, or Anadulia, called by the Turks Dulgadir. This country is unfit for the purpoſes of agriculture, being rough and hilly; but it abounds in excellent paſtures, and produces abundance of admirable fruit, wines, and cattle, particularly horſes and camels, beſides vaſt herds of goats and ſheep, veniſon, all kinds of game, &c. There is ſilver, copper, iron, allum, &c. in the mountains. The province is divided into four ſangiacſhips, which are again ſubdivided into zamets and timariots. The plundering banditti, or free-booters, are very troubleſome in this country.

The principal places are, 1. Caiſar, the antient Cæſarea: it is a large town on the banks of the Milas, near mount Argæus, and about ſeventy miles weſt of Secias. The walls are ſtrong, and flanked with towers. The caſtle is in the center of the city. The bazar is handſome, and well furniſhed with all ſorts of merchandize: the houſes in its neighbourhood are built either in the form of a tower with a cupola, or they reſemble a loaf. The city is well ſupplied with water from the river; and their principal trade is in cotton. 2. Malathiah, at the confluence of the Euphrates and Arſu, was antiently called Mytilene. It is in thirty-eight degrees twenty-two minutes north latitude, and thirty-eight degrees fifty-ſix minutes eaſt longitude. It was formerly the ſeat of the Ottoman princes, and now of a Greek archbiſhop. It is ſtill a conſiderable town. 3. Mars, or Maraſch, is a large well built city in the ſouth-eaſt boundaries of the province. It is ſituated on a ſmall river, which falls into the Euphrates, about two miles to the ſouthward of Trebizond: it is the reſidence of a baſſa, and a place of ſome commerce. Pauſanias the Greek hiſtorian, the two Gregories of Nazianzen, St. Baſil, and St. George the tutelar ſaint of England, may be ranked the foremoſt among the eminent men who were born in this province.

IV. Caramania is the fourth and laſt diviſion of Aſia Minor. It extends itſelf along the Mediterranean coaſt from north to ſouth, compriſing the antient Lycia, Pamphilia, Piſidia, Lycaonia, and Cilicia, with part of Tſauria, Phrygia, Pacatiana, Galitia, Salutaris, and Cappadocia. It reaches from the neighbourhood of Alexandretta to the gulf of Macri, at the mouth of which lies the iſland of Rhodes. This country is called Caraman-Ili by the Turks, and is divided into the Greater and Leſſer; the latter lying along the ſea-coaſt, and the former to the north of mount Tauris. It is governed by a beglerbeg, whoſe revenue is exceedingly large, and ſeven ſangiacs, with many zaims and timars, are ſubordinate to him. The following are the principal places in this province.

1. Myra, or Myrra, called by the Turks Strumita. This was once a conſiderable city, but is now dwindled almoſt to nothing, it is about twenty-two miles north-eaſt of Patora, ſituated near the mouth of the Limyrus.

2. Patora; which was once the metropolis of Lycia: but is now a very inconſiderable village near the mouth of the Xanthus, between the gulfs of Satalia and Macri.

3. Satalia, called by the Turks Sataliah, is the antient Attalia. It was formerly an important city in Pamphylia, at the bottom of the gulf of its name, in thirty-ſix degrees forty-five minutes north latitude, and thirty-one degrees twenty minutes eaſt longitude. It is the ſtrongeſt place the Turks have upon this coaſt. The entrance of the harbour is both difficult and dangerous. This ſingular place is divided into three diſtinct towns, each of which is ſeparated from the others by its own ſtrong walls, and the gates are ſhut up preciſely at noon every Friday till one o'clock, from a pretended prophecy, that on ſuch an hour the Chriſtians are to ſurprize it. The whole is about ſix miles in circumference; the buildings are good, the place populous, and the trade conſiderable. The ſummers are ſo hot, that thoſe who can afford it retire towards the mountains, where there is more air and ſhade. The caſtle, which commands the town, is a very good one. The Chriſtians had formerly a fine church in one of the towns, but it is at preſent converted into a Turkiſh moſque. The neighbouring country is fertile and delightful, being covered with citron and orange groves, which afford an excellent odour.

4. With reſpect to Sagaluſſus, though antiently a tolerable town, it ſcarcely merits at preſent the name of a village. The ſame may likewiſe be ſaid of Antiochia Piſidiæ, or Cæſarea, which ſtands at the foot of mount Tauris, and was once the metropolis of the province.

5. Iconium which the Turks call Cogni, is the metropolis of the beglerbegate. It ſtands in the antient Lycaonia, in a fertile pleaſant plain, near a fine lake of freſh water, which was antiently called Palûs Trogilis. It is about one hundred and ten miles from the Mediterranean ſea.

It is ſurrounded with ſtrong walls, adorned with towers, and a broad ditch. The Turks only inhabit the city; the Greeks, Armenians, and Jews, inhabit the ſuburbs, which are ſpacious. The city is commanded by a ſmall caſtle, and adorned with ſeveral moſques, a ſeraglio, and ſome ſpacious caravanſeras. The mutton here is exquiſite, the wool of the ſheep admirable, and their tails ſo large, that they are drawn upon ſledges faſtened to the animal.

6. Tarſus, which was antiently the capital of Cilicia, and one of the fineſt towns of the Leſſer Aſia, but is at preſent quite decayed. It was the birth-place of the great apoſtle St. Paul; and is ſituated upon the Cydnus, about ſix miles from its mouth. The Turks call this town Tarſon, Tariſſu, and Hom. If we may judge by the ruins of the old wall, it appears to have been near twelve miles in circumference.

cumference. At the mouth of the river there is a good commodious harbour: and about a mile below the town there is the lake Rhegma, through which runs the Cydnues.

7. To the eaſtward of Terſus, is Adana, a conſiderable town on the river Choquen: it ſtands about thirty-five miles on the road to Aleppo, and about eighteen miles from the Mediterranean. This town contains a great number of beautiful fountains ſupplied with water by aqueducts, and over the river there is a ſuperb bridge of fifteen arches. The adjacent country is exceedingly pleaſant, and the ſoil extremely fertile.

8. The laſt place is Ajazzo, or Lajazzo, formerly called Iſſus, and is ſituated on a gulf of the Mediterranean, to which it gives its name. It was antiently a place of very great importance, and is at preſent a neat, ſtrong, opulent, ſea-port town.

Azar, Ainzarba, Teleneſſus, Xanthus, Pheſelis, Pignara, Olbia, Magidis, Side, Perga, Sitnum, Arpendus, Termeſſus, Olbaza, Lyſtra, and ſeveral other cities and towns, which were known to the antients, but of which the moderns have very imperfect accounts, are now ſo reduced to poor, mean, little hamlets, or ſo totally ruined and deſerted, as not to merit any particular deſcription.

The rivers of moſt note in Caramania are the Xanthus, Lamus, Ceſtrus, Eurymedon, Cydnus, Sarus or Smarus, Pyramus, Limyras, Latamno, &c.

Caramania contains many celebrated mountains, moſt of which are branches of mount Tauris or Taurus, viz. Olympus, there being many mountains in Aſia of this name; Cragus, the etymology of which Bochart derives from the Arabic word Crac, which ſignifies a rock; from whence it is probable the Engliſh word Crag originated; and Antipagus, all in Lycia. The great chain called mount Tauris begins in Lycia, and runs eaſtward. In Cilicia, the moſt remarkable is Amanus.

We muſt not omit to mention the celebrated Lycian volcano mountain, called by the antients Chimæra. Its bottom was infeſted with ſerpents, the middle parts afforded paſture for goats, and the top was haunted by lions. This gave the idea to the poets to feign the monſter Chimæra, which was repreſented with the head of a lion belching fire, a goat's body, and a ſerpent's tail. Hence incongruous ideas are called chimæras, and inconſiſtent ſtratagems are ſaid to be chimerical. The Lycians built the city of Hepheſtiæ near this mountain, in honour to Vulcan, on account of its volcano.

SECT. IV.

Gives an account of Syria, its diviſion, ſituation, extent, cities, towns, climates, ſoil, fertility, produce, inhabitants, &c.

SYRIA, called by the Turks, Sourie and Soriſtan, was originally ſo called from its capital Tzor and Tzur, which the Greeks ſoftened into Sur and Tyre. This country is ſituate between thirty-five and forty-one degrees of eaſt longitude, and between thirty-one and thirty-ſeven degrees of north latitude, and, in the moſt extenſive ſenſe, includes Syria, properly ſo called, Phœnica or Phenice, and Judea or Paleſtine. It extends from north to ſouth about four hundred miles, and about two hundred from eaſt to weſt. The antient kingdom of Syria, which Seleucus and his ſucceſſors governed, extended as far eaſtward as Perſia.

The modern Syria is bounded by Turcomania or Armenia, and Aladulia on the north, by the river Euphrates, which divides it from Diarbeck or Meſopotamia, on the eaſt, by Arabia on the ſouth, and by the Levant ſea, and Cilicia or Caramania on the weſt. Syria is at preſent divided into three governments, or beglerbegſhips, viz. 1. That of Aleppo. 2. Tripoli; and, 3. Damaſchus or Scham; every one of which are ſubdivided into ſangiacſhips or little governments, which have their reſpective baſſas who command them under the beglerberg of the province.

The beglerbergſhip of Aleppo is the moſt northerly of theſe, the capital whereof is of the ſame name, ſituate in thirty-ſeven degrees forty minutes eaſt longitude, and thirty-ſix degrees thirty minutes north latitude, about ninety miles eaſt of the Levant ſea, but on four hills, in the middle of a ſpacious plain, being of an oval figure, and about three miles in circumference, and ſurrounded by a ſtone-wall. The caſtle ſtands on the higheſt hill in the middle of the city. The town is better built than moſt of the towns of Turky, and there are a great many moſques, caravanſeras, bagnios, fountains, and reſervoirs of water, fine gardens, vineyards, and orchards of apples, oranges, lemons, cherries, and ſome other fruits, which are but indifferent. It is one of the briſkeſt towns of trade in Turky, where the merchants purchaſe ſilks, carpets, mohair, yarn, ſhagreen, Turky leather, cotton, and other produce of Perſia and Turky: the churches and houſes of the Chriſtians are in the ſuburbs, of which there are four ſects of eaſtern Chriſtians, viz. Greeks, Armenians, Jacobites, and Maronites or Syrians. It is computed there are two hundred thouſand ſouls in the city and ſuburbs, of which thirty thouſand are Chriſtians, beſides five thouſand Jews; for moſt of the maritime powers in Europe have their conſuls and factors here, and are allowed their chapels and public worſhip in them. There are about forty Engliſh factors, who live in a large ſquare building, like a college, and have their chaplain, to whom they allow a handſome revenue, and he performs divine ſervice as in a college. No people live more genteelly than theſe factors do; they ride out in the country, and follow their ſports at vacant hours, with as much freedom as they could in England. The beglerberg of Aleppo commands all the country between the Levant and the river Euphrates, but the governor of the caſtle is independent, and ſome check upon him. Twelve miles ſouth-eaſt of Aleppo there is a ſalt lake ſeven miles wide, having a dry cruſt of ſalt on the ſurface, with which the magazines about Aleppo are filled.

The ſoil in the neighbourhood of Aleppo produces good crops of wheat and barley, and their vallies abound in olive trees and capers, but there is very little paſture; their graſs is burnt up in the fair ſeaſon. Their kitchen gardens produce ſallads, cauliflowers, artichoaks, melons, kidney beans, and other pulſe.

As Aleppo is accounted the fineſt and moſt opulent city in all Syria, we ſhall here give our readers a more particular deſcription of it and the environs. The houſes are of ſtone, built in a quadrangular form, conſiſting of a ground floor and an attic ſtory; the roofs are flat, and either ſpread with plaiſter or paved with ſtone: the ceilings, pannels, doors, windows, &c. are neatly gilded and painted, and adorned with inſcriptions from the koran, or the beſt of Aſiatic poets. The doors of the houſes are ſtrongly caſed with iron, but the locks are only ſlightly made of wood. The ſtreets have a dull appearance, being ſhielded from the view by dead walls. The beſt houſes have uſually on the ground floor a hall covered with a dome, with a fountain in the middle to cool it. There is a fountain of ablution, and ſometimes a little garden in the area of each; and in every garden there is cypreſs. The kans are ſpacious and elegant, but the ſhops are ſmall: the buyer ſtands always without, none being admitted within a ſhop but the maſter and his clerk. They uſually ſhut them about an hour and a half after ſun-ſet. The ſtreets, though narrow, are extremely clean, and always well paved: all offenſive manufactures and diſagreeable trades are confined to the ſuburbs; in which, among others, there is a glaſs manufactory. Every houſe has a well; but the waters being briſkiſh, are not uſed in dreſſing proviſions, or to drink; the water for theſe purpoſes being brought from ſome fine ſprings by means of an aqueduct, and properly diſtributed by communicating pipes. The houſe fuel is wood and charcoal, but the bagnios are heated with dung, the parings of fruit, &c. in the collection of which many poor people are employed.

The weſtern part of the city is waſhed by a ſtream called Coic, which, with the wells in the city, and the water brought by the aqueduct, is all the water that is to be found for the ſpace of thirty miles round; the neighbouring villages having no water but rain water, which they ſave in large ciſterns. The air is ſo pure, and free from damps, that the inhabitants ſleep on the houſe-tops without the leaſt inconvenience.

Their only winter is from December 12, to January 20, but even then the ſun has great power in the middle of the day. The ſnow never lays more than a day upon the ground, and the ice is ſeldom ſtrong enough to bear the weight of a man. From May to the middle of December, the air is extremely hot; but the moſt malignant heat continues only about five days, during which the inhabitants keep within doors as much as poſſible, and defend themſelves from the pernicious winds by ſhutting cloſe their windows and doors. The harveſt commences at the beginning of May, and uſually laſts about twenty days.

Near the city, but more particularly in the neighbouring country from Shogre to Letachia, are a great number of tobacco plantations, a conſiderable trade being carried on in that article with Egypt. At ſome diſtance from the

city

city a ſpecies of fullers earth is found, which is an excellent ſubſtitute for ſoap. Black cattle are ſcarce, the larger ſort are kept for labour, the ſmaller have ſhort horns, and the buffaloes are valued on account of their milk. The Turks or Jews ſeldom eat beef, their food being mutton, of which they have plenty at Aleppo. There are two ſorts of ſheep, the one reſembling the Engliſh ſheep, and the other with large tails, already mentioned. The goats have long ears and give excellent milk. The people are very fond of leban or coagulated milk. The butter and cheeſe is made either from the milk of cows, buffaloes, ſheep, or goats. The common bread is made of wheat badly fomented, and badly baked: people of faſhion have, however, a better ſort. Beſides theſe, they have biſcuits and ruſks ſtrewed with fennel flour.

Here are plenty of hares and antelopes; the latter are of two ſorts, viz. the antelope of the mountain, and the antelope of the plains. The former is the moſt beautiful, the back and neck being of a dark brown; the latter, though the colour is brighter, is neither ſo ſwift nor ſo well made. Tame rabbets are kept in the city, and ſome few wild ſtags are found in the country, as well as porcupines; the Franks of the Romiſh perſuaſion, often eat land turtles and frogs. The camels of this country are good and ſerviceable; but the horſes are very indifferent; theſe laſt are fed with barley, as oats do not grow nearer than Antioch. Hyænas are found among the rocks; they ſeldom attack the human race, but commit great ravages among the flocks, and even plunder the ſepulchres. In the city of Aleppo are a vaſt number of dogs, and the environs are infeſted with wolves: ſerpents are very numerous, particularly a white ſnake, which is found in houſes, but whoſe bite is not venomous. The ſcolopendra and ſcorpion often ſting the natives, but a few hours pain is the only conſequence. Here are alſo locuſts, lizards, bees, ſilk-worms, all kinds of fowls, &c. Hawking and hunting are favourite amuſements: the ſportſmen have a very beautiful ſpecies of the greyhound: ſhooting is exerciſed only for a ſubſiſtence.

The common language is vulgar Arabic; Turks of condition ſpeak the Turkiſh; the Jews, Hebrew; the Armenians their native tongue; and ſome of the Syrians underſtand the Syriac; but the Greeks know little or nothing of either the antient or modern Greek language.

The people are in general well made, of a middle ſtature, inclining to lean, but inactive and languid: the citizens are uſually fair: but the peaſants, who are expoſed to the ſun, ſwarthy; both have black hair and black eyes; they are tolerably handſome when young, but ſeem to appear old by thirty. The females marry about the age of fourteen. It is very ſingular, that the men gird themſelves very tight about their waiſt in order to make themſelves look ſlender; and the women do all they can to render themſelves plump, as they deem a ſlender waiſt a great deformity. They are for the moſt part polite: and though they often quarrel, never fight: the coffee-houſes are frequented only by the vulgar. The amuſements within doors are cheſs, back-gammon, draughts, and the game of the ring, which only conſiſts of gueſſing under what coffee-cup the ring is put; the winner blacks the face of the loſer, and puts a fool's cap on his head. Though Chriſtians are fond of playing for money, the Turks only play for amuſement, or ſometimes for a feaſt to entertain their friends. Dancing is deſpiſed, and only practiſed by buffoons, who, as well as wreſtlers, are attendants at all entertainments.

They entertain their viſitors with a pipe of tobacco, wet ſweetmeats, and coffee, without ſugar or milk. When particular reſpect is intended, ſherbet and a ſprinkling of roſe water are added. But as ſoon as the hoſt begins to wiſh his viſitor gone, the wood of aloes is produced, which implies, that the viſit has been ſufficiently long. Men and women here ſmoke to exceſs. The tube of the pipe is made of the wood of the roſe-tree, but the bowl is of clay. Opium is in little eſteem at Aleppo, and they who take it to exceſs are looked upon as debauchees. Here are no coaches; the better ſort of people ride on horſeback, with a number of ſervants on foot parading before them. Women of rank are carried in litters, and the lower claſs in covered cradles on mules.

The people here go to bed early, and ſleep in the principal part of their cloaths. Their bed conſiſts of a mattreſs, and over it a ſheet, in ſummer; and a carpet, with a ſheet ſewed to it in winter. The men are either lulled to reſt by muſic, ſmoke themſelves to ſleep, or are talked to ſleep by their women, who are taught to tell innumerable ſtories for that purpoſe. The people in general are groſly ignorant, few even of the better ſort can read. The clergy are not only divines, but lawyers and phyſicians: they have many colleges, but little or nothing is taught in them. The government permits not the practice of anatomy: their phyſicians and ſurgeons, therefore, can know but little of the ſtructure of the human body, or the medical art.

The women in the villages, and all the Chinganas and Arabs, wear gold or ſilver rings, through their right noſtrils. The old men colour their beards black, to conceal their age: and the old women dye their hair red, with henna, to render it graceful. They likewiſe dye their hands and feet.

The ſlaves in Aleppo are in general white, being Georgians, but they have a few that are black, and are brought from Ethiopia, by the way of Cairo. Criminals here are hanged, impaled, or beheaded, at the option of the judge; but janiſaries are ſtrangled by a cord twiſted twice round the neck, and drawn tight with a piece of ſilk.

A Maronite nuptial ceremony is thus conducted: the bridegroom's relations are invited to an entertainment at the houſe of the bride. After ſupper, they return to the bridegroom's houſe, who hitherto has not appeared: for he is obliged to hide himſelf, and not to be found without a pretending ſearch. At length he is brought out in his worſt cloaths; but ſoon after the bridemen conduct him to a chamber, which contains the wedding garments, where he is left to dreſs himſelf. After midnight, the company, preceded by a band of muſic, each carrying a lighted candle, go to the bride's houſe and demand her. Admittance is refuſed. A mock fight then enſues. The bride is taken priſoner, and, being cloſely veiled, is conducted to the bridegroom's houſe. The night is ſpent in feaſting and mirth: but the bride muſt not ſpeak the whole time. The biſhop or prieſt comes the next morning to perform the ceremony, in which he puts crowns on their heads, and joins the hands of the bride and bridegroom, who each have a ring to put on the finger. A few ridiculous and riotous ceremonies enſue; and the bridegroom is not left to himſelf till twelve o'clock at night, when he is permitted to retire to the bride. All the bride's female acquaintance ſend flowers to her as preſents for ſome days after her marriage, but ſhe is not allowed to ſpeak for the ſpace of a month, even to her huſband.

The Engliſh have a conſul, chaplain, chancellor, and chiau, at Aleppo. The French have their conſul, dragomen, and other officers, and are more numerous than the Engliſh. No Dutchmen reſides here except the conſul. A few Venetian merchants and Italian Jews are, however, ſettled in the place. The plague is the moſt dreadful calamity at Aleppo; it begins to rage in June and decreaſes in July; and uſually viſits the inhabitants every ten years, when it commits vaſt devaſtations. To avoid the infection, the following particulars are to be obſerved: "Never go abroad faſting; drink plentifully of acids; live regularly, but not abſtemiouſly; avoid exceſs and paſſion; breathe through a handkerchief or ſponge wetted with vinegar, or an infuſion of rue; ſwallow not the ſpittle; waſh your mouth, face, and hands often with vinegar; air your cloaths well, change them often, and ſmoak them with ſulphur."

Scanderoon, the port town to Aleppo, is ſituate on the Levant ſea, in thirty-ſeven degrees of eaſtern longitude, and thirty-ſix degrees fifteen minutes north latitude, about forty miles north-eaſt of the iſland of Cyprus; it had antiently the name of Alexandretta, and is ſuppoſed to have been built by Alexander the Great. The town makes no great figure at preſent, and is inhabited chiefly by ſeafaring men: few people care to reſide there that can help it, the ſalt marſhes rendering it very unhealthy. When ſhips arrive, the factors who reſide here, ſend advice of it to Aleppo immediately by carrier pigeons bred there, which fly home in about in five hours, though Aleppo is near ninety miles diſtant from this port.

Antioch is ſituate in a fine plain, eighteen miles in extent, on the river Haſi, once Orentos, near the Levant ſea, in thirty-ſeven degrees of eaſtern longitude, and thirty-ſix degrees of north latitude, about thirty miles ſouth of Scanderoon, once the capital city of all Syria, but now in ruins. Here the diſciples of the bleſſed Jeſus firſt obtained the name of Chriſtians. The Greeks gave this town the name of Epidaphne, from the grove and oracle of Apollo that was conſulted here. The Turks call it Antzochia. The vaſt number of plantanes, poplars, ſycamores, fruit-trees, &c. in the gardens of the town, make it at a diſtance look like a foreſt. It has a caſtle which commands the town and river, and ſome conſiderable remains of antient temples, walls, churches, &c. together with

with an extenſive canal. St. Paul and St. Barnabas preached a twelvemonth in this place; St. Luke the evangeliſt, and St. Ignatius the martyr, were born here.

Aſiatic Tripoli, is ſituate on the Levant ſea, at the foot of mount Libanus, in thirty-ſix degrees fifteen minutes eaſt longitude, and thirty-four degrees thirty minutes north latitude, the capital of this diviſion of Syria, antiently ſtiled Phœnicia, the firſt and greateſt of all the maritime powers on this continent; their navigation extending eaſtward to the fartheſt ſpice iſlands in the India ſeas, and to the moſt weſterly coaſts of Europe and Africa; Tripoli is now the capital of the province, and ſeat of the beglerbeg or viceroy, and garriſoned by two hundred janiſaries: it is rather a road than a harbour, there being very little ſecurity for the ſhipping which lies here. It is ſaid to be called Tripoli, as conſiſting formerly of three towns, which ſtood upon as many hills, about a furlong diſtant from each other; a rivulet runs through their gardens, which abound in plantations of oranges and mulberry trees; and they have a pretty good ſilk manufacture.

This city contains eight thouſand houſes, and ſixty thouſand inhabitants, who conſiſt of Turks, Jews, and Chriſtians. It is watered by a little river, which has a ſtone bridge over it, and turns ſeveral mills. The air is clear and healthy, the country rich and fertile, and the town plentifully ſupplied with all kinds of proviſions. The Chriſtians have ſome monaſteries and chapels, and the Jeſuits a handſome chapel: here is a large handſome moſque, which was once a Chriſtian church.

Sidon or Sayd, is ſituate on the ſame coaſt, in thirty-ſix degrees thirty minutes eaſt longitude, and thirty-three degrees fifteen minutes north latitude, about ſeventy miles ſouth of Tripoli, and about as much to the northward of Jeruſalem; this was the mother of Tyre, and the firſt city that attempted a foreign trade by ſea. It is at preſent a ſangiacſhip, and governed by a Turkiſh baſſa, ſubject to the beglerbeg of Tripoli; the town though ſmall is ſtill well peopled, containing about ſix thouſand inhabitants; and near the place are magnificent ruins, which diſcover its ancient grandeur. The exports conſiſt of Turkey leather, piſtachios, ſenna, buffaloes ſkins, cotton, blue ſilks, rice, ſoap, aſhes, oil, raiſins, &c. Here are many moſques, two kans, a public bagnio, and a fine ſquare building called the cotton market.

Tyre or Sur, is ſituate on the coaſt of the Levant, in thirty-ſix degrees of eaſtern longitude, and in thirty-two degrees thirty-two minutes north latitude, twenty miles ſouth of Sidon: it ſtands on a peninſula, and at diſtance makes a grand appearance, but when you approach it there is little elſe to be found beſides ruins. On the north was an old Turkiſh caſtle, where we meet with only broken walls and pillars at preſent: the inhabitants are poor fiſhermen who live in vaults and caves. The iſland of Tyre, which was joined to the continent by Alexander, ſeems to have been of a circular figure, and not to have contained above forty acres of ground, round which are ſtill the remains of an ancient wall: in the middle of the ruins ſtands a pile higher than the reſt, being the eaſt end of a great church, which Mr. Maundrel conjectures to have been the cathedral of Tyre, for it was a biſhop's ſee; and he obſerves, that of all the ruined churches which he ſaw in this country, he always found the eaſt end ſtanding and tolerably intire; and that he did not ſee fewer than an hundred of theſe inſtances; from whence he ſeems to be of opinion that they have been preſerved by a miraculous providence, as ſtanding monuments of Chriſtianity in theſe unbelieving regions, and are preſages of its future reſtoration. This is not the antient Tyre which was deſtroyed by Nebuchadnezzar, after eleven years ſiege, but that which was built on an iſland about half a mile from the coaſt, which Alexander could not take till he had made a cauſeway from the continent to the iſland; and the citizens ſtill making a very brave defence; Alexander, after he took the city, crucified two thouſand of the inhabitants on croſſes, erected upon the ſhore, which muſt ever render his memory infamous to poſterity. It is aſtoniſhing the world ſhould ſo far miſtake his character, as to compliment him with the name of Great, unleſs they eſteem him great for perpetuating what all the virtuous part of the world abhor, namely the moſt cruel murders, robberies, drunkenneſs, ingratitude to his friends, and, after all his prepoſterous vanity, in forcing the people he had enſlaved to pay him divine honours. Louis IV. in imitation of him, alſo expected to be adored, for acting the part of the common enemy and ſcourge of mankind.

Between forty and fifty miles to the ſouth of Sidon, on the ſame coaſt, ſtands the town of Acra, antiently called Acho: it was enlarged by Ptolemy the firſt, and called by him after his own name Ptolemais, but ſince it has been in the poſſeſſion of the Turks, it has almoſt acquired its antient name again, being called Acca or Acra. On the eaſt and north of it lies a ſpacious fertile plain; on the weſt it is waſhed by the Mediterranean, and on the ſouth by a large bay, extending from the city as far as mount Carmel. The Saracens took it from the Chriſtians in the time of Omar, and afterwards with the reſt of Syria it fell into the hands of the Turks; it was ſeveral times taken and retaken in the holy war. In the year 1191 it was taken by King Richard the firſt of England, and Philip of France, and given to the knights of St. John of Jeruſalem, who kept poſſeſſion of it an hundred years, when the Turks again made themſelves maſters of it, and razed it to the ground.

There being a fine nunnery in the town of Acra when the Turks took it the laſt time by ſtorm; it is related of the abbeſs, that fearing ſhe, and the virgins under her care, ſhould be obliged to ſubmit to ſuch brutal uſage as is frequently practiſed by the ſoldiers on ſuch occaſions, ſummoned the nuns together, adviſing them to cut and mangle their faces, as the only means to preſerve their virgin purity, and immediately cut and diſfigured her own, to ſet them an example; the nuns thereupon gaſhed and tore their faces, and cut off their noſes, and made themſelves ſuch diſmal ſpectacles, as they might be infallibly ſure would preſerve them from a rape; at which, it is ſaid, the Turkiſh ſoldiers were ſo enraged, who expected here to have found a kind of paradiſe on earth, and to have indulged their wanton flames among the beautiful young nuns, that they put them every one to the ſword; thus reſtoring them, ſays an ingenious traveller, to a new and inviolable beauty.

We proceed now to enquire into the preſent ſtate of Damaſcus, the capital city of the ſouth part of Syria, and the ſeat of a Turkiſh beglerbeg or viceroy. This city is called Sanchor Scham by the Turks, and ſtands in thirty-three degrees of north latitude, and thirty-ſeven degrees four minutes eaſt longitude, two days journey to the eaſtward of Sidon and the Mediterranean ſea. As we approach this town, on the ſouth-weſt ſide of it, there is erected a little building on the top of a high precipice, under which runs the river Barrady, from whence Damaſcus appears a perfect paradiſe. It is ſituate in a plain of that extent, that the mountains which encompaſs it on the farther ſide are but juſt diſcernable. The town is built on the weſt ſide of the plain, about two miles from the place where the river Barrady falls from the mountains, the gardens extending almoſt thither. The city ſtretches itſelf from the ſouth-weſt to the north-eaſt, extending near two miles in length, and is narrow in the middle, but ſwells to a greater bulk at each end. It hath eight gates, and ſtrong walls; and the principal ſtreets, both in the city and ſuburbs, are arched, to keep off the ſun and rain. It is encompaſſed with gardens for near thirty miles about; which are well planted with fruit of all kinds, and ever freſh and green, being watered by ſeveral branches of the river Barrady. You ſee alſo towers, and ſteeples, and pleaſure houſes in every part, lifting up their heads among the trees, which renders the proſpect ſtill more entertaining. The Barrady, which plentifully ſupplies both the gardens and city with water, as ſoon as it iſſues from the clefts of the neighbouring mountains, immediately divides itſelf into three ſtreams, of which the middlemoſt and biggeſt runs directly to Damaſcus, through a large field called the agar damaſcenus, and ſerves all the fountains and receptacles of water in the city. The other two branches, which ſeem to be the work of art, flow on the right and left, on the borders of the gardens, into which they are let by little channels, and diſperſed into every part of them. There is not a garden which has not a fine quick ſtream improved into fountains, caſcades, or other water-works, though it muſt be confeſſed they are not contrived with ſo much art, as in ſome gardens of Europe. This river having thus contributed to the beauty and fertility of the fields and gardens about Damaſcus, loſes there ſo much of it waters, that in a few leagues beyond the city it is intirely dried up, and never reaches the ſea. The Greeks, and, from them, the Romans, called this river Chryſorrhous. It is ſuppoſed the branches of the Barrady were the Abana and Pharphar; mentioned in 2 King.

The moſques, bagnios, bazars, kans, &c. are magnificent, but the private houſes are low and mean, being erected either with ſun-burnt bricks or mud; yet though the houſes are deſpicable, they are in general accommodated with ſtately apartments, ſquare court yards, marble fountains,

fountains, and marble portals. One coffee-houſe in the town will contain five hundred people; it is divided into two parts, the one for ſummer, the other for winter. In a large field, called the meidan, near the city, is an hoſpital for pilgrims and ſtrangers of all religions, who are maintained at the Grand Signor's expence. The grand moſque is a magnificent edifice, and was formerly a Chriſtian church, built by the emperor Heraclius, in honour of Zechariah, the father of John the Baptiſt; but at preſent it is death for any one except a muſſulman to enter it. The Jews have ſome handſome ſynagogues, and Chriſtians of all denominations have their churches of worſhip according to their own communion. About the middle of the city there is a caſtle of an oval form, with ſtrong walls fourteen inches thick, flanked with ſquare towers mounted with cannon, and well furniſhed with arms, water, &c. it is garriſoned by fifteen thouſand janiſaries; five thouſand to guard the city, five thouſand to attend the Sultan when he goes to Badgat, and five thouſand to eſcort the Mecca caravan. There is a large bake-houſe, where biſcuits are made for the pilgrims that are going to Mecca, as the Grand Signor allows them two hundred camels load of biſcuit, and the ſame quantity of water. The manufactures of Damaſcus are ſcymetars, knives, ſword-blades, bridle-bits, and many other iron and ſteel wares, in which about twenty thouſand of the inhabitants are employed. Caravans bring hither the merchandizes of Turky, Arabia, and India, and caravans are continually going to and returning from Bagdat, Aleppo, Mecca, &c.

The neighbouring territory is pleaſant and fertile; the grapes are remarkably fine, ſome of the bunches weighing from thirty to forty pounds; and the ſheep, which are exceedingly large, and their meat delicious eating, have tails that weigh in general ſixty pounds. Near the city, alabaſter is found in great quantities, and a red earth, as an efficacious remedy againſt the bite of venomous creatures. The corn is not here threſhed as in moſt other countries; but the ſtraw is cut off with iron pincers faſtened to wooden rollers, drawn over the corn by a horſe. The emperor Julian formerly ſtiled Damaſcus the city of Jupiter, the eye of the eaſt, and the ſeat of magnificence. Mahomet, beholding it from a neighbouring mountain, was ſo delighted with the appearance of the city, and its environs, that he refuſed to enter, or even approach any nearer to it, ſaying, "I am ſure there is but one paradiſe deſigned for man, and I will not enjoy mine in this world."

We ſhall conclude our deſcription of the cities and places in this diviſion of Syria with an account of the venerable ruins of what was once one of the moſt magnificent cities in the univerſe, called by the Greeks Heliopolis, or the city of the ſun. About thirty miles north of Damaſcus, and the ſame eaſt from the ſea-coaſt, in thirty-three degrees north latitude, and thirty-ſeven degrees thirty minutes eaſt longitude, ſtands the city of Balbeck, in a moſt engaging ſituation, on the eaſt ſide of the valley of Bocat, for it is encompaſſed with pleaſant and fruitful gardens, through which run ſeveral fine rivulets. The city is of a ſquare figure, and ſurrounded with a tolerable good wall, with towers at equal diſtances, each ſide of the ſquare being about a quarter of a mile in length, but the houſes within are very mean, ſuch as we uſually find in Turkiſh villages. On the ſouth-weſt ſide of the city are the ruins of a noble heathen temple, with ſome other buildings belonging to it, all of them exceeding magnificent; but of late years theſe antient ſtructures have been pieced up, and the whole converted into a caſtle. The additional buildings are of no mean architecture, but are however eaſily diſtinguiſhable from the more antient.

As we approach the ruins, the firſt thing we obſerve is a little round pile of building, all of marble encompaſſed with beautiful pillars of the Corinthian order, which ſupport a lovely cornith that runs all round the ſtructure, and though this part of the fabrick be in a very tottering condition, the Greeks have converted it into a church, and celebrate divine ſervice in it at preſent. From this place we come to a large firm pile of building, very lofty, and compoſed of vaſt ſquare ſtones, but yet does not ſeem to be part of the original building. Through this we advance into a ſtately arched walk or portico, an hundred and fifty paces long, which reaches to the temple.

The form of the temple is an oblong ſquare, thirty-two yards in breadth, and ſixty-four in length, of which the anti-temple took up eighteen, and is now tumbled down. The body of the temple, which is ſtanding, is encompaſſed with a noble portico, ſupported by pillars of the Corinthian order, ſix feet and three inches in diameter, and forty-five feet high, conſiſting each of three ſtones only. These pillars ſtand at the diſtance of nine feet from each other, and as much from the wall of the temple. A ſtately architrave runs round the capitals of the pillars, and a corniſh exquiſitely carved. The portico is covered with large ſtones, hollowed like an arch, and extending between the columns and the wall of the temple, and the figures of ſome Heathen gods and goddeſſes or heroes are carved on each ſtone: among the reſt there is a Ganymede and an eagle flying away with him, done to the life.

In the walls of the temple all round are two rows of pilaſters, one above another, and between the pilaſters, niches, which ſeem deſigned for images. About eight yards from the upper end of the temple are ſtanding part of two fine fluted pillars, which ſeem to have made a partition in that place, and to have ſupported a canopy over the throne of the chief idol. On that part of the partition which is remaining are ſtill to be ſeen carvings in relievo, repreſenting Neptune, tritons, fiſhes, ſea gods, Arion and his dolphin, and other marine figures. The roof of the temple is entirely broke down, but yet, ſays Mr. Maundril, the whole, as it now ſtands, ſtrikes the mind with an air of greatneſs beyond any thing we have ſeen, and is an eminent proof of the magnificence of the ancient architecture. This temple was antiently accompanied by ſome other magnificent buildings, as is evident from four aſcents to it, one upon each angle, with marble ſteps long enough for ten people to go a-breaſt.

The old wall, which encompaſſes all the ruins abovementioned, is built with ſtones of that prodigious bigneſs, that the natives aſcribe the architecture to the devil. A gentleman who travelled to theſe parts, was at the pains of meaſuring three of the largeſt of theſe ſtones, and found one of them twenty-one, and the other two twenty yards apiece in length; each of them being four yards broad, and as much in depth, and theſe three ſtones lay in the ſame row, end to end, extending ſixty-one yards; and which was equally ſtrange, they were lifted up into the wall more than twenty feet from the ground.

The palace, which is what the Turks call the caſtle, muſt have been one of the moſt ſuperb ſtructures that imagination can conceive, but it is much more decayed than the temple. A dark arched vault, containing many buſts, leads to an hexagonal building which forms a ſpacious theatre; the end opens to a terrace which is aſcended by marble ſteps; you then enter a ſquare court ſurrounded by magnificent buildings: on each hand are double rows of pillars, which form galleries of ſixty-ſix fathoms in length, and eight in breadth. The bottom of this court is overſpied by a building amazingly ſumptuous, which appears to have been the body of the palace; the columns are as large as thoſe of the Hippodrome at Conſtantinople; nine of them are ſtanding, and a good piece of the entablature: but it is ſurpriſing that each of theſe large columns is made of one intire block only. All the buildings in this caſtle front the eaſt, and the Corinthian order prevails throughout the whole: there is no place where ſuch precious remains of architecture and ſculpture are to be found, in which the fine taſte of Greece and the magnificence of Rome ſeem to be blended; the ornaments are at once innumerable and exquiſite. Beneath the whole are vaults in which vaſt flights of marble ſtairs, of two hundred ſteps in a flight, are frequently found. The turn and elevation of theſe vaults are bold and ſurpriſing; they contain many noble halls and ſuperb apartments, admirably decorated. Some of theſe vaults are dark, others receive light from large windows, which ſtand on a level with the ground above, but the moſt ſingular circumſtance is, that all theſe aſtoniſhing edifices are built with ſuch enormous ſtones, as thoſe before mentioned, without any viſible ſigns of mortar, or any kind of cement whatever. Many houſes, which contain various apartments, are cut out of the ſolid rocks. It is inhabited by about thirty or forty Chriſtian families, a few Jews, and near eight hundred Turks.

We ſhall now proceed to deſcribe thoſe towns in Syria which are of inferior note; the principal of which, on that ſubdiviſion of Syria Proper, called Comagene, are, 1. Tamoſata, which the Turks now call Scempſal, and was once the capital of Comagene, but at preſent is only a wretched village, ſurrounded by heaps of ruins. It ſtands on the Euphrates, on the confines of Armenia Major, twenty-two miles from Ediſſa: this was the birth-place of the celebrated ſatirical poet Lucian. 2. Dolica, called by the Turks Doliche, once an epiſcopal ſee, but at preſent a mean, ill-built town, thinly peopled, and of little conſideration. It is ſituated on the river Marſyas, which diſembogues itſelf into the Euphrates. Nothing now remain but the names and a little rubbiſh of the antient

tient cities Germanicia, Singia, Antiochia ad Taurum, Catamana, Deba, Chaomia, and Chelinadura.

Tertaſo, formerly called Orthoſia and Antaiadas, from its being ſituated over againſt the little iſle of Aradus, was once a famed ſea-port, and an epiſcopal ſee; at preſent, it is a very inconſiderable place, and inhabited only by poor fiſhermen: it is about nine miles to the northward of Tripoli.

Latakia, or Ladhikiya, the antient Laodicea, was founded by Seleucus Nicanor, or the Victorious, and called by him after his ſiſter's name. It is the moſt northern city of Syria, ſituated on a riſing ground, with a full proſpect of the ſea, in thirty-five degrees thirty minutes north latitude, and is a conſiderable maritime town. It contains many antique remains, particularly ſeveral rows of columns of granite and porphyry, with part of an aqueduct, which Joſephus affirms was built by Herod: the ſtructure is ſpacious, but not arched. Here is a moſque formed of a magnificent antient triumphal arch, ſupported by Corinthian pillars; the architrave is embelliſhed with a variety of warlike trophies. Many Greek and Latin inſcriptions are found among the ruins, but they are in general ſo much defaced as to be illegible. To the weſtward of the city are the remains of a cothon, big enough to hold the largeſt navy in the univerſe. The mouth which is about forty feet wide, is defended by a caſtle, and the whole is an amphitheatrical form; it is ſo choaked up at preſent, as to admit only a few veſſels.

A little to the northward of the city are thoſe remarkable catacombs which excite the attention of travellers. They contain large ſtone coffins, embelliſhed with emblematical figures, ſhells, &c.

The covers of ſome are ſupported by pilaſters, generally of the Corinthian, but ſometimes of the Ionic order: theſe coffins are depoſited in cells on the ſides of a number of chambers hollowed deep into the rock, being each from ten to thirty feet ſquare. The moſt reſpected of theſe ſepulchral chambers is that called St. Teckla, which is dedicated to that firſt virgin martyr; in the midſt of it is a ſpring, to which many marvellous effects are aſcribed.

The intermixture of rocks, woods, ſepulchres, plains, grottoes, fountains, caſcades, &c. render the whole of the adjacent country extremely romantic.

A few miles from a place called the Serpent Fountain, are the Spindles, or Maguzzels, a name which is given to ſeveral painted cylindrical buildings that are erected over a number of ſepulchres.

Oppoſite to the northern extremity of mount Libanus, are the ruins of the antient city of Arka, to the eaſtward a romantic chain of mountains appear; a fine extenſive plain, interſperſed with caſtles, villages, ponds, rivers, &c. opens to the north; and the ſea is ſeen to the weſt. The city was erected on the ſummit of a hill of a conical form, which appears to have been a work of art: the inhabitants were ſupplied with water from mount Libanus, by means of a magnificent aqueduct, notwithſtanding a fine ſtream waters the valley below the city. The places of inferior note in Cœlo-Syria come next under conſideration.

Apamea, founded by Seleucus Nicanor, and ſo named in honour of his mother, is greatly fallen from its antient ſplendor, but ſtill remains a conſiderable town, ſtanding on a ſpot of ground which is almoſt ſurrounded by a lake formed by the river Orontes, about ſixty miles to the ſouthward of Aleppo: ſo that it hath no communication with the land but by an iſthmus, or ſmall rock. The Turks and Greeks call it Hama: it is the reſidence of a beglerbeg, whoſe government is very extenſive: the adjacent territory is exceedingly rich and fertile; the city is well watered, retains many marks of its antient magnificence, and was very early an epiſcopal ſee. It lies in thirty-five degrees ſix minutes north latitude, and thirty-ſeven degrees eighteen minutes eaſt longitude. Seleucus conſtantly fed five hundred large elephants near this city.

Near mount Liſa, between Antioch and Tortoſa, there is a little mean village called Margat, which was antiently a conſiderable place, called Marathos.

On the river Orontes, between Apamea and Laodicea, the town of Emeſa, Emiſſa, or Emiſa, is ſituated. The mad Roman emperor Heliogabalus was born there, and on that account took the whim into his head, to be made one of the prieſts of its temple; the Turks at preſent call it Haman, or Aman. It is under the juriſdiction of the beglerbeg of Damaſcus, who governs it by means of a deputy. It ſtill makes a conſiderable figure, notwithſtanding what it has ſuffered by earthquakes, and the various changes it has undergone. It is ſurrounded by good ſtone walls, with ſix ſuperb gates, and ſeveral magnificent towers at proper diſtances. The walls are environed by a ſpacious ditch, and on an eminence there is a caſtle which commands and defends the town. Here are ſome fine churches, the greateſt part of which are converted into moſques. The cathedral is a magnificent ſtructure, ſupported by thirty-four marble columns, adorned with baſſo-relievos and Greek inſcriptions. The Chriſtians are permitted to pray in it at certain times, beſides which they have ſome churches appropriated entirely to their own uſe. The bazans, kans, caravanſeras, &c. are in general very handſome ſtructures. The inhabitants trade in ſilks, and a fine kind of needle-work of ſilk, gold, and ſilver, curiouſly intermingled together. The adjacent country is very rich and fertile, and the gardens in the environs exceedingly delightful, abounding in a great variety of excellent plants and delicious fruits. In all the gardens great number of mulberry-trees are planted in regular rows, and well-watered, as the demand is very great for mulberry-leaves to feed their ſilk-worms with. This city and Aleppo are the principal places in the diviſion of Cœlo-Syria.

The town of Botrys, or Botrus, in Phœnicia, was once a conſiderable place, but is now a poor village of fiſhermen, ſtanding on the coaſt to the ſouth of Tripoli, and called by the Turks Patron, or Elpatron.

On the coaſt, about twenty miles ſouth of Tripoli, is ſituated Byblus, or Byblos, formerly a fine city, but now a mean village, denominated Gebail. The river Adonis, deſcending from mount Libanus, runs through the town. This river is ſubject to ſwell to an immoderate degree by the melting of ſnow or falling of rains, and at certain times the waters appear bloody, which the ſuperſtitious inhabitants uſed to impute to the death of Adonis, who is alluded to in ſcripture under the name of Tammuz, or Thammuz, Ezek. viii. 14. The natural cauſe of this pretended bloodineſs, is only a kind of minium, or red earth, which is brought away by the waters when they ſwell to an unuſual height, and give the river a crimſon tinge. In this town there is a deputy governor ſubordinate to the beglerbeg of Syria, and a ſmall garriſon; there is, however, but little trade, the harbour being almoſt choaked up.

The city of Berytus was once in a flouriſhing ſtate, but is now upon the decline: the ſtreets are narrow, dirty, and dark. It is, however, a trading place, and a ſtage for the caravans that go to Grand Cairo. It is ſituated on the ſea-coaſt, in a fertile and delightful country, about four miles from Tripoli. Some ſtately ruins are ſtill viſible about the town, particularly thoſe of the palace and gardens of Taccar-dine, the fourth emir or prince of the old Druſians, and of an old amphitheatre ſuppoſed to have been built by Agrippa. The trade conſiſts of fine tapeſtry, camlets, ſilks, cinnamon, nutmegs, ginger, caſſia, pepper, rhubarb, cochineal, &c. gourds, colocynth, &c. alſo mulberry and other trees, abound along the coaſt.

Serepta, Serphant, or Serphanda, a city antiently celebrated for the abode which the prophet Elias made in it with a poor widow whom he relieved, is at preſent but an indifferent village about a mile from the ſea, and ſituated on a hill.

SECT. V.

Treats of Paleſtine, or the Holy Land, being in the ſouthern diviſion of Aſiatic Turky, its ſituation, extent, air, climate, ſoil, mountains, rivers, lakes, cities, towns, &c.

PALESTINE, called alſo Judæa and the land of Canaan, is ſituated between thirty-one degrees thirty minutes, and thirty-two degrees twenty minutes north latitude, and from thirty-four degrees fifty minutes, to thirty-ſeven degrees fifteen minutes eaſt longitude, being bounded by the Mediterranean ſea, on the weſt; Syria and Phœnicia, on the north; Arabia Deſerta, on the eaſt; and Arabia Patræa, on the ſouth. It is therefore near two hundred miles in length, and about ninety in breadth towards the middle, but increaſes or diminiſhes twelve or fifteen miles in other places; the longeſt day is about fourteen hours fifteen minutes. The air of Judæa is the moſt ſalubrious and pleaſant imaginable; neither heat nor cold are felt in the extreme; but an agreeable ſerenity diffuſes itſelf throughout the year, which puts the ſtranger in mind of the golden age; and as the climate is the moſt admirable in the univerſe, we have no doubt but in the early ages of the world, when the paſtoral life was the moſt honourable, and agriculture the moſt reputed employ, it far exceeded its preſent excellency, by means of the general cultivation of the country.

We

We have the moſt authentic teſtimonies of the richneſs and fertility of its ſoil: in particular, that it abounded in corn, wine, oil, honey, pomegranates, dates, figs, citrons, oranges, apples of paradiſe, ſugar-canes, cotton, hemp, flax, cedars, cypreſſes, and a great variety of other ſtately, fragrant, and fruitful trees, balm of gilead, and other precious drugs, &c. cattle, fowl, fiſh, game, and other delicacies as well as neceſſaries of life. Whoever, indeed, conſiders the very ſmall extent of Judæa, will be ſenſible that nothing but ſuch aſtoniſhing fertility could enable it to maintain ſuch a number of inhabitants as reſided in it in the time of king David, ſince they amounted to ſix millions. The produce of the land not only ſubſiſted this prodigious multitude, but there was a ſufficient ſuperfluity to export to Tyre and other places. Yet the ſoil was only cultivated ſix years in ſeven, as the ſeptennial year was always a time of reſt from the affairs of agriculture; but we muſt obſerve, that the whole of the country was cultivated, and that woods, parks, waſte grounds, &c. were unknown. An eminent writer affirms, that with a little cultivation it would yield as much as in the days of king David and his ſon Solomon; but that it is now unhappily inhabited by the moſt indolent people exiſting.

Libanus and Anti-Libanus, are the principal mountains of Paleſtine, forming a chain that divides Syria from Paleſtine: the whole is about one hundred leagues in compaſs, and conſiſts of four ridges one above another, two of which are fertile, and two barren, viz. the lower is rich in grain and fruit, the next is rocky and barren; the third abounds in gardens and orchards; though higher than the preceding, and the ſummit is ſteril and uninhabitable, by reaſon of the exceſſive coldneſs on its airy brow: the Maronites inhabit its lower regions, and Arabs all the other parts except the top. In this mountain ſeveral celebrated rivers have their ſource, viz. Jordan, Rocham, Nahur-Roſſian, Naha-Codicha, and Abouali, the firſt only of which runs through Paleſtine. Of theſe mountains the weſtern part alone is properly called Libanus, the caſtern being named Anti-Libanus, and the intervening part Cœlo-Syria. The whole chain, however, always was, and is ſtill looked upon, as a retreat for robbers.

Hermón, like Libanus, is very high, and for the greateſt part of the year capped with ſnow.

Tabor, anciently called Mons Alabyricus, and Ilabyrieum, from a city of that name which ſtood upon it, is admirable with reſpect to its conſtant verdure, beauty, fertility, and regularity, as well as for its ſituation, which is in the middle of a large plain, at a diſtance from any other hill: a winding aſcent of about two miles leads up to it; and the plain, on its top, is half a mile in length, and a quarter of a mile in breadth. This mountain is held in great veneration, and has been much reſorted to by Chriſtians of all ages, as it was the ſcene of our Saviour's tranſfiguration.

Carmel, ſituated on the ſea-ſhore, is the moſt remarkable head-land on that coaſt. The prophet Elijah is ſuppoſed to have reſided here in a cave, previous to his being taken up to heaven. The cave is eighteen feet in length, and eleven in breadth, and is ſtill ſhewn to travellers.

Olivet, or the mountain of olives, is only about a mile from Jeruſalem, being ſeparated therefrom by the brook Kidron, and the valley of Jehoſhaphat. It is of a conſiderable height, and from its ſummit there is a fine proſpect of Jeruſalem. It runs in a ridge, and has three or four heads higher than the reſt; from one of the principal Chriſt aſcended into heaven; and the impreſſion of a foot in a hard rock, ſhewn there at this day, is ſaid to have been made by him!

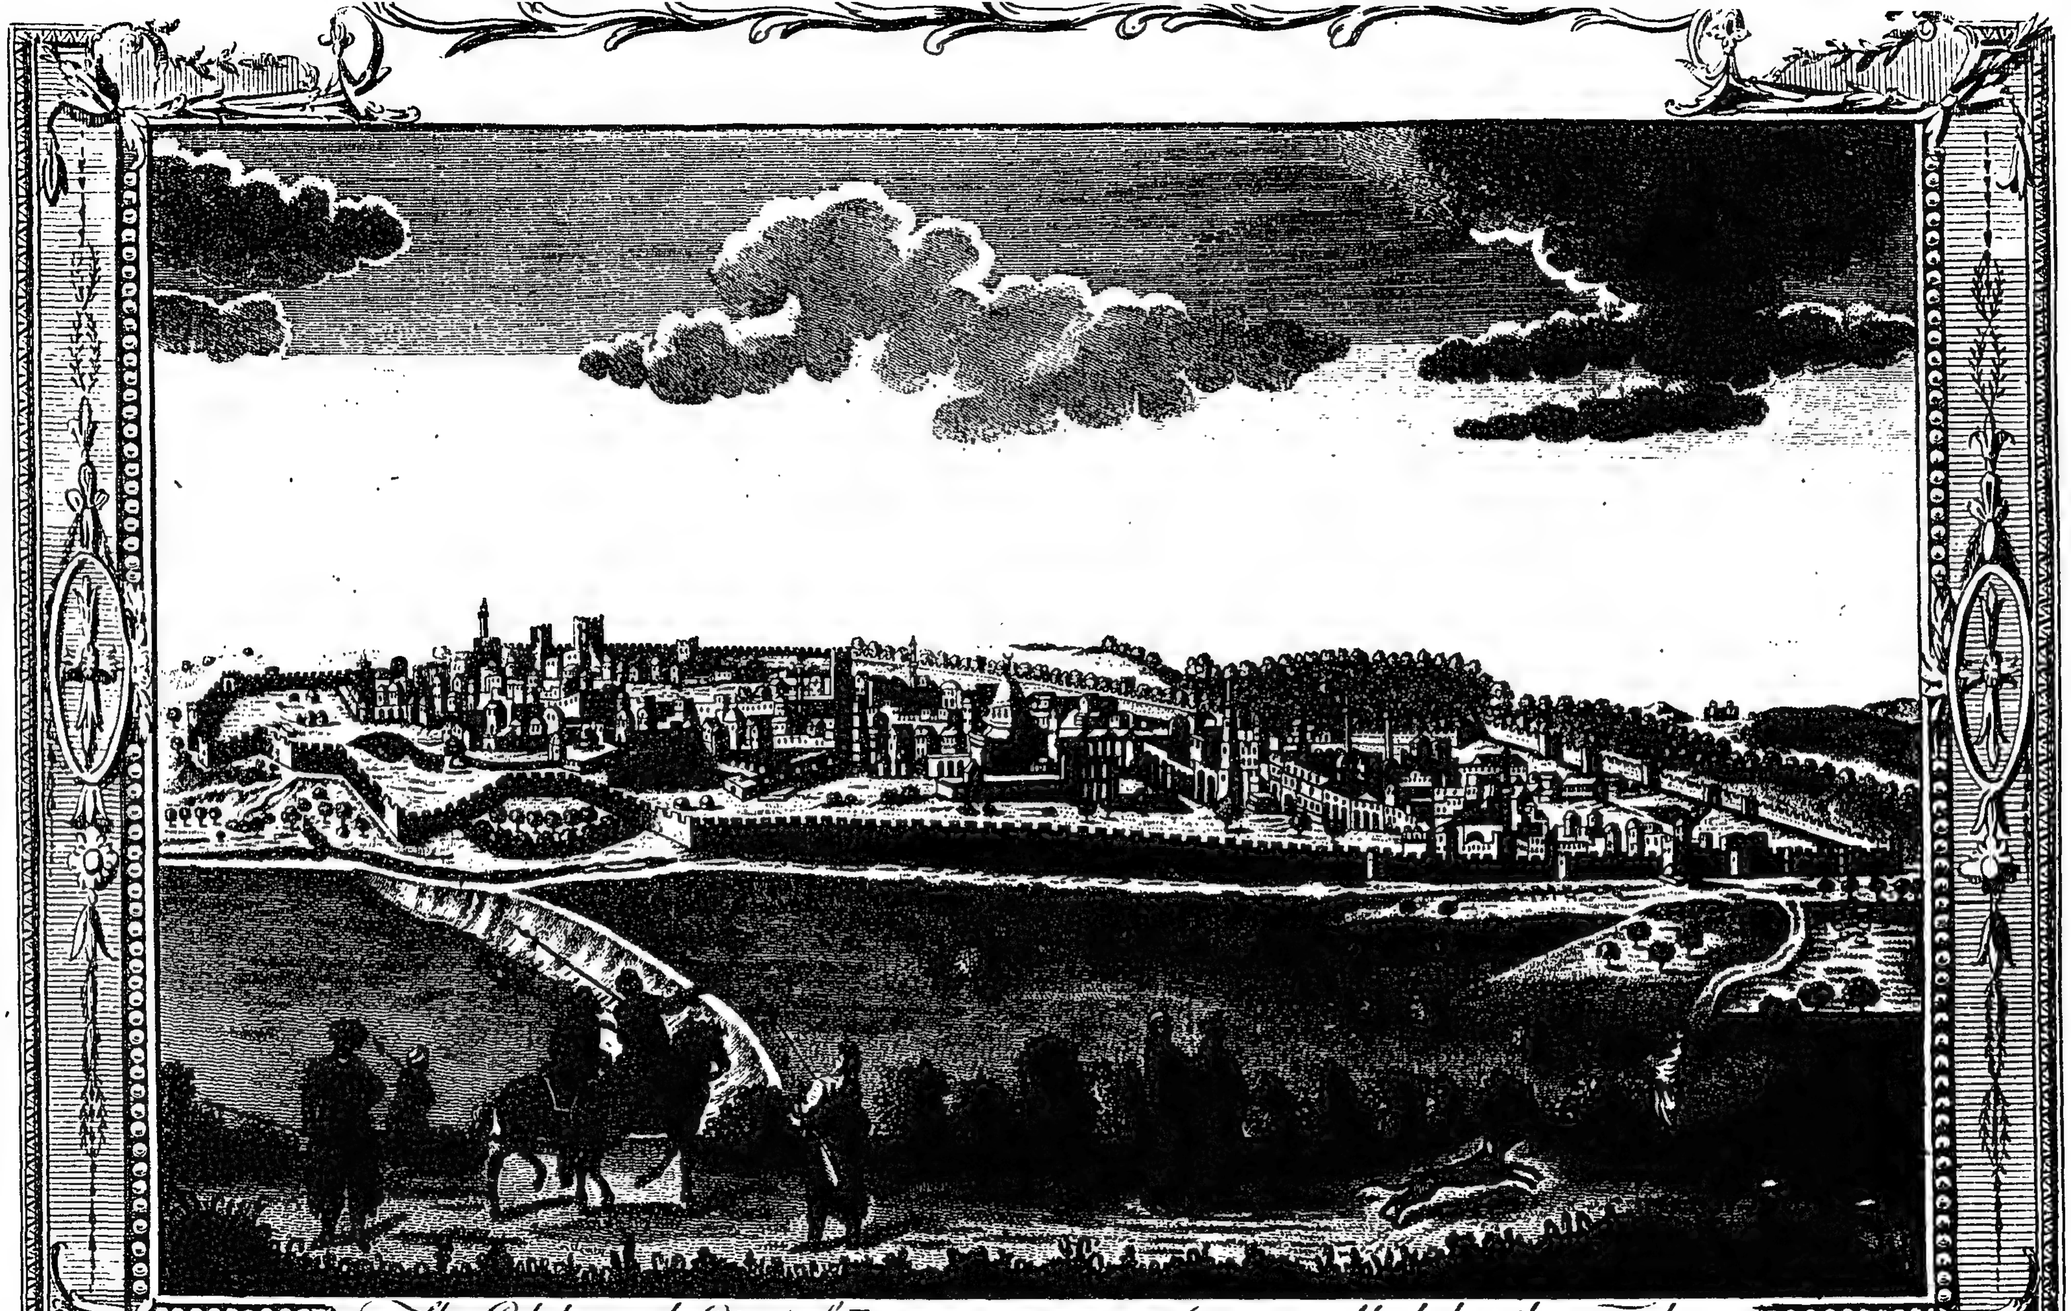
Calvary, or Golgotha (the place where our Saviour was crucified), is a rocky hill on the weſt ſide of Jeruſalem, and was antiently uſed as a general charnel-houſe to that city, from whence it derived its name of Golgotha. This mountain, according to the authority of the antient fathers, is the ſame on which Abraham went to offer up his ſon Iſaac. It was formerly the place where criminals were executed; but, ſince the crucifixion of Chriſt, it hath been ſo reverenced and reſorted to by Chriſtians of all denominations, that it hath, if we may be allowed the expreſſion, drawn the city round about it, for it now ſtands in the midſt of Jeruſalem. Conſtantine the Great encloſed it within the new walls: and, that none of Calvary ſhould be excluded, he even left out ſome part of mount Sion.

Moriah is the mountain on which the temple of Solomon was built.

Gibion ſtands about a quarter of a mile from Jeruſalem, and the pool from whence Hezekiah brought water by an aqueduct into the city, is ſtill to be ſeen on it.

Ebal or Hebal, and Gerizim, though leſs conſiderable than the former, are nevertheleſs remarkable for being the mountains on which the twelve tribes of the Iſraelites were placed, ſix tribes on each, to hear the curſes pronounced by the Levites on the tranſgreſſors of the law of Moſes, as recorded in Deuteronomy xxvii. There is likewiſe Engedi, near the lake of Sodom; Amalich and Gahaſh, in the tribe of Ephraim; Piſgah and Nebo, on the other ſide Jordan; whence Moſes was permitted to view this country, called The Land of Promiſe; the mountains of Gilboa, famed for the defeat of Saul and Jonathan by the Philiſtines, and the chain of hills called the mountains of Gilead, extend from north to ſouth beyond Jordan, and are celebrated for their excellent reſin or balm.

The chief inland ſeas, or rather lakes, are, the Dead ſea, or lake of Sodom; the ſea of Galilee or lake of Tiberias; and the Samachonite ſea, ſea of Jezar, or lake of Samachon.



The firſt of theſe, called by the ſeveral names of the Dead ſea, lake of Sodom, Aſphaltic lake, or Salt ſea, hath had many erroneous reports concerning it; namely, that nothing would ſink in it; that it caſt ſuch a ſtench and ſmoke, that the very birds died in attempting to fly over it; hence, and becauſe nothing would live in it, it was termed the Dead ſea; that there grew apples about it fair without, but all aſhes and bitterneſs within; and that the ruins of the five cities that were deſtroyed by fire from heaven, were ſtill to be ſeen under the water in clear weather; that a ſmoke conſtantly aſcended from it, &c. All theſe abſurd notions have been refuted from ſcripture itſelf, by Reland, in his Paleſtine illuſtrated. This lake is called Aſphaltite, from the quantity of bitumen in and about it. Formerly it was imagined that great quantities of this combuſtible matter were thrown up by the ſea; but the mountains on both ſides produce it, and not the lake. It reſembles pink, and is only to be diſtinguiſhed from it by the ſulphureouſneſs of its taſte and ſmell. For the bitumen itſelf, ſome have miſtaken a black pebble found on the ſhores of the lake, which being held in the flame of a candle, preſently takes fire, and burns with a moſt intolerable ſtench. Beſides the above quality, theſe pebbles have this ſingular property, that by burning, their weight only, and not their bulk, is diminiſhed. A traveller of credit affirms, that it contains fiſh, though he confeſſes, that no collection of waters in the univerſe have ſo great a degree of ſaltneſs, from which quality it is denominated the Salt ſea. Galen obſerves, that the exceeding ſaltneſs of the water is mixed with an unpleaſant bitterneſs; and that with reſpect to ſpecific gravity, it as much exceeds other ſea-waters, as they do river-waters Its waters are clear, limpid, and tranſparent. It is about twenty-four leagues in length, and between ſix and ſeven in breadth. It is bounded on the eaſt and weſt by exceeding high mountains; on the north, by the plains of Jericho; but to the ſouth, the view is intirely open beyond the reach of the eye.

The lake of Tiberias, or ſea of Galilee, is much ſmaller than the lake of Sodom, but abounds in fiſh, and is highly commended for the excellency of its waters: the river Jordan paſſes through it. On this ſea, St. Peter, Andrew, John, and James, followed their employ as fiſhermen, till Chriſt called them to be fiſhers of men.

The Samachonite ſea, or lake of Samachon, is an hundred furlongs north of that of Tiberias, near the ſource of the river Jordan; it is not above half a mile broad in the wideſt part, but is between ſeven and eight miles in length.

The moſt conſiderable, or indeed the only river in this country, is Jordan. It takes its courſe at the lake of Phiala, enters the Samachonite lake, whence proceeding it divides the ſea of Galilee, and at length diſcharges itſelf into the Dead ſea; after riſing at Phiala, it runs under-ground for the ſpace of fifteen miles; then appearing again at Panoum, is paſſes the before-mentioned Samachonite lake, flows for fifteen miles more, enters the ſea of Tiberias, and, having paſſed it, ſtreams through a deſert till it diſembogues itſelf into the Aſphaltite lake. Contrary to the general nature of rivers, it is fulleſt in ſummer-time: its banks are ſo covered with tall reeds, willows, tamariſks, &c. that they harbour innumerable lions, and other wild beaſts. Its ſtream is ſo rapid and ſtrong, that a man cannot ſtem it in ſwimming. The breadth in the wideſt part does not exceed ſixty feet: the waters are turbid or muddy, the natural conſequence of its rapidity; but they are at the ſame time ſalubrious and incorruptible.

Arnon-Jabok, Cherith, Soree, Kiſhon, Boſor, Belus, Nahâr-al-Sarat, and Jezreel, are the other rivers, or rather rivulets, in this country.

The Celebrated City of JERUSALEM (*now called by the Turks* Cudsembaric) *including it's several famous Buildings now in decay.*

Bolge sculp.

being punished for his remissness, he sat down and comprized the whole in the following admirable line:

"The modest water saw the Lord, and blush'd:"

The master was so charmed with the energy and beauty of this sentence, that he easily pardoned the young pupil for not rendering the theme more copious. Cana was the native or at least dwelling-place of the apostle Nathaniel, of Cana in Galilee; see John xxi. 2.

7. The lot of the tribe of Issachar was bounded on the north by Zebulun; on the south, by the other half of Manasseh; on the east, by Jordan; and on the west, by the Mediterranean. It contained the mounts Carmel and Gilboa, the valley of Jezreel, and plain of Galilee, now called Saba: though its fertility is astonishing, it contains only a few miserable inhabitants, who reside in scattered huts, and has scarce any remaining traces of the towns or villages it might formerly contain. But as the following places in their antient state, were remarkable, on account of some curious circumstances with which they were connected, we shall here give some description of them.

According to Joshua, chap. xix. the city of Shunem, or Shunen, was situated on the borders of the tribe of Issachar. In 1 Samuel xxviii. 4. it mentions, that the Philistines pitched here, as the Israelites did in Gilboa. This city was likewise famous as the place of residence of the hospitable Shunammite, who was so kind to the prophet Elisha.

Another remarkable place is Endor, mentioned 1 Sam. xxviii. as the place of residence of a witch, or woman who had a familiar spirit, to whom Saul applied, that she might raise the spirit of Samuel: it was situated on the west of the river Jordan. St. Jerom and Eusebius inform us, that in their days there was a considerable town of that name at about four miles to the southward of mount Tabor.

The other half tribe of Manasseh had Issachar on the north, Ephraim on the south, the Mediterranean on the west, and Jordan on the east. It was a beautiful country, finely diversified with mountains, vallies, lawns, springs, &c. The most considerable place was Bethsan, or Bethshan, situated on the west of Jordan, and the south coast of the sea of Galilee: it was considerable in the time of St. Jerom and Eusebius: the Turks call it Elbyzan; the Jews called it Bethsan; and the Greeks, Scythopolis, as it is likewise named in the Apocrypha.

Salem, or Solyma, was another remarkable place: but no traces are at present left of this or any of the other last mentioned towns; nor can their situation be ascertained.

8. The lot of the tribe of Ephraim, afterwards known by the name of Samaria, had the river Jordan on the east; the Mediterranean on the west; the tribe of Benjamin, on the south; and the half tribe of Manasseh, on the north: the rupture between the kingdoms of Israel and Judah originated here. The principal places in this lot were these which follow:

Sichem or Sechem, since Neopolis; it was once considerable, being a city of refuge, and, after the destruction of Samaria, the capital of the revolted kingdom: on the place where it stood, there is at present a town known by the name of Naplosa or Naplouse, between the mounts Ebal and Gerizim. It is the seat of a Turkish sangiac, and capital of a territory consisting of one hundred villages. It consists of only two streets lying parallel under Gerizim, but well built and full of people; though travellers reckoned it to be in a poor condition, compared with what its antient ruins shew it to have been.

Arimathea, or Ramah in Hebrew, which signifies a high place, was the place of the nativity of the prophet Samuel.

Samaria, antiently called Someron, from the mountains on which it was built, but now Sebaste, was the capital of the revolted kingdom, and raised by its monarchs to great splendor; it was destroyed by the Assyrians, but Herod rebuilt it, and embellished it with many magnificent edifices, of which there are still some remains, particularly a large square piazza encompassed with marble pillars, some standing, others lying; the fragments of some strong walls, and the church built by the empress Helena over the place where John the Baptist was beheaded, or, as some say, buried. The remains of this church are divided into two parts, one of which belongs to the Christians, and the other to the Turks; the latter division is paved with marble, and has a chapel under-ground, to which there are twenty-three steps to descend; there are three tombs in it, where it is affirmed the Baptist, Elisha, and Obadiah are buried. The Turks likewise say, that in this chapel St. John was imprisoned and beheaded; for a trifle of money they let Christians down to see the tombs, or rather to peep at them through some openings in the wall. Not far from these ruins, Jacob's well is shewn, where Christ held the conference with the Samaritan woman; it is covered by a stone vault; and they who are desirous of seeing it are obliged to be let down through a narrow hole, where they may discover the mouth of it: it is hewn out of the solid rock, is three yards in diameter, and thirty-five in depth, five of which are filled with water.

There is at present nothing remaining of Shiloh, or Sio, celebrated for the tabernacle in which the ark was kept, till just before the death of Eli; see 1 Sam. iv. 3, &c.

To the southward of the whole country lay Judea, properly so called, which contained the tribes of Benjamin, Judah, Dan, and Simeon.

9. The lot of the tribe of Benjamin had Samaria on the north, Jordan on the east, and Dan on the west. The principal places in this lot are the following:

Jerusalem, antiently the regal seat of the Jewish monarchs, and the centre of the Jewish religion. In its most flourishing state, the city was divided into four distinct parts, each being enclosed by its own walls, viz. The old city of Jebus, which stood on mount Zion, or Sion, where the prophets dwelt, and where king David built a superb palace, which became the residence both of himself and his successors, on which account it was called the city of David. 2. The Lower City, or the Daughter of Zion, so called on account of its having been built subsequent to the other. In this division stood the two magnificent palaces which Solomon built for himself and his queen; the fine palace of the Maccabæan princes; the noble amphitheatre erected by Herod, which was said to be capable of containing eighty thousand spectators; the citadel built by Antiochus, which was destroyed by Simon the Maccabee; and the second citadel called Antonia, which was erected by Herod upon a craggy rock. 3. The New City, principally inhabited by merchants, artificers, mechanics, &c. and, 4. Mount Moriah, on which the temple of Solomon was built, of which an ample description is given, 1 Kings vi. vii.

Jerusalem is still reckoned the capital of Palestine, situate on a mountain, about thirty miles east of the Levant, in thirty-six degrees of eastern longitude, and thirty-two degrees of north latitude, about ninety miles south of Damascus, and two hundred and thirty miles north-east of Grand Cairo in Egypt, from which it is divided only by the territory of Arabia Petræa. The situation of the city is altered from what it was at the crucifixion of our Saviour; for mount Calvary then stood without the walls, but has now drawn the city round about it, and the church of the sepulchre built upon it now stands almost in the middle of the town, and mount Sion, which stood near the center, is now left without the walls. The present town is not more than three miles in circumference, but is presumed to have been much larger in its flourishing state; it is but thinly inhabited at present, and the buildings mean; the resort of Christian pilgrims to it is the most considerable advantage it has now, and the accommodating them with lodgings and provisions the chief business of the inhabitants. A bassa and a good garrison is kept here by the Turks, to keep good order, collect the Grand Signor's revenues, and protect the pilgrims against the Arabs, who possess the adjacent country. The grandest building in the place is the church of the sepulchre, in which every Christian nation almost has a chapel. The middle of the church is covered with an open dome or cupola, from whence the church receives light; and under this open cupola stands the glorified sepulchre. There are also in this church twelve or thirteen places, consecrated on account of some particular actions done in them, relating to the death and resurrection of Christ, as the place where he was nailed to the cross, the place where the soldier stood who pierced his side, where the angels appeared to the woman after the resurrection, &c. and on Good-Friday, annually, our Saviour's passion is solemnized in this church, and all parts of it acted; such as nailing him to the cross, crowning him with thorns, taking the body down from the cross; and here is to be seen the cleft of the rock which was made by the earthquake, when our Saviour expired.

The wall and fortifications are very antique, having old square towers upon them instead of bastions; but these are sufficient for its defence, there being no other enemy near it, but the wandering Arabs, who have no artillery. The ditch is inconsiderable; and the gates are six in number, viz. Damascus, St. Stephen's, Herod's, Sterquiliana, Bethlehem, and Mount Sion gate; besides the Golden

gate, which is ſhut up, on account of a prophecy which the Turks have among them, that the Chriſtians are to take Jeruſalem by that gate.

In the ſouth part of the city, on mount Moriah, ſtand the edifices called Solomon's temple, which is ſituated upon the antient temple above-mentioned; but it is uncertain by whom this was erected. The middle part, where the Jewiſh ſanctum ſanctorum was ſuppoſed to have ſtood, is converted into a Turkiſh moſque.

The Turkiſh ſangiac, who governs this city, reſides (as they tell us) in the very houſe where Pontius Pilate is ſuppoſed to have lived. Moſt of the churches have been converted into moſques. The prieſts and other Chriſtians are kept miſerably poor by the tyranny of the government, and have ſcarce any ſubſiſtence but what they procure by accommodating ſtrangers with food and lodging, and ſelling them relics.

The moſt remarkable antiquities in the neighbourhood of Jeruſalem are:

The pools of Bethesda and Gihon; the former is one hundred and twenty paces long, forty broad, and eight deep; it is at preſent dry, and the arches dammed up; but Gihon, which is about a quarter of a mile from Bethlehem gate, is a magnificent relic, one hundred and ſix paces long, ſixty broad, lined with a wall and plaiſter, and well ſtored with water.

In the valley of Jehoſhaphat is the tomb of the Virgin Mary: there is a deſcent to it by a flight of forty-ſeven magnificent ſteps. On the right hand is the ſepulchre of St. Anne, the mother of the bleſſed Virgin; and on the left hand is that of Joſeph her huſband; the whole is cut into the ſolid rock.

The next thing remarkable is Abſalom's pillar or place, which they aſſure us was erected by that prince in order to perpetuate his memory, as he had no male iſſue: it reſembles a ſepulchre, though it is not known that he was buried there. A great heap of ſtones lie about it, which are always increaſing; for all Jews and Turks, who paſs by it, make a point of throwing a ſtone each upon the heap, as a token of abhorrence to Abſalom for his unnatural rebellion againſt his father. The ſtructure itſelf is twenty cubits ſquare, and ſixty high, adorned below with four columns of the Ionic order. From the height of twenty to forty cubits it grows leſs, and is plain, a ſmall fillet at the upper end excepted; from thence to the top it is circular, and runs up ſpirally to a point, the whole being cut out of a ſolid rock: there is a room within conſiderably higher than the level of the ground without, on the ſides of which are niches, probably to receive coffins.

Eaſtward of the above is the tomb of Zechariah, the ſon of Barachiah, whom the Jews ſlew between the temple and the altar, as it is commonly ſuppoſed. It is cut out of the rock, eighteen feet high, and as many ſquare, and adorned with Ionic columns on each front, cut out of the ſame rock, and ſupporting a cornice: the whole ends like a diamond, in a jointed top.

The moſt elaborate, curious, and magnificent antique remains that imagination can conceive, are, the royal ſepulchres without the walls of Jeruſalem. It is uncertain by whom they were built, but they conſiſt of a great number of apartments, moſt of which are ſpacious, all cut out of the marble rock.

There is a ſpot of ground near Jeruſalem, of thirty yards long and fifty broad, which is now the burial place of the Armenians. It was formerly the Aceldama, field of blood, or potter's field, purchaſed with the price of Judas's treaſon, as a place of interment for ſtrangers. It is walled round, to prevent the Turks from abuſing the bones of the Chriſtians; but one half of it is occupied by a charnel houſe.

The remains of an old caſtle are ſhewn at Bethany, which ſtood in the road between Jeruſalem and Jericho: this place, it is affirmed, belonged formerly to Lazarus: there is a deſcent of twenty-five ſteps to the room where he was laid, and the tomb out of which he was raiſed.

Jericho is about twenty-three miles from Jeruſalem, and was remarkable for being the firſt city invaded by the Iſraelites after their paſſage over Jordan, when it was taken by the ſingular fall of its walls. It is reduced from a magnificent city to a little mean village, without any veſtiges of its former ſplendor, except ſome grand arches of an old conduit.

10. The lot of the tribe of Judah was bounded, on the ſouth, by the mountains of Edom; on the north, by Benjamin; on the eaſt, by the Dead ſea; and on the weſt, by the Mediterranean. This was the moſt fertile, populous, and largeſt of all the twelve lots, but at preſent there are no remains of any places which it might formerly contain, except Bethlehem, the place of the nativity of our Saviour Jeſus Chriſt, and therefore the moſt worthy to be held in eſteem by all mankind, for the bleſſings beſtowed upon them by the Redeemer.

Bethlehem is diſtant about ſix or ſeven miles from Jeruſalem to the ſouth-weſt in the way to Hebron: it lies in thirty one degrees thirty-five minutes north latitude, and in ſixty-five degrees fifty minutes longitude. It was antiently called the city of David, having been the birth place of the royal pſalmiſt; it is ſeated on a pleaſant hill, in a fine fertile plain, and enjoys a moſt excellent air. It was once a fine and flouriſhing city, but is now a poor village, only reſorted to at this day on account of its being the place of our Lord's nativity, over which Helena, the mother of Conſtantine, erected a magnificent temple, the roof whereof is cedar, ſupported by four rows of white marble pillars, ten in each row; the walls of the church is built in the form of a croſs, of which the chancel conſtitutes the upper part, and is covered with a noble cupola. Under the church in a cave hewn out of the rock is the chapel of the nativity, where they ſhew the manger our Saviour was laid in, cut alſo out of the rock, and now cruſted with marble. An altar with the repreſentation of the nativity is erected here, and lamps kept burning before it. Here is alſo the chapel of St. Joſeph, the ſuppoſed father of our Lord and of the Holy Innocents: and adjoining to the church is a monaſtery of Franciſcans: they ſhew a valley near this town where they ſay Jacob kept his flocks; being the ſame, as they relate, where the angels appeared to the ſhepherds, declaring the birth of Chriſt. Here the ſame pious empreſs alſo built a church, but it is now in ruins.

In the neighbourhood of Bethlehem, are thoſe famous fountains, pools and gardens, ſaid to have been the contrivance and delight of Solomon, and to theſe works this king is ſuppoſed to allude, Eccleſ. ii. 5, 6. where, among other inſtances of his magnificence, he reckons his gardens, vineyards and pools. Theſe pools are ſo diſpoſed, that the waters of the uppermoſt deſcend into the ſecond, and thoſe of the ſecond into the third; their figure is quadrangular, and their breadth the ſame in all, but their length is different, the firſt being about an hundred and ſixty paces long, the ſecond two hundred, and the third two hundred and twenty. They are all lined with a wall, and contain a great depth of water: and about an hundred and twenty paces from them is a fountain, from whence they principally derive their waters, which are carried thither by a large ſubterraneous paſſage: but there is an aqueduct laid from it, which receives part of the ſtream, which carries it by many turnings and windings about the mountains of Jeruſalem. And our author does not think it improbable that the pools abovementioned are the ſame with Solomon's, there being not the like ſtore of excellent ſpring water in all Paleſtine. But I ſhould tire the reader's patience to enumerate every little place which ſcripture ſtory has rendered remarkable in the Holy Land; I ſhall mention therefore but very few more, before I take my leave of it, and one is a convent of Greeks, between Bethlehem and Jeruſalem, called the convent of the holy croſs, having obtained that name, becauſe, according to tradition, here is the ground which nouriſhed the root that bore the tree which yielded the timber that made the croſs of our Saviour, and under the high altar is ſhewn the hole where the ſtump of the tree ſtood, which the pilgrims frequently fall down before and worſhip; and this perhaps is as remarkable an inſtance of the credulity and ſuperſtition of the poor bigotted people, as is to be met with in the Chriſtian or heathen world; and cannot but excite the laughter of infidels.

Another pious fraud of the Greek fathers is their pretending, that upon every Eaſter eve a miraculous flame deſcends into the holy ſepulchre at Jeruſalem, and kindles all the lamps and candles there. But we ſhall quit this place, and paſs on to Hebron, the antient ſeat of David before he took Jeruſalem, but which hath long ſince been ruined; near it ſtands the village called Elkapil, on a pleaſant hill that overlooks a moſt delightful valley. Ruinous as its preſent condition is, it ſtill contains a handſome church, built by the empreſs Helena, over the ſepulchral cave, where Abraham and Sarah, Iſaac, Jacob, and Leah lie buried. The Turks, Chriſtians, and Jews, all regard it with equal veneration. This town is the capital of a diſtrict, conſiſting of about twenty-four little villages, which the Turks call the territory of the friends of God.

There was formerly a very ſtrong fortreſs called Bethzor, or Bethzora, which is ſuppoſed to have ſtood upon

a craggy hill twenty miles to the ſouthward of Jeruſalem, where there is now a village named St. Philip, from a tradition that it was from a fountain near this place where St. Philip baptized the eunuch of queen Candace.

The village of Engaddi, on the top of a rock near the Dead ſea, about four miles eaſt of Tekoah, is famed for the great quantity of palms, and other odoriferous trees, which grow on the mountains above it. Among the caverns of theſe mountains, two are very remarkable; the one for being the retreat of Lot and his daughters after the conflagration of Sodom, &c. and the other for being the cavern in which David ſo generouſly ſpared the life of Saul, contenting himſelf with only cutting off the ſkirt of his garment.

11. The lot of Dan was bounded, on the ſouth by Simeon; on the north, by Ephraim; on the eaſt, by Judah and Benjamin; and on the weſt, by the Philiſtines country and the Mediterranean; the length being forty miles from north to ſouth, and the greateſt breadth not exceeding twenty-five miles. It abounded in all the neceſſaries and luxuries of life; and the ſpies brought to the Iſraelitiſh camp from this country noble ſpecimens of its admirable fertility.

12. The lot of the tribe of Simeon lay in the moſt ſouthern corner of Judea; and was bounded by Dan, on the north; by Gihon, on the ſouth; by Judah, on the eaſt; and a neck of land, towards the Mediterranean, on the weſt. This part was not ſo fertile as the reſt of the land of Canaan, nor were the towns either many or conſiderable, none deſerving any mention, even in antient times, except Anthedon and Rhinocolura, which are now poor ruined towns ſtanding on the ſea coaſt, and Beerſheba, of which, in Gen. xxi. we learn, that Abraham, having entered into a ſolemn league of friendſhip with Abimelech, king of the Philiſtines, who had before taken ſeven wells from him, preſented the king with ſeven young ſheep; and intreated him to accept of them as a token that he had dug ſuch a well, and ſhould thenceforth be permitted peaceably to enjoy it: upon which occaſion the place was called Beer-Sheba, or the Well of the Oath, becauſe of the covenant made relative thereto. Hence the name of Beerſheba was in proceſs of time given to the city erected near it.

The following are the moſt remarkable places compriſed in a ſmall part of the preſent Paleſtine, ſituated on the coaſt of the Mediterranean, and extending to the ſea-port of Jamnia, which was long ſubject to the five lords of the Philiſtines.

1. Aſkalon, which is dwindled into a very trifling village: it ſtands on the ſea-coaſt, and was the native place of Herod the Great, who was thence called Aſcalonites. This was an epiſcopal ſee from the earlieſt ages of Chriſtianity; and, during the holy wars, had many ſtately edifices remaining, which have ſince been all ruined by the Turks and Saracens.

2. Gaza lies in thirty-one degrees twenty-two minutes north latitude, and thirty-five degrees eaſt longitude, and is ſituated between two and three miles from the Mediterranean ſea. It retains many monuments of its priſtine grandeur, and on all ſides ſome noble remains of antiquity are to be ſeen, viz. ſeveral rows of ſtately marble columns with all their ornaments intire, magnificent ſepulchres, monuments, &c. Among theſe is one in particular ſurrounded by a high wall, which belongs to a Turkiſh family. Near the city ſtands a round caſtle, flanked with four ſquare towers, defended by two ſtrong iron gates, and other works; oppoſite to which is the ſeraglio, where the baſſa's wives and attendants are kept, and a little above are the remnants of an old Roman caſtle, the materials of which are ſo firm, that the hammer can make no impreſſion on them. The Greeks and Armenians have each a church here; and near to that of the latter, the ſpot is ſhewn where the temple ſtood which Sampſon pulled down over his head, and deſtroyed at once himſelf with a great number of Philiſtines. The caſtle is the reſidence of a ſangiac, who is ſuppoſed to have near three hundred ſmall villages or hamlets under his juriſdiction. At a little diſtance from the town quite up to Egypt, the country is inhabited by a race of wild Arabs, who not being ſubject to any regular government, are continually roving about from place to place.

3. Maſſuina, or New Gaza, ſtood about ten miles from Aſkalon, near the mouth of the river Bezor: it was the antient ſea-port to the former, or Old Gaza, and on that account only was of note: about it are ſtill ſome antique remains, but it is uncertain whether they belong to New or Old Gaza.

4. Two miles from the ſea, and about three miles ſouth from Gaza, ſtands a town named Lariſſa; it is at preſent a poor mean place, defended by an old caſtle, and a garriſon of two hundred men, but was formerly celebrated as the burial place of Pompey the Great, who was killed in its neighbourhood.

5. Raphia ſtands at a little diſtance from the above; but is now ſo inconſiderable as ſcarcely to deſerve mentioning; though in the time of the Maccabees it was a place of ſome account.

6. Gath was antiently the principal of the five capital cities of the Philiſtines, being the regal ſeat; but it dwindled away ſo early, that no veſtiges of it are now remaining, and it is even uncertain where it exactly ſtood. It was famed as the reſidence of the remnant of the giant race, and was the place of Goliah's nativity.

7. Ekron was the northernmoſt of all the five cities which gave name to the five lordſhips of the Philiſtines; it was once a place of great wealth and power, and frequently mentioned in the ſacred writings, but is now little noticed by any profane authors, being almoſt dwindled to nothing.

8. Aſhdod, or Azotus, bore an extraordinary fame among the antients: it was ſituated about twelve miles to the north of Aſkalon. The ſituation was inland, and the circumjacent country exceedingly fertile and pleaſant. It was famous for the temple of Dagon, where was the grandeſt and moſt famous god the Philiſtines had. To him they attributed the invention of agriculture. Some inſiſt that the idol Dagon repreſented a man; while others affirm, that it reſembled a ſea-monſter. There are at preſent no traces of this city left, though in the times of primitive Chriſtianity it was an epiſcopal ſee, and was even a fair village in the time of St. Jerom.

Thus having given a geographical deſcription of the antient as well as preſent ſtate of the Holy Land, which was the ſcene of a great variety of the moſt remarkable and intereſting tranſactions, in which the antient Jewiſh patriarchs, prophets, and kings, bore a conſiderable part; and alſo the ſpot in which our glorious Redeemer wrought many miracles, and accompliſhed the work of redemption; as foretold in the Old Teſtament, and fulfilled in the ſacred and inſpired pages, written by the four evangeliſts; we think it unneceſſary to recapitulate thoſe memorable events in this place: but for the general ſatisfaction of our readers, beg leave to refer them to the Rev. Dr. *Wright's New and Compleat Life of Chriſt*, printed in crown folio; and now publiſhing in thirty-ſix weekly numbers, at only ſix-pence each, with elegant copper-plates.

SECT. VI.

Contains an account of the original of the Turks, their genius, temper, perſons, habit, diet, liquors, diverſions, ceremonies, &c.

THE Turks are generally agreed to have been of Scythian or Tartarian original, and to have been very little known till the eighth century, when they came down upon Georgia, and plundered that country. In the year 844 they penetrated as far as Armenia Major, where they fixed themſelves; and from them this country obtained the name of Turcomania. But we ſhall have occaſion to ſpeak more particularly of them as a nation, when we come to treat of their hiſtory.

With reſpect to their genius and temper, they affect to appear ſedate, paſſive, and humble, but they are eaſily provoked, and their paſſions are furious and ungovernable: they are full of diſſimulation, jealous, ſuſpicious, and vindictive: in religious matters, narrow-minded, bigotted and enthuſiaſtic: they ſeem to have no manner of inclination for the improvement of arts and ſciences, any more than for the manuring or cultivating their lands; a ſluggiſh indolent way of life is preferred to every thing elſe: and the greateſt of them ſaunter away the beſt part of their time among the women, in their harams. Anatolia, the moſt fertile country in the world, lies great part of it unmanured; and ſeveral provinces of that empire, which formerly were exceedingly populous, and abounded in all things, are now become perfect deſarts for want of culture; and ſcarce any thing but ruins are to be ſeen in thoſe countries which were heretofore famous for fine cities and elegant buildings.

Theſe people, as they ſeldom or never travel, ſo they have no curioſity to be informed of the ſtate and condition of other countries, or indeed of their own: they never enquire after news, and if a miniſter of ſtate happen to

be

be diſplaced, or ſtrangled, they do not concern themſelves about the reaſon of it; you hear them ſay no more on ſuch an occaſion, but that there is a new vizier, or a new baſſa, of ſuch a province; but, perhaps, that is as much as they dare ſay in ſtate matters; however, it is certain they are far from being talkative; for we frequently ſee five or ſix of them ſit ſmoaking together, and a word ſhall ſcarce drop from any of them in a quarter of an hour. Some women are alſo, among the common people, addicted to ſmoaking: the ſtems of their pipes are of roſe or cherry-tree wood, ſome of them carved or ornamented with ſilver: the bowls are neatly made of clay: the rich uſe the Perſian caalean, which is, making the ſmoke paſs in ſilver tubes through a veſſel of water before it reaches the mouth, which renders it leſs diſagreeable to the ſmell and taſte. Friendſhip, wit, and agreeable converſation they are perfect ſtrangers to, as a modern traveller obſerves; but in matters of trade they are ſharp enough, and will carry long accounts in their heads, without the help of books, by a natural arithmetic, improved by cuſtom and neceſſity.

Walking is no leſs their averſion than talking: the taking a walk, as we call it, for walking ſake, is to them the moſt ridiculous exerciſe in the world, and they look upon our people to be diſtracted or mad, when they ſee them taking a turn backwards and forwards; they chooſe rather to loll all day long or ſit croſs-legged on their ſofa's: and though they have company about them, there is no more converſation amongſt them than among ſo many horſes: they aſſociate themſelves together at certain times, as animals of a lower ſpecies do, but their ſatisfaction ſeems to ariſe only from their ſitting near each other. Thoſe who have country houſes or gardens diſtant from the towns, will ſcarce ſubmit to the toil of viſiting them; becauſe where coaches, and other ſuch like vehicles are little in uſe, they are under the neceſſity of breaking through that fixed and ſettled habit of indolence which ſeems univerſally to poſſeſs them.

The honeſty and probity of the Turks is highly cried up by ſome travellers; but our merchants obſerve, that thoſe who deal with them ought to be upon their guard; and indeed, as all people agree that covetouſneſs and extortion are the faſhionable vices of Turky, and univerſally practiſed by their governors and miniſters of ſtate, who expoſe offices and every thing to ſale, it is not likely that their inferiors are perfectly innocent: they will not perhaps be guilty of an open fraud, or a downright lie, which might affect their credit in trade, and ruin their reputation; but where they can circumvent another ſecurely, it is not to be ſuppoſed they will reſiſt the temptation, where covetouſneſs is ſo predominant. Some I find make a diſtinction between native Turks and thoſe who have changed their religion upon ſecular views: theſe latter are by all people held to be the moſt abandoned villians, whatever ſhews of ſanctity they may put on; and for the reſt, I do not at all doubt but the probity of our own merchants is at leaſt equal to that of the Mahometan traders.

The temperance of the Turks has been obſerved alſo to exceed that of the Chriſtians; but there are few of them which abſtain from wine in private, notwithſtanding their law prohibits it; and the government puniſhes ſeverely thoſe that are found diſordered by it in the ſtreets: nay, thoſe very magiſtrates who puniſh others for drunkenneſs, will, like thoſe of ſome Chriſtian nations, drink in the night to a very great exceſs; and ſo as they behave themſelves quietly and inoffenſively in their liquor, do not think they have committed any great crime. Sodomy alſo is a vice which they are intolerably addicted to, notwithſtanding they are indulged in taking as many women as they pleaſe.

Their charity however, if it be not done for oſtentation, as ſome travellers ſuggeſt, is very commendable: they are careful even to prevent the unfortunate being reduced to neceſſities; they viſit the priſons, and pay the debts of the poor who lie there. In caſe of fires, which are very frequent in their timber buildings, the loſſes of the ſufferers are ſoon made up by the contributions of others. They repair highways, erect fountains and ciſterns at their own expence, for the conveniency of travellers: build caravanſeras for the entertainment of them; and ſome devout people, it is ſaid, ſet up ſheds by the way ſide purely to be aſſiſtant to people in their journies, and refreſh the wearied traveller. The charity of ſome of them extends even to animals and plants: they will purchaſe the liberty of impriſoned birds, procure food for others, and religiouſly water certain trees.

Their quarrels ſeldom proceed to blows, and duelling is not known amongſt them; but no people exceed them in billingſgate language and complicated curſes, when they are provoked, but never prophane the name of God, or make themſelves merry with ſacred things, as Chriſtians often do. Their pride is inſupportable, deſpiſing and contemning all people but their own, eſpecially thoſe of a different religion: themſelves alone they eſteem wiſe, valiant and holy; the reſt of the world are a pack of reprobates, not entitled to the good things of this life or another. It is not only held lawful, but their duty to extend their conqueſts to the ends of the earth, and bring all nations in ſubjection to the Mahometan yoke; and they are taught that by dying fighting in this cauſe they purchaſe ſeats in paradiſe.

The doctrines of fate and predeſtination have ſuch an influence here, that no man flies from his houſe in the plague, which is very common amongſt them, nor do they ſend a ſlave away who is infected with it, but attend the ſick as if the diſtemper was not contagious. This perſuaſion alſo inſpires them with courage in the field.

As the Turks make choice of wives for their beauty or merit, it is no wonder that both men and women are handſome; they ſearch every country where beauties are to be met with as diligently as our gentlemen purſue the ladies for their fortunes: people here ſeem more careful in the breed of their dogs and horſes than their children, and their iſſue frequently ſhew it.

In Turky the men ſhave their heads, leaving one lock upon the crown; and uſe a proverbial expreſſion in juſtification of the practice, that "the devil neſtles in long hair;" they wear their beards long, except the officers in the palace and military men, and theſe leave only whiſkers on the upper lip. All of them wear turbans uſually white, but the family of Mahomet green. A turbant contains a whole piece of linen or ſilk, wound about their heads to the bigneſs of half a buſhel almoſt, and adorned ſometimes with lace or fringe; the greater the quality of the man, the bigger his turbant is uſually. (Their Chriſtian ſubjects, the Greeks and Armenians, are not ſuffered to wear white turbants.) Next their ſkins the Turks wear a kind of ſhirt, without collar or wriſtbands, and over it a long veſt tied with a ſaſh, the ſleeves cloſe and reaching down to their wriſts; over the veſt they uſually wear a looſe coat of the banjan make, of almoſt any colour; their breeches or drawers are cloſe before and behind, and let down when they water, which the men do ſitting as well as the women. The ſtockings are of a piece with their breeches; inſtead of ſhoes they wear yellow ſlippers, which is another mark of diſtinction; they will not ſuffer a Chriſtian to wear ſuch: the ſlippers are always put off in entering a houſe or temple, but the turbant or cap never. They put their knife, handkerchief and purſe in their boſoms, and have a daggar or poinard in their ſaſh.

The firſt part of the ladies dreſs is a pair of drawers very full, which reach to the ſhoes, and conceal the legs more modeſtly than petticoats; theſe are made of thin roſe-coloured damaſk, brocaded with ſilver flowers. The ſhoes are of white kid leather embroidered with gold: over this hangs a ſmock of a fine white ſilk gauze, edged with embroidery; this ſmock has wide ſleeves hanging half way down the arm, and is cloſed at the neck with a diamond button; but the ſhape and colour of the boſom are very well to be diſtinguiſhed through it. The antery, is a waiſtcoat made cloſe to the ſhape, of white and gold damaſk, with very long ſleeves falling back, and fringed with deep gold fringe, and ſhould have diamond or pearl buttons. The caftan, of the ſame ſtuff with the drawers, is a robe exactly fitted to the ſhape, and reaching to the feet with very long, ſtrait falling ſleeves: over this is a girdle about four fingers broad, which all who can afford it have entirely of diamonds or other precious ſtones; thoſe who are not at that expence, have it of exquiſite embroidery on ſattin, but it muſt be faſtened before with a claſp of diamonds. The curdee, with a looſe robe, is put on or thrown off according to the weather, being a rich brocade lined either with ermine or ſables, and has ſleeves which reach very little below the ſhoulders. The headdreſs is compoſed of a cap called talpoc, which in winter is of fine velvet embroidered with pearls or diamonds, and in ſummer of a light ſhining ſilver ſtuff; this is fixed on one ſide of the head, from which it hangs a little way down with a gold taſſel, and is bound on either with a circle of diamonds, or a rich embroidered handkerchief: on the other ſide of the head the hair is laid flat; and here the ladies are at liberty to ſhew their fancies, ſome putting flowers, others a plume of heron's feathers, in ſhort what they pleaſe; but the moſt general faſhion is a large bouquet of jewels made like natural flowers, the buds of pearls, the roſes of different coloured rubies, the jeſſamines of diamonds

diamonds, the jonquils of topazes and the like, ſo well ſet and enamelled, that it is hard to conceive any thing of that kind ſo beautiful. The hair hangs at its full length behind, divided into treſſes, braided with pearl or ribbands, in great quantities.

Their food is chiefly rice, mixed with the ſoup or gravy of ſtewed meat, which ſcarce wants a knife to cut it; both their roaſted and boiled meat are ſo much done, that they can pull it to pieces with their fingers. Their grand diſh here, and in all the Eaſt, is pilau, which conſiſts of mutton and fowls boiled to rags; and the rice being boiled perfectly dry, the ſoup made of the meat, which is very high ſeaſoned, is poured upon it. Thoſe that do not chuſe rice have cakes baked upon the hearth, which they eat inſtead of bread. Their uſual liquors are water, ſherbet, or coffee. As for the common people, they live very much upon cucumbers, melons, roots, and other garden ſtuff, and have the ſame ſmall liquors as their betters.

Few of the Turks lie in beds, but on carpets, mattreſſes or mats, on a ſopha or raiſed floor, on the ſides of the room, or at the end of it, and cover themſelves with quilts. They lie in linen waiſtcoats and drawers, as they do in other eaſtern countries, and have no need of ſheets.

The uſual ſalutation among the Turks is, a little inclination of the head, and clapping the right hand to the breaſt: but when they ſalute a perſon of diſtinction, they ſtoop ſo low, as to take up the hem of his veſt and kiſs it. They uſually ſit in an open hall upon a ſopha, (which is a bench or ſtage about five feet broad, and a foot and a half high, at the upper end of the hall, and ſometimes on all ſides of the room, covered with carpets and cuſhions to lean on.) Here they ſpread a piece of leather when they eat, and ſet little wooden tables about half a foot high, ſometimes, upon which they place a great bowl of rice, with a ladle, meat and plates, and the maſter of the houſe ſays a ſhort prayer of grace, which he begins, "In the name of God almighty, merciful," &c. and one napkin of blue linen ſerves all the company.

The Turks play at drafts and cheſs to paſs away their time, but not for ſums of money; and thus they think they comply with the intention of their law, which prohibits gaming chiefly upon account of the quarrels it creates, there being no likelihood of falling out where nothing is hazarded. Some of the natives delight in their country muſic, which is not the moſt harmonious in the world; and their derviſes have a kind of religious muſic, to which they dance with all their might, till they are ready to drop down. They have their dancing-girls here alſo as well as in Perſia and India, with whom they entertain themſelves ſometimes. Their manly exerciſes are ſhooting at a mark with fire arms, or bows and arrows on horſeback, in every poſture almoſt; and they are taught to dart a little ſtaff, with which they attack and purſue one another on horſeback, and ſometimes give and receive dangerous bruiſes.

Their manner of travelling over the deſerts with the caravans, does not differ from that of the Perſians and Arabs, which we have mentioned already; we therefore beg leave to add here ſome obſervations of Mr. Motraye upon the ſame ſubject, who aſſures us, that it is cheaper travelling in Turky than in any country in the world, not only on account of the great plenty of proviſions, but the ſmall expence of horſe hire, and particularly for Franks, or European Chriſtians; for if a gentleman is about to undertake a journey, he need only apply himſelf to the ambaſſador or reſident of his nation, who will ſend his interpreter with him to court, or the governor of the place, and procure him a menzil firman, or a yoll firman, which are never refuſed: by the firſt of theſe all his expences are borne, whether of horſes or proviſions, during the whole journey at the Grand Signor's charge, who at the diſtance of every three or four leagues, has houſes of entertainment, and horſes laid to furniſh the couriers and expreſſes he ſends to the ſeveral parts of the empire, and for any other perſon to whom the court grants one of theſe firmans or orders, for there are no ſtated general poſts in Turky, as with us: however, the expreſſes which the court ſends will take the letters of the Frank merchants with them upon very reaſonable terms, and deliver them at Aleppo, Smyrna, Bagdat, &c.

When a gentleman who has the Grand Signor's order, or firman, arrives at any ſtage, there are people ready to take care of his horſes and baggage, and provide freſh horſes while he refreſhes himſelf; and there is alſo ſomething dreſſed, as meat, fiſh and rice, at whatever hour of the day or night he comes in. If the traveller has only a yoll firman he pays ten aſpers (half-pence) for every three miles for his own horſe, but nothing for his guide or proviſions.

As for the caravanſeras or inns where travellers lodge who have no firman, we meet with them in almoſt every town and village at proper diſtances: thoſe in the towns are magnificently built of ſtone and covered with lead; they are generally in the form of a ſquare with a little piazza or cloyſter in the inſide, and cells for lodging, like thoſe in monaſteries. They are furniſhed with mats or ſtraw, but no beds to lie on; and the traveller does not only lodge gratis, but in ſome they give boiled rice, meat and bread to ſuch travellers as will accept it; but proviſions are ſo cheap, that people generally make uſe of their own; and ſuch is the hoſpitality of the Turks, it is obſerved, that if a poor traveller has no proviſion of his own, he may without any ceremony ſit down and eat with any of his countrymen.

The roads, bridges, ciſterns, and caravanſeras for entertainment of travellers, are kept in repair in Turky by the contributions and labours of private people, who look upon it to be a work of charity, and highly acceptable to heaven, to provide for the neceſſities of the wearied traveller; even thoſe who live by their labour, and have nothing elſe to contribute, will ſpend part of their time gratis in theſe employments, and travellers relate, that in the eaſtern parts of this empire towards Meſopotamia, the hoſpitable natives, like Abraham of old, will invite travellers to their tents and houſes as they paſs through their country, and contend for the honour of entertaining them.

SECT. VII.

Treats of the produce, manufactures, and trade of the Turks.

TURKY in Aſia produces rice, wheat, barley, raw ſilk, carpets, goats-hair, mohair yarn, goats-wool, cotton wool, cotton yarn, dimities, burdets, ſhagreen-ſkins, blue, red, and yellow cordovants, coffee, (the product of Arabia) rhubarb, turpentine, ſtorax, gum ſenegal, gum traganth, gum arabic, opium, galls, maſtic, worm ſeed, ſenna, emeralds, terra lemnia or ſigillata, pomgranates, ſponges, piſtachio nuts, dates, almonds, wine, oil, figs, raiſins, mother of pearl, viſacy, valinia for dying, ſal ammoniac, china root, alum, botargo, Roman vitriol, box wood, bees-wax, and ſaffron.

We have before obſerved, that the Grand Signor's dominions are the beſt ſituated for a foreign trade, of all countries in the world, as they lie in the middle of the continent; and the ſeas bordering upon them give the Turks an opportunity of trading with every nation, more eaſily than other people can. The Red ſea and the gulf of Perſia render the voyage very ſhort to India and China; by the Mediterranean, the Ægean, and the Black ſea, they might trade with every country of Europe and Africa. They have timber and naval ſtores in their own territories ſufficient to build the largeſt fleets! but for want of application all theſe advantages are loſt. They ſeldom or ever undertake diſtant voyages either to the eaſt or weſt: the product of Turky is exported in foreign bottoms, and by the ſame veſſels all the product of foreign countries is carried thither. They concern themſelves very little in navigation; their own ſhips do little more than tranſport the produce of one province to another, and their ſhips of war, their royal navy, is not able to contend with the meaneſt of the maritime powers of Europe.

The raw ſilk imported from the Grand Signor's dominions is for the moſt part of the growth of Perſia; the ſilk which Turky produces being manufactured and ſpent there. There are no wrought ſilks imported into England from Turky, or any other country, becauſe they are at preſent prohibited by act of parliament to be worn here: but the Turky burdets, which have a mixture of ſilk, are however pretty much worn amongſt us, and wrought ſilks may be brought to England, provided they are exported again.

It ſeems to be much more for the intereſt of the Chriſtian princes, that theſe fine countries ſhould be in the hands of the indolent Turks than of any Chriſtian power, not only as it would make that power which ſhould poſſeſs them dangerous to the reſt; but they might monopolize moſt of the trade of the world; for it is not much more than a month's voyage from Baſſora, or the Red ſea, to India, from whence might be imported all the riches of the eaſt, and from the ports on the Mediterranean they might be diſtributed to all the kingdoms of the weſtern world in their own bottoms, and conſequently they might ſet what price they pleaſed upon them: the trading nations

of Europe were ſo ſenſible of this, that when they ſaw it in the power of the imperialiſts to drive the Turks out of Europe, as was once the caſe, when prince Eugene, the imperial general, drove them before him almoſt to Adrianople, then the Engliſh and Dutch interpoſed, and by their mediation put a ſtop to the imperial arms.

The prices of the moſt conſiderable articles we import from Turky were, not long ſince, as follows:

Sherburf ſilk and Ardept ſilk imported from Smyrna, is ſold by the batman of two thouſand four hundred drachms, which ought to hold out eleven great pounds of twenty-four ounces, (as this and all raw ſilk is ſold) for ſixteen pounds and a half of ſixteen ounces to the pound; is worth about ſixty-five dollars per batman, the firſt ſort, without the charges of cuſtom, &c.

	Dollars.	
Cotton wool — —	14	Per quintal of 100 rotillo's, which ought to weigh 122 pounds Engliſh.
Cotton yarn as in goodneſs	20 to 37½	
Galis — — —	20	
Valinia — — —	1½	
Box-wood — — —	1½ to 2	
Bees-wax — — —	44	

Goats wool, the oque of eight hundred drachms, or five pounds ſix ounces Engliſh, Dollars 3¼.

	Dollars.	
Scammony — — —	7½	Per oque of 400 drachms, or 2 pounds 11 ounces Engliſh.
Worm-ſeed — — —	1½ to 2	
Roman vitriol — —	¼	
Mohair yarn from —	1½ to 5	
Scio Turpentine — —	2	
Gum tragant — —	⅔	

SECT. VIII.

Containing an account of the forces and revenues of the Grand Signor.

THE Turkiſh forces are of two ſorts. The firſt may be compared to our guards and ſtanding forces that are paid out of the treaſury, namely, the ſpahis and janiſaries; the one horſe and the other foot. The ſecond ſort of ſoldiers are thoſe which are raiſed and paid by the gentlemen of the country, who hold their eſtates of the prince, on condition of bringing a certain number of men and horſes into the field whenever they are required; theſe are called zaims or timariots. We ſhall ſpeak firſt of the ſtanding forces, the ſpahis and janiſaries.

The ſpahis or horſe, were originally gentlemen, who had their education in the academies of the ſeraglio, and are about twelve thouſand in number, divided into two bodies, viz. the ſilachtari, whoſe colours are yellow; and the ſpahaoglari, whoſe colours are red: theſe laſt were the eſquires or ſervants to the former, but are now equal, having in ſome battle ſtood their ground, when their maſters ran away, whereupon the emperor ordered that there ſhould be no diſtinction made between them for the future. Bows, arrows, and darts, were formerly their weapons; but now they have carbines and piſtols like our troopers. The ſpahis of Aſia are ſaid to be generally beſt mounted; but thoſe of Europe beſt diſciplined. Their pay is very different, from twelve to one hundred aſpers a day; but none have more than one hundred, which is about four ſhillings and two-pence of our money; and though it may be imagined that thoſe of the lower claſs could not ſubſiſt, and keep themſelves and their horſe, on ſix-pence a day, yet proviſions are ſo exceedingly cheap in Turky, that it is very poſſible to maintain themſelves with that allowance, eſpecially as their ſons are allowed to be enrolled in that body, and receive twelve aſpers a day each; and when the Grand Signor takes the field in perſon, he advances to the ſpahis five thouſand aſpers a man, to furniſh them with arms and accoutrements. Theſe gentlemen manage their arms and horſes very dexterouſly, but charge in no manner of order, though with a great deal of fury; which if their enemies can ſuſtain a little while, they retire in more haſte than they advanced, and can never be brought to return to the charge again. Great numbers of volunteers uſually join the ſpahis when the Turks enter into a war, in hopes of being preferred in that body.

The janiſaries, who are all foot, are educated alſo in the ſeminaries of their ſeraglios, where they are traihed up to arms; and in order to increaſe and recruit this body, every fifth Chriſtian captive, under fifteen years of age, is reſerved for the Grand Signor's ſervice; and the moſt comely lads amongſt them have a ſuitable education given them, being firſt inſtructed in the Turkiſh language and religion. The body of janiſaries did not at firſt exceed ſeven thouſand, but were afterwards increaſed to twenty-five thouſand, and there may be one hundred thouſand more that purchaſe the name and privileges of janiſaries; but theſe ſeldom ſerve in the army, or receive pay: the reſt of the ſlaves that are not incorporated in this body, are brought up to ſuch buſineſs and employments as are found fitteſt for the ſervice of the ſeveral royal palaces; the moſt ingenious are prepared for offices in the ſtate; others are made gardeners, ſmiths, carpenters, &c. and ſome are quartered on the lands and eſtates in Anatolia, from whence this body is frequently recruited.

As ſoon as a young janiſary is enrolled, he receives from one aſper a day to ſeven, beſides his diet; but this pay is never increaſed to more than twelve aſpers till he is an officer. Thoſe that are unmarried live in a particular quarter of the town, and eat in common as in a convent, and have their cloathing alſo provided for them by the government; but living idly, and having nothing to do in time of peace, they frequently grow mutinous, and pretend to direct the adminiſtration: and if they apprehend any of the miniſtry are not their friends, they demand their heads, nor will this always ſatisfy them; they proceed ſo far ſometimes as to depoſe the Grand Signor, and advance one of his relations to the throne.

Their diſaffection is uſually diſcovered when they come to the divan, whither they are ſummoned twice a week by their aga, or general, and have an entertainment provided for them from the Grand Signor's kitchen. If they apprehend that they are like to be oppreſſed, or diſcountenanced by any great man, they overturn their plates, and ſlight the meat provided for them; which when the court are appriſed of, they endeavour to ſatisfy them by gratuities and fair promiſes, to prevent the diſaffection becoming general. There are about one hundred and ſixty houſes or apartments of the janiſaries in Conſtantinople, which are called chambers, and every chamber has its tchorbagi, or captain; the odabaſhee, or maſter of the chamber, who is lieutenant of the company; the wekilbarg, or pay-maſter; the baizacktie, or enſign, who carries the colours; the cook, who puniſhes them when they have committed any fault; and the under-cook, whoſe buſineſs it is to ſummon all married janiſaries, who live at Conſtantinople, to attend when there is occaſion for them: but their marrying being a bar to their preferment, moſt of them live ſingle, and have two meals a day provided for them. Theſe troops are moſt relied on in the day of battle; and indeed the reſt are little better than our militia; nor can the diſcipline either of the ſpahis or janiſaries be much applauded, for though they charge an enemy with great fury, they obſerve very little order, and it is very well for their enemies that they are too proud to learn. Baſſa Boneval was very well qualified to have inſtructed them, but they would not bear the mention of it; and he ran the hazard of being ſacrificed to their reſentment by propoſing it. No Chriſtian power would be able to oppoſe the Turks, if their numerous armies were diſciplined like thoſe of the Europeans.

Beſides the ſpahis and janiſaries, which are the flower of their armies, there is that other militia, already mentioned, which is much more numerous; and are raiſed and maintained by ſuch gentlemen as hold their lands of the government by military tenures; and ſuch gentlemen are denominated either zaims or timariots, according to the number of men they are obliged to bring into the field. The revenues of the lands of a zaim are from twenty thouſand aſpers to ninety-nine thouſand nine hundred and ninety-nine; if they are valued at an aſper more, it is the revenue of a ſangiac, bey, or baſſa, which is from one hundred thouſand aſpers to nine hundred and ninety-nine thouſand nine hundred and ninety-nine: If it amounts to more, it is the revenue of a beglerbeg, or viceroy, who has ſeveral governments or ſangiacſhips under his command. A zaim is obliged to raiſe from four to nineteen ſoldiers; and a timariot is not obliged to maintain more than four. Some timariots hold their lands directly of the Grand Signor; and others of the beglerbeg or viceroy of the province.

In time of war the zaims bring grand tents or pavilions into the field, to which are annexed kitchens, ſtables, and all manner of conveniences; and for every five thouſand aſpers yearly rent, muſt find a trooper compleatly armed, which does not amount to nine pounds ſterling; and that it is ſaid, will maintain a trooper there, proviſions are ſo cheap, though it would not maintain a foot ſoldier here; and in time of peace the zaims and timariots are no expence. Theſe ſoldiers are formed into regiments, having their ſeveral colonels, captains and other commiſſion officers.

officers, and have different colours: the colonels are commanded by ſangiacs or baſſas, and theſe by the beglerbeg or viceroy of the province; and the whole army is commanded by the Grand Signor; and when he is not in the field, by the prime viſir or ſeraſkier. The zaims and timariots are obliged alſo to find men for the ſea-ſervice; and both of them are obliged to ſerve in perſon by land; but the timariots only on board the fleet.

The province of Natolia Proper brings about twenty-ſix thouſand men into the field; Caramania or Cilicia, five thouſand; Diarbec, eleven thouſand; Damaſcus, three thouſand; Sivas (part of Armenia Major), eleven thouſand one hundred; Erzerum, twelve thouſand three hundred; Van, three thouſand five hundred; Maroſeli, one thouſand three hundred; Cyprus, two thouſand five hundred; Tripoli, one thouſand eight hundred; Rika, two thouſand; Trebizond, one thouſand four hundred; Aleppo, three thouſand two hundred; Tchilder (part of Georgia), two thouſand four hundred; the captain baſſa for the iſles, three thouſand five hundred; Romania, in Europe, twenty-ſeven thouſand; the militia on the frontiers of Hungary ſeventy thouſand.

The horſe raiſed by the zaims and timariots only are computed to amount to one hundred thouſand men and upwards; to which are added a great number of volunteers, that ſerve at their own expence, in expectation of ſucceeding the zaims and timariots that fall in battle, who chuſe to engage in the moſt deſperate enterpriſes. When a zaim is ſuperannuated or diſabled, he may reſign to his ſon, or ſome other relation. A peaſant or farmer cannot be a ſpahi or trooper, unleſs on the frontiers where he has manifeſted his courage againſt the enemy; and in that caſe he is allowed to be a candidate for the lands of a zaim or timariot that is dead. In Romania, when a zaim or timariot dies in battle, his lands are divided equally among his children; but when he dies a natural death, the beglerbeg or viceroy of the province has the diſpoſal of the eſtate, and ought to give it to the perſon who is moſt capable of ſerving the government; but he conſiders principally his own intereſt, and gives it to him that advances moſt money, which has rendered that militia much leſs conſiderable than they were heretofore. But there are many zaims and timariots in Anatolia, whoſe lands deſcend to their heirs.

The forces of the Grand Signor in Egypt are computed to amount to eighty thouſand men; notwithſtanding which his authority is often diſputed by the Egyptian princes, which are about twelve in number, and whoſe concurrence ſeems neceſſary to the raiſing money and the making laws in that kingdom; and, if any incroachments are made on their liberties and properties, they are ready to defend them; and have ſometimes depoſed the beglerbeg, and compelled the Grand Signor to appoint another more acceptable to them. Theſe are moſt of them the deſcendants of the Mamelukes, or Mamlucks, who were for ſome hundreds of years ſovereigns of this kingdom. In Egypt, therefore, the Grand Signor ſeems to be but a limited monarch. The tributary countries, ſuch as Tartary, Walachia, and Moldavia, are obliged to raiſe a certain number of troops, and join the Turkiſh army when required. The kan of the Crim Tartars is obliged to raiſe one hundred thouſand men; and the princes of Moldavia and Walachia are obliged to bring ſixty or ſeventy thouſand men into the field. The two laſt are Chriſtian princes of the Greek communion.

The revenues of the Grand Signor ariſe from the demeſne lands, or lands of the ſtate; from the duties of import and export, or cuſtoms; by the tribute paid by the kan of Crim Tartary, Moldavia, Walachia, and the Grecian iſlands; by a poll-tax on the Chriſtians, and thoſe who are not of the eſtabliſhed religion: and the armies raiſed and paid by the zaims and timariots in time of war may well be reckoned part of the revenue, as it ſaves him ſo great an expence; but the greateſt part of the public revenue ariſes from the preſents and annual payments which are made by the governors and other great officers of ſtate, and the confiſcation of their eſtates when they die or are diſplaced; for whatever his beglerbegs, viceroys, or governors, have amaſſed or extorted from the people, falls to the Grand Signor at laſt, who is heir general to all of them, and only allows their wives and families a ſubſiſtence out of them; but it is not ſo with the native Turks, the gentlemen of the country, who are not in office, their eſtates uſually deſcend to their children, and ſo it is in that rich province of Egypt. The Grand Signor has not more than half a million ſterling from thence, more than what bears the charges of the government; and if he ſhould attempt to raiſe more in that kingdom, it would probably occaſion a general revolt of the Egyptian princes, who may be looked upon as independent ſovereigns almoſt in their reſpective territories, and cannot be diſplaced by the Grand Signor: as to the reſt of his dominions, this prince is not only heir to all his officers of ſtate, but has vaſt ſums of them, when they enter upon their poſts, and annually afterwards. When a great man in the ſeraglio is nominated to a government, he immediately makes a preſent to the throne, and, if he has no treaſure of his own, uſually borrows it of the eunuchs of the ſeraglio, who are generally great uſurers, and know how to get paid again. For if ſuch governors are not punctual in repaying what they borrow, the eunuchs know how to miſrepreſent their actions at court, to the endangering their heads: the firſt money, therefore, a baſſa extorts from the people, is paid to the eunuch he borrowed it of.

Beſides the conſtant revenue, if there happen to be a war with the Chriſtians, or any other preſſing neceſſity, the treaſures of the moſques or churches, which are very great, may be made uſe of to ſave the ſtate.

The emperor has alſo a private treaſure lodged in vaults, as a reſerve in extraordinary caſes, where none but the officers of the treaſury and the prime viſier ever enter. And as this is an arbitrary government, the Grand Signor is, in reality, maſter of the purſes of all his ſubjects: and it is not an uncommon thing, when the treaſury is low, to borrow ſums of thoſe that are known to abound in wealth; and what is borrowed of private men, is always punctually repaid; but what is borrowed of governors, or officers of ſtate, is ſeldom returned; for theſe are not ſuppoſed to have a property in any thing, but what the ſovereign can demand when he pleaſes. Theſe are creatures raiſed by him, and have nothing but what they receive from his bounty; and though they are veſted with great power and wealth for a time, they are really in a worſe ſituation than the lower claſs of people, who enjoy what they have with as much eaſe and freedom as the ſubjects of any other country, though they are ſeldom preferred to any poſts in the government.

SECT. IX.

Affording a deſcription of the Grand Signor's court, alſo of his haram or ſeraglio, women and other inhabitants of it, great officers of ſtate, and ſome maxims of the Turkiſh policy.

THE dominion of the Turkiſh emperors being founded in force, their power is unlimited, and they look upon their people, as well as their country, to be their property, and at their diſpoſal; the Grand Signor is reſtrained by no laws or compacts but thoſe of his religion; nevertheleſs, we muſt alſo obſerve, that though he exerciſes an arbitrary dominion over his governors and officers, who depend upon him for all that they enjoy, yet private gentlemen, native Turks, who are not in any poſt, enjoy their liberties and properties as fully as if it was a limited monarchy, as Motraye aſſures us, who lived amongſt them, and made it his buſineſs to inform himſelf of the nature of their government and adminiſtration: and ſhould their ſovereign break in upon their properties, it would very probably occaſion an inſurrection. Over his Chriſtian ſubjects, indeed, which are almoſt as numerous as the Turks, he tyrannizes moſt unmercifully, as well as over the great officers of ſtate, and ſuffers his Mahometan ſubjects to inſult and abuſe the Chriſtians with impunity; though they are the moſt uſeful of his people, and chiefly carry on their manufactures and foreign traffic, without which it would be difficult for the government to ſubſiſt. He compels the Chriſtians, alſo, to diſtinguiſh themſelves by the colour of their cloaths and other marks of contempt, by a burdenſome poll-tax, and other duties, from which the native Turks are exempted.

The Grand Signor, among his other titles, aſſumes theſe; namely, "The Shadow of God, a God on Earth, Brother of the Sun and Moon, Diſpoſer of all earthly Crowns;" and as long as he is ſucceſsful, his ſubjects adore him; but if he is unfortunate in his wars, he loſes his dignity, is ſlighted, and frequently depoſed. This prince is never crowned, but, on his acceſſion, is carried from the palace, and inaugurated at a place called Job, near the walls of Conſtantinople, where the tomb of ſome of their prophets ſtands, which according to their traditions is the tomb of Job. Their traditions add, that Job was

a judge in the courts of Solomon, and that Alexander was the general of Solomon's army; which diſcovers their extenſive knowledge of hiſtory and chronology! At the inauguration, after ſolemn prayers for the proſperity of the Grand Signor, the muſti gives him his benediction and his majeſty ſwears to maintain the laws of Mahomet, by which is underſtood only that part of the law which concerns religion; for he is at liberty to repeal and alter any other part of it.

Thoſe who receive any pay or ſalary from the government, or are in any office under the crown, are ſtiled the Grand Signor's ſlaves, which is a much more honourable title than ſubject here, as well as in Perſia; and in effect, they have the command of thoſe ſubjects who are not in the Grand Signor's pay, and inſult them at their pleaſure. The term "ſlave," in Turky, ſignifies one who is entirely reſigned to the emperor's will, and ready to execute whatever he commands, how difficult or dangerous ſoever it be.

The young lads who are educated in the ſeraglio, and deſigned for employments in the government, are called ichoglans; they are the children of Chriſtian parents taken in war, or preſents of the viceroys and governors from Georgia, Circaſſia and the remote parts of the empire. The moſt beautiful, well ſhaped, ſprightly children that can be met with. The Grand Signor reviews them before they are admitted, and orders them to be received into the ſeraglios of Pera, Adrianople or Conſtantinople, which are the three colleges or ſeminaries, where they are educated according to the opinion he entertains of them; but thoſe who are ordered for the ſeraglio of Conſtantinople are eſteemed moſt in the way of preferment, and are placed under the care of the chief of the white eunuchs called the capi agaſi. The eunuchs (who ſtudy every lad's genius, directing his ſtudies towards what he ſeems beſt qualified for) treat their pupils with extraordinary ſeverity, it is ſaid, not paſſing by the ſmalleſt faults; ſometimes they order them a certain number of blows upon the ſoles of their feet, and at others puniſh them by watching, faſting, &c. making them undergo a ſeverer diſcipline than the novices in a monaſtery.

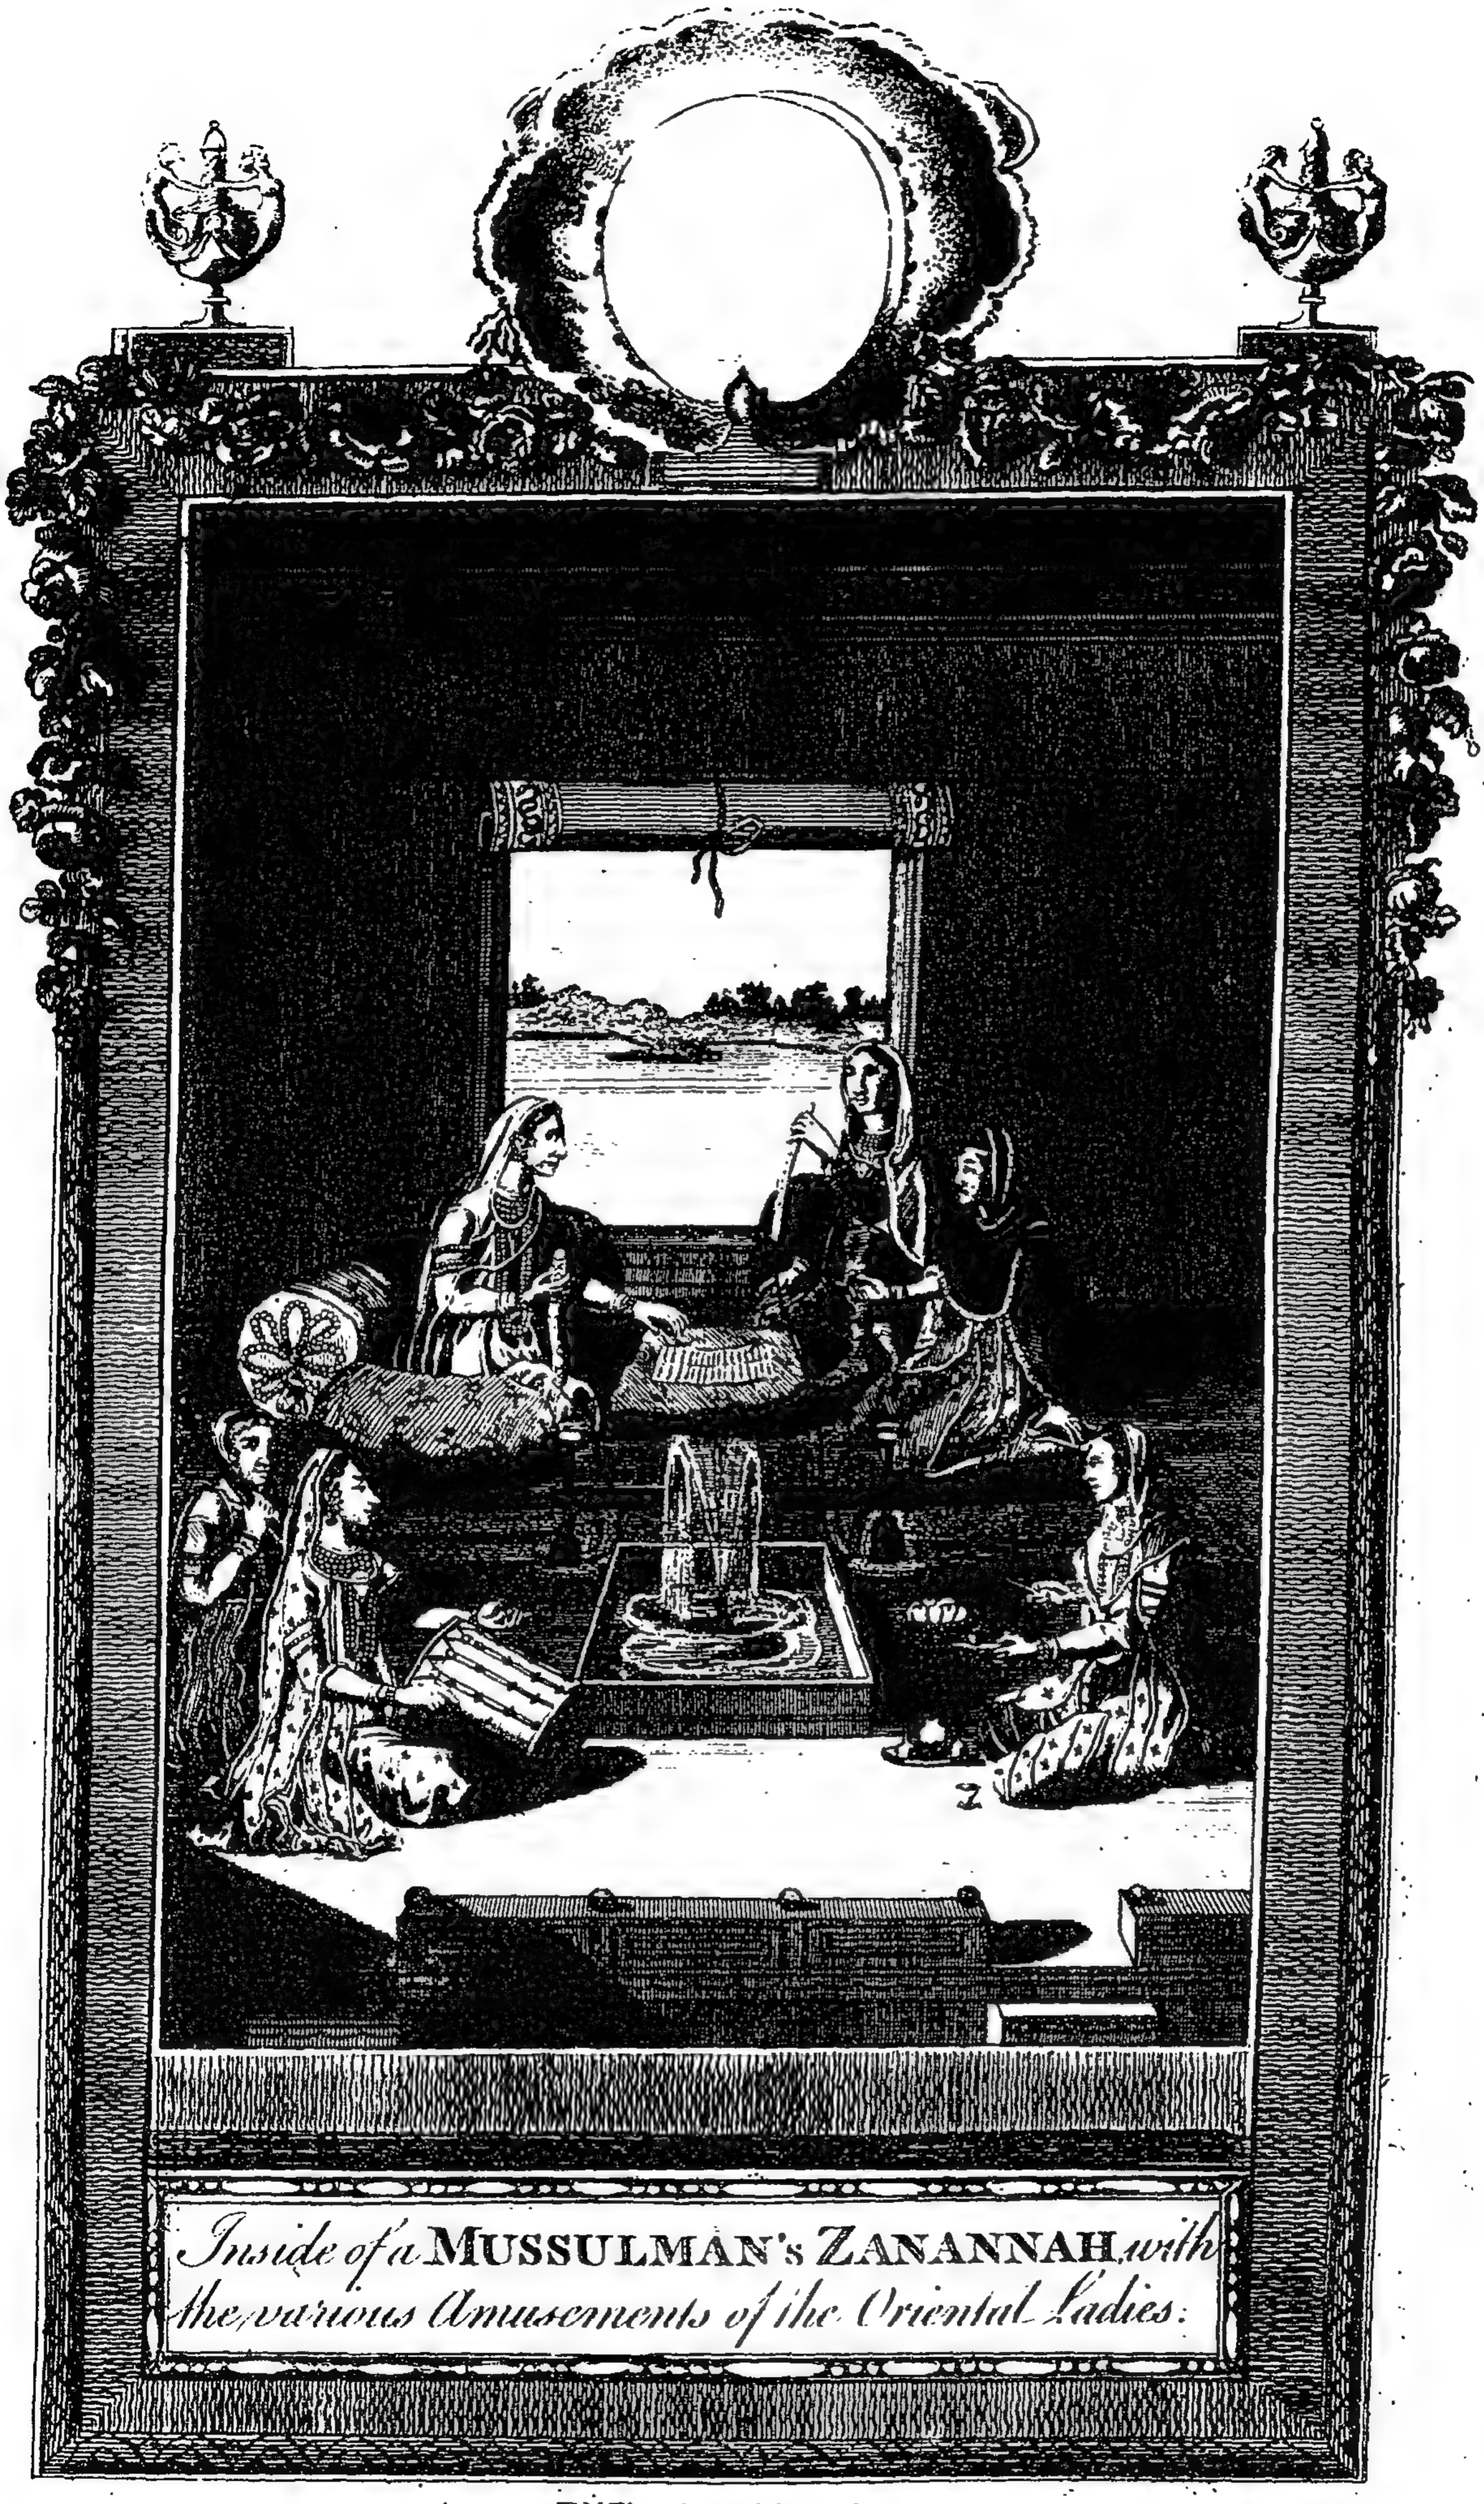
The firſt leſſons which are taught them are, ſilence, and an humble modeſt behaviour: then they are inſtructed in the rites of the Mahometan religion, and to ſpeak, read and write the Turkiſh language, and afterwards the Perſian and Arabic. Their diet is rice, and other wholeſome food fit for ſcholars, and their cloathing generally of Engliſh cloth. They are never from under the eunuchs eyes, and lodge in long rooms upon ſofas, where lamps are always burning, and an eunuch between every five to inſpect their behaviour. When they are fit for manly exerciſes, they are taught to handle the ſpear, to draw the bow, and throw the gerit or dart, in which they ſpend ſeveral hours in a day, and are ſeverely corrected if they make no proficiency. Thus by conſtant exerciſe they improve their health and ſtrength, and become fit for military employments: they are taught, as in Perſia, to ſhoot their arrows on horſe-back in a full career, backwards, forwards, ſideways, and almoſt in any poſture: and at theſe exerciſes the Grand Signor himſelf is ſometimes preſent.

From theſe ſeminaries, the emperor makes choice of all the officers of his houſhold, which are forty in number, of whom twelve are the principal; and as governments fall, they are preferred, but ſeldom till they are forty years of age. When they leave the ſeraglio, they recommend themſelves to the favour and patronage of the principal eunuchs; and, on theſe occaſions, appear as polite and obſequious in their addreſſes as our courtiers do in this part of the world; for they treat thoſe of a different faith with great haughtineſs, or rather inſolence, yet they behave with as much civility towards each other as gentlemen do elſewhere.

As the lads of the ſeraglio never have the ſight of a woman, they frequently fall in love with one another, to which is ſometimes given the name of platonic love, which frequently ends, however, in luſt; nor can the ſevereſt puniſhments deter them from purſuing it. The old eunuchs watch them ſtrictly, when they perceive any ſymptoms of this paſſion; but they will carry it on by ſigns, when they are prohibited the converſation of the amiable object; and there are ſometimes ſuch jealouſies among rivals, and ſuch ſchemes for deſtroying thoſe they ſuſpect, as ſometimes throws the whole apartment into confuſion. The great officers of the ſeraglio, alſo, ſometimes make love to the pages, who are uſually the moſt beautiful boys, and make intereſt to get them retained in their ſervice, ſuffering themſelves to be governed and influenced by them. There are inſtances of emperors, who have kept ſuch boys, and admitted them to a ſhare in the government.

The ladies of the ſeraglio, alſo, make love to one another ſometimes; which would tempt one to think, there is no ſtifling an amorous flame, but if it is not ſatisfied in the way nature directs, will find another vent. The deaf and dumb, or mutes, in the ſeraglio, are about forty, who converſe by ſigns; ſome of theſe conſtantly attend the emperor. Dwarfs that act the part of buffoons are ſtill retained in this court, as they were in courts and great families here in the laſt age, when gentlemen made themſelves merry with the defects and deformities of their own ſpecies. But no people have a greater ſhare in the government of the ſeraglio, or a greater influence on affairs of ſtate without, than the eunuchs and caſtrated inhabitants. Theſe princes ſeem to confide more in their eunuchs, than in any of their officers or ſervants, not only to guard the chaſtity of their women, but in the moſt important affairs. The kiſlar agaſi, a black eunuch, is the ſuperintendant of the women; and the capi agaſi, a white eunuch, is governor of the pages and white eunuchs belonging to the court.

The ſeraglio is ſupplied from time to time with young blooming beauties taken in war, or purchaſed in Georgia and Circaſſia, but chiefly by the governors of provinces, who never fail to make preſents to the court of ſuch young ladies, in their reſpective provinces, as are eminent for their beauty: and when theſe young ladies are admitted into the ſeraglio, they are taught muſic and dancing, and whatever may render them moſt agreeable to their lord. When any of them are made choice of to attend the Grand Signor in his apartment, ſhe is complimented, on the occaſion, by the reſt of the ladies of the court; and ſhe that has the firſt ſon, is in a manner empreſs, and ſtiled the haſaki ſultana. For the Grand Signor never marries any of them, ſince Bajazet was taken priſoner with his wives, and ſaw them abuſed by the conqueror's officers.



The only women that have a man to themſelves in Turky, are the Grand Signor's ſiſters or daughters, whom he marries to the governors of provinces, and other great men: theſe ladies aſſume the ſtate of queens, and have their huſbands in as much ſubjection as other Turkiſh huſbands have their wives, and oblige them to put away all the reſt of the wives and concubines, how long ſoever they have lived with him. And it ſeldom fails to prove fatal to him, if he takes another woman to his bed.

If the chief ſultana loſes her ſon, ſhe loſes her title, and the next who has a ſon ſucceeds her. The Grand Signor frequently takes the air with his women in the gardens of the ſeraglio, after the gardeners and all others have had notice to keep their diſtance; and he ſometimes goes over the Boſphorus with them to the palace of Scutari on the Aſian ſide, which is not much more than a mile from Europe; the ladies being carried thither in covered boats, ſo that no man can ſee them; and when the emperor removes with the court by land to any other palace, the ladies ride in cloſe chariots, and ſignals are made for all men to quit their houſes which lie near the road, and remove a good diſtance from it.

We come next to give an account of the great officers of ſtate, who are generally of the number of the royal ſlaves, who have had their education in the ſeraglio: and at the head of theſe is the grand vizier, on whom the Grand Signor, in a manner devolves his authority, leaving the adminiſtration entirely in his hands. He has the ſole command both in peace and war; has the direction of the revenue, and is the ſupreme judge in civil as well as criminal cauſes; though it is very rare they meet with a genius capable of executing ſo many different charges.

There are, beſides the grand vizier, ſix other ſtiled viziers of the bench of council, and baſſas of three horſe tails, becauſe there are three ſtandards or horſe-tails carried before them, whereas other baſſas have but one. Theſe viziers are men learned in the law, and well verſed in politics, whom the grand vizier ſummons to the divan as his council, though he is at liberty to take or reject their advice as he ſees fit: the muſti, and other civil judges, are alſo frequently called to aſſiſt at their councils, and ordinary matters are uſually referred to ſome of their determinations.

Their divans are both councils and courts of juſtice, and one is held every day of the week at the vizier's palace, except Fridays; he goes alſo four times a week to the divan in the ſeraglio in great ſtate, being preceded by the chiaux baſſa, and ſeveral other chiauxes and virgers, and attended by the great officers of the empire, and his Albanian guards on horſeback, the people ſhouting and wiſhing

Inside of a **MUSSULMAN's ZANANNAH** *with the various Amusements of the Oriental Ladies:*

Phillips & Smith sculp.

wiſhing him proſperity as he marches through the ſtreets.

The Turks apprehend, that nothing contributes more to the peace and ſecurity of their empire, than their deſtroying all appearance of a nobility and great families amongſt them, and ſuffering no ſucceſſion to eſtates or offices. Their baſſas or governors are all taken out of the ſeraglio, perfectly ignorant of what blood or family they were of, and have no powerful relations or dependants to ſupport them, if they ſhould entertain any aſpiring thoughts. The duration of their command is alſo ſo very ſhort, that they have not an opportunity of ingratiating themſelves with the people, or forming an intereſt ſuperior to that of the Grand Signor: and of all the rebellions that have been formed by the baſſas of diſtant provinces, we ſcarce find any one that has been of long duration; the rebels have been uſually diſperſed without coming to a battle. The Sultan has no more to do, but to procure their leader to be taken off, and he is ſure of a victory without fighting, there being no powerful relations to ſupport the cauſe; and it is farther obſervable, that when a rebel meets with ſucceſs, he is never able to maintain himſelf any other way than by ſetting up another prince of the royal family, who is no ſooner eſtabliſhed in the government, but he uſually makes the perſon who raiſed him a preſent of a bow-ſtring (i. e. cauſing him to be ſtrangled) for fear of being ſerved as his predeceſſor was before him.

The baſſas of ſome petty governments, indeed, have been allowed the privilege of leaving their commands to their children, as heretofore the baſſa of Gaza; but one of them happening to live ſeventy-five years in that government, it was thought ſo ill a precedent, and ſo contrary to the Turkiſh politics, to ſuffer a perſon to remain ſo long in one command, that he was invited to court, and, without any proceſs or charge againſt him, ordered to be ſtrangled as ſoon as he arrived. And becauſe power naturally attends on riches, if they remain long in a family, the wealth of a baſſa is ſcarce ever permitted to deſcend to his children.

When a baſſa dies who has married a ſultana, her dowry is firſt paid out of his eſtate, and the reſt devolves on the emperor; and if there be any iſſue of ſuch marriage, the Sultan makes ſome proviſion for the ſons; but it is an unalterable maxim, that ſuch ſons ſhall never be preferred to any conſiderable poſt in the government, leſt their near relation to the royal family, ſhould inſpire them with ambitious views. One reaſon that the Turks encourage traffic ſo little, is, deſignedly to impoveriſh their ſubjects, that they may not have it in their power, how much ſoever they may have it in their will, to rebel. Lord Bacon obſerves, that it is not poſſible for a nation overloaded with taxes to retain a martial ſpirit; they ſubmit to oppreſſion, and patiently endure all kind of violence. This ſeems to be the opinion of the kings of France, and other princes, who chuſe to reign over ſlaves, rather than a free people. The Turks keep many countries in ſubjection, that were once wealthy and warlike nations, who, by the loſs of their liberty and properties, is, and, like the poor French in their wooden ſhoes, throw up their caps, and cry, Vive le Roy, when they are periſhing, and deprived of all the neceſſaries of life by their grand monarque.

SECT. X.

Treats of the Mahometan religion profeſſed by the Turks, and alſo of the Greek church in the Ottoman empire.

THE religion of the Turks, namely, the Mahometan, is divided into a multitude of ſects: every conſiderable town almoſt differs from another in ſome particulars, which is ſuppoſed to proceed from the many proſelytes they make almoſt of every nation, ſome of whom are induced to profeſs the Mahometan faith to obtain their liberty, and others, in hopes of preferment; and every nation introducing ſome favourite opinions or doctrines of the country from whence they came, naturally occaſions a variety of ſects: and if they be not oppoſite to the Turkiſh doctrines, and they hold the unity of the Godhead, and Mahomet's miſſion, and obſerve the five chief precepts, viz. their purifications, prayers, faſts, alms, and pilgrimages, and ſo they do not advance any opinions that may prove dangerous to the ſtate, the government takes little notice of them.

We have before hinted, in treating of Arabia, that as Mahomet left no ſons, both Turks and Perſians derive their ſpiritual and temporal authority either from Hali, the huſband of his daughter Fatima; or from Abubeker, whoſe daughter Mahomet married. As the Perſians prefer the doctrines of Hali, and the Turks thoſe of Abubeker, and charge each other with corrupting and miſinterpreting the koran; theſe two ſects retain ſtronger prejudices againſt one another, than they do either againſt the Jews or Chriſtians; and when they are at war, both nations call the war "the cauſe of God," and their adverſaries heretics, and ſeldom give quarter to each other in battle. Among the Turks, there are four ſects, which differ only in ceremonials, and are eſteemed orthodox in the main. 1. The firſt are called the hanniſſes, who inhabit Turky and Tartary. 2. The ſhaffees, of which are moſt of the Arabian tribes. 3. The malchees, who poſſeſs the coaſt of Barbary, viz. Algiers, Tunis and Tripoli, and, according to ſome, thoſe of Morocco; and, 4. The hambelles, who are a ſmall tribe of Arabians. All the Mahometans, except the Perſians, are of one of theſe ſects; but then theſe are ſplit into a multitude of other ſects, diſtinguiſhed by the names of their reſpective leaders. We ſhall mention ſome of them; and firſt, the ſect of moatzali, who are ſtiled the defenders of the equity and unity of God; theſe are again ſubdivided into two and twenty other ſects, who maintain their ſeveral tenets with a kind of frantic zeal, charging thoſe that differ from them with infidelity. One of the ſubdiviſions maintain, that Chriſt was eternal, aſſumed a body, and was incarnate, and that he will judge the world at the laſt day; which they prove by that text in the koran, viz. "Thou, Mahomet, ſhalt ſee thy Lord return in the clouds."

The moſt general opinion in relation to a future ſtate is, that the virtuous will be happy; that the wicked will be puniſhed for a time, but will at length be admitted into Paradiſe.

There is another ſect that believe tranſmigration, that the ſouls of the deceaſed go into other animals, which makes them extremely compaſſionate and tender of them.

The ſect ſtiled the eſcrachi are of opinion, that the happineſs of the other world conſiſts in the contemplation of the divine nature, and not in ſenſual enjoyments.

There is another ſect, which may be ſtiled the doubtful, who will be poſitive of nothing; they neither endeavour to perſuade any thing, or to diſſuade any man from his purpoſe. They obſerve, that truth may be, and often is, ſo dreſſed up, that it cannot be diſtinguiſhed from falſehood; and therefore to any queſtions that are aſked them, they anſwer, "God knows, it is unknown to us." And of this ſect are ſome of their greateſt men; but I take this to be rather an article of policy than religion, as it may be dangerous to give their opinions one way or other in an arbitrary government.

Great numbers either are, or pretend to be, atheiſts; but theſe are generally renegados, who have apoſtatized, and the moſt profligate amongſt them, who, dreading to be called to account hereafter, endeavour to perſuade themſelves they have nothing to fear after death. They believe the world to have been what it is from eternity; that men, as well as trees and flowers, periſh; and one generation will ſucceed another, as it has done hitherto, to all eternity.

The Mahometans have their derviſes or friars, and convents, as well as the Chriſtians, and it is pretended that their religious houſes were inſtituted by Mahomet; but there is no particular mention made of them in their books till within theſe four or five hundred years. The word derviſe ſignifies one that is poor, and has renounced the world. The firſt convent that was erected is at Cogni (olim Iconium) in Lycaonia, in which there are between three hundred and four hundred derviſes, the ſuperior of which houſe is the general of the whole order, by virtue of a charter of Ottoman, from whom their emperors derive their pedigree. Theſe derviſes go meanly cloathed, put on a dejected look, faſt, pray, and perform penances as the Roman Catholics do, and have ſtrings of beads by which they number the prayers they repeat: on Tueſday every week the ſuperior of the convent preaches or expounds part of the koran to them, at the concluſion whereof the monks having made a profound reverence to their ſuperior, fall into a dance, turning round perpetually with prodigious ſwiftneſs, one playing to them on a kind of flute. The muſic ceaſing they ſtop in an inſtant, not at all diſordered by their circular motion, to which they have been trained up from their infancy; and this they pretend to do in memory of Mevaluna, their founder, who continued this circular motion, they aſſure us, fourteen days, without eating or drinking, and then falling into a trance, received certain revelations concerning the inſtitutions of this order, the flute being (as they tell us) the inſtrument that Jacob and other holy ſhepherds uſed to praiſe God upon;

upon; but, however that be, it has a very doleful ſound, which would incline one to think they were rather bewailing their condition, than praiſing the deity: but as the koran prohibits all kinds of muſic in their devotions but vocal, this is uſed by few; nor do they ring bells to call people to prayers, it is ſaid, for the like reaſon, but ſummon them from the minorets, or ſteeples of the moſques.

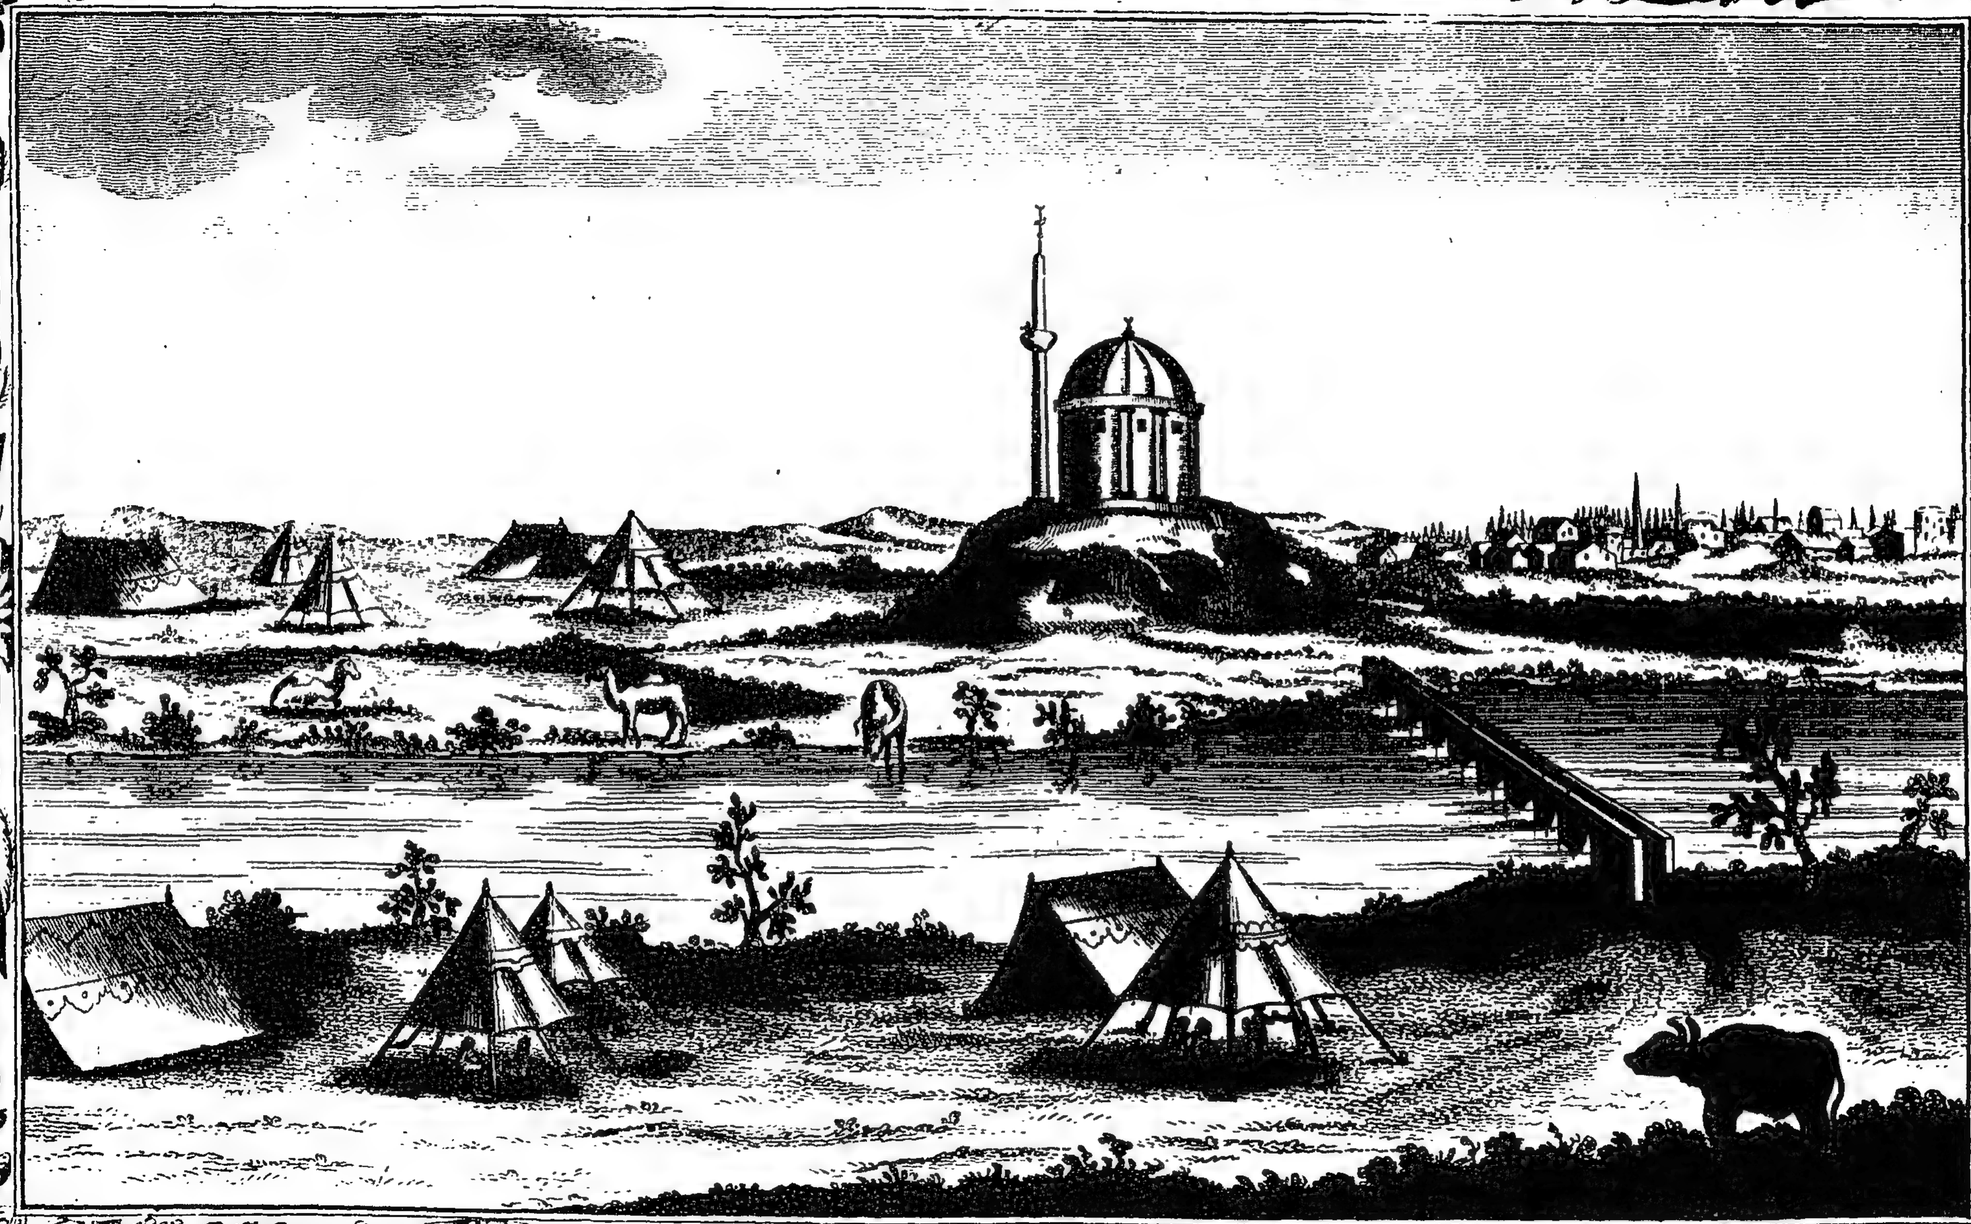
Notwithſtanding theſe deryiſes, like the Romiſh friars, vow chaſtity, poverty, and obedience, they may leave the convent if they deſire it, and enter into the ſtate of matrimony. In theſe convents they are taught the Turkiſh, Perſian, and Arabic languages, but ſcarce any art or ſcience, unleſs it be legerdemain or magic, or rather a pretence to it, and are as mere drones as the monks in this part of the world. To increaſe their ſtupidity, they ſwallow as much opium as would poiſon a dozen men that are not uſed to it; and though it may raiſe their ſpirits at firſt, this is ſucceeded by a ſtupefaction which renders them incapable of any kind of converſation. There are monaſteries of theſe derviſes all over the empire, and through India as far as China, where the brethren are entertained in their travels; and as they have excellent intelligence, the Turks make uſe of them as ſpies in the eaſtern nations. From theſe convents come moſt of the ſheiks or preachers, to which office any man may advance himſelf, as there needs no ordination; and he may lay it down again when he pleaſes: thoſe of the family of Mahomet are ſtiled emirs, and are known by their green turbans, that being Mahomet's favourite colour. Theſe are eſteemed ſuch holy men, that any one who ſtrikes them forfeits his right hand; theſe emirs ſeldom apply themſelves to any trade, except it be the purchaſing of ſlaves to make Mahometans of them, this being eſteemed a very meritorious employment among the Turks. We muſt not omit to mention their ſantos or hermits, who go naked, and let their hair grow down to their waiſts: theſe are in a manner adored by the devout people, and in ſome parts of the empire take upon them to ſcreen criminals from juſtice.

The office of high-prieſt, as well as that of king, having been aſſumed by Mahomet, his ſucceſſors, the caliſs of Babylon, exerciſed both for ſeveral hundred years; but the mufti, or high-prieſt in Turky, and other Mahometan countries, enjoys little more than the ſhadow of temporal power at this day, and their princes take the liberty of advancing and depoſing them at their pleaſure. The mufti has indeed ſtill the power of appointing all civil magiſtrates, their civil and eccleſiaſtical laws being in reality the ſame.

The koran and the comments upon it, are the rule by which they judge of all matters, unleſs where the temporal power, in ſome extraordinary caſes, is pleaſed to interpoſe; all appeals are made to him; and in caſes of importance, he is the laſt reſort. The Grand Signor ſcarce ever alters or reverſes his ſentence; and without his fetfa or fiat no conſiderable revolutions are taken, either in regard to peace or war; but if he refuſes to ratify or confirm what the miniſtry reſolve on, he is depoſed, and a more complying high-prieſt advanced in his ſtead; but the reaſon of demanding the mufti's fatfa at this day, ſeems to be, to prevent the clamours of the people, where ſucceſs does not anſwer their expectations, it being preſumed that men will ceaſe to murmur where a reſolution has been approved by their high-prieſt. When the Grand Signor writes to the mufti, he directs to the "Eſad, wiſeſt of the wiſe, inſtructed in all knowledge, the ſpring of virtue and true ſcience, key of the treaſure of truth," with ſeveral other pompous epithets.

Though the koran is generally held to be the rule of the Mahometan faith and practice, the mufti takes the liberty to make it ſpeak what language he pleaſes, as appears from many inſtances. It being demanded of him, what they ſhould do in relation to the hours appointed for their devotion, if they happen to be in a part of the world where the whole day was but an hour long; he anſwered, heaven did not require things impoſſible, but ſo as the duty was performed within the twenty-four hours, it was ſufficient; and the Mahometans being appointed to turn their faces towards Mecca when they pray, it was demanded, if they ſhould be in part of the globe, either by ſea or land, and did not know towards what point Mecca lay, how they ſhould comply with that precept: the mufti directed them to obſerve a circular motion at their prayers, and they would not fail ſometimes to ſet their faces right.

The cadiliſquiers are the next judges to the mufti, of which there are three, viz. 1. The cadiliſquier of Romania. 2. The cadiliſquier of Natolia; and, 3. The cadiliſquier of Egypt, who are eccleſiaſtics; and no man can be advanced to the high office of mufti till he has paſſed through one of theſe; and there is in every province a mollah cadi, who is the chief judge of the province, to whom the people may appeal from the ſeveral cadis or judges in the towns of that province; but notwithſtanding theſe already mentioned are ſaid to be the only legal judges, the begler begs and governors of towns and provinces take upon them to puniſh men, and even to put them to death ſometimes, without allowing them any trial whatever.



The imaums, or prieſts which officiate in their moſques, are not appointed by the mufti or any eccleſiaſtic, nor are they ſubject to them; any one who has the reputation of an honeſt man, and can read the koran, may take upon him this office on the recommendation of the people of the place to the governor of the town or province, when a church happens to be vacant; and as the conſent of the governor is neceſſary towards admitting one to officiate as a prieſt, ſo he may turn him out when he pleaſes; and the prieſt may leave his cure, and become a layman again, if he ſees fit. Their habit is the ſame as that of other peoples, only their turbans are a little enlarged, and they aſſume an air of gravity: and in the moſques, when the Imaum ſtands, or ſits, or proſtrates himſelf, the people imitate him: the Imaum alſo reads ſome part of the koran every Friday, which is their ſabbath, but ſeldom preaches. This is the buſineſs of the ſheicks, who make preaching their profeſſion; and theſe uſually have their education in the convents already mentioned. There is another duty the Imaums perform, and that is the calling the people to prayers at the appointed hours, from the tops of their minorets or ſteeples; for they will not ſuffer bells any more than inſtrumental muſic in their churches, as has been obſerved already.

The moſques are endowed with all the lands and revenues which belonged to them when they were Chriſtian churches: the lands which belonged to the cathedral church of Santa Sophia, now converted into a moſque, amount to fifty thouſand pounds a year; the rents whereof are employed to the maintenance of the imaums and doctors of their law, that officiate in the moſque, to the education of young lads, to the providing oil for the lamps, and to the relief of the poor; and what remains is laid up in the treaſuries of the reſpective churches, for the repair and beautifying them, and ſometimes employed in carrying on wars againſt infidel nations, when they apprehend themſelves in imminent danger. The tenants of the lands appropriated to churches, ſometimes pay their rent in kind, viz. corn, and other products of their lands; and theſe tenants, it ſeems, enjoy greater privileges than any other men, and are not liable to be plundered and oppreſſed either by the baſſas or janiſaries, as other inhabitants ſometimes are. None are ſo abandoned, as to pillage what is appropriated to pious uſes. Churches that have no lands belonging to them, have eſtates in money; the intereſt whereof is applied to the ſame uſes as the rents of lands appropriated to their temples are: there are no other caſes where the Turks allow of uſury, except it be for the maintenance of orphans.

When the Grand Signor inveſts the mufti in his office, he puts on him a veſt of ſables, and preſents him with a purſe of gold, of the value of one thouſand dollars, and grants them a revenue of one thouſand aſpers (about two guineas) a day; beſides which, the mufti has the preſentation to the royal moſques, which he ſells openly, and preſents are frequently made by the great men, to favour them in their addreſſes to the Grand Signor and his miniſters, which amounts to more than all the other articles.

A Mahometan, when he enters a temple, puts off his ſhoes inſtead of his cap, and, while he is there, neither ſalutes, converſes, or takes notice of any perſon, nor can any accident divert him from his prayers; nor may he ſpit, cough, or rub himſelf, any of which actions would ſo defile him, that he muſt waſh, and return to his prayers again: they ſigh and groan in a very doleful manner, till they begin to pray. The prieſt begins with the praiſes of God, and all the people follow him, and imitate his actions, as well as repeat his words; but both prayers and praiſes are very ſhort; the whole not above the length of two or three little collects. What they inſiſt upon chiefly at their devotions, is, that "God is one; that he neither begets, nor is begotten; has none like him, or equal to him; and that Mahomet is the meſſenger of God." They believe their prayers will not be heard, unleſs they forgive their enemies; and therefore, on every Friday, they endeavour to be reconciled to thoſe they have quarrelled with; and for every day of the week, they have a particular prayer; as on Friday, they pray that God

would

White, sculp.

would bleſs all true believers; on Saturday, they pray for the converſion of the Jews; on Sunday, for the converſion of the Chriſtians; on Monday, for the prophets; on Tueſday, for the prieſts, and thoſe that honour the ſaints; on Wedneſday, for believers in ſlavery among infidels; and on Thurſday, for the whole world, of every nation and religion without diſtinction.

The Mahometans perform their devotions with the greateſt ſolemnity on Fridays, when the emperor, miniſters, and magiſtrates, all reſort to the moſques in Turky; though in Perſia they ſeldom appear in the moſques, but pray ſingly in their houſes, or in the fields: and the Turks are generally cenſured for being too public and oſtentatious in their prayers. Their enemies ſuggeſt that they are hypocrites at the bottom, as they are frequently (like the Phariſees of old) ſeen praying in the markets, and the corners of the ſtreets, and other public places, to obtain the applauſe of men; and a writer of credit, who reſided ſome time among them, obſerves, that their religion ſeems calculated to keep up great gravity and ſolemnity, without the leaſt tincture of virtue: he further remarks, that they were the moſt lowly proſtrations, and utter their prayers in a moſt hollow diſmal tone; which, with them, are eſteemed the great excellencies of prayer. But we are inclined to think, that this character is in general too ſevere; and that, on the contrary, there are ſome among them who are in reality as ſincere and devout as they pretend to be.

Their Ramazan, or Lent, is the moſt ſtrict faſt that any nation obſerves; for no perſon, not ſo much as a day-labourer, will eat, or drink, or ſmoak, till ſun-ſet at that ſeaſon; but they are allowed to eat and drink in the night-time; and the whole town, and particularly the moſques, are illuminated both within and without till morning. At the end of the month the faſt ends, and at the next new moon, viz. the beginning of the month Schenval, the feſtival called Bairam begins, which laſts three days, when they celebrate a thankſgiving in their moſques or temples, and ſing ſeveral ſhort hymns, and among others, that which follows, viz. "We thank thee, O Lord, the only infinite, perfect, eternal, and moſt merciful being; in that thou haſt communicated thy all holy, true, and pure law to us; and that we have preſerved it in its purity, as it was delivered to us by the prophet, ſervant, and ambaſſador, Mahomet; to whom be ſalvation and bleſſings; as alſo to thy other prophet Jeſus, the ſon of Mary, Moſes, David, Solomon, &c.

After prayers, the Sultan receives the compliments of the great officers of the porte, ſeated on his throne, and even of the ſultaneſſes. The people, dreſſed in their beſt habits, viſit one another; and acquaintance embrace when they meet in the ſtreets; and where they have had any differences, they are reconciled. Even their women, at this time, are allowed the liberty of going abroad, it is ſaid; and ſome of them make uſe of the opportunity to break looſe from their keepers. Sacrifices of oxen, ſheep, and lambs, are alſo made by the wealthy, and their fleſh diſtributed among the poor; ſo that at this time a general joy appears, and moſt of our travellers compare it to the Eaſter of the Chriſtians, becauſe it ſucceeds their Ramazan, as Eaſter does our Lent. It is alſo a moveable feaſt, being held in every month in the year, in the compaſs of thirty years, or thereabouts; for the Mahometan year in eccleſiaſtical matters being lunary, and conſequently, between eleven or twelve days ſhort of ours, their faſts and feſtivals happen ſo many days ſooner every year, than they did the preceding year.

The Armenians, Maronites, Jacobites, and other ſects of Chriſtians in the Turkiſh empire, have their patriarchs; and the pope appoints a titular partriarch at Conſtantinople, as well as a biſhop.

The Greeks and eaſtern Chriſtians have ſuch a prejudice againſt the Latin or Roman church, that they would rather continue under the dominion of the Turk, than live under a popiſh prince: and the Papiſts, on the other hand, treat the Greeks as infidels, and are continually inciting the Turks to deſtroy and oppreſs them. They cauſed one of the patriarchs of Conſtantinople to be put to death upon falſe ſuggeſtions they made to the government, becauſe he refuſed to ſubmit to the pope.

The whole Greek church, taking in every ſect, is of a vaſt extent, containing not only the Chriſtians of the Turkiſh empire, who are in many parts of it much more numerous than the Mahometans themſelves, but alſo the Chriſtians of Muſcovy, the Coſſacks, the inhabitants of Podolia, and Black Ruſſia, the people of Ethiopia and Abyſſinia, ſouth of Egypt. Thoſe of Circaſſia, Georgia and Mingrelia, and the inhabitants of the iſlands in the Mediterranean, under the Venetians, are generally of the Greek communion: but we ſhall treat chiefly of thoſe who are under the dominion of the Turk, who are governed by four patriarchs, viz. the patriarchs of Conſtantinople, Alexandria, Antioch, and Jeruſalem.

The Greeks obſerve twenty-two fixed and immoveable feaſts; the two firſt of which are, the nativity of the bleſſed virgin Mary, and the exaltation of the Holy Croſs; the reſt conſiſt principally of the antient Greek ſaints and martyrs. They keep four annual faſts. They give to their patriarch of Conſtantinople, whom they conſider as their head, the pompous titles of Moſt Holy Father, or Your Holineſs, Moſt bleſſed Father, or Your Bleſſedneſs: making him in all reſpects equal to the pope. The revenues of their prieſts are very ſmall. Marriage, with them, is no legal objection againſt a perſon's going into orders; but the general practice of their church is againſt marriage afterwards: they have a great number of deacons, who belong to the biſhops; and their monks lead a very ſevere courſe of life. The modern Greeks reckon up ſeven myſteries or ſacraments, which they are ſuppoſed to have taken from the Latins; namely, baptiſm, unguent of chriſm, the euchariſt, penance, holy orders, matrimony, and oil with prayer. Their celebration of the euchariſt is attended with a great number of ceremonies. The laity are obliged to receive the communion four times in the year, with which they readily comply; and none omit it at Chriſtmas or Eaſter. They alſo retain the doctrines of confeſſion and penance; but, with reſpect to the former, they do not require the penitant ſhould enumerate every particular circumſtance, for if he diſcloſe as much as he thinks it prudent to declare, it is accepted. Divorces are eaſily obtained among the Greek Chriſtians, as theſe people are very prone to revenge where they have been ill uſed. They retain only the Nicene or rather Conſtantinopolitan creed in their liturgies and catechiſms, and are wholly ſtrangers to that of St. Athanaſius: but they acknowledge the holy ſpirit to be of the ſame ſubſtance with the Father and the Son; to be God from eternity, proceeding from the eſſence and nature of the Father, without beginning, and to be equally adored. With reſpect to the ſtate of the dead, the Greek church believes, that the ſouls of the righteous do not go immediately to heaven, but to ſome third place, which is ſometimes called Paradiſe, where they wait till the reſurrection: and though it is ſaid they deny purgatory, they imagine however, that the ſouls of ſuch as are not ſufficiently purified to enter Paradiſe are confined in ſome ſecret receſſes under-ground, there to ſuffer grievous pangs; and that theſe may receive a mitigation of their torments from the prayers, oblations, and ſacrifices of the living. They admit of pictures of our Saviour and the ſaints, and honour them by bowing, kiſſing, and offering up their devotions before them. They uſe two kinds of adoration, in which great part of their worſhip conſiſts: in the firſt, they bow almoſt to the ground; the other is only a little inclination of the head and knee, which they perform when they come firſt into the church, or when they happen to come within ſight of a church or chapel either by ſea or land. They perform their devotions with their faces towards the eaſt; nor do they pull off their caps in the church, except at ſolemn proceſſions, when the goſpel is read, or at the celebration of the euchariſt. The Greeks abſtain from blood, and things ſtrangled. When they are brought upon their oaths, they lay their hand upon the croſs, afterwards kiſſing it, and putting it to their foreheads.

Upon the whole, it is rightly obſerved, reſpecting the religion of the Greek church, that there is a great deal of ſuperſtition intermixed with their divine offices; as the perfuming their churches, the pictures of their ſaints, the holy table, and the people, with incenſe; their frequent croſſing themſelves, the extravagant reſpect they pay to the unconſecreted elements, and their concluding many of their prayers with theſe words: "For the interceſſion of our Lady the ſpotleſs Virgin, Mother of God," &c. with ſeveral prayers and aſcriptions to the Virgin Mary, which come little ſhort of blaſphemy.

The Greek and other Chriſtians are greatly oppreſſed by the Turks, who will not ſuffer any of them to wear the honourable garb of thoſe of the eſtabliſhed religion, under the ſevereſt penalties: it is criminal for a Chriſtian to be ſeen with a white turban or a yellow ſlipper, which are worn only by their haughty maſters; and every raſcally Turk will beat and inſult a Chriſtian upon the leaſt, and ſometimes upon no provocation: for which there is no remedy but patience. The ordinary capitation-tax

every

every Chriſtian pays is not to be accounted among their greateſt grievances: the baſſas and inferior magiſtrates are ever finding ſome pretence or other to extort ſums of money from them; and the over righteous Mahometan ſcarce thinks it a crime to give falſe evidence againſt a Chriſtian.

SECT. XI.

Contains a hiſtory of the Turks, from the earlieſt accounts of that nation, to the concluſion of the war between them and the Ruſſians in 1772, and the treaty of peace ratified by thoſe two powers in 1774.

IN the eighth century, the Turks, who had before that time reſided chiefly north of the Palus Maotis and the Euxine ſeas, travelled ſouthward, and ſettled in Georgia, between the Euxine and the Caſpian ſeas, where they continued about two hundred years. About the year one thouſand, they removed farther ſouthward into Armenia, the name of which they changed into that of Turcomania. They ſoon after ſubdued Bagdat, ravaged Perſia, and made themſelves maſters of the northern provinces of Arabia, at which time they were all Pagans; but their leader Tangrolipix thought proper, from motives of policy, to turn Mahometan, well knowing that a ſovereign of a different religious perſuaſion is never agreeable to the generality of the people. The Turks then proceeded to invade the territories of the Grecian emperor in Aſia Minor, where they conquered ſeveral cities, as the Saracens had done in Syria, Paleſtine, and Egypt.

The emperor of Conſtantinople was at this time head of the Aſiatic Chriſtians, who, being greatly oppreſſed, implored the aſſiſtance of the different ſovereigns of Europe, in order to oppoſe both Turks and Saracens: all Europe took the alarm: the pope alſo intereſted himſelf in the affair; and the clergy in general uſed their endeavours to excite an emulation, by which the Holy Land (as they termed it) might be reſcued from the hands of the infidels.

The firſt cruſade commenced in the year of our Lord 1096, when eight hundred thouſand perſons engaged in the enterprize, and proceeded towards Paleſtine: but above half of them periſhed by ſickneſs, famine, and the ſword; the latter being cut off by the Chriſtians through whoſe countries they paſſed, and who were obliged to repel force by force, in order to put a ſtop to their depredations. Many of the undiſciplined multitude, who arrived at Conſtantinople, were cut to pieces on their landing: but the more regular troops under the conduct of Godfrey of Boulogne, and other ſkilful commanders, arrived at Conſtantinople in tolerable order; but their numbers creating a jealouſy in the breaſt of the Grecian emperor, inſtead of joining them as he had promiſed, he contrived by every ſiniſter means to diſtreſs them; however, to avoid their reſentment of this treacherous conduct, he granted them ſhipping to tranſport the troops; on muſtering of which, it appeared, that the Chriſtians had one hundred thouſand horſe, and near twice that number of foot.

This vaſt army began its operations by beſieging Nice in Bithynia; to relieve which the Sultan Soliman marched, but was totally defeated, when the place ſurrendered, and was put into the Grecian emperor's hands, as had been previouſly agreed upon. The Chriſtian army then proceeded towards Antioch, when Sultan Soliman, at the head of two hundred thouſand men, gave them battle, but was again totally defeated. Antioch was ſoon after taken; but the Chriſtian leaders did not think proper to put it into the hands of the emperor of Conſtantinople, whoſe perfidy had ſo repeatedly diſguſted them. They then marched to Jeruſalem, which they inveſted with only fifty thouſand men, their numbers being ſo far reduced; and the garriſon was at the ſame time more numerous than the beſiegers. The arrival of a fleet of Engliſh, Norman, Flemiſh, and Genoeſe ſhips, however, gave new birth to their operations, by bringing them a freſh ſupply of men. The outward wall was ſoon carried by ſtorm, and the city itſelf was ſoon after taken ſword in hand, when Godfrey of Boulogne was crowned king of Jeruſalem. He ſoon ſubdued Ptolemais, Ceſarea, Antipatris, Aſcalon, &c. but died within a year after his coronation; and Baldwin of Bruges ſucceeded him, A. D. 1100. In his reign, the Chriſtians took the city of Tyre, and obtained three victories over the infidels; he then laid ſiege to the city of Damaſcus, but proved unſucceſsful in his attempt: after reigning thirty years, he died, and was ſucceeded by Fulk, earl of Anjou, in 1131. During this reign the Chriſtians began to quarrel among themſelves; but, Fulk being killed by a fall from his horſe, his eldeſt ſon, under the title of Baldwin II. was elected king in the year 1142; but being then only thirteen years of age, his mother was joined with him in the government.

Four diſtinct kingdoms were eſtabliſhed by the Chriſtians, who had been in poſſeſſion of the Holy Land and countries adjacent more than forty years: theſe were, 1. The kingdom of Edeſſa, which comprehended the countries on the banks of the Euphrates. 2. The kingdom of Tripoli, which was near the ſea coaſt. The kingdon of Antioch; and, 4. The kingdom of Jeruſalem.

The continual diſcords among the Chriſtians gave great advantage to Sanguin, ſultan of Aleppo, and afterwards to Nauraddin his ſon, who retook many of the conquered places; which occaſioned the Chriſtians again to ſolicit the aſſiſtance of the European ſovereigns. Upon which invitation, Conrad, emperor of Germany, at the head of one hundred thouſand men, undertook the expedition; but the Grecian emperor, proving as great an enemy to him as the Turks, he loſt the greateſt part of his army, and returned home greatly diſappointed and chagrined.

In 1187, Salading, ſultan of Damaſcus, was very ſucceſsful againſt the Chriſtians, from whom he took Jeruſalem. This engaged Frederic, emperor of Germany, in another cruſade; but the imperial forces, who proved for ſome time ſucceſsful, were at length viſited by the plague, which deſtroyed the army. Richard I. of England, and Philip Auguſtus of France, were then ſtimulated by the pope to carry their arms into Paleſtine, which they did in 1190; but the two kings diſagreeing, this, like the preceding enterpriſes, likewiſe miſcarried.

Conſtantinople was taken by the Latins in 1200; and Baldwin, earl of Flanders, being elected emperor thereof, ſoon after laid ſiege to Adrianople; but the Greeks inviting the Tartars to their aſſiſtance, the Chriſtian army was defeated, and Baldwin himſelf taken priſoner. They cut off the hands and feet of the unhappy monarch, and left him to periſh miſerably in the field, where he died three days after in the firſt year of his reign, and the thirty-third of his age. After this, Henry, the brother of Baldwin, being elected emperor of Conſtantinople, by the aſſiſtance of the king of Theſſaly, drove the Tartars out of Thrace, and recovered all the places they had taken from the Chriſtians.

As the ſultan of Egypt was now become the moſt formidable Mahometan power, the Chriſtians determined to invade that country, which they did under the conduct of Lewis king of France, commonly called St. Lewis, who ſet out from Europe with a fleet of one thouſand eight hundred ſail, containing an army of ſixty thouſand men, including about thirteen thouſand knights, Engliſh, French, and Cypriots. The army landed near Damietta, which they entered without oppoſition, the infidels having previouſly abandoned it. Lewis left his queen at Damietta, with a conſiderable garriſon, and began his march towards Grand Cairo, at the head of twenty thouſand horſe, and forty thouſand foot: but they were ſo harraſſed by the enemy, that they were above three months in advancing forty miles. At length the Mahometans, taking advantage of the van of the Chriſtian army being ſeparated from the main body, attacked the cruſaders with great fury, totally defeated them, took priſoner the king of France, and all the troops who were not ſlain in the engagement. It was debated by the Mahometans, whether they ſhould not cut the throats of all the priſoners; but avarice getting the better of revenge, they determined to ſpare them, in order to exact a large ranſom for the recovery of their liberty. They therefore agreed to releaſe the king of France, and the reſt of the priſoners, upon the delivering up Damietta, and paying an immenſe ſum of money to the captors.

An army of Tartars, under the conduct of Haalon, came down about this time like a torrent from the northward, and took Bagdat, Aleppo, Damaſcus, and Iconium. The ſultan of Egypt at the ſame time poſſeſſed himſelf of the principal places in Syria. Theſe tranſactions occaſioned another cruſade to be undertaken in 1271, by prince Edward, afterwards Edward I. of England: he took Nazareth, and defeated the Turks in ſeveral engagements; but not being properly ſupported by other Chriſtian princes, he returned to England, after having been a year and a half in Paleſtine; whereupon Elphis, ſultan of Egypt, invaded Syria, took Tripoli, Tyre, Sidon, Berethus, and all the towns poſſeſſed by the Chriſtians, except Ptolemais. A truce was however agreed upon for five years;

years; but being broken by the Chriſtians, the ſultan of Egypt laid ſiege to Ptolemais, but dying before the place, his ſon Araphus took it by ſtorm, and gave the plunder to his ſoldiers: after which, the Chriſtians were intirely expelled from Paleſtine, one hundred and thirty-two years ſubſequent to the taking of Jeruſalem. But Caſſianes the Tartar, who was ſovereign of Perſia, revenged the quarrel of the Chriſtians, by falling upon the Sultan of Egypt, defeating his armies, recovering moſt of the places in Syria and Paleſtine, which he had taken; and rebuilding the city of Jeruſalem, which he did at the deſire of his queen, who was an Armenian Chriſtian: he likewiſe offered to join the Chriſtian princes, and re-eſtabliſh them in the Holy Land; but the principal ſovereigns in Europe were unhappily engaged in war amongſt themſelves, and could not therefore ſpare any forces to ſend to Paleſtine; upon which, Caſſianes retired into Perſia, and the Sultan of Egypt recovered all he had loſt. The Turkiſh lords, upon the death of Aladin, the laſt prince of the Selzucian family, divided the country among themſelves, the principal of whom was Ottoman or Othman, the ſon of Enthogrul.

When the Turks were driven out of Perſia by the Tartars, the Chriſtians of Bithynia permitted their flocks and herds to graze upon their mountains; but the Turks, after having been here for ſome time, began to claim the place as their right, and to diſpute the poſſeſſion of it with the Chriſtian natives; whereupon the latter complained to the governors of the neighbouring Grecian caſtles, that thoſe whom they had ſuccoured, through compaſſion, wanted now to be their maſters. The Grecian governors, therefore, aſſembled a body of forces, in order to compel the Turks to acknowledge the ſovereignty of the Grecian emperor, or relinquiſh the place: but Ottoman putting himſelf at the head of a body of troops, defeated the Chriſtians, and took Cara Chiſar, a fortreſs ſituated on the frontiers of Bithynia and Phrygia. He afterwards plundered all Bithynia; which ſo greatly alarmed the Chriſtians, that they prevailed upon the governor of Belezugar to invite Ottoman to the ſolemnization of a wedding at his caſtle, that they might have an opportunity of taking him off. Ottoman, being appriſed of the deſign, contrived to introduce a party of ſoldiers in diſguiſe, who killed the governor and all his gueſts, and took poſſeſſion of the caſtle. He then made himſelf maſter of many other places in Phrygia, and even laid ſiege to the city of Nice. The emperor of Conſtantinople ſent an army to relieve the places, but it was defeated by Ottoman, who from that time, viz. A. D. 1300, took upon himſelf the title and ſtate of ſultan, and made Neapolis the ſeat of his government. The Chriſtians invaded the territories of this new ſovereign, but were defeated; and Ottoman now growing old, conſtituted his ſon Orchanes generaliſſimo, who ſubdued all the remaining places in Bithynia and Phrygia, and ſucceeded his father, who died A. D. 1328, as ſultan.

Orchanes, having taken Abydos, at the entrance of the Helleſpont, on the Aſiatic ſhore, from thence tranſported his army into Europe, and, in 1338, took Gallipoli, which was the firſt town in Europe the Turks ever poſſeſſed. This prince died in 1359.

Amurath, who ſucceeded his father Orchanes, was in the beginning of his reign diſturbed by a confederacy between the leſſer Mahometan princes in Aſia and the Chriſtians: but ſuppreſſing theſe, he tranſported his army into Europe, where he took many places from the Grecian emperor, particularly Adrianople, which he ſubdued in 1362, and made the capital of all his Aſiatic and European dominions. About this time the body of janiſaries was eſtabliſhed; for every fifth captive above fifteen years of age was by Amurath's order, retained in his ſervice, and educated in the ſeraglio, when at a proper ſeaſon thoſe of the largeſt ſtature were to be ſelected for the guard of the ſultan.

The Servians, Bulgarians, and Illyrians having raiſed an inſurrection, and invaded the European dominions of Amurath, he returned into Aſia to ſuppreſs it; but the emperor of Conſtantinople not joining them at this critical juncture, the ſultan, at the head of two hundred thouſand men, croſſed the Boſphorus, and totally defeated them. Amurath, however, ſurvived this victory but a ſhort time; for a Chriſtian ſoldier, pretending to beg his life of him, took an oppoſtunity of ſtabbing him with a dagger, which he had concealed under his cloaths, of which wound the ſultan immediately died, in the year 1373, and was ſucceeded by his ſon Bajazet, who, that he might have no rivals, began his reign by the murder of his brother. He then invaded Servia, and laid ſiege to Crotava, which ſurrendered on condition that the garriſon ſhould have leave to march unmoleſted away, and join the Chriſtian army. They were however no ſooner out of the town, than Bajazet ordered a detachment of his troops to put them all to the ſword; which bloody injunction was immediately executed.

The Turkiſh generals, the enſuing year, plundered the countries north of the Danube; while Bajazet himſelf paſſing the Helleſpont, took the city of Philadelphia in Lybia, conquered Caramania, Ionia, and the coaſt of Natolia. The compliance which the Grecian emperor had ſhewn the Turks, was not of any ſervice to him; for Bajazet, unmindful of his obligations to that monarch, laid ſiege to Conſtantinople, which was ſo well defended, that he blockaded it for eight ſucceſſive years; till Sigiſmund, king of Hungary, aſſiſted by the French, compelled him to raiſe the ſiege; but Bajazet ſoon after defeated the Chriſtian army, and took ſuch a multitude of priſoners, that every Turkiſh ſoldier had a ſlave to his ſhare. After this victory, Bajazet again laid ſiege to Conſtantinople, but was obliged a ſecond time to raiſe the ſiege on account of the approach of a vaſt army under the command of Tamerlane, commonly called The Great, the Mogul monarch, who had been invited to march againſt Bajazet, not only by the emperor of Conſtantinople and other Chriſtian princes, but by the Mahometans themſelves, who were greatly oppreſſed by that tyrant. The defeat of Bajazet by Tamerlane, and what afterwards befel him, we have already taken notice of in our account of Tamerlane, p. 57, 58. to which we beg leave to refer.

The five ſons of Bajazet, after his death, diſputed for the ſovereignty of the Ottoman empire, during ten years; but at length Mahomet, the youngeſt, proving ſucceſsful, was unanimouſly acknowledged ſole ſovereign of the Turkiſh dominions. Having rendered Walachia and Tranſylvania ſubject to him, he died in the year 1422, and was ſucceeded by his ſon Amurath, commonly called Amurath II.

This prince, after ſuppreſſing ſeveral domeſtic inſurrections, ſubdued great part of Greece, recovered Savia and Caramania, and then invaded Hungary with an army of eighty thouſand men; but was repulſed by the prince of Tranſylvania, who, being joined by the king of Poland, paſſed the Danube, drove the Turks out of Servia, and advanced to mount Hemus; the paſſes of the mountains were, however, ſo well guarded, that the Chriſtians, not being able to penetrate into Romania, were obliged to retreat: the Turks purſued them, and, coming up with their rear, a general battle enſued, when the Chriſtians obtained a complete victory. During this engagement, the celebrated Scanderbeg, who commanded a body of Turkiſh troops, deſerted to the Chriſtian army. This prince was the ſon of John Caſtiot, prince of Epirus, whoſe territories Amurath invaded, and compelled him to deliver up his four ſons as hoſtages for his fidelity. Amurath then ordered all the young princes to be circumciſed, and inſtructed in the Mahometan ſuperſtition; and, on the death of their father, ſeized the country of Epirus as his own, after putting to death the three elder princes. He however pretended to have a great regard for the younger, on whom he conferred the title of Scanderbeg, which ſignifies Lord Alexander, Scander implying in the Turkiſh language Alexander, and beg being the titular appellation for lord. The Turk's affected kindneſs could not however efface from the young prince's boſom the ſenſe of the wrongs he and his family had ſuſtained from the infidels; he was a Chriſtian in his heart, and had long meditated to eſcape from the Mahometan. The abovementioned battle preſented him with an opportunity, when he not only enticed three thouſand ſoldiers, who were natives of his own country Epirus, to deſert with him, but brought off the Ottoman ſecretary of war. He afterwards proceeded towards Croia, the capital of Epirus, and compelled the ſecretary to write an order in the name of the baſſa his maſter to the governor, commanding him to deliver up that city to the care of Scanderbeg. The governor, not ſuſpecting but that the order really came from the baſſa, and was written with the concurrence of Amurath, delivered up the place without heſitation. Scanderbeg being joined by the inhabitants, immediately put all the Turks in the place, who refuſed to turn Chriſtians, to the ſword; and having aſſembled an army of twelve thouſand men, marched to Petrella, which ſurrendered upon the firſt ſummons, and Stelluſa followed the example; which ſucceſs gave him encouragemeht to invade Macedonia, and lay it under vaſt contributions, raiſing by this means a ſufficient ſum of money in the enemies country to pay, and even augment his army.

Alarmed at the proceedings of Scanderbeg, Amurath sent Ali bassa, at the head of forty thousand men, to prevent his excursions; but Scanderbeg had the good fortune to defeat him. The Turkish monarch, therefore, dreading the consequences of these successes, patched up a peace with the Hungarians, that he might have an opportunity of bending his whole force against Scanderbeg. The Hungarians, soon became sensible of the error they had committed, in making a peace with the Turks at the time the prince of Epirus was so successful, and consequently enabled to make a powerful diversion in their favour; these sentiments were followed by a breach of the treaty: they were however, totally routed at the battle of Varna, and their king Uladislaus slain.

The sultan now determined that his forces should plunder Epirus; but three armies, which he sent for that purpose, were severally defeated by the fortunate Scanderbeg; and it is remarkable, that his forces never amounted to a third part of the number of the Turks in all these engagements.

Amurath, enraged at length with his continual losses, disappointments, and defeats, by an handful of men, raised an army of one hundred and forty thousand troops, at the head of which he himself marched, and laid siege to the capital city of Croia, which was defended by a strong garrison and a brave governor, on whom Scanderbeg could depend, while that prince commanded a flying army in the mountains, which continually harrassed the Turkish forces. Amurath assaulted the city many times with great fury; but he was not able to reduce it, for he died before its walls, in the thirtieth year of his reign, and was succeeded by his eldest son Mahomet, surnamed Mahamot II. This prince, immediately after the death of his father, raised the siege, and returned to Adrianople.

This prince began his reign by murdering his brothers, and then proceeded to besiege Constantinople, which he took on May 20, 1453. The last Grecian emperor, Constantine Palcologus, was killed in the assault; and all his relations, with the principal citizens, were afterwards put to death in cold blood by Mahomet. The plunder of this wealthy city was given to the troops, and the seat of government was transferred from Adrianople to Constantinople. Mahomet, having thus added the Grecian empire to his own, assumed the title of emperor, which has ever since been retained by the succeeding sovereigns of the Turks.

Among other captives taken at Constantinople, there was a beautiful young virgin, named Irene, with whom Mahomet became so enamoured, that he neglected all public affairs for the enjoyment of her society in private. This remissness with respect to the business of the state, occasioned a dangerous mutiny among the janisaries; but Mahomet's temper was so fierce and savage, that none dared to mention the situation of his affairs. At length one of his bassas ventured to acquaint him with his danger. Mahomet severely reprimanded him for his insolence, as he termed it; but being sensible of the seasonableness of his advice, he told him, "That his subjects should find, that he could rule his passions as well as he could rule kingdoms." He then gave orders that the principal officers of the army, and all the great officers of state should attend him the ensuing day in the divan. At the time appointed, every one attended with wondering expectation. The emperor appeared, and with him the beautiful Irene, dressed with the most costly care in all the extravagance of Asiatic elegance. The emperor then ordered the lovely Greek to stand upon a raised floor, and sternly demanded of all present, if they thought he was blameable for devoting himself to so charming an object. They unanimously agreed, that it was impossible for any man to resist so much beauty. "Then, said he, you shall find that I am more than man." So saying, he instantly seized the fair Irene by her beautiful locks of hair, and struck off her head with his scymetar, to the great astonishment of all present. Some have greatly commended, and others have severely blamed Mahomet on account of this singular transaction. Whether Mahomet was sated by a long uninterrupted possession of Irene's charms, or was really that patriotically heroic monarch he wished to be thought, is immaterial; but it is our opinion, he might either have parted from the lady, or evinced his regard for his subjects, without proceeding to such a barbarous extremity. His ferocious conduct plainly proved, that all his passions were of the brutal kind; his love being founded on sensuality, and his pretended sentiments of honour on a savage and vain parade of dignity and self-importance.

Mahomet, being entirely roused from his lethargy by his late danger, deprived some of the princes of the Morea of their territories, subdued Servia, and laid siege to Belgrade; but was defeated by Hunniades, the brave prince of Transylvania, who unhappily died the same year. He then attacked the Mahometan princes on the south coast of the Euxine sea, particularly the prince of Smope, whose capital he besieged by sea and land: which being surrendered to him, he invested Trebizond, took it, and put an end to that little empire. He then extended his conquests in Europe, and subjugated Walachia. His prodigious success, obtained him the name of Great; nevertheless, he was a most abandoned cruel wretch, and guilty of almost every crime which could debase human nature. He died A. D. 1481, in the thirty-third year of his reign, and was succeeded by his eldest son

Bajazet II. who spent so much time in a pilgrimage to Mecca, that he was near being supplanted by his brother Zemes. This so much alarmed him, that he had his brother murdered, and rewarded the assassin with the post of prime minister, though he was only a barber. He took several towns from the Venetians; but was continually alarmed with domestic plots against his life, which at length took effect; for he was dethroned by the janisaries, who made his son Selim emperor.

This prince began his reign by murdering his father, his brothers, and all their children; he then subdued the Mamelukes, and put an end to their empire in Egypt, which from that time became a Turkish province. Selim died A. D. 1520, in the fifty-fourth year of his age, as he was preparing to invade the Christian princes.

Solyman II. or Solyman the Magnificent, succeeded his father Selim; and immediately after his accession laid siege to Belgrade, which he took on the 29th of August, 1521. He invaded the island of Rhodes the year ensuing, the capital of which submitted to his arms on Christmas-day 1522. Solyman then invaded Hungary, defeated the Hungarians, and took the cities of Buda, Pest, and Segedin. In 1529 he penetrated into Austria, and laid siege to Vienna, but it was so well defended, that he was obliged to raise the siege and retire; he returned, however, again into Austria, with an army of five hundred thousand men; but the emperor, and other Christian princes, being well prepared to receive him, he again retreated to Constantinople.

Andrew Doria, the celebrated Genoese admiral, joining the fleets of several Christian powers, particularly that of the Spaniards, invaded the Morea. Solyman, in return, ordered his fleet, under the command of his admiral Barbarossa, to plunder the coasts of Italy and Sicily. These orders being obeyed, the Turkish admiral stood over for the African coast, where he deposed the deys of Algiers and Tunis, and had those kingdoms confirmed to him by the emperor.

Solyman, in the mean time, invaded Persia with a large army, but met with very little success in this expedition. He then sent a fleet to the Red sea, to attack the Portuguese settlements in the East Indies; but his design here likewise failed.

At this time the French, who were contending with the emperor of Germany for the Milanese, made an alliance with the Turks, whose fleets again plundered the Italian and Sicilian coasts; and the Ottoman armies met likewise with great success in Hungary and Italy.

Solyman again invaded Persia in 1548; but the Persians destroyed the country before him as he advanced, by which means most of his army perished, and he was obliged again to retreat; but to make him some amends, he, in 1551, took the strong city of Temeswar, in Hungary, and the territories belonging to it.

The emperor, who was now advanced in years, became so extremely fond of his concubine Roxalana, that he put his eldest son Mustapha to death to oblige her, and even consented to marry her, though no Turkish sovereign, from the time of Bajazet, had ever been married, as it was contrary to the policy of the Turkish government.

Bajazet the youngest son, soon after underwent the same fate as his brother Mustapha, for being concerned in a plot against the government.

The Turks now made a fruitless attack upon the island of Malta, but still continued successful in Hungary; when death put an end to Solyman's progress, A. D. 1566, and took him off by means of a bloody flux, in the seventy-seventh year of his age, and forty-seventh of his reign.

Selim II. the only surviving son of Solyman, succeeded him, whose first expedition was, to invade the island of Cyprus. He laid siege to Nicosia, which he took by storm, A. D. 1570, and the ensuing year he invested Famagusta, which capitulated upon honourable terms, but the garrison were no sooner marched, than a great number of the inhabitants were massacred, and the brave governor, Bragadine

gadino was flayed alive. The baſſa Muſtapha here found an immenſe treaſure, which he put on board three ſhips, together with many lovely captives, among whom was a young lady of exquiſite beauty, who, dreading the thoughts of being ſacrificed to the embraces of a Turk, ſet fire to the powder, which blew up the ſhip in which ſhe was, and the two others that were near it, together with herſelf, all the Chriſtian captives, and the Turkiſh ſailors.

In the mean time the Turkiſh admiral proceeded to make deſcents on many of the Venetian iſlands, as Epirus, Dalmatia, &c. from whence he carried many thouſands of the inhabitants into captivity. It is affirmed, that the town of Curzola was forſaken on the approach of the Turkiſh fleet, by the governor and all the men; but that the women, taking up arms, defended the place till a ſtorm aroſe, and obliged the Turks to retire to their gallies, in order to preſerve them.

The Turks, in the year 1571, fitted out the largeſt fleet that ever they ſent to ſea, which was engaged at the entrance of the gulf of Lepanto, by the united Chriſtian fleet, commanded by Don John, brother to the king of Spain, in conjunction with the Venetian admiral. The fight was obſtinate and bloody, and laſted five hours, when the Ottoman fleet was totally defeated; the Turkiſh admiral, with fifteen thouſand men, were killed, and one hundred and ſixty gallies taken, or ſunk: the Chriſtians loſt about ſix thouſand men, among whom were many brave and diſtinguiſhed officers.

Selim, after this overthrow, equipped another fleet, and took Tunis, on the Barbary coaſt, from the Spaniards, which was the laſt conſiderable action of his life, for he died September 9, 1574, in the fifty-ſecond year of his age, and ninth of his reign.

Amurath III. eldeſt ſon of Selim, ſucceeded to the throne. Like many of his predeceſſors, he began his reign with an act of cruelty, by the murder of his five brothers; and, to prove himſelf a true Turk, and not inferior in cruelty to any of his anceſtors, he had them executed in his preſence. That nothing might be wanting to complete the barbarous ſpectacle, he obliged his late father's favourite ſultana to be preſent, who was ſo affected at the maſſacre of the young princes, that ſhe ſtabbed herſelf to the heart, and expired in the preſence of the young tyrant. He attempted to reduce the Perſians, but loſt three fine armies in the attempt. Theſe diſappointments ſo chagrined him, that in 1589 he aſſembled an army of one hundred and eighty thouſand men, and gave the command of it to the grand viſir. In this expedition, the Turks loſt eighty thouſand men by the ſword and famine; in 1592, as the ſultan found that his troops carried on this war with great reluctance, he withdrew the army from Perſia, in order to employ it in Hungary. Nothing, however, deciſive was done; and Amurath died January 18, 1595, in the thirty-third year of his age, and twentieth of his reign; and was ſucceeded by his ſon,

Mahomet III. who alſo began his reign according to the Ottoman cuſtom, by putting his brothers to death, who were no leſs than twenty in number; however, he was not ſufficiently glutted with this bloody ſacrifice, for he ordered ten of his father's concubines, whom he imagined to be pregnant, to be thrown into the ſea. As ſoon as he was ſeated on the throne, finding that his general Ferrat Baſſa had been unſucceſsful in Hungary, he ordered him to be ſtrangled. The Chriſtians, however, ſtill proving victorious, Mahomet aſſembled an army of two hundred thouſand men, put himſelf at their head, took the city of Agria, where he practiſed unheard of cruelties, and afterwards defeated the Chriſtian army; by which means he recovered Moldavia and Walachia. Being obliged to march back into his own country, to quell ſome domeſtic tumults, the Chriſtians ſeized the opportunity, and recovered many of the places they had loſt; while, on the other ſide, the Perſians retook Tauris.

Mahomet's cruelties had rendered him ſo obnoxious to the people, that a conſpiracy was formed to depoſe him, and place his eldeſt ſon upon the throne. Being appriſed of the affair, he had his ſon ſtrangled, and put to death all the conſpirators who were ſo unfortunate as to fall into his power; but now, being every-where unſucceſsful, and many of the inſurgents continuing in arms, he began to think that the wrath of God purſued him for his manifold crimes. To avert, therefore, the vengeance of heaven, he ordered prayers to be put up for him throughout his dominions: and ſent two mollas, barefooted on a pilgrimage to Mecca. He died, in 1604, ſtung with all the horrors of a guilty conſcience, in the forty-fifth year of his age, and ninth of his reign. His ſon Achmet ſucceeded him.

In the reign of this prince, the Turks obtained ſome advantages over the Chriſtians, being joined by the Proteſtants of Auſtria, Hungary, and Tranſylvania, who were ſo cruelly perſecuted by the Roman Catholics, that they were obliged even to ſeek ſuccour from leſs intolerant infidels.

The principal ſultana of Achmet, underſtanding that the emperor had taken one of his ſiſter's ſlaves to his bed, was ſo inflamed with jealouſy, that ſhe cauſed her to be ſtrangled. This Achmet reſented, by ſtabbing her, and trampling upon her body. At length he departed this life on the 15th of November, 1617, in the 31ſt year of his age, and thirteenth of his reign, and was ſucceeded by his brother,

Muſtapha, whoſe acceſſion was extremely ſingular. The brothers of the ſultans had uſually been put to death by the reigning ſovereign, through the abſurd idea of rendering himſelf ſecure; but Achmet, being only thirteen years of age when he aſcended the throne, was adviſed to ſpare his brother Muſtapha, till he ſaw whether he ſhould have any children of his own, as no other prince of the Ottoman family was then living. Thus Muſtapha was ſecured by the policy of the ſtate, till Achmet had children, when it was debated in council whether he ſhould not be put to death, and the execution was agreed upon accordingly; but Muſtapha was again providentially ſaved, for Achmet dreaming that he ſaw his brother executed, was ſo terrified at the viſionary ſpectacle of horror, that he would never ſuffer the ſentence to be put into execution. Muſtapha, however, reigned but five months; for the baſſas, finding him totally unqualified to govern, again confined him to the ſaraglio, and advanced to the throne his nephew,

Oſman, who, ſoon after the commencement of his reign, marched to the frontiers of Poland; but the janiſaries refuſing to march any farther, he was obliged to patch up a diſhonourable peace with the Poles. This ſo enraged him, that he determined totally to aboliſh the body of janiſaries; which thoſe regular bravoes underſtanding, they murdered him in 1622, and reſtored his uncle Muſtapha to the throne; but he, being no better qualified to govern than before, was a ſecond time depoſed; when they advanced Amurath to the imperial dignity, who was the younger brother of Oſman.

Amurath IV. aſcended the throne in 1623: his reign was not only filled with inſurrections and mutinies, but the Perſians ravaged the Turkiſh frontiers, took Bagdat, which the Ottoman forces beſieged three years, without being able to recover. This emperor was a cruel tyrant, but he was certainly impartial in his inhuman conduct, equally oppreſſing and murdering Chriſtians and Turks, but in many inſtances he ſhewed himſelf to be a moſt ſavage and unfeeling monſter.

During this reign, a dreadful fire happened at Conſtantinople, which conſumed upwards of twenty thouſand houſes. Amurath, however, determined on a Perſian war; but, being in great want of money, he encouraged a number of informers to accuſe the richeſt people he could get intelligence of, with being guilty of various crimes. This gave him a pretence to put them to death, and ſeize their effects. By theſe infernal means he was enabled to raiſe an army of three hundred thouſand men, when, marching to the frontiers of Turky, he took Tauris, ordered it to be plundered by his ſoldiers, marched back without atchieving any thing farther, and then ordered a feſtival of ſeven days to celebrate his wonderful exploits!

Amurath's cruelties now grew dreadful and deteſtable to every one; the murders he committed were incredible, and the modes of execution were ſhocking to human nature; among the reſt, his brothers Bajazet and Orchan fell victims to his ferocious diſpoſition: indeed murder was his ſupreme delight, for the moſt favourite amuſement of this blood-thirſty wretch was, to ſit in a pavilion in the palace gardens, and fire upon thoſe who paſſed by in boats, by which means he killed a prodigious number. It muſt, however, be admitted, that he ſeldom performed theſe frolics but when he was drunk; but it was unhappy for his ſubjects that he was ſcarce ever otherwiſe.

He prepared again to invade Perſia in 1637: but, before his departure, cauſed another of his brothers to be ſtrangled, who was a promiſing prince of great accompliſhments. He then inveſted Bagdat, when the garriſon ſurrendered on condition of receiving no perſonal injury. Amurath ſolemnly promiſed to ſpare their lives; but they had no ſooner laid down their arms, than he ordered them all to be cut to pieces, including in the bloody mandate not only men, but women and children. For this conqueſt he cauſed

cauſed a feſtival of twenty days continuance to be proclaimed, at which he very happily drank himſelf into a fever, that took him off on the 8th of February, 1640, in the eighteenth year of his reign, and only the thirty-ſecond of his age. This tyrannical brute was ſucceeded by his brother Ibrahim.

The reaſon why Ibrahim was not murdered as well as the reſt of his brethren, was owing, as ſome ſuppoſe, to there not being any other prince of the Ottoman line living; but others ſay, that he was an ideot; on which account Amurath deſpiſed him too much to think him dangerous. Ibrahim, however, had more cunning than was ſuppoſed; for it appeared, that he had acted folly and feigned ideotiſm only to ſecure his life.

This prince in the beginning of his reign, put an end to the ravages of the ſavage Coſſacks, took the city of Aſoph, and added the greateſt part of the iſland of Candia to the Turkiſh dominions. He was, however, in 1648, depoſed by his mother and the janiſaries, and ſoon after murdered; after which, they placed on the throne his ſon Mahomet IV. then a child of ſeven years of age.

During the minority of the emperor, the ſultana mother, the grand viſir, and the aga of the janiſaries, were inveſted with the adminiſtration; but affairs turning out a little unſucceſsful, the grand viſir was ſoon depoſed, as were ſeveral others who ſucceeded him; for be the fault where it may, that miniſter is ſure to bear the blame.

In 1658, a formidable inſurrection was with difficulty ſuppreſſed. The Turks were next viſited by the plague, which uſually carried off one thouſand four hundred or one thouſand five hundred people every day in the city of Conſtantinople only. An obſtinate battle was fought in Hungary, between the Chriſtians and Turks; in which the latter were totally defeated, and left ſeventeen thouſand men dead on the field of battle: this occaſioned a peace between the Porte and the emperor of Germany; however, to recompenſe the above loſs, the antient Chaldæa was ſubdued, and added to the Turkiſh empire, together with the iſland of Candia.

The Turks, in 1672, invaded Poland, conquered many of its towns, and obliged the government to conſent to pay ſeventy thouſand dollars annually: but on the failure of the ſtipulated payment, the war broke out again in the enſuing year, when the Poliſh general Sobieſki had the good fortune to obtain a ſignal victory over the infidels. The people of Tripoli in Barbary, about the ſame time killed the baſſa, and threw off the Turkiſh yoke, by which they became independent of the Porte in every thing, except a ſmall tribute. In 1683, the Turks laid ſiege to Vienna, but were attacked in their trenches and routed by John Sobieſki, King of Poland, at the head of the Germans and Poles. The city of Buda was afterwards inveſted by the Imperialiſts, and taken, Auguſt 22, 1686. King George the Firſt, then elector of Hanover, was preſent at this ſiege; and brought from thence the two Turks, who afterwards conſtantly attended him when he was King of England: ſeveral other noble volunteers were preſent, particularly Lord Cutts, who took a young Turk priſoner, to whom he gave the name of Budiana; this Mahometan afterwards turned Chriſtian, and became an officer in the Engliſh army. In the ſame year, the Venetians recovered great part of the Morea; prince Lewis of Baden totally defeated the Turks; and the Poles gave a great overthrow to the Tartars.

Theſe, and other ſubſequent ill ſucceſſes, ſo diſpirited the troops, that they demanded the grand viſir's head; this the Grand Signor ſent them, with the heads of ſeveral other great officers, without which they did not appear diſpoſed to be ſatisfied; but, after all his compliances, they depoſed him in the thirty-ninth year of his reign, and fifty-third of his age. He died a natural death five years after in the ſeraglio.

In 1687, Solyman III. brother of the laſt emperor, was advanced to the throne. In the beginning of this reign, the duke of Bavaria took Belgrade; prince Lewis of Baden obtained a victory over the Turks at Boſnia; and the Venetians extended their frontiers in Greece and Dalmatia. This run of ill luck induced the Turks to offer very advantageous terms to the Chriſtians; but the treaty was broken by the machinations of the French king Lewis XIV. who promiſed to invade Germany, and divide it with the Turks; but neither they nor the French were able to compaſs their deſigns; and Solyman died in the fourth year of his reign, and fifty-third of his age.

Achmet II. brother of Solyman, ſucceeded him, in 1691; and on the 19th of Auguſt in the ſame year a numerous army of Turks paſſed the Danube, but they were defeated by prince Lewis of Baden, where the grand viſir and twenty-eight thouſand men were ſlain. Achmet died in the fourth year of his reign, and fifty-firſt of his age, and was ſucceeded by his nephew,

Muſtapha II. who raiſed an army of one hundred and twenty thouſand men; took Lippa, and defeated the Imperialiſts: his fleet was likewiſe ſucceſsful againſt the Venetians; but, on the other hand, the Ruſſians took Aſoph from him, and opened a communication to the Black ſea.

Prince Eugene, in 1692, defeated the Turks at Olack, when the prime viſir, and thirty thouſand men were ſlain. A diſhonourable peace being now concluded, the ſultan was depoſed in 1703, and his brother Achmet raiſed to the throne.

Achmet III. began his reign with diſplacing all the great officers of ſtate who had brought about the revolution; the reaſon for which was ſaid to be, that they aſſumed too much upon that account.

In 1709, the king of Sweden, after his defeat at Pultowa, took refuge in the Turkiſh territories, and had ſufficient intereſt to ſtir up the Grand Signor to declare war againſt the czar of Muſcovy; the czar raiſed a large army, but, not acting with prudence, he was ſoon compelled to ſign whatever conditions the Grand Signor pleaſed to preſcribe.

The Turks, in 1715, ſubdued the Morea, on which the emperor of Germany declared war againſt them; and in 1716 the Ottoman army was defeated at Carlowitz by prince Eugene. In this battle, the grand viſir, the aga of the janiſaries, a great number of baſſas, and one hundred thouſand men were ſlain: Tuneſwaer was taken by the Imperialiſts this campaign; and in 1717 prince Eugene took Belgrade, and again defeated an army of two hundred thouſand Turks. However, by the mediation of Great Britain and Holland, a peace was concluded in 1718.

After theſe tranſactions, the Turks, in 1722, invaded Perſia, and had ſome ſucceſs till compelled by the celebrated Kouli Khan to retire. Achmet's ill ſucceſs occaſioned him to be depoſed; and in 1730 his nephew Mahomet was raiſed to the throne.

Mahomet V. as ſoon as he began his reign, made peace with Perſia, and entered into a war with Ruſſia. In 1737, the Turks defeated the Imperialiſts at Crotſka, and took Orſova. In 1739, they beſieged Belgrade; but a treaty being entered into between the Germans, French, and Turks, it was unanimouſly agreed, that the Turks ſhould have Belgrade, but the fortifications were to be demoliſhed. The Danube and Save were to be the northern boundaries of the Turkiſh territories; the river Atlanta and the iron gate mountains, the eaſtern boundary; and the river Unna, the weſtern limits, towards the German dominions. By another treaty, the Ruſſians were obliged to demoliſh all their forts on the Palus Mœotis, and Euxine ſea, and to deſtroy the fortifications of Aſoph.

Mahomet was of a pacific and juſt diſpoſition, and on that account reſpected much by the Chriſtian princes. Nothing material, except the above tranſactions, happened during his reign; and on the 13th of December, 1754, he died ſuddenly of a fit of the aſthma, and the ſame day his brother Oſman was proclaimed emperor, from the minarets of the moſques.

Oſman III. began his reign in a time of profound tranquillity; and nothing material occurred till his death, which happened in 1757, when he was ſucceeded by his brother,

Muſtapha III. who began his reign with every perſonal advantage: he was of a different diſpoſition from moſt of his predeceſſors, being of a liberal way of thinking, a lover of learning, and the firſt who introduced the art of printing into the Ottoman empire. In the year 1766, a general ſpirit of liberty ſeemed to diffuſe itſelf through many parts of the world. The Turkiſh empire was affected by its influence, the Georgians began to aſpire at independence, and many inſurrections happened in Egypt and Cyprus; which, though ſuppreſſed, evinced the ſpirit that prevailed at this period.

A war broke out, in 1768, between Ruſſia and the Porte, and a confederacy was formed againſt the Ruſſians among their own ſubjects and dependents, which was fomented and increaſed by the Ottomans. The confederates were, however, obliged to retreat into the Turkiſh territories. A Turkiſh army was aſſembled between Choczim, Bender, and Oczakow, the Ruſſians formed a line of troops along the frontiers of Poland, and a large body of Tartars appeared on the Ruſſian ſhore.

The Ruſſian admiral Spiritdoff ſet ſail, in 1769, with a powerful ſquadron for the Levant, and was afterwards joined, in 1770, with two other conſiderable fleets commanded

manded by a don Elphinſtone and Count Orloff: ſoon after which, an engagement happened between the Turkiſh and Ruſſian fleets, near Napoli-di-Romani; in which the former were totally defeated, and took ſhelter in the harbour of the above-mentioned place, whither admiral Elphinſtone purſued and greatly annoyed them. Count Orloff was at this time acting by land in the Morea, but he ſoon after joined the other ſquadrons; and the whole fleet, on the 7th of July, 1770, engaged that of the Turks, who were totally defeated. In this fight, which was very bloody and deſperate, admiral Spiritdoff engaged the Capitana of one hundred guns, yard-arm to yard-arm, when the Turkiſh ſhip taking fire, the flames communicated to the Ruſſian ſhip: both unhappily blew up, and the crews, a few officers and men excepted, periſhed, either in the exploſion or the waves. The Turks now fled, in order to ſecure themſelves in the bay of Schiſma, where a few nights after their fleet was burnt by means of three fire-ſhips ſent amongſt them by the Ruſſians. It may well be imagined, that a fleet conſiſting of one hundred ſail, almoſt in one general blaze, muſt preſent a ſcene of diſtreſs and horror dreadful beyond deſcription; while the flames with the utmoſt rapidity were ſpreading deſtruction on all ſides, and ſhip blowing up after ſhip, with every ſoul on board, that feared to truſt the waves to ſwim for ſhore; the Ruſſians kept pouring upon them ſuch ſhowers of cannon-balls, ſhells, and ſmall-ſhot, that not one of the many thouſands of their weeping friends on land, who ſaw their diſtreſs, dared venture to their relief. Nothing now remained but united ſhrieks and unavailing cries, which, joined to the martial muſic and the loud triumphant ſhouts of the victors, ſerved to ſwell alternately the various notes of joy and ſorrow that compoſe the dirge of the departing glory of the Turks. The loſs on the part of the Ruſſians was admiral Spiritdoff's ſhip, and between ſeven and eight hundred men: on the ſide of the Turks, beſides the deſtruction of their whole fleet, above nine thouſand men periſhed.

After this diſaſter, the Turks quitted Schiſma in great conſternation, and, haſting to Smyrna, murdered an incredible number of Greeks and other Chriſtians, whom they ſuppoſed to be well affected to the Ruſſians, ſparing neither age nor ſex. The Ruſſians alſo, in this expedition, ſpread deſolation through the coaſts of Greece, Aſia, and the iſlands of the Archipelago, and greatly injured the trade of the Levant; but they acquired little benefit to themſelves by their ſucceſſes. This year likewiſe the Turkiſh army on the Danube, under the command of the grand vizier, was attacked and routed in its trenches at Babadagh.

Negociations were in 1772, ſet on foot, in order to procure a peace; but the plenipotentiaries not agreeing, the whole proved fruitleſs; nothing, however, of any conſequence was performed this year by either army. But in Syria and Egypt the people were in open rebellion; Ali Bey was, however, defeated and driven out of Egypt by Mahomet Aboudaab, when he ſought refuge in Syria, and was affectionately received by his friend Sheik Dabir, an Arabian prince.

Muſtapha III. departed this life at Conſtantinople, on the 21ſt of January, 1774, in the fifty-eighth year of his age, and ſeventeenth of his reign, with the character of having been the wiſeſt, beſt, moſt humane, and diſintereſted monarch that ever governed the Ottoman empire. He was ſucceeded by his brother Abdul Hamet.

On this emperor's acceſſion to the throne, ſome commotions were excited in favour of the young prince Selim, but they were eaſily ſuppreſſed: the war upon the Danube was carried on with vigour; nor did the Ottoman miniſtry fail to encourage as much as poſſible the rebellion of Pugatcheff againſt the Ruſſian government. The Turks were, however, defeated in various engagements; diſorder, mutiny, and deſertion, prevailed among the troops; the grand vizier being abandoned by the greateſt part of his forces, was obliged to accede to the terms preſcribed by the enemy, who had ſurrounded him at Schumla. Theſe ill ſucceſſes threw the whole Ottoman empire into confuſion; the Porte, however, under the preſent complexion of affairs, thought proper to ratify the articles of peace, the principal of which were: 1. The independency of the Crimea. 2. The abſolute ceſſion to Ruſſia of Kilburn, Corche, Jenichala, and all the diſtrict between the Bog and the Niaper. 3. A free navigation in all the Turkiſh ſeas, including the paſſage through the Dardanelles, with all the privileges and immunities which are granted to the moſt favoured nations. In return for which conceſſions, Ruſſia was to reſtore all ſhe had conquered. Aſoph and Taganrock excepted.

Soon after the concluſion of this peace, the grand vizier died, as is ſuppoſed of a broken heart, on his return to Conſtantinople; and public rejoicings were made at St. Peterſburgh, for the uncommon ſucceſs of the Ruſſian arms. The rebel Pugatcheff was alſo not long afterwards defeated by the Ruſſian forces, taken priſoner, and put to death.

Mahomet Aboudaab, with an army of Egyptians, in the year 1745, conquered the country of the old and brave Shiek Daher; but Aboudaab dying in the midſt of his ſucceſſes, Shiek Daher was in hopes of retrieving his affairs, when a baſſa arrived upon the coaſt of Syria with a conſiderable reinforcement. Shiek Daher was ſoon ſubdued, his treaſures ſeized, and his head ſent to Conſtantinople.

At the beginning of the preſent year 1782, the Kiaſa Bey was depoſed, and his place ſupplied by Amer Effendi, an intimate friend of the grand vizier. In the ſame year, the Porte cauſed the dragoman of the Morea to be beheaded, and has annexed his income of ten thouſand piaſtres per annum to that of dragoman to his ſublime highneſs, who will for the future enjoy a ſalary of twenty thouſand piaſtres annually, beſides ſeveral other emoluments.

Since the foundation of the Turkiſh empire, it has been governed by twenty-eight monarchs, the firſt ſeven of whom were kings, beginning with Ottoman, or Oſman, who mounted the throne in 1300, and ending with Amurath II. who began to reign A. D. 1422. After this reign, its monarchs aſſumed the title of emperor, of whom there were twenty-one, the firſt of whom was Mahomet II. who began his reign in the year 1450; and the laſt was Abdul-Hamet, with whom we cloſed our hiſtory, who aſcended the throne in 1774, and was the brother and ſucceſſor of Muſtapha III.

CHAP. IX.

THE NEW AND COMPLETE HISTORY AND DESCRIPTION OF

THE ASIATIC ISLANDS IN THE PACIFIC AND INDIAN OCEANS.

JAPAN.

SECT. I.

Treats of the extent of the empire of Japan, its cities, palaces, buildings, furniture; genius and temper of the people, their habits, diet, diverſions, feſtivals, forms of ſalutation, manufactures, huſbandry, &c.

THE extenſive and opulent kingdom of Japan (which the natives uſually call Niphon) conſiſts of three large and many leſſer iſlands, is one hundred and thirty degrees eaſtward of London, extending from thirty to forty one degrees north latitude, and from one hundred and thirty to one hundred and forty-ſeven degrees eaſt longitude, the whole cluſter being about ſix hundred leagues in circumference, and two hundred in length. The larger iſlands are Japan itſelf; Xims, the next in extent, and Xicoco the ſmaller of the three, which is ſituated between the former two, and is divided into four provinces. There is alſo the iſland of Tonſa, which lies ſouth of Niphon, being divided from it by a narrow channel; the capital

city whereof is Nava, ſituate on the north eaſt part of the iſland. The iſland of Bungo lies ſouth-weſt of Tonſa, being between four and five hundred miles in circumference, the capital city whereof is Nangaſcki, ſituate on a bay of the ſea, on the weſt ſide of the iſland (of which more hereafter): and near this city is the little iſland of Difnia, not much more than a mile round, where the Dutch factory are permitted to reſide; but of this we ſhall ſpeak more particularly, under the article of their trade with the Japaneſe. The iſland of Firando is pretty conſiderable, extending from thirty-three degrees twenty minutes to thirty-four degrees north latitude, and from one hundred and thirty-one to one hundred and thirty-two degrees eaſt longitude.

Jeddo, or Yeddo, the capital of Niphon, and of the whole empire, ſtands in the midſt of a fine plain in the province of Muſaſi, and is ſituate on a bay of the ſea, in the north-eaſt part of the iſland, in one hundred and forty-four degrees ten minutes of eaſt longitude, and thirty-ſix degrees of north latitude; being one of the largeſt, moſt opulent, and beautiful cities in that part of the world. The imperial palace, with its courts, parks, and gardens, is a ſquare of five miles in circumference, and ſtands in the middle of the city: that part of the palace where the king reſides, makes ſuch a ſhining appearance, that ſome travellers have related, it is covered with gold plates inſtead of tiles: probably, they reſemble the varniſhed gilded tiles which cover the palace of Pekin.

This noble ſtructure is formed by ſeveral piles of buildings, and incloſes many ſtreets, courts, apartments, pavilions, guard-houſes, gates, draw-bridges, gardens, canals, &c. In it reſides the emperor and his family, the royal domeſtics, tributary princes, and their retinues, the miniſters of ſtate, many officers, and a great garriſon. The walls are built of free-ſtone, which are not cemented by mortar, or braced together with iron; but being prodigiouſly large, are laid looſe upon each other; which is a precaution taken, that they may not receive any conſiderable injury from the earthquakes which are ſo frequent. Many of the ſtately apartments are formed and altered at pleaſure, by means of magnificent ſcreens, and ſuperb moveable partitions. The principal apartments are, the hall of attendance, where the emperor gives audience; the council chamber, where the miniſters of ſtate meet; the hall of a thouſand mats, where the tributary princes do homage, &c. This magnificent palace was built in the year 1600, in the reign of the emperor Tayko.

The city is in the form of a creſcent; and is interſected in almoſt every ſtreet by canals of water, where banks are planted with rows of trees. Theſe canals not only ſerve as ornaments to the city, but are of ſingular utility in caſes of fire, as they both afford a ready ſupply of water, and ſtop the progreſs of the conflagration. There is a ſtrong caſtle to defend the city, which is not ſurrounded by walls; the river Tonkag waters it, ſupplies the caſtle ditch, and, being divided into five ſtreams, has a bridge over each. The principal of theſe bridges, named Niphonbas, is the ſtandard from which all the roads, poſts, and diſtances of the empire are taken. The ſtreets are wide and handſome, but irregular. The public buildings are magnificent, but the private dwellings are mean, though neat. This city is under the direction of two governors, who rule a year each alternately like the chief magiſtrate of London; under theſe are inferior officers like our aldermen, who have the direction of particular diſtricts or wards; and ſubordinate to theſe are the ottonas, to each of whom the care of a particular ſtreet is committed.

The next royal city is that of Meaco, ſituate on a lake, near the middle of the iſland of Niphon, about three hundred miles ſouthward of Jeddo, in forty-five degrees thirty-eight minutes north latitude, and one hundred and thirty-eight degrees fifteen minutes eaſt longitude, being two hundred and ſeventy-ſix miles weſt of Jeddo, and was the antient metropolis of the whole empire, but is at preſent the reſidence of the dairo. It is built in a pleaſant and extenſive plain, on the ſouthern coaſt of the iſland of Japan, being ſurrounded at ſome diſtance by mountains, which give a delightful and romantic proſpect to the whole. The circumjacent country between the city and the mountains, and the mountains themſelves, are covered with temples, ſepulchres, and monaſteries, and embelliſhed with a variety of orchards, gardens, groves, caſcades, and purling ſtreams. Three conſiderable rivers water the fertile plain, and unite their ſtreams in the centre of the city, where a magnificent ſtone bridge facilitates the communication between the upper and lower town. The dairo has his reſidence in the north part of the upper town.

On the weſtern ſide of the city is a ſtrong caſtle, which ſerves as a palace for the cubo, when he comes to pay homage. It contains a ſmall garriſon, is ſix hundred yards in length, has a tower in the centre, and is ſurrounded by two ditches, the one dry, the other full of water, and abounding with the moſt delicious fiſh. Since the emperor's court has diſcontinued to reſide here, this city has greatly declined; it was then twenty miles in length, nine in breadth, excluſive of the ſuburbs, and ſurrounded by ſtrong and ſtately walls. The ſtreets were long and narrow, and exceedingly crowded with inhabitants; for on a liſt being given in by order of the government, the number amounted to five hundred twenty-nine thouſand ſeven hundred and twenty-ſix, though the dairo's court, and ſtrangers not conſtantly reſiding in the place, were not included; but it is ſaid at preſent not to contain above one hundred thouſand ſouls. The univerſities, colleges, monaſteries, temples, &c. are almoſt incredible in number, and magnificent in appearance. The private houſes are but two ſtories high, built of wood, and covered with clay, or thatched. Every houſe is obliged to have a reſervoir, or trough of water, ready in caſe of fire: but they join neatneſs with ſimplicity; and every trade or calling hath a particular ſtreet or diſtrict aſſigned to it.

The palace of the dairo is incloſed by magnificent walls flanked with ſtately towers, and ſurrounded with a double ditch. It contains twelve capital ſtreets, in the centre of which are the royal apartments, ſuperbly built, elegantly furniſhed, and adorned with gardens, orchards, pavilions, terraces, groves, &c.

Oſaca is the next moſt conſiderable city in Japan, which is ſituated at the mouth of the river Jedogawa, about fifteen leagues from Meaco, and in thirty-five degrees fifteen minutes north latitude, and one hundred and thirty-ſeven degrees twenty minutes eaſt longitude. It is deemed the principal ſea-port in the empire, and is filled with an incredible number of merchants, tradeſmen, mechanics, eccleſiaſtics, &c. It is ſo populous, that an army of eighty thouſand men has been drawn from it upon emergencies. It is near fifteen miles in circumference, contains many elegant houſes, and ſome palaces belonging to the nobility. A ſtrong quadrangular caſtle defends the port. The walls are thick, the towers with which they are flanked well fortified, and the garriſon numerous. Two officers command here, one has the ſuperintendance of the caſtle, and the emperor's treaſures, ſtores, and cuſtoms; the other preſides over the garriſon: but the city itſelf hath a governor of its own, who hath the regulation of all civil affairs. The houſes in this city are covered with a kind of earth of a yellow colour, which gives their roofs an elegant appearance.

In this city, the watchmen make the hour known by means of three inſtruments. An hour after ſun-ſet, they beat a drum, the ſucceeding hour is ſignified by ſtriking on a brazen bowl, and the hour ſubſequent to that by ringing a bell; the next hour they begin again with a drum, proceed to the bowl and bell, and ſo continue the whole night, uſing the three inſtruments alternately. In all other parts of the empire, however, the hour of the night is told by beating againſt each other two wooden cylinders.

Suranga is ſituated in thirty-five degrees twenty-two minutes north latitude, and one hundred and forty-two degrees thirty minutes eaſt longitude, is the capital of the province of the ſame name, and a very conſiderable ſea-port town, ſome of the emperors reſided in it; and ſome of the Engliſh were not long ſince permitted to trade with the merchants who lived chiefly in the ſuburbs. It is now greatly on the decline, but ſtill retains ſome of its antient privileges, particularly the liberty of coining money.

Saccai ſtands about twenty miles from Oſaca; it is inhabited by a proud ſet of people, who all boaſt of their anceſtors, and pretend to be deſcended from the antient Japaneſe emperors. This city is very advantageouſly ſituated as a place of ſtrength, being defended on the different ſides by a ſtrong wall, an inacceſſible mountain, a capacious ditch, and a formidable caſtle. Near the harbour is a little iſland called Pic-nes, celebrated for its pleaſant groves, and famed as the reſidence of a favourite idol, to whoſe temple many of the inhabitants of the city repair in boats; and ſome, through exceſs of zeal, jump into the water by the way, and drown themſelves.

Cangoxima is a ſea-port on the ſouthern part of the iſland of Ximo, and was the firſt place where the Portugueſe landed when they diſcovered Japan. It lies in thirty-one degrees forty-two minutes north latitude, and one hundred and thirty-three degrees ſixteen minutes eaſt longitude, a

ſtrong

A Method of Riding &c. practised by the

RUSTICS of JAPAN.

strong castle is built on a rock in the harbour, and a light-house on another very high rock in the harbour. Many stately temples adorn the city, and a good garrison is kept here.

Nangasicki (mentioned above) lies in thirty-two degrees thirty-six minutes north latitude, and in one hundred and thirty-one degrees twenty-two minutes east longitude. The city is in the form of a crescent, delightfully situated among verdant lawns, and surrounded by pleasant hills: it contains many handsome buildings, particularly temples, and is strongly garrisoned. The streets in general are narrow and crooked, but run a considerable length, the temple, or some public building, usually terminating the vista. The town is watered by three rivers, and divided into upper and lower; the former containing twenty-six, and the latter sixty-one streets; but strangers reside in the suburbs, and are narrowly watched. The principal buildings are five warehouses, in which are laid up all the materials for forming three men of war, which, upon an emergency, may be taken out, and put together in a very short time; a powder magazine, the palaces of the two governors, the palaces of between twenty and thirty-five grandees, sixty-two temples, thirty-five bridges, twenty being of stone, and the rest of timber, &c. the kokina or prison, which the people very emphatically stile hell. It consists of about one hundred dungeons, or cages separate from each other, apartments for private executions, and baths in which the prisoners are obliged to wash themselves, in order, as much as possible, to prevent infections.

The Japanese build with wood, and generally upon one floor; but their apartments are very commodious: the partitions of their rooms are made to fold up like a screen, so that they can lay several rooms into one, as they have occasion. The houses of the nobility are wainscoted with cedar, the floors paved and covered with fine mats, their ceilings are painted and gilded, and the doors finely varnished. The tradesmen and inferior people content themselves with thatched roofs and clay walls, though they have a little apartment built of stone or earth where they secure their most valuable goods from fire. They have no glass, or any thing like it in their windows, but only wooden shutters.

They use neither tables, beds, or chairs; but sit on mats when they eat, and lie on them when they sleep. Their rooms are usually hung with pictures or painted paper, the rest of their furniture consists in cabinets, screens, china-ware, and fine swords, which they hang up in their rooms.

A strict watch is kept every night, lanterns hung out, and every ward or division in their cities shut up; that in case of fire, it is said, they are not suffered to break in upon one another.

The inhabitants of this island are said to be of a quick apprehension, good understanding, modest, patient and courteous; and so just in their dealings, that if a person makes a mistake they will not take the advantage of it. On the other hand, we are told by the same authors, that they are cruel, ambitious and uncharitable; and have so little compassion for the poor, the sick or the lame, that they will let them lie and perish before they will relieve them; that they are intolerably proud, and so passionate, that they will kill themselves if they cannot have their revenge. However inconsistent this character may seem to be, there are few books of travels where the reader will not be shocked with contradictions of this nature; and perhaps if we observe a medium here, as in other doubtful cases where the writers are not competent judges, or give characters of a people from some few instances they have observed, we shall come nearer the truth, than by adhering strictly to either. These people probably are neither so exceedingly courteous or patient as some relate, or so barbarous and passionate as others would have us believe; and Japan being a country not only the most distant from us, but the most inaccessible to Europeans of any other upon the face of the earth; it may be some time before we are rightly informed of the temper and genius of this people.

The persons of the Japanese have in general but a forbidding appearance; a very flat nose, and eye-lids disgustingly thick disfigure a face unproportionably broad, and disagreeably tawny. Their stature is short, their bodies thick, and their legs clumsy; though many of them differ from this description, and resemble the Chinese, who live under the same parallel; and their habits are alike, namely, vest, gowns and drawers, or breeches, that fall down to their ancles, and slippers without heels; but they wear no cap or hat, and screen themselves from the weather with the fan they always carry in their hands, or extensive umbrellas the slaves carry over their heads, which are close shaved half way. Every gentleman wears a brace or dagger in his sash, and a great broad sword on his thigh whenever he goes abroad.

People of figure eat chiefly venison, fish and wild fowl of their own taking. Some sects among them eat no meat, or drink any strong drink, but live upon rice, roots, herbs and fruit; water and tea are their usual liquors; and some indulge in strong beer, made of wheat and mixed with spirits. Their diversions in towns, are plays and masquerades: the subject of their plays here, and in most eastern countries, is the history of some hero, or great man, their country hath produced.

There is a great festival celebrated every year, when they visit the tombs of their ancestors: at these solemnities every house is illuminated, and they march out of their towns at midnight in a solemn procession to the graves of their dead friends, where they eat and drink, and make merry for several nights successively: at the conclusion of the feast they march round the town with flags, streamers, and banners, beating upon brass pans before the temples of their idols, and at the doors of their great men.

Their instrumental music is not at all harmonious, but some of their voices are pretty tuneable. At the end of every play or masquerade there is always a noble entertainment provided at the charge of the company: these people, it is observed, spend great part of their night in eating and drinking, which others spend in sleep; and because their manners and customs are acknowledged to be different from the rest of the world in many instances, some people carry it so far as to affirm they resemble us in nothing; and particularly, that instead of bowing to shew their respect to their betters, they stand up as stiffly as they can: but I find by the best writers that they bow their bodies as we do, and never approach their magistrates but upon their knees. As for putting off their shoes or slippers instead of hats, the people of the other eastern nations always put off their shoes when they enter their temples, or the houses of those for whom they have any respect; which appears to be a custom almost as antient as the world, and therefore need not be thought strange in the Japanese. And as for their not putting off their hats, this need not occasion any wonder, since they wear none.

They keep their roads in very good repair, and shew the distances of places by placing trees at the end of every three miles. But there are no inns or public houses for the entertainment of travellers: and what is a very great nuisance in them is, the carcases of their malefactors, whom they generally crucify with their heads downwards, are placed upon the roods in terrorem.

As to their trade, the natives themselves are not permitted to carry on any but with Jesso, Korea, the Chinese and the Dutch. The Portuguese Christians about the year 1628, being accused of forming a conspiracy against the crown and government, the Christians were all cut to pieces, and a decree made against having any commerce with them, or any nation that profess Christianity. The Dutch, to convince the Japanese that they were not Christians, did not refuse to trample upon the cross of our Saviour; and the Japanese are so well satisfied of their infidelity, that they are permitted to have a factory there to this day; which all other nations, who abhor their impious hypocrisy, are excluded from: but the Japanese are so jealous even of the Dutch, that when any of their ships arrive, a magistrate goes on board and takes an account of the number of their men, and carries their sails, ammunition, guns and rudder ashore, till they are ready to sail. Nor have the Dutch factory, which stands on the point of a rock, and is separated from the city by a river and a wall, any communication with it for eight or nine months in the year.

A judicious and accurate traveller, gives the following description of the island of Dimia in the Dutch possession: "This island (he says) is not more than two miles in circumference; and no Dutchman can stir out of it, or come into the town of Nangasicki (to which it is joined with a bridge) without hazarding his being cut to pieces by the guards, who are appointed to watch their motions: nor are the Dutch so much as suffered to have a lighted candle in their houses in the night-time. If the centinels perceive the least noise, they blow a horn, and the governor immediately sends a party to learn the reason of it, which does not return till the occasion is discovered, and then the authors are severely threatened, if not punished. In this lamish condition the Dutch remain eight months in the year."

The Japanese mechanics and manufactures excel in their different branches, and are even far superior to the ingenious

ingenious Chineſe. Their ſilks and cottons are excellent, and their Japan ware and porcelain unequalled. The ſwarms of pirates in their ſeas add to the obſtacles that obſtruct their commerce. The commodities exported are, wrought ſilk and cotton, Japan ware, porcelain, gold, ſilver, copper, iron, ſteel, artificial metals, furs, tea finer and better cured than that of China; gums, medicinal herbs, roots, &c. diamonds, pearls, coral, ſhells, ambergris, &c. Whatever goods the Japaneſe want, they pay for either by way of barter for other commodities, or in bullion of gold, ſilver, or copper.

Their ſhips, which reſemble thoſe of the Chineſe, are built of cedar-wood, but are only fit for very ſhort voyages: they are built from eighty to ninety feet in length, and from twenty to twenty-five feet in breadth, and conſtructed both for ſailing and rowing: they contain many little cabins, ſeparated by ſkreens, folding doors, &c. they have only one maſt and one ſail: the ropes are made of rice ſtraw, and the anchors of coarſe iron. Their pleaſure-boats, which are intended only for the navigation of lakes, rivers, &c. are extremely beautiful, being finely gilt, carved and otherwiſe adorned with the moſt curious and ſuperb embelliſhments.

The Japaneſe have almoſt all ſorts of cattle and poultry that are found in Europe, but their horſes are very ſmall. Rice is the principal grain the country affords, which is managed in the ſame manner as in China, and always grows in water till it is ripe. They have alſo very good red wheat, but not in ſo great quantities as rice. Their huſbandmen are little better than ſlaves; they plow and manure the ground for the great lords, but have no properties of their own.

The gardens ſeem to be in much greater perfection here than in Perſia; they have a handſome large court uſually before their houſes, and a garden behind them, laid out into fine walks, mounts and terraces, and adorned with greens and flowers, which are ſeen from the ſtreet, there being always a large viſto from the outward gate through the houſe into the gardens.

There is a prodigious high mountain in Japan, which, though it ſtands above eighteen leagues within the land, is ſeen above forty leagues at ſea. There are alſo eight volcanoes, or mountains which vomit fire and ſmoke.

SECT. II.

Containing an account of the Japaneſe learning, arts and ſciences, laws and puniſhments, and of the revenues, forces, and prerogative of the crown, &c.

THE common learning of the Japaneſe conſiſts in reading, writing, underſtanding their own hiſtory civil, military, and eccleſiaſtical, and a few ſimple precepts of morality; but many of them acquired ſeveral branches of the mathematics and philoſophy from the European miſſionaries at various times, which their deſcendants ſtill retain; their philoſophy, however, is tinctured with many ſuperſtitions of their own, and their aſtronomy blended with the abſurdities of aſtrology. Prior to the arrival of the Europeans in their country, they were ſo ignorant with reſpect to geography, that they imagined their own empire, China and Siam, to be the only countries in the univerſe; and their notions were very imperfect with reſpect to the extent and ſituation of theſe: they have, however, many univerſities and public academies, for the training up of youth in the learning of the country, and the practice of the moral duties. Theſe ſeminaries are well ſupplied with books, and reſorted to by a great number of ſtudents, governed by bonzas, who are uſually of noble deſcent, and well endowed with money for their ſupport. According to the Portugueſe miſſionaries, theſe ſuperiors of the public ſeats of learning are adepts in moral philoſophy, and great maſters of the moſt perſuaſive elocution. Indeed it is not to be wondered at that they make a ſwift progreſs in whatever they are taught, being poſſeſſed of the moſt retentive memories. Their poetry is lofty, ſublime, melodious, and deſcriptive; their muſic is leſs agreeable; but their paintings are the beſt executed by any of the orientals, though they fall far ſhort of the Europeans in every eſſential except colouring, in which they exceed them.

Theſe people have no regular ſyſtem of phyſic; their doctors truſt to experience, and always preſcribe according to precedent, if they have a precedent to go by; but where that is wanting they proceed intirely by conjecture, ſo that ſimilar caſes, and gueſs-work, form the whole of their materia medica: but the moſt faſhionable remedies, upon all occaſions, are hot and cold baths. The ſurgeons are more unſkilful than the phyſicians in every thing except the cure of the ſkuki, a moſt grievous kind of colic peculiar to the Japaneſe, which they almoſt inſtantly remove, by taking blood from the part afflicted, with a ſmall needle made of gold or ſilver. Both phyſicians and ſurgeons, are, however, highly eſteemed by the people, and uſually acquire conſiderable fortunes by their practice among them.

The Japaneſe write, like the Chineſe, from top to bottom in columns, which they begin at the right hand; and their letters were originally the ſame; but they have changed the form, and even the ſound of many, in order to differ as much as poſſible from the Chineſe, whom they naturally hate, and affect upon all occaſions to hold in the utmoſt contempt.

The invention of gunpowder and printing is claimed by them, as well as the Chineſe, the preparation and uſe of the firſt they are much inferior to them; but they excel them in the latter, which is performed in a ſimilar manner, as well as in the compoſition of ink and paper.

Children are educated in this country with great care, and won to a love of their ſtudies by motives of emulation, and the moſt captivating endearments. They differ from all the other oriental nations in inculcating a contempt of pain and death, teaching them to deſpiſe all kinds of luxuries, weaning them from every thing that in the leaſt tends to effeminacy, and enuring them to every kind of hardſhip.

Not only the petty kings, but every lord of a diſtrict, and father of a family, has the power of life and death, and tries and condemns his dependents according to his own arbitrary will; there being few written laws, if any, and no public courts of juſtice in this country; the ſmalleſt theft, or a bare aſſault, gaming, and even lying, as it is ſaid, is often puniſhed with death: and for defrauding the king of his revenue, murder or treaſon, and ſuch enormous crimes, the offenders relations, parents and children ſuffer with him; except the female relations, who are ſold for ſlaves. The petty kings are ſeldom put to death, but baniſhed to a certain iſland, where they are put to ſervile employments during the remainder of their lives. Their uſual puniſhments for great offences are burning, crucifying with the head downwards, tearing them to pieces with horſes, and boiling them in oil; and where an offender refuſes to come in and ſubmit, he is ordered to be cut in pieces wherever he is found. A gentleman or ſoldier convicted of any capital crime, has the favour of dying by his own hands; and it is reckoned very ignominious if he waits for the executioner to diſpatch him in that caſe.

This prince's revenues are alſo ſaid to amount to an incredible ſum, far exceeding the revenues of all the princes in the world beſides; which inclines me to think there is a miſtake of a figure or two; and that the writers, who agree pretty near in the ſum, have only copied after one another: though it is obſervable, that the revenues and forces of diſtant kingdoms are often magnified beyond all belief. Some authors have aſſerted, that the revenues of the emperor amount to twenty-eight millions ſterling; but the truth of this is greatly to be doubted.

When this prince goes abroad, he is attended by no leſs than five or ſix thouſand of his guards, and his ſtanding forces are ſaid to amount to twenty thouſand horſe and one hundred thouſand foot in time of peace: in time of war each of the petty ſovereigns is obliged to furniſh his quota, which increaſes the army to thirty-eight thouſand horſe, and three hundred and ſixty-eight thouſand foot: but againſt whom ſuch numerous forces ſhould be raiſed is not eaſy to conceive: we having no account of any foreign wars they were ever engaged in. The Japaneſe troops march in diviſions of fifty men each, five in front, and ten deep, each diviſion being commanded by a ſingle officer, who keeps them in exact order. They are armed with either muſkets, pikes, bows and arrows, ſabres and targets, or battle-axes. Five of theſe diviſions form a kind of regiment; but they are not accompanied by any warlike muſic; between each diviſion are three led horſes finely capariſoned, and three ſlaves are appointed to lead each horſe with long reins. The captains ride on horſeback behind their reſpective diviſions; on each ſide of the horſes are a kind of paniers, containing the officers bedding and baggage. When an officer grows old, he is permitted to have a ſmall ſort of couch or ſupporter behind him, againſt which he may commodiouſly lean, when fatigued, by ſitting upright.

Japan and the neighbouring iſlands are under the government of fifty or ſixty petty kings, veſted with ſove-

reign

in which the PRIEST *is performing their* NUPTIAL CEREMONIES.

Wale delin. *Page sculp.*

reign power in their reſpective territories, but ſubject to one grand monarch, who can depoſe and puniſh them as he ſees fit. Antiently this great king was high prieſt as well as ſovereign of theſe iſlands; and the preſent dairo, or high prieſt, who is a deſcendant of the former kings, enjoys ſtill the ſtile and ſtate of a king, notwithſtanding another family poſſeſſes the throne: and, it is ſaid, the reigning prince is obliged to marry one of his daughters, and do him homage once in three years, and acknowledge he holds his crown of that family: but this ſeems to be done rather on a religious, than civil account.

The king commits the adminiſtration of the government to his prime miniſter, who is ſtiled cubo: one of the cubo's ſtripped the dairo of the civil and military authority; ſo that the cubo may at preſent be deemed the emperor, as he hath all the power; and the dairo, the high prieſt or pontiff, as he ſtill poſſeſſes all the eccleſiaſtical dignity: he has a privy-council alſo, conſiſting of twenty-eight members, of which four are petty kings. The vaſſal kings are obliged to attend at court one half of the year, and have each of them a houſe in the king's palace at Jeddo, as has been hinted already. The eldeſt ſons of the principal nobility are alſo kept at court till they are preferred to ſome poſt; and for the farther ſecurity of the government, oaths of allegiance are alſo adminiſtered every year; and ſo jealous is the prince of his ſubjects, that he has ſpies throughout all the country: but the better to divert them from ſeditious practices, it is ſaid, he employs one hundred thouſand of his ſubjects by turns in erecting palaces and public buildings, or beautifying them, and in throwing up high-ways through the country. The Japaneſe, for domeſtic purpoſes, coin various pieces of money. The gold coin are obans and cobans; ten cobans make one oban; and the latter is of about two guineas value. The ſilver coin is compoſed of a variety of flat pieces of different ſhapes, dimenſions, weight and value; and a copper coin is ſtamped for the inferior purpoſes of change.

SECT. III.

An account of the religion, temples, and ſuperſtition of the Japaneſe; alſo of their marriages and funerals.

THE Japaneſe are idolaters and worſhip the heavens and the planets, with ſeveral monſtrous idols; but the gods they principally adore are Xaca and Amida, to whom they chiefly apply in their diſtreſs: they give no account of the creation of the world, but generally believe the immortality of the ſoul, and a ſtate of rewards and puniſhments, and moſt of them believe tranſmigration, or that their ſouls ſhall animate other bodies after death. They have abundance of cloyſters and nunneries, where their prieſts and devotees live unmarried, and perform ſuch penances as their religion requires; and confeſſion, the jeſuits tell us, is practiſed amongſt them, in which their prieſts are ſo ſtrict, that if they apprehend any thing is concealed, it is as much as the poor ſinner's life is worth; for they throw him down from the top of the rocks, where their ſtools of confeſſion are placed, to create the greater dread, and induce their diſciples to be ſincere.

There is a ſtately temple at Meaco, built of free-ſtone, which captain Saris tells us, is as long as the body of St. Paul's, and as lofty, with an arched roof, ſupported by mighty pillars, in which ſtands an idol of copper, which reaches as high as the roof, and according to Sir Thomas Herbert, his chair is ſeventy feet high and eighty broad, his head big enough to hold fifteen men, and his thumb was forty inches round, by which we may form a judgment of the whole; this temple ſtands upon a high hill, and on each ſide of the aſcent are fifty pillars of free-ſtone, ten paces from each other, and on the top of every pillar a lanthorn, which make a fine ſhow in the night. There are no leſs than ſixty other temples in Meaco, and between three or four thouſand gilded idols in them. In the road between Surungo and Jeddo ſtands the idol dabis, made of copper, in the form of a man ſitting upon his legs and extending his arms, and is two and twenty feet high. At Tencheda the bonzes pretend their god appears in human ſhape to a young virgin whom they bring every new moon into the temple there; having placed her before the great image they illuminate the place with golden lamps and burn perfumes, when on a ſudden the lights are miraculouſly put out, and ſomething in human form immediately embraces, and ſometimes impregnates the young damſel, but whether the phantom they worſhip, or one of his prieſts do her the favour, is left to the reader to conjecture: however that be, the quondam maid is from thenceforward highly honoured, and at her coming out of the temple is entertained with ſongs and muſic, and ſo inſpired, ſays Sir Thomas Herbert, is the enthuſiaſtic girl, that ſhe takes upon her to reſolve the moſt difficult queſtions that are propounded to her. The bonzes, or prieſts, are ſo reſpected by their prince, that he riſes up to ſalute them, and ſuffers them to ſit in his preſence: they preach up great auſterities, and teach morality and a contempt of the world. But the Romiſh prieſts will have it, that they are lewd fellows, and do not live according to their doctrine.

Chriſtianity was firſt preached in this iſland in the year 1552, by ſome Portugueſe prieſts, ſent thither by father Xavier from Macao; and the Chriſtian religion ſo encreaſed, that before the year 1622 three petty kings, and ſeveral other great men, with multitudes of people, made profeſſion of the Chriſtian religion, if we may credit the miſſionaries. But about that time, a decree was made for extirpating all Chriſtians under the Japaneſe government; whereupon there followed ſo terrible a perſecution, that there is not now one Chriſtian left in Japan, nor are any people who acknowledge themſelves Chriſtians ſuffered to come into their ports.

The Japaneſe allow of polygamy and concubinage. The conſent of the parties is ſeldom aſked in Japan any more than it is in China; children are diſpoſed of by their parents very young, and when they are arrived at a proper age, are led to the temple, where a bonze places them before an image of ſome of their gods, putting a lighted torch in either of their hands, while he repeats the words of the contract; after which oxen or other animals are ſacrificed to the idol, according to the quality and circumſtances of the married pair; and the ceremony is concluded by a grand proceſſion to the bridegroom's houſe, where the gueſts are entertained for ſeveral days.

The wife has no fortune here any more than in China, and after marriage ſhe is entirely in the power of her huſband, who may puniſh her, or take away her life if ſhe does not behave well, eſpecially if ſhe be falſe to his bed. The women, it is ſaid, eſteem it no crime to procure abortion, and if they are poor, or bring too many girls, will ſtrangle them with their own hands; but the boys are always provided for by the ſovereign. Common women are allowed here, and no puniſhment or brand of infamy is fixed upon procurers in their life-time; though they are treated as criminals when they die, and their bodies are thrown into the highways, and ſuffered to rot above-ground.

The Japaneſe do not inter their dead as the Chineſe do, but burn the corpſe, putting the aſhes into an urn. The family and friends of the deceaſed attend the corpſe to the funeral pile, with lighted torches in their hands, and the eldeſt ſon ſets fire to the pile, into which are thrown ſweet wood and aromatic gums, which perfume the air, and this makes the funerals of people of condition vaſtly expenſive. The whole concludes with a banquet and entertainment of ſuch muſic as is beſt ſuited to diſpel melancholy reflections. They pay an annual viſit to the tombs of their anceſtors; at which time, when the company have arrived at the ſepulchres of the dead, the bonzes deſcribe the ſituation of the perſons deceaſed, and inform their relations of all that they have occaſion for in the other life, which demands are uſually very extravagant; the kindred, however, furniſh every article with great ſatisfaction, which they ſend, together with a few kind and complimentary meſſages, to the defunct, by means of the bonzes, who convert the whole to their own uſes, and leave the dead to ſhift as well as they can for themſelves.

As the Engliſh have had no commerce with Japan for upwards of one hundred and fifty years, and as we can receive no intelligence from thence but what the Dutch are pleaſed to give us, a letter from an Engliſh Eaſt India captain to his friend in England, when we were allowed a free trade to that kingdom, may give us a juſter account of the ſtate of it, than any thing that has been communicated to us ſince; the ſubſtance whereof follows.

"SIR,

"I arrived at Firando, one of the iſlands of Japan, on the 11th of June, 1613. It is ſituate in thirty three degrees fifty minutes north latitude, a little weſt of the iſland of Bongo. Here Foyne Sama, the viceroy, or king of Firando, as he is called, came on board our ſhip, with his nephew Tone Sama. They were attended by forty galleys, ſome of them rowed with ten, and others with fifteen oars

of a ſide. The king and his nephew were clothed in blue ſilk gowns, and each of them had on a fine linen ſhirt and breeches; their heads were ſhaved half-way; the reſt of their hair, which was very long, was tied up in a roll on the hinder part of the head; they had neither hat nor cap on; nothing on their heads but their hair; each of them had a kind of ſteward, who commanded their ſlaves. They ſaluted me by putting off their ſhoes, and claſping their hands together, and bowing a little, carried them as low as their knees. I entertained them in my cabin, after which they took their leave, and ſeveral of the great men of the iſland came on board, every one bringing a preſent of veniſon, fiſh, fowl, or fruit. The king came on board again, and ordered ſixty of his gallies to aſſiſt in bringing the ſhip into the harbour, there being a dangerous point to paſs. I came to an anchor at length before the town of Firando, in five fathom water, ſo near the ſhore that I could talk to the people in their houſes. We ſaluted the town with nine pieces of cannon; but they had none to anſwer us, and no fort, but a barricado for ſmall ſhot.

"The ſhip was continually crouded with people; among whom were ſome women of quality, that I introduced into my cabin; and ſeeing the pictures of Venus and Cupid there, they immediately fell down and worſhipped them, taking theſe pictures for the Virgin Mary and her Son, having been taught to adore ſuch pictures by the Portugueſe miſſionaries. The king afterwards brought ſome of his ladies on board, who had ſilk gowns on, one ſide folded over the other, and girt with a ſaſh, their hair long, and tied up in a roll on the crown of the head, none of it ſhaved off. They had good features, were very fair, but had no colour in their faces, but what they had laid on. They were of a low ſtature, but very fat; had delicate limbs, their legs bare, only a ſort of half-buſkin tied on the inſtep with ribbons: they ſeemed ſomething baſhful till the king bid them be merry, and then they ſung, and played on an inſtrument that reſembled a lute; they kept time, and ſung and played by book; and after I had entertained them, and made them ſome ſmall preſents of Engliſh curioſities, the king and the ladies took their leave.

"I afterwards went on ſhore, and delivered my preſents to the king, in which were plate and other things to the value of one hundred and forty pounds; and the king, inviting me to an entertainment, drank to me out of one of the cups (part of the preſent) filled with rice-arrac, containing a pint and a half. He drank it off to the king of England's health; in which I pledged him, and he made all the company do the ſame.

"The king afterwards brought ſome actreſſes on board, who go from one iſland to another, acting comedies in the great towns they paſs through. They are all one man's ſlaves, who ſets a certain price upon their favours, which he can never advance, on pain of being capitally puniſhed: there is no bargain made with the courteſan, but with her maſter, whom ſhe is obliged to obey. A nobleman, when he travels, is not aſhamed to ſend for one of theſe keepers to his inn, and bargain with him for one or more girls to wait on him at table, and be his bedfellows, if he thinks fit; for all men of faſhion are waited on by women only in the houſe. Theſe keepers of hackney-girls, in their life-time, are admitted into the beſt company; but when they are dead, the corpſe is treated with the greateſt indignity, not ſuffered to be buried, but dragged through the ſtreets, and thrown into the fields to rot above-ground, or be devoured by dogs.

"A Dutch ſhip coming in while I lay at Firando, it was reported that the crew were Engliſhmen; for the natives did not at firſt diſtinguiſh one of theſe nations from the other, and the Portugueſe had repreſented both as pirates, and taught them a ſong, which they called the Engliſh croſomia, acting a kind of farce alſo, wherein they pretend to ſhew how the Engliſh attack the Portugueſe ſhips at ſea.

"While we lay in the harbour, two of the officers happening to quarrel, and a challenge to fight on ſhore appointed, we were in great danger of being called to an account by the magiſtrates; for, according to their laws, whoever draws a weapon in anger is to be cut in pieces immediately, though he does no hurt; and if he wound another, the whole family or company to which he belongs, ſuffers with him.

"The king of Goto, an iſland a little ſouth of Firando, being brought on board by king Foyne to take a view of our ſhip; I entertained him very ſplendidly, and fired ſeveral guns on his going aſhore, at which he expreſſed great ſatisfaction, and invited me and my friends to his iſland. I have ſeen ſome executions here, and particularly of two men and a woman for adultery; two of her lovers meeting at her houſe together, in the abſence of the huſband, and wounding one another, they were apprehended, and king Foyne ordered all three to be cut in pieces, which ſentence was immediately executed, and after the execution, every one of the company had a ſtroke at the ſufferers with their cuttans (ſwords) till their fleſh was all cut into little bits.

"On the third of Auguſt king Foyne furniſhed me with a galley with twenty-five oars of a ſide, and ſixty men beſides, to carry the king of England's preſent to the emperor. We paſſed between ſeveral iſlands, moſt of them well inhabited, and ſeveral good towns upon them, particularly the iſland Finate, defended by a ſtrong caſtle of free-ſtone; and along the coaſt, as far as Oſaca, were people, who lived, with their whole families, in veſſels upon the water, and their women catched fiſh, by diving for them in eight fathom water. Theſe women may be known by their eyes, which are as red as blood. When I arrived at Oſaca, I had nineteen horſes provided for me at the emperor's charge, to carry my people and the preſent, and they furniſhed me with a palanquin (a couch with an arched canopy) and a led horſe: and one run before me with a pike, to make way: we changed horſes at every ſtage; the road was for the moſt part even, and where a hill happened to be in the road, it was cut through, and the diſtances were marked at the end of every three miles. Villages and country-houſes ſtood very thick, and the roads were thronged with people. Their temples were uſually in groves, ſurrounded by the cells of their prieſts: When we came near the ſuburbs of any great town, we ſaw the bodies of malefactors nailed to croſſes, where they hang till they are devoured, and cauſe an intolerable ſtink. We uſually travelled about forty-eight miles a day: ſix men carried my palanquin on their ſhoulders, and up-hill they added four more, travelling as faſt as I could have done on horſeback. We arrived at Surunga, where the emperor reſided, on the ſixth of September, and on the eighth I was carried in my palanquin to the caſtle, which is the emperor's court, the merchants and people who attended me, carrying the preſent before me on little tables of ſweet-wood, they had provided me. Having entered the caſtle, I paſſed over three draw bridges, on every one of which was a court of guard; having aſcended ſome ſtone ſteps, I was met by the emperor's ſecretary and admiral, who introduced me into a large room, and ſat down on mats croſs-legged. Soon after I was led between them into the preſence-chamber, where they directed me to bow to the emperor's chair of ſtate. The preſent being ranged upon the floor, the emperor came in, to whom I paid my compliments after the Engliſh manner, and delivered his majeſty's letter, which he liſted to his forehead, and directed his interpreter to tell me I was welcome, and that I ſhould reſt myſelf a day or two after my fatiguing journey, and his anſwer ſhould be ready for the king of England. I had afterward an audience of the king's ſon, at the city of Jeddo, to whom I delivered my preſents. On the nineteenth the king ſent me two ſuits of armour, varniſhed, as a preſent to his majeſty, with a letter, wherein he thanks the king for his preſent of ſuch curious things as his country did not produce; neither had he ſeen the like before. His ſubjects were welcome to him; he applauded their ſkill in navigation, that they could viſit a country ſo remote without being terrified at paſſing through ſo immenſe a gulf and ſuch ſtorms, to promote commerce, which he ſhould give them all manner of aſſiſtance in, deſiring his majeſty to accept his preſent, as a mark of his friendſhip: and adds, that he had given orders for drawing up articles of trade between the two nations, as his majeſty deſired.

"By theſe articles he granted, that Sir Thomas Smith, the governor, and the reſt of the Eaſt India company, might reſort to any of his ports to trade, without paying any duties of import or export: that they might build one houſe or more in any part of his empire; and if any of their goods happened to be caſt by ſhipwreck on his coaſts, they ſhould be reſtored; if any of the merchants died, their effects might be diſpoſed of by the Cape merchant; and all offences committed by the Engliſh ſhould be tried and puniſhed by him: neither their perſons nor goods ſhould be ſubject to the laws of Japan; that payment ſhould be immediately paid for all goods contracted for, without any deductions; and that they ſhould be at liberty to make diſcoveries on the land of Jeſſo or Yedſo, and his ſubjects ſhould furniſh them with proviſions.

SECT.

SECT. IV.

Containing the natural history of Japan in general, and an account of its respective sovereigns, &c.

JAPAN being situate between the fourth and seventh climates, the sun rises there about eight hours before it does with us. The sea breezes greatly mitigate the heat in summer, but they render the winter excessively cold, and occasion the seasons to be more inconstant than in any other parts of the Indies. Heavy rains sometimes continue almost the whole year; but in the months of June and July, which are called the water-months, they are always excessive. The country is likewise frequently visited with dreadful storms and hurricanes, thunder, lightning, &c.

The soil is rocky, or rather sterile; but the industry of the inhabitants hath overcome the unkindness of nature, and given fertility to a land of itself unfertile. They have rice, of which they make bread, and brew beer; with the barley they feed cattle, convert their fine wheat into cakes, and of two species of beans they grind one to meal to boil for eating, and with the other make a kind of confectionary. They have, besides Indian wheat, millet, and many other sorts of grain. Even the rocks, and other barren places, have been so well cultivated, as to produce abundance of fruits and plants. They have good pasturage, which feeds great numbers of buffaloes, oxen, sheep, horses, deer, &c. and various flowers and herbs, particularly excellent tea. There are great quantities of fish in the circumjacent seas, rivers, and interior lakes. Besides the abovementioned animals, they have a fine breed of horses that are small, but uncommonly swift and extremely beautiful. Many wild beasts, that yield a great number of valuable furs, and elephants, whose teeth are a very profitable article to them, are found here.

The principal rivers are, 1. The Ujingava, whose waters are so furious, that no bridge can be built over it; 2. The Corric, that takes its name from the province in which it rises; and, 3. The Askagava, remarkable for its depth and perpetual fluctuation. The chief lake, called Citz, is one hundred miles in length, and twenty in breadth. It disembogues itself into the sea on the southwest side of the island: this extensive large lake is formed by the conflux of several rivers, which are in general exceedingly rapid and many dreadful cataracts descend from the mountains.

The seas which incircle this country produce red and white coral, ambergris, admirable pearls, and many curious shells, sea-weeds, &c. but the greatest wealth of the empire results from its invaluable mines, particularly those of gold. The emperor claims an exclusive right to all the gold and silver mines, as well as all the gold sand, in his dominions. The copper mines are innumerable, producing a fine and coarse sort. The bowels of their mountains are likewise pregnant with sulphur, iron, and steel; but they have not any quicksilver, antimony, sal-ammoniac, calamy, cinnabar, or borax.

They procure salt by inclosing portions of ground near the sea, covering them with fine sand, and repeatedly throwing sea-water upon the sand, till it is well impregnated with the saline particles: it is then placed in large vessels, with holes in the bottom, for the salt to fall into proper receivers, as it filtres, through the sand: after which it is boiled, and brought to a proper consistency.

Earthquakes, and the volcanoes, of which there are eight very dreadful ones in the country, are supposed to be effected by the sulphur every where inclosed in the bowels of the earth. From the same cause may be deduced their hot baths and mineral springs, which are extremely numerous; some equal the heat of boiling water, and others are even as hot as boiling oil. They have many cold mineral springs, but neither of them are applied medicinally, through the extreme ignorance of their physicians.

A species of white ants is found in Japan: they are exceedingly beautiful, but very mischievous; for they pierce, with their little snouts, through every thing they come near, except metal and stone, and greatly damage all kinds of goods, if not prevented from approaching them, by strewing the adjacent places with salt, which is abhorred and avoided by these little insects.

There are in Japan some of the finest ducks in the universe for size, shape, and beauty. The nightingales are likewise some of the most melodious to be found. The beetles make an agreeable kind of humming noise, which gradually rises to a pretty high note. The night-fly, however, exceeds all other Japanese insects for its beauty: the body is about three inches long, round, and finely shaped: it has four wings, viz. two close to the body, which make a brilliant appearance, by means of the admirable blue and gold streaks, with which they are tinged; and two above these, whose transparency not only admits of the others being seen through them, but even adds to their shining lustre. This insect is a mighty favourite with the ladies, and has given rise to the best fable ever written by any of the Japanese poets.

A great number of camphire-trees grow near the hot-springs: they resemble laurels, and bear purple or black berries. The cedars of Japan are some of the finest in the universe; and many other trees abound in those islands, particularly plantanes, &c. some of which, when sawn or cut asunder, exhibit admirable figures of birds, beasts, landskips, &c. Many curious pieces of furniture are made of these, which appear very beautiful when polished.

There are in this empire many useful stones of various colours; also abundance of excellent marble, which is used in the construction of many of the principal edifices; they have also porcelane earth, &c. With respect to other articles in the animal, vegetable, and mineral systems not mentioned above, Japan abounds in most that are met with in the Chinese empire, already described.

With respect to the history of the Japanese, their annals are replete with such inconsistent absurdities and ridiculous fables, that no dependence can be placed on them till about six hundred and sixty years before Christ, which is their common æra; and according to which, our present year 1782 is with them the year 2442: it is likewise to be observed, that the Japanese year begins with the nearest new moon which either precedes or follows the fifth day of February. The histories written by the natives take very little notice of the policy, virtues, vices, or transactions of their monarchs, but are filled with an account of their descent, names, birth, succession, length of reign, &c. We shall present our readers with the following account of their sovereigns, taken from their own historians.

1. Simmu was the founder of the Japanese monarchy: he began his reign six hundred and sixty years before Christ. In the seventieth year of his reign, he instituted a form of government, established laws, civilized the people, taught them chronology, and several arts and sciences; divided time into years, and years into months and days; secured the crown to his posterity; and, having reigned seventy-nine years, died in the one hundred and forty-ninth year of his age; but as nothing particular happened in his reign, or in those of several of his successors, we shall only give a catalogue of their names till a remarkable reign renders a more ample account necessary.

2. Sui-sei; who reigned thirty-three years, aged eighty-four. 3. Enei; reigned thirty-eight, aged eighty-four. 4. Itoku; reigned thirty-five, aged seventy-seven. 5. Kosio; reigned eighty-three, aged one hundred and fifteen. 6. Koau; reigned one hundred and one, aged one hundred and thirty-seven. 7. Korei; reigned seventy-six, aged one hundred and twenty-eight. 8. Kowkim; reigned fifty-six, aged one hundred and sixteen. 9. Kay-kwo; reigned fifty-nine years, aged one hundred and eleven. 10. Swin-sin; reigned sixty-eight, aged one hundred and nineteen. 11. Sinin: reigned ninety-eight, aged one hundred and thirty-nine. 12. Key-ko; reigned sixty, aged one hundred and forty-three. 13. Sey-mau; reigned sixty, aged one hundred and eight. 14. Tsiauai; reigned nine, aged fifty-two.

15. Tsiauai was succeeded by his empress Sinku-cogu, who was the first female that reigned in Japan, she waged war against the Koreans, and headed her army in person; but finding herself pregnant she returned to Japan, and was delivered of a son, that succeeded her, and who afterwards on account of his military exploits was ranked as a god, and became the Mars of the Japanese; the empress herself, who reigned seventy years, was deemed the Bellona of this empire.

16. Woosin; who reigned forty-three years, and died aged one hundred and thirteen. 17. Nintoku; reigned eighty-seven, aged one hundred and eleven. 18. Ritsiu; reigned six, aged seventy-eight. 19. Fansey; reigned eight, aged sixty-three. 20. Inkioo; reigned forty, aged eighty. 21. Ankoo; reigned three, aged fifty-seven. 22. Jurukia; reigned twenty-three, age uncertain. 23. Senei; reigned five, aged forty-two. 24. Gen-soo; reigned three, aged eighty-five. 25. Nin-ken; reigned eleven, aged fifty-seven. 26. Buretz: reigned eight, age uncertain. 27. Kei-tei; reigned twenty-seven, aged eighty-one. 28.

Ankan

Ankan; reigned two, aged ſeventy-one; theſe two laſt-mentioned were both deified. 29. Seukva; reigned four, aged ſeventy-four. 30. Kimme; reigned thirty-two, aged ſixty-three. 31. Fit-atzee; reigned fourteen, age uncertain. 32. Joo-mei; reigned two, age uncertain. 33. Siaſium; reigned five, age uncertain. 34. Syko; an empreſs, her age not noticed. 35. Dſione; reigned twelve, age uncertain. 36. Kwogozu; reigned three, an empreſs, her age not known. 37. Kootoku; reigned ten, age uncertain. 38. Sime, an empreſs; reigned ſeven, her age not known. 39. Tent-tſii; reigned ten, age uncertain. 40. Teu-mu; reigned fourteen, age unknown. 41. Tſi-bo, an empreſs; ſhe reigned ten, age unknown. 42. Mon-mu; reigned eleven, age unknown. 43. Genmei, an empreſs; reigned ſeven, age unknown. 44. Genrioo, an empreſs; ſhe reigned nine years, then abdicated, lived twenty-five years afterwards, and died in the forty-eighth year of her age. 45. Sio-mu; reigned twenty-five, age uncertain. 46. Koo-Ken, an empreſs; reigned ten, age uncertain. 47. Fai-tai; reigned ſix, age uncertain. 48. Sto-tokru, an empreſs; reigned five, age unknown. 49. Koonin; reigned twelve, age unknown. 50. Kwan-mu; reigned twenty-four, aged ſeventy. 51. Fei-dſo; reigned four, age not mentioned. 52. Saga; reigned fourteen, ditto. 53. Siunva; reigned ten, ditto. 54. Nimio; reigned ſeventeen, ditto. 55. Montoku; reigned eight, ditto. 56. Seiva; reigned eighteen, ditto. 57. Joſey; reigned eight, ditto. 58. Kooko; reigned three, ditto. 59. Uda; reigned ten, ditto. 60. Day-go; reigned thirty-three, ditto. 61. Sinzaku; reigned ſixteen years, ditto.

62. Murakami, A. D. 947, and 1607 of the Japaneſe year, called together a ſynod of the clergy, to regulate all that related to the eccleſiaſtical eſtabliſhment in Japan, and to preſcribe the ceremonials of the modes of worſhip proper for every ſect.

Thirteen emperors are mentioned, from the death of this monarch, till the reign of Kon-jey, but nothing worth recording happened in their reigns: they occupied the ſpace of one hundred and ſeventy-four years: after theſe, the throne was filled by

76. Kon-jey, who began his reign in the year 1142. In his time was born the celebrated crown general, Jeritomo, who rendered himſelf ſufficiently formidable to ſtrip the dairos of their ſecular power, and to veſt it in his own family in ſucceſſion.

A double chronology commences from this period, including the reigns of the dairos and of the cubos. The number of dairos, from Kon-jey to Ken-ſen, is thirty-eight, who occupied a ſpace of five hundred and forty-five years, that is, from the year 1142, to the year 1687, or from the Japaneſe year 1802 to 2347; after which period the excluſion of all Chriſtians from Japan, the Dutch excepted, and the total ſilence of the Dutch writers upon every ſubject but thoſe which relate to trade, and emoluments accruing from their commercial affairs, render it impoſſible to ſay any thing farther of the Japaneſe hiſtory. And as the dairos are totally excluded from ſociety, the tranſactions of that period are not to be connected with their names, but ſhould be recorded in the reigns of the cubos, which are as follows: 1. Jeritomo reigned eleven years. 2. Joriije, five. 3. Tametomo, ſeventeen. 4. Joritzne, eighteen. 5. Joriſane, eight. 6. Mune-takaſinno, fifteen. 7. Kore-jaſſinno, twenty-four. 8. Kume-ſinno, twenty-five. 9. Mori-kuni-ſinno, twenty-five. 10. Sonun-ſinno, two. 11. Nari-joſi-ſinno, three. 12. Taka-udſi, twenty-five. 13. Joſi-jaki, ten. 14. Joſi-mitz, forty. 15. Joſi-motzi, twenty-one. 16. Joſi-karra, not one. 17. Joſi-nori, fourteen. 18. Joſi-Katz, three. 19. Joſi-Maſſa, nine. 20. Joſi-Nato, under his father. 21. Joſi-tanme, eighteen. 22. Joſi-ſimnu, fourteen. 23. Joſi-far, thirty. 24. Joſi-tir, ſixteen. 25. Joſi-taira, four. 26. Joſi-aki, five. 27. Nobmaga, ten. 28. Fide-Nobu, three. The Japaneſe do not mention the ages of theſe princes; and indeed they have been more remiſs in this particular in the recent than in the early reigns; perhaps the great length of the former rendered them more remarkable than the latter could be from their general brevity.

29. Taycho; who was of a very mean extraction, but in his youth raiſed himſelf to be butler to a tributary prince, and by dint of valour and merit was at length exalted to the cuboſhip. He was the firſt monarch who obliged the petty kings and great lords to attend him perſonally, and ſuffer their wives and kindred to reſide in his palace, as hoſtages for their fidelity; by which prudent policy, he ſtruck at the very root of that rebellious ſpirit ſo common in Japan, and put an end to the poſſibility of raiſing inſurrections. He expelled the Portugueſe from Japan, prohibited their ever after trading with his ſubjects, and began the firſt perſecution againſt the Chriſtians. He died on the ſixth of December, 1598. He was deified after his deceaſe, and called the ſecond Mars of Japan.

30. Quanbacumdono, who was the nephew of Taycho, is accounted the thirtieth cubo, as he reigned for ſome time in conjunction with his uncle; but having diſobliged that monarch, he was ordered to rip up his own bowels; the moſt honourable method of ſuffering death in Japan.

31. Fide-Joſi: he was the ſon of Taycho, and began his reign at ſix years of age; during his minority, the affairs of government were conducted by his father-in-law Jjejas, for Fide Joſi had been contracted in his infancy to a daughter of that nobleman, who deprived him of his crown and life, after a reign of fourteen years.

32. Jjejas Samma, when he had uſurped the throne, made the following articles the principal objects of his reign: 1. The total extirpation of the Portugueſe from Japan. 2. The prohibiting any of his ſubjects to leave the empire, and the recalling thoſe who were in foreign parts. 3. The publication of ſeveral edicts againſt gaming, luxury, and duelling. 4. The granting a Dutch factory to be eſtabliſhed in Japan.

The perſecution of the Chriſtians in Japan, both natives and foreigners, was carried on with ſuch horrid cruelty, that in the firſt four years of his reign twenty thouſand five hundred and ſeventy perſons were maſſacred. Notwithſtanding which in the two ſucceeding years, after the churches had been ſhut, and the public profeſſing of Chriſtianity prohibited, the jeſuits, by their private endeavours, made twelve thouſand proſelytes; and when any of theſe were detected, they not only abſolutely refuſed to abjure the Chriſtian faith, but readily ſubmitted to death, and ſuffered martyrdom with aſtoniſhing conſtancy. And indeed, the perſecution continued forty years, reckoning from its commencement in the reign of Taycho, with unremitting cruelty, before Chriſtianity could be totally exterminated. Jjejas died at about ſeventy years of age, having reigned about five years after the death of Fide-Joſi.

33. Fido-Tado, who was the grandſon of the above monarch, continued the above perſecution, till at length the Chriſtians, driven to the utmoſt deſpair, retired, to the number of thirty-ſeven thouſand to the caſtle of Simabara, in the iſland of Ximo, where they determined to defend themſelves to the laſt extremity. The Japaneſe army laid ſiege to the place, which held out for three months; but at length was compelled to ſurrender on the 12th of April, 1638, when the Chriſtians were all put to the ſword. This monarch reigned eighteen years, and was ſucceeded by his ſon,

34. Jjemitz; who reigned twenty-one years, he left the crown to

35. Tjetznako, who was the ſon of the former, reigned thirty years, and was ſucceeded by

36. Tſinajos. This monarch was the laſt prince that we have any authentic account of, and was upon the throne when the Dutch ambaſſador was at Japan, in 1692, being then forty-three years of age, and had reigned thirteen years; he was a great philoſopher, a ſtrict obſerver of the laws, exceedingly humane and benevolent, and in all reſpects ſtudied to promote the true intereſt and happineſs of his people.

Whether the land of Jeſſo or Jadſo, be annexed to Japan or not, the inhabitants of both countries doubt, becauſe vaſt and inacceſſible mountains interpoſe, which hinder the communication. Neither doth it as yet clearly appear, whether this land of Jeſſo is a part of Tartary, or whether by any arm of the ſea divided from it. The Chineſe affirm, that Tartary runs three hundred leagues eaſtward beyond their famous wall; ſo that if we follow theſe, the country of Jeſſo and Japan may ſeem to be annexed to Tartary. But thoſe of Jeſſo ſay, that there runs an arm of the ſea betwixt them and Tartary; which opinion may ſeem to receive ſome confirmation from what thoſe Hollanders affirm, who were ſhipwrecked (ſome years ſince) upon Corea, a peninſula of China; they ſay they ſaw there a whale, upon whoſe back ſtuck an harping iron of Gaſcony; and the credit of this aſſertion not being queſtioned by any, it is moſt probably to be conjectured, that this whale paſſed from Spitzberg through the neareſt arm of the ſea, rather than through the more remote. Be it how it will, we may hence ſafely conclude, that the ſea which lies beyond Japan and Spitzberg is paſſable, and that through more, perhaps, than one arm, or channel, by which they communicate.

To be more particular in our deſcription of this place, it is neceſſary to obſerve, that it extends from forty-two to fifty degrees of north latitude, which track is known, but how much farther it reaches, has not been aſcertained: nor do the Japaneſe geographers ſeem better acquainted with it than the European. The ſouthern part lies oppoſite to the northern coaſt of Niphon or Japan, and together they form the ſtraights of Sangaar and Jeſſo, which are ſeparated by the little iſland Matſuma.

The Japaneſe trade to Jeſſo for furs, and a fiſh called karazakki, that is caught upon its coaſt, and which is conſidered in Japan as a great delicacy; but the natives of Jeſſo never come to Japan, as they are afraid to croſs the ſtraights, though it requires but a day to ſail over them.

The people of this country are ſtrong, fierce, and ſavage; they wear their hair and beards long, and cover themſelves all over with the ſkins of wild beaſts, with the fur outwards, ſo that upon the whole, they have a moſt frightful appearance. Thoſe who live on the ſouthern coaſt are ſaid to be much more civilized than ſuch as reſide in the inland parts; and that the emperor of Japan had a governor, and a garriſon in the capital, which is called Matzimai, to receive his tribute, which is paid in furs, feathers, and ſilver.

The country is rocky, woody, but little cultivated, and in many places barren; it only produces a coarſe kind of barley, ſome roots, and a few fruit-trees. The natives are expert in fiſhing, hunting, and the uſe of the bow and arrow, which are their only weapons. They are ſtrong, hardy, and addicted to drinking, when they can procure liquor; they have their ears bored, and have ſilver ornaments hanging to them. The people worſhip the firmament, but have few religious ceremonies.

A more favourable deſcription of theſe people is given by father De Angelis, a Cicilian jeſuit, who went to Jeſſo in 1620, and reſided a conſiderable time among them: he informs us, that the natives are ſtouter, taller, and fairer than the Japaneſe; that they let their beards grow very long, but ſhave the fore-parts of their head; that they make a very ſtrong wine, which they drink to exceſs; and dreſs themſelves in very pretty ſilk, cotton, or linen gowns, which are long, and embelliſhed with needle-work tolerably executed. He likewiſe tells us, that beſides bows and arrows, they uſe lances, ſcymetars, and poiſoned darts; that they are quarrelſome, capricious, paſſionate, and revengeful; but at the ſame time almoſt as ceremonious and inſincere as the Chineſe. Polygamy is allowed among them; and adultery they thus puniſh: the man pays a pecuniary fine, and the woman is cloſe ſhaved, which is the greateſt diſgrace that can happen to her. If the gallant refuſes to pay the fine, the huſband has a right to ſtrip him whenever and wherever he meets him, and ſend him home naked: to effect which, he calls to his aſſiſtance all that are near at hand, who are obliged to aid him in plundering the adulterer.

All the particulars mentioned by the above jeſuit are confirmed by ſeveral Dutch mariners, who have, ſince his time, viſited Jeſſo; and farther add, that their boats are made of ſlight boards ſewed together with cords made of the bark of a tree, called coxo, which, when they return from fiſhing, are unſewed again, and carefully laid up; that many of the natives wear rings on their fingers, as well as trinkets in their ears, and paint their lips and eyebrows blue; that the men are very jealous; the women in general modeſt; and, the language is a corrupt mixture of the Chineſe and Japaneſe tongues.

Matzimai, the capital town, is a very inconſiderable place. Here the prince of the country, as well as the Japaneſe governor, reſide, but the former is obliged to go once a year to make a preſent to the emperor of Japan, and to do him homage.

Criminals are executed here in a very ſingular manner: the culprit is laid flat upon his back, his arms and legs being ſtretched out, and held tight by two ſtout fellows to each; then the executioner, who is armed with an iron headed club, dances round him, ſings a ſong, and at length diſcharges ſuch a blow at his head as breaks his ſcull, which is immediately followed by another on the ſtomach, that diſpatches him in an inſtant.

We have no other account of the Higher Jeſſo or Oku, from the Japaneſe geographers, than that it is nine hundred miles in length; but the ſouthern part of Jeſſo, already deſcribed, were conquered by Joritimo, the firſt cubo of Japan, and annexed to the dominions of that empire.

SECT. V.

Containing an account of the Philippine and Ladrone or Marian iſlands.

THE Philippine iſlands are ſituate in the Chineſian ſea, part of the pacific ocean, between one hundred and fourteen and one hundred and thirty degrees of eaſtern longitude, and between five and nineteen degrees of north latitude, about one hundred leagues ſouth-eaſt of China. There are eleven hundred of them, and ſeveral very large. The chief of the moſt northerly of them is Manila or Luconia, which is the largeſt of the Philippines, and is ſituate in fifteen degrees of north latitude, being about four hundred miles long and above one hundred and eighty broad in moſt places.

The capital of this iſland, and of all the reſt, is the city of Manila, ſituate on a bay in the ſouth-weſt part of the iſland, being two miles in circumference, ſurrounded by a wall and other works, a very commodious harbour, but of difficult acceſs, on account of the rocks and ſands which lie before it; a caſtle defends the entrance.

The chief buildings are the cathedral, pariſh churches and convents; one of the religious houſes is appropriated to the ſupport of orphans, daughters of the inhabitants, who are provided for during their lives; or, if they chuſe to marry, have a portion of two or three hundred crowns given them. Their churches, chapels and altars, are richly adorned, and their proceſſions on holidays as ſplendid as in Spain. The college of the jeſuits here, as in moſt Popiſh countries, is more magnificent than any of the reſt.

The iſland of Luconia, or Manila, is eſteemed healthful, and the water in it the beſt in the world. It produces all the fruits of warm climates, and has an excellent breed of horſes carried thither from Spain. It is well ſituated for the Indian and Chineſe trade; and the bay and port, which lies on the weſt ſide of it, is a large circular baſon of ten leagues diameter, entirely land-locked. The city of Manila, which ſtands on the eaſt ſide, is large and contains ſeveral ſpacious ſtreets and grand houſes, and at the beginning of the firſt war with the Spaniards, in the reign of king George II. was an open place, only defended by a little fort; but conſiderable additions have lately been made to its fortifications. The port peculiar to the city is that of Cabite, which lies two leagues to the ſouthward, and here the ſhips employed in the Acapulco trade are ſtationed.

The city is healthfully ſituated, and well watered, and has a very fruitful country in its neighbourhood; but it is ſome diſadvantage to its trade, that it is difficult getting out to ſea to the eaſtward, through ſuch a number of iſlands; here the Spaniards waſte abundance of time, and are often in great danger.

The trade from hence to China and India conſiſts chiefly in ſuch commodities as are intended to ſupply Mexico and Peru, namely, ſpices, Chineſe ſilks, and manufactures, particularly ſilk ſtockings, of which no leſs than fifty thouſand pair have been ſhipped in one cargo, with vaſt quantities of Indian ſtuffs, callicoes and chints, which are much worn in America, together with other ſmall articles, ſuch as goldſmiths work, &c. wrought at the city of Manila by the Chineſe, of which nation there are not leſs than twenty thouſand reſiding there, as ſervants, manufacturers, or brokers. All theſe articles are tranſported annually to the port of Acapulco in Mexico: this trade is not open to all the inhabitants of Manila, but is reſtrained to the convents of Manila, principally to the jeſuits, being a donation to ſupport the miſſions for the propagation of the Catholic faith. The tonage of each ſhip is divided into a certain number of bales, all of the ſame ſize; and the convents have a right to embark ſuch a quantity of goods on board the Manila ſhips as the tonage of their bales amount to. The trade is limitted by royal edicts to a certain value; according to ſome, it ſhould not exceed ſix hundred thouſand dollars: but it is frequently known to amount to three millions.

The bulk of the people of Manila are of Chineſe or Malayan extraction, and there are ſome blacks. The Spaniards, though feweſt in number, have the government in their hands. The adjacent country is full of fine plantations, farms, and country-houſes of the principal inhabitants. Upon the mountains, in the middle of the country, the people live in tents and huts, under the ſpreading trees. The plains are overflowed in the rainy ſeaſon, the houſes built upon high pillars; and the people have no communication but by boats during the rains,

which uſually fall in June, July, Auguſt, and September, and then happen terrible ſtorms of wind and thunder. Earthquakes are frequent; the city of Manila has ſuffered ſeveral times by them; and from the volcanoes, which abound here, iſſue torrents of fire and melted minerals. Theſe are the inconveniences we meet with; but the fair ſeaſon is for the moſt part exceedingly pleaſant.

The city of Manila contains about three thouſand inhabitants; and during the ſecond war in the reign of king George II. was, in the year 1763, taken by admiral Corniſh and Sir William Draper. It was, however, ſtipulated to be ranſomed; but the ranſom-money hath never yet been intirely diſcharged. The prieſts take prodigious pains to make converts to the Romiſh faith, and have been pretty ſucceſsful in their endeavours. The Indians pay a poll-tax; and a conſiderable ſum of money is annually allowed for the ſupport of female orphans, both of Spaniſh and Indian parents.

The complexions of the ſeveral people who inhabit theſe iſlands are very different. The blacks are as black as the Caffres of Afric, but differ from them in their features and long hair, and therefore are ſuppoſed to be of Indian extraction; and as they poſſeſs the mountainous and inacceſſible parts of the country, it is conjectured, that they were the original inhabitants, and driven up thither by ſucceeding adventures.

The deſcendants of the Malayans (inhabitants of Malacca) are very tawny, the Chineſe not ſo dark, and the Spaniards are pretty near the colour of the Chineſe. There is alſo a nation of painted people, called Pintados, who colour their ſkins like our anceſtors the Picts.

The natives are for the moſt part of a moderate ſtature, and their features juſt; the Spaniards have taught them to cloath themſelves, except the blacks, who only tie a cloth about their loins, and another about their heads, and uſually go bare-foot.

Rice and fiſh are moſt eaten by thoſe who live near the ſea-coaſts, and the mountaineers eat the fleſh they take in hunting, and the fruits of the earth, which grow ſpontaneouſly in great plenty. Their liquor is water, which they uſually drink warm as the Chineſe do. They have alſo palm wine, and ſpirituous liquors diſtilled from the juice of the ſugar-cane, rice, &c. They bathe twice a day in cold water, either for health or diverſion, or both: plays are another diverſion, and they are entertained frequently with dancing and mock-fights.

Theſe iſlands are extremely well ſituated for trade; all the rich merchandize of India is ſent from hence to America, and the treaſures of Mexico and Peru are brought hither annually, by which exchange, it is ſaid, they make a profit of four hundred per cent.

Few countries enjoy a more fruitful ſoil; the people in many places live upon what the earth produces ſpontaneouſly, and the ſurface of the ground is exceeding beautiful; the trees are ever green, and ſeldom without fruit.

Their neat cattle run wild in the mountains, and are hunted, as well as deer, wild hogs and goats. The monkies and baboons found here are very ſagacious: during the ſeaſon, when there is no fruit to be got, they go down to the ſea-ſide to catch oyſters; that the fiſh may not pinch their paws, they put a ſtone between the ſhells, to prevent their ſhutting cloſe. Wax is ſo plentiful, that they make no other candles, and never burn lamps. Their bees are of ſeveral kinds, ſome of them very large, and make their combs in the woods, producing ſuch quantities of honey as would almoſt ſubſiſt the natives.

Medicinal and ſweet gums iſſuing from the bodies of trees are part of the produce: ſerpents of various kinds are found in theſe iſlands; but the fathers who relate that ſome of them are ſo large, they will ſwallow a ſtag, horns and all, ſurely do not expect to be believed, any more than when they relate, that the leaves of trees are converted into inſects; but the laſt of theſe ſtories may proceed from a miſtake, for it is certain that ſome inſects depoſit their eggs (as they do with us) upon the leaves of trees, which are hatched there, as is the caſe of the cochineal fly; and they might ignorantly imagine that thoſe inſects proceed from the leaf. The alligators are very dangerous, and the ignana, a kind of land alligator, does a great deal of miſchief. Among their birds, are peacocks, parrots, cocatoos, and turtle-doves, which are very beautiful, fowls with black bones, and the bird tavan, which lays a number of eggs in trenches in the ſand, and leaves them to hatch there. The ſaligan faſtens her neſts to ſome rock, as a martin does againſt a wall, which diſſolving into a kind of jelly in warm water, is eſteemed delicious food. Here is alſo the xolo bird, which eats like a turkey; the camboxa is a well-taſted fowl peculiar to theſe iſlands. The herrero or carpenter is a fine large green bird. It is called the carpenter, becauſe its beak is ſo hard, that it digs a hole in the trunk, or ſome large branch of a tree, in order to build its neſt.

Their fruits are mangoes, plantains, bananoes, cocoas, tamarinds, caſſia, and the cocoa or chocolate nut, which has been brought over from Mexico; oranges, lemons, and all manner of tropical fruits. The cinnamon and nutmeg tree have been planted here, but degenerate, and are good for little.

A great deal of good timber and dying woods grow in theſe iſlands; and the calamba, or ſweet-wood, a kind of cane, grows in the mountains, which, if cut, yields a draught of water, and is of great ſervice to the natives.

They have one plant that has all the properties of and is uſed as a ſubſtitute for opium; of this the natives are very fond, and frequently intoxicate themſelves with it.

Flowers and ſweet herbs grow wild here, but they do not cultivate them in their gardens, and there are abundance of medicinal, as well as poiſonous herbs and flowers, which do not only kill thoſe that touch or taſte them, but ſo infect the air, that many people die in the time of their bloſſoming: on the contrary, theſe iſlands are providentially well furniſhed with antidotes, particularly the bezoar ſtone, which is found in the belly of a creature much like a deer; and the root dilao, which is like ginger, and heals wounds made by any venomous beaſt, being bruiſed and boiled with oil of cocoas.

The tree camondog is ſo venomous, that the pilchards eating the leaves which fall into the ſea die; as will the perſons who eat the poiſoned fiſh. The liquor which flows from the trunk of this tree ſerves theſe people to poiſon the points of their darts which they blow through the trunks abovementioned; the very ſhadow of the tree is ſo deſtructive, that, as far as it reaches, no herb or graſs grows; and, if tranſplanted, it kills all the other plants it ſtands near, except a ſmall ſhrub which is an antidote againſt it, and always with it; a bit of a twig of this ſhrub, or a leaf carried in a man's mouth, is ſaid to be a ſecurity againſt the venom of the tree, and therefore the Indians are never without it.

The maka bukay, which ſignifies the giver of life, is a kind of ivy which twines about any tree, and grows to the thickneſs of a man's finger; it has long ſhoots like vine branches, of which the Indians make bracelets, and eſteem them a preſervative againſt poiſon. There are many other trees and plants of extraordinary virtue in theſe iſlands; among others, there is the ſenſitive plant, in all reſpects like a colewort, which growing out of a rock, avoids the touch, and retires under water: there is another that grows on St. Peter's hill about Manila, which is not very tall, and has little leaves, which whenever it is touched, draws back and cloſes all its leaves together; for which reaſon the Spaniards call it la vergin coſa, that is, the baſhful.

There grows near Cathalagan, in the iſland of Samar, a plant of a ſurpriſing virtue, diſcovered by the fathers of the ſociety, as they tell us, of late years: the Dutch have alſo ſome knowledge of it, and, it is ſaid, will give double the quantity of gold for it. The plant is like ivy, and twines about any tree it grows near: the fruit which grows out of the knots and leaves reſembles a melocotoon in bigneſs and colour, and within has eight, ten or ſixteen kernels as big as a hazel nut, each green and yellow, which when ripe, drop out of themſelves.

The uſual doſe given of it is the weight of half a royal, that is the ſixteenth part of an ounce, powdered and mixed in wine or water; if it has no effect the firſt time, the doſe is repeated, and is a powerful antidote againſt any poiſon, either of venomous herbs or darts which are uſed by the natives of Macaſſar, Borneo, and the Philippines.

The general language ſpoken in theſe iſlands is the Malayan tongue; beſides which, every people have a language peculiar to themſelves. They write on cocoa-nut leaves, with an iron ſtyle or pen; and arts and ſciences having been introduced by the Spaniards, the natives have nothing of this kind to boaſt of before their arrival.

All theſe iſlands, except Mindanao and Paragoa, are under the juriſdiction of a Spaniſh viceroy, who has governors under him in every other iſland and town of conſequence; and the like courts are erected for the trial of civil and criminal cauſes, as in old Spain. The archbiſhop of Manila, the biſhops and their commiſſaries, determine eccleſiaſtical cauſes as in Europe; but there lies an appeal from them to the pope's delegate, who reſides in one

of

of the islands. The court of inquisition has also a commissary here. But notwithstanding the Spaniards are represented as sovereigns of these islands, this must only be understood of the open country and the sea-coasts, in which there may be three hundred thousand souls: but these are not a tenth part of the inhabitants, the rest look upon themselves as a free people: every mountain almost is possessed by a different tribe, who make war upon one another, the Spaniards seldom intermeddling in their quarrels. The Chinese were formerly so numerous here, that they disputed the authority of the Spaniards over them: it is computed that forty thousand of them resided in and about the city of Manila; but the Spaniards compelled them to submit, and banished some thousands of them, the rest were permitted to remain here, to carry on their manufactures; for they are almost the only artificers.

Their arms are bows, arrows, and lances or spears, broad swords, and tubes or trunks, through which they blow poisoned arrows, the slightest wounds whereof are mortal, if immediate remedies are not applied. They have cane shields also covered with a buffaloe's hide, and a head-piece for defensive arms.

These savages, as the Spaniards call them, worship one supreme God, and their ancestors, as the Chinese do, from whom most of them are descended; they worship also the sun and moon, and almost every thing they see, whether animate or inanimate, groves, rocks, rivers, and one particular tree, which they would esteem it a sacrilege to cut down, believing the souls of some of their friends may reside in it, and that in cutting the tree they may wound a near relation. Instead of temples, they have caves, wherein they place their idols, and sacrifice to them. Some beautiful young virgin first wounds the victim with a spear, and then the priests dispatch the animal; and, having dressed the meat, it is eaten by the company. Superstition prevail among them; they have their lucky and unlucky days; and if certain animals cross the way when they are going upon business, they will return home, and go out no more that day. The Spaniards tolerate them in their idolatrous worship; and suffer them to game, on paying to the government ten thousand crowns per annum. They are also much given to a detestable vice; and did not imagine it to be a crime, till the Spaniards punished them for it.

The men purchase their wives here as in China; and the marriage ceremony is performed by a priestess, who sacrifices some animal on the occasion; after which, the bride is led home, and the whole concludes with an entertainment as at other places. They marry in their own tribe, and with their neareft relations, except the first degree; some of them are confined to one wife, other tribes allow a purality of women, and divorces for reasonable causes on either side. Children are either named after heroes or flowers, or from some accidental circumstance that occurs at the time of their birth; but as soon as they marry, they chuse new names, and their parents are obliged to make use of their old ones.

The dead are washed and perfumed, wrapped in silk, and put in a close coffin, near which a chest is placed that contains the arms of a man, or domestic utensils of a woman: mourners are hired to assist in making a dismal noise. They bury their dead as in China, and do not burn them: as soon as the body is buried, an entertainment is made, and all is converted to mirth and festivity. In general, they mourn in black garments; and shave their heads and eye brows.

The next Spanish island to that of Manila is Samar or Philippina, between which and Manila is a narrow channel, called the straight of Manila, the north-east point whereof is called Spirito Sancto; the island is near four hundred miles in circumference, the chief town, Cathalagan, governed by a Spanish alcade. The island of Sebu, which lies in ten degrees south latitude, is the place where Magellan first set up the Spanish colours; the chief town, named Nombre de Dios, afterwards made a bishop's see, has in it a cathedral and several other churches and monasteries. The island of negroes lies west of Sebu, and was so named because it is inhabited chiefly by blacks. Mindanao lies the most southerly of any of the Philippine islands, and is the largest of them except Manila, being near two hundred miles in length, and one hundred and fifty in breadth. It is possessed by people of different nations and different religions; but the Mahometans, who are situate on the sea coasts, are much the most numerous, whose sovereign is stiled sultan of Mindanao. Those who possess the middle of the island are called Hillanoons, and another nation stiled Solognes, are situate on the north-west coast. The air of this island is not so hot as might be expected, being refreshed frequently by the sea breezes, and the periodical rains, which lay the flat country under water. The winds blow from the east, from October to May, and then turn about and set westerly; next month the rains and storms succeed: at first there are not more than two or three showers a day; they afterwards come oftener, with violent hurricanes and loud thunder, and the wind continues westerly until November, during which time they have such storms that trees are blown up by the roots, the rivers are overflowed, and they do not see the sun or stars sometimes in a week: about August the air is very cool, the rain and wind are moderate in September, and in October the wind blows from the east again, and it continues fair till April, and sometimes May.

Mindanao, the capital city, lies on the south side of the island, in one hundred and twenty-three degrees fifteen minutes of eastern longitude, and six degrees twenty minutes north latitude, near the mouth of a river, and about two miles from the sea; the houses being built on bamboo pillars, sixteen or eighteen feet above the surface of the ground, on account of the annual floods, when they have no communication with one another but by boats. The city is about a mile in length, built along the winding bank of the river; the Sultan's palace is supported by one hundred and eighty trees, and has twenty cannon mounted in the front; and several of the nobility have great guns in or before their houses. Large ships cannot come up to the town, there being scarce eleven feet water on the bar, at the entrance of the river.

The natives are held to be men of a sprightly genius, but very lazy, and indolent, and will rather thieve than work; but none are more active when they find there is a necessity for it; and there may be two reasons for their lazy disposition, one from the heat of the climate, and the other from the tyranny of the government, no man being sure he shall enjoy what he acquires by his industry.

The Mindanayans are of a low stature, and very slender, of dark tawny complexions, black eyes and hair, flat faces, short noses, wide mouths, and black teeth, which they take abundance of pains to dye of that colour; and they wear the nails of their left hands almost as long again as their fingers, scraping and dying them with vermillion.

The men have a haughty mein, and yet are said to be very complaisant to foreigners, unless they are insulted, and then they seldom fail to resent the affront, and destroy their enemy by poison or a dagger, never hazarding their persons in a duel.

Their habit is a linen frock and drawers, and a small piece of linen cloth tied about their heads; but they go bare-foot: the complexion and features of the women are better than those of the men; but yet they too much resemble the other sex, and cannot be admired for their beauty: they wear a frock like the men, and a piece of cloth round their waists; the sleeves of the frock being large, and coming down to their wrists. Their hair is tied up in a roll at the hinder part of their heads. The men shave their heads, all but a lock that is left in the middle of the crown, like other Mahometans; their beards are very thin, being pulled up by the roots with tweezers. People of figure are clothed in silk or fine calico; the women go barefoot as well as the men, and adorn their arms and fingers with bracelets and rings. They are not restrained from conversing with their countrymen or foreigners.

The food of people of condition is flesh, fish, and fowl of all kinds, except hogs flesh, which the Mahometans never touch. The poorer sort content themselves with rice and sago. Rice is the principal part of the meal with all of them; they take it up with their hands, using neither knives or spoons; and their meat, whatever it be, is boiled to rags, that it may very easily be pulled to pieces with their fingers. They usually drink water, but make a pretty strong liquor with plantains; they wash before and after every meal, and bathe several times a day. Swimming is one of the chief diversions of the women, as well as the men, to which they are used from their infancy.

Upon joyful occasions the dancing girls, as they are called, are sent for to divert the company; but this dancing consists only in skrewing themselves into lascivious postures, and addressing their great men with flattering speeches. They have plays and mock fights also acted before them, and hunting of wild beasts is their principal rural sport, in which their women partake; but their hunting is only driving the deer and other game into an inclosure, from whence they cannot escape, and then shooting at them.

Mindanao is a fruitful ſoil, well watered with rivers, and their mountains afford excellent timber. Of the libby, or ſago tree, there are large groves; the ſago is the pith of a tree which the natives eat inſtead of bread, and is frequently brought over to Europe, being ſo grained, that it is ſometimes taken for a ſeed. They have no corn but rice. Plantains, guavas, mangoes, and all tropical fruits, abound here. Cloves and nutmegs have been tranſplanted hither, and appear fair to the eye; but it is ſaid they degenerate, and the fruit is good for nothing: if theſe plants were cultivated, poſſibly they might equal thoſe of the ſpice iſlands.

Here are no beaſts of prey in this iſland, but almoſt every other uſeful animal, ſuch as horſes, cows, buffaloes, and hogs, with bunches over their eyes; here are alſo ſnakes, ſcorpions, and other venomous inſects; and the feathered kind are the ſame as in Manila.

The Malayan language is generally ſpoken here; and the Mahometans have the koran and books of devotion, in the Arabic language. The liberal arts do not flouriſh here; they are forced to employ the Chineſe to keep their accompts for them; nor have they ſo much as a clock or a watch in all the country, but beat upon drums every three hours, that people may know the time of the day. There are ſcarce any other working trades, except goldſmiths, carpenters, and blackſmiths, who perform their work very well with the tools they have, for the ſmiths have neither vice nor anvil, nor the carpenters any ſaws, but when they have ſplit their planks, plane them with the ax or adze. Their diſeaſes are fluxes, fevers, and the ſmall-pox; and ſome are affected with a kind of leproſy, or dry ſcurf, which covers the body, and itches intolerably.

The religion of the ſaltan, and thoſe who inhabit the ſea-coaſts, is Mahometaniſm, and that of the inland people is Paganiſm, differing little from the Chineſe. In allowing a plurality of wives and concubines, the Mahometans of this iſland imitate thoſe of Turky, only they allow their women greater liberties, ſuffering them to converſe freely with their acquaintance or ſtrangers; but it is ſaid they are ſo prejudiced againſt ſwines fleſh, that one of their great men refuſed to wear a pair of ſhoes made by an European, when he was informed that the threads with which they were ſewed were pointed with hogs briſtles. They look upon themſelves to be defiled, if they touch any thing which belongs to a hog; they durſt not kill them, leſt they ſhould be defiled by the touch of the weapon they make uſe of, which occaſions theſe animals to multiply ſo faſt, that the iſland is over-run with them. They are very glad to ſee the Europeans kill them, but muſt undergo ſeveral ablutions or waſhings, if they ſhould happen to touch a man that had eaten its fleſh.

The ſultan of Mindanao is an abſolute prince, and his throne hereditary; both the perſons and purſes of his ſubjects are in his power, and if he knows any of them abound in wealth, he borrows it of them. He has one great miniſter, in whom he lodges the adminiſtration of the government, both civil and military, to whom both natives and foreigners muſt apply themſelves for liberty to trade. Their wars are chiefly with the mountaineers, who inhabit the middle of the iſland, with whom they are very cautious of coming to a general engagement; but when the armies are pretty near, they begin to entrench and cannonade each other, and will remain in the ſame camp ſome months, ſending out parties to make incurſions into the enemies country, and ſurprize defenceleſs places. Their arms are a crice or ſhort dagger, and a broad ſword, a ſpear, and bows and arrows.

The moſt conſiderable of the Philippines that have not been mentioned, are Mindora, ſouth-weſt of Manila; Panay, and Leyte, which lie north of Mindanao; and the iſland of Paragoa, which lies very near the north part of Borneo, and is ſubject to one of the princes of that iſland.

Philippina was the firſt that was diſcovered of this cluſter of iſſands, and conſequently gave name to the reſt. It lies between twelve and fourteen degrees north latitude, and is the moſt fertile and pleaſant of all the Philippines, exhiting a ſcene of perpetual verdure; for here the ſun is powerful, without being diſagreeable.

The Ladrone iſlands are ſituate in the Pacific ocean, in one hundred and forty degrees of eaſtern longitude, and between twelve and twenty-eight degrees of north latitude. Guam or Ignana, the largeſt, is ſituate in thirteen degrees twenty one minutes, north latitude, ſeven thouſand three hundred miles weſt of Cape Coricntes in Mexico, according to Dampier. The other inconſiderable iſlands are, 2. Sarpanta. 3. Bonaviſta or Tinian. 4. Seſpara. 5. Anatan. 6. Sarignan. 7. Guagam. 8. Alamaguan. 9. Pagon. 10. The burning mountain of Griga. 11. Magna. 12. Patas. 13. Diſconocida; and, 14. Malabrigo.

Guam is about twelve leagues long, and four broad, lying north and ſouth. It is pretty high champaign land, ſloping down towards the coaſt. The eaſt ſide, which is the higheſt, is fenced with ſteep rocks, on which the waves conſtantly beat, driven by the trade wind. The weſt ſide is low land, in which are ſeveral little ſandy bays divided by rocks.

The natives of Guam are of a good ſtature, have large limbs, a tawny complexion, black long hair, ſmall eyes, thick lips, and are long viſaged. They are ſometimes afflicted with a kind of leproſy, otherwiſe the country is healthful, eſpecially in the dry ſeaſon. The rains begin in June, and laſt till October, but are not violent.

The iſland produces rice, and moſt tropical fruits, and one ſort, which Dampier has named bread-fruit, grows upon a tree like apples, and at its full bigneſs is as large as an ordinary foot-ball; it has a hard thick rind, and within a ſoft yellow pulp, of a ſweetiſh taſte; the natives eat it inſtead of bread, having firſt baked or roaſted it in the embers: it is in ſeaſon eight months in the year, and grows only in theſe iſlands.

Dampier relates, that when he was there (about the year one thouſand ſeven hundred) there were not above one hundred Indians upon the iſland, though he was informed there had been three or four hundred ſome time before: and the reaſon given why there was no more at that time was, becauſe moſt of them had burnt their plantations, and fled to other iſlands on their being uſed ill by the Spaniards.

Their ſwift-ſailing ſloops, or flying proas, are the admiration of all that ſee them; the bottom of the veſſel, or the keel, is of one piece, made like a canoe, twenty-eight feet in length, built ſharp at both ends, one ſide of the ſloop flat, and the other rounding with a pretty large belly; being four or five feet broad, with a maſt in the middle. They turn the flat ſide to the wind, and having a head at each end, ſail with either of them foremoſt, and have never any occaſion to tack. Dampier computed they would ſail twenty-four miles an hour. The tide never riſes above two or three feet at this iſland.

The writer of lord Anſon's voyage relates, that they arrived at the iſland of Tinian or Bonaviſta, one of the Ladrone iſlands which lies north of Guam, on the 27th of Auguſt, 1742, being ſituated in fifteen degrees eight minutes north latitude, and one hundred and fourteen degrees fifty minutes weſt of Acapulco in America. This iſland is twelve miles in length, and ſix in breadth, extending from the S. S. W. to N. N. E. The ſoil is dry and ſandy, and the air healthful; the land riſes in gentle ſlopes from the ſhore to the middle of the iſland, interrupted by vallies of an eaſy deſcent. The vallies and gradual ſwellings of the ground are beautifully diverſified by the encroachments of woods and lawns; and the woods conſiſt of tall ſpreading trees, celebrated for their aſpect or their fruit; the turf of the lawns clean and uniform, compoſed of fine trefoil, intermixed with a variety of flowers; the woods, in many places, open, free from buſhes, and underwood, affording moſt elegant and entertaining proſpects.

The cattle on this iſland were computed to amount to ten thouſand, (we ſuppoſe he means horned cattle) all perfectly white except their ears; beſides which there were hogs and poultry without number. The cattle and fowls were ſo fat, that the men could run them down, and were under no neceſſity of ſhooting them. Their fleſh is well taſted, and very eaſy of digeſtion.

About the beginning of the preſent century, this iſland was ſaid to contain at leaſt thirty thouſand inhabitants, when a dreadful mortality raging among them, prodigious numbers died; and the calamity prevailing with equal violence in the iſlands of Rota and Guam, the Spaniards obliged thoſe that remained at Tinian to remove to Guam, in order to make good the deficiency by the number of the ſouls that had periſhed in that iſland; ſince which time Tinian has been wholly uninhabited. The ruins of the buildings in Tinian, ſome of which are of a particular form, evince it to have been once a populous place. The iſland of Rota has not any thing in it that demands particular attention. Its chief produce is rice, which is cultivated by a few Indians, who live there undiſturbed, but are ſubject to the Spaniſh governor.

Though the other iſlands are uninhabited, they are in general exceedingly fertile, the air good, and the climate temperate. They alſo produce plenty of proviſions; but they

they are ſeldom viſited on account of the great inconvenience ariſing from the want of water for anchorage. Tinian is moſt commodious in this particular, but even there it is very unſafe from June to October, when the weſtern monſoons blow.

Several other iſlands have lately been diſcovered to the eaſtward of the Philippines; and from them called the New Philippines, of which father Clain, in a letter from Manila (inſerted in the Philoſophical Tranſactions) gives the following account: that he happening to be at the town of Guivana, in the iſland of Samar, found twenty-nine palars, or inhabitants of certain newly-diſcovered iſlands, who were driven there by the eaſterly winds which blow in theſe ſeas from December to May. They had run before the wind for ſeventy days together, according to their own relation, without being able to make any land till they came in ſight of the town of Guivam: they were thirty-five perſons, and embarked in two boats with their wives and children when they firſt came out, but ſeveral periſhed by the hardſhips they underwent in the voyage; they were under ſuch a conſternation when a man from Guivam attempted to come on board them, that all the people which were in one of the veſſels, with their wives and children, jumped overboard; however, they were at length perſuaded to ſteer into the harbour, and they landed the 28th of December, 1696. They eat cocoa-nuts and roots which were brought them very freely, but would not touch boiled rice, the common food of the Aſiaticks. Two women, who had formerly been caſt a-ſhore from the ſame iſlands, were their interpreters; they related that their country conſiſted of thirty-two iſlands, and by the form of their veſſels and ſails their country ſeemed to be in the neighbourhood of the Marianas or Ladrone iſland; they related that their country was exceeding populous, and that all the iſlands are under the dominion of one king, who keeps his court in the iſland of Lamarec: the natives go half naked, and the men paint and ſtain their bodies, making ſeveral ſorts of figures upon them, but the women and children are not painted; the complexion and ſhape of their face is much like thoſe of the tawny Philippines or Malayes: the men wear only a cloth about their loins which covers their thighs, and another looſe about their bodies which they tie before. There is little difference betwixt the dreſs of men and women, but that the cloth which the women wear hangs a little lower on their knees; their language is different both from the people of the Philippines and the Ladrone iſlands, and comes neareſt to that of the Arabs: the women that ſeem moſt conſiderable amongſt them, wear necklaces, bracelets, and rings of tortoiſe-ſhell. They ſubſiſted themſelves all the time they were at ſea with the fiſh they catched, in a kind of wicker baſket with a great mouth, ending in a point, which they hauled after them; and their drink was rain-water which they happened to be ſupplied with: they have no cows or dogs in their iſlands, and they run away at the ſight of the one, and the barking of the other; neither have they any horſes, deer, cats, or any four footed beaſts whatever; or any land fowls but hens, which they breed up, and never eat their eggs: they were ſurpriſed at the whiteneſs of the Europeans, having never ſeen any people of this complexion, as they were at their manners and cuſtoms: it does not appear that they have any religion, nor do they uſe any ſet meals, but eat and drink whenever they are hungry or thirſty, and then but ſparingly. They ſalute any perſon by taking him by the hand or foot, or gently ſtroaking his face: among their tools they have a ſaw made of a large ſhell, ſharpened with a ſtone, having no iron or other metals in their country; and were ſurpriſed to ſee the many tools uſed in building a ſhip. Their arms are lances or darts, headed with human bones and ſharpened. They ſeem to be a people of much life and courage, but of a peaceful diſpoſition; and are well proportioned, but not of a large ſize.

SECT. VI.

Treats of the iſlands of Formoſa, and Hainan, or Aynan, partly ſubject to the Chineſe.

WE have, in the preceding part of this work, (viz. in p. 56.) taken occaſion barely to mention theſe iſlands, as belonging to the empire of China; but as we now propoſe to give a general deſcription of the Oriental iſlands, a fuller account of thoſe abovementioned will be more properly introduced in this place.

The iſland of Formoſa is extremely fertile, and in general a delightful country; and on that account obtained its name, the word Formoſa ſignifying fair or beautiful. Its longitude from Pekin is from three degrees twenty minutes to five degrees forty minutes eaſt; ſo that when the ſun is almoſt vertical over it, the climate is rather hot; but this is far from being diſagreeable, as the violence of the heat is greatly mitigated by the ſituation of the iſland, which is ſo elevated, as to receive the moſt agreeable advantages from the cooling breezes of the ſea.

Some parts of theſe iſlands belong to the Chineſe, to whom the natives are ſubject; but in the other parts they live independant, and are only ſubject to their own laws and government. That part of this iſland poſſeſſed by the Chineſe is particularly fertile; and produces great quantities of different kinds of grain, eſpecially rice; and its fertility is greatly augmented by numerous rivers, whoſe ſtreams flow conveniently through it.

There is as great a variety of fruits to be found here, as in any other parts of the Indies; particularly oranges, cocoas, bananas, ananas, guavas, papayas, &c. alſo ſeveral kinds of thoſe produced in Europe, as peaches, apricots, figs, grapes, and cheſnuts. They have likewiſe a ſort of melon, which is of an oblong form, and much larger than thoſe in Europe: they have a white or red pulp, and are full of a fine juice, which is exceedingly grateful to the taſte. Sugar and tobacco alſo grow here to the greateſt perfection; and the trees that produce theſe are ſo agreeably arranged, that they appear as if calculated to embelliſh the moſt beautiful gardens.

They have but few wild beaſts in this iſland, and thoſe are ſeldom ſeen, as they chiefly inhabit the diſtant parts of it, which are very mountainous, and ſeldom reſorted to by the inhabitants. They have ſome horſes, ſheep, oxen, goats, and hogs; and but few birds, the principal of which is the pheaſant. The rivers are ſtocked with great plenty of fiſh of various kinds.

They have neither havens nor ſea-ports, and the coaſts about the iſland are very high and rocky, ſo that it is almoſt impoſſible to invade it. Teovang, or Tyowang, is the only bay in the whole iſland, where ſhips of any bulk can approach; and this is ſituated at the mouth of a river ſo narrow, and defended by ſuch high rocks and forts on each ſide, that no enemy could poſſibly enter it, but muſt fail in the attempt.

Thoſe natives of this iſland, who are under the dominion of the Chineſe, are divided into forty-five boroughs or towns, thirty-ſix of which are in the northern part, and nine in the ſouthern. They are in general of a low ſtature, have a large mouth, and are very ſwarthy in complexion: they have a very high forehead, and are altogether greatly diſproportioned, for the body is very ſhort, the neck ſmall, and the arms and legs are remarkably long. They go almoſt naked, their dreſs conſiſting only of a rough piece of cloth tied round the waiſt, and reaching to the knees; but they adorn their bodies with the figures of trees, flowers, animals, &c. in doing of which they undergo ſuch violent pain, that only a ſmall part of the operation muſt be performed at one time; ſo that it will take ſome months before the whole is completed. Theſe embelliſhments, however, are only permitted to ſuch as have diſtinguiſhed themſelves either by feats of activity or courage. The better ſort avoid the puniſhment of obtaining theſe ornaments, by uſing the hair of animals intermixed with ſilk, and embroidered with gold and ſilver. They have all, however, liberty to adorn their arms and ears, which they do with the greateſt profuſion; and on their heads they wear a kind of coronet, the top of which is terminated by a plume made of the feathers of cocks or pheaſants.

The inhabitants of the northern part are better cloathed than thoſe of the ſouthern, as the climate is leſs temperate: their dreſs conſiſts of the ſkins of beaſts, particularly ſtags, which they kill in hunting. This garment is, however, very uncouth, in its form, being ſhaped like a veſtment worn by prieſts, and without ſleeves. They wear a kind of bonnet on their heads, made of the leaves of bananas, and adorned with coronets placed one above another, in the form of a pyramid: the whole is faſtened with locks of hair of different colours; and the top is terminated by a plume of feathers, like thoſe in the ſouth.

The houſes of thoſe in the ſouthern part are mean cottages made of earth and bamboo covered with ſtraw, and ſo cloſe together, that they are only ſeparated by a very ſlight partition; but thoſe in the north are built after the manner of the Chineſe: their cuſtoms, however, in both parts are the ſame. They have neither chairs, tables, benches, or beds; inſtead of the latter, they uſe the leaves

of trees, and lay themſelves down without any ſort of covering.

They do not take much pains in dreſſing their meat, for the leſs it is done, the better they like it; and ſome of them reliſh it moſt when it is ſo raw as barely to have felt the effect of the fire. They dreſs their victuals in a kind of chimney or ſtove placed in the centre of the room; and are extremely filthy in their manner of eating it: they have neither diſhes, ſpoons, nor knives; ſo that when the proviſion is dreſſed it is laid on a piece of wood or mat, and they pull it to pieces with their fingers. Their food conſiſts chiefly of boiled rice, which they eat inſtead of bread; the fleſh of ſheep and goats and game, which they ſometimes catch in the woods, by ſhooting them, or running them down; the latter is the moſt common method; for ſuch is their agility, that the ſwifteſt horſe will be out-run by them.

Bows and arrows are their principal weapons; they uſe theſe with ſuch dexterity, that at the diſtance of four hundred yards they will kill a pheaſant flying.

They do not purchaſe their wives, as in China; and have little ceremony in their marriages: when a man fixes on any object that he wiſhes to make his wife, he goes ſeveral days together with muſic, which he plays for ſome time before the door, but he is not permitted to enter the houſe. If the object of his affections approves of him, ſhe comes out, and they agree upon terms, which being made known to their parents, the marriage feaſt is prepared, and the friends of each party are invited. The feaſt conſummates the marriage; after which, inſtead of the wife going home with her huſband, he continues in his father-in-law's houſe, and, during the remainder of his life, provides for him as for himſelf.

They believe in one Supreme Being, and ſeem to entertain wiſer notions than the inhabitants of many eaſtern countries, though ſome writers have deſcribed them as mere infidels, and perhaps they are conſidered as ſuch by the Chineſe, who acknowledge, however, that they are not ſubject to cheat, thieve, or quarrel; but, on the contrary, that they practiſe all the duties of equity and mutual benevolence. They worſhip idols as in China, to which they offer ſacrifices of hogs, rice, &c.

Their manner of treating the dead, before interment, is very ſingular. When a perſon dies, they lay him on a ſcaffold made of bamboo, which they place over a ſlow fire for nine days; after which, they wrap the corpſe in a mat, and lay it on a higher ſcaffold, covered with a pavilion made of ſhreds of ſilk, cloth, &c. Here it remains for two years, at the expiration of which, they dig a large hole in the ground and bury it. Each of theſe ceremonies is accompanied with feaſting, muſic, dancing, &c. but the funeral ceremonies are very trifling.

The impreſſion which an object of diſtreſs ſtrikes on the minds of theſe people, and the notions of humanity with which they are poſſeſſed, are diſplayed in one cuſtom, which is almoſt univerſal, namely, if a perſon is exceeding ill, or afflicted with any painful diſorder which is not likely to be removed, they think it a kindneſs to put a period to his life.

Each town or borough has a diſtinct government. Three or four of the moſt antient, who are known to be men of integrity, are appointed as judges over the reſt, who determine all differences; and he who refuſes to ſubmit to the deciſion, is baniſhed the town; nor can he either return, or be admitted into any of the others, ſo that he is obliged to finiſh his days, without ever again participating of the natural enjoyments of ſociety with the reſt of his countrymen.

The Formoſans pay an annual tribute to the Chineſe, which conſiſts of certain quantities of grain, the tails and ſkins of ſtags, and other productions of the country. In order to collect this tribute, a perſon is appointed to each town, who learns the language of the natives, and diſcharges the office of interpreter between them and the mandarins of China. There were formerly twelve boroughs in the ſouthern part of the iſland, that paid tribute to the Chineſe; but, from the tyrannic conduct of their interpreter, or gatherer of the tax, they revolted, drove the interpreter out of the town, and no longer continued to pay the tribute.

The capital city of this Iſland, which is called Taiouan-fou, is, with ſeveral other conſiderable towns, in the poſſeſſion of the Chineſe. It is large and populous, and carries on ſo extenſive a trade, that it is little inferior to ſome of the moſt opulent in China. It is plentifully ſupplied with all kinds of proviſions, either of its own product, or commodities brought from other countries, as rice, cotton, ſugar, wine, tobacco, and dried veniſon, the latter of which is greatly admired by the Chineſe, and conſidered as the moſt delicious food. They have likewiſe all kinds of fruits, medicinal herbs, roots, gums, &c. with plenty of cotton of various ſorts, linen, ſilk, &c.

The ſtreets are long and ſpacious, and the buildings on each ſide have awnings, that join in ſuch a manner as to cover the ſtreet; but theſe are only uſed during the hot months, to keep off the exceſſive heat of the ſun. Some of the ſtreets are near three miles in length, and between thirty and forty feet broad; theſe ſtreets are chiefly occupied by dealers, whoſe ſhops are furniſhed with all kinds of goods, ranged and diſplayed to the beſt advantage. Theſe ſhops appear very brilliant, and many people walk in the ſtreets merely to gratify themſelves with the ſight of ſo great a variety of the richeſt commodities. The houſes are in general very ſmall, and are built of clay covered with thatch.

There are neither walls or fortifications for the defence of the city: but it has a good garriſon of horſe and foot, conſiſting of ten thouſand men, who are principally Tartars. Theſe are commanded by a lieutenant-general, two brigadier-generals, and a number of inferior officers, who after having ſerved three years, or ſooner, if they ſhould require, are at liberty to relinquiſh their ſituation. The harbour is tolerably good, and ſheltered from the winds; but the entrance to it is dangerous for ſhips of burden, the bottom of it being rocky, and the depth not being above ten feet at the higheſt tides.

The iſland of Formoſa, according to the moſt authentic hiſtorians, was firſt inhabited by the Japaneſe, about the beginning of the laſt century. Theſe people were ſo pleaſed with the appearance of the country, that they built ſeveral ſmall towns, and ſoon ſettled a colony; however they were but a ſhort time on the iſland before they were interrupted by the Dutch, a ſhip belonging to whom being accidentally forced into the harbour, the people landed on the iſland, in order to obtain refreſhments, and repair the damage the veſſel had ſuſtained by the ſtorm. Pleaſed with the apparent fertility of the country, and the wholeſomeneſs of the climate, they formed a plan for circumventing the Japaneſe, by taking the iſland into their own poſſeſſion. Fearful, however, of offending them, leſt it might be injurious to their trade, they were very cautious in what manner they proceeded; and though they were the moſt powerful, yet they were rather deſirous of obtaining their wiſhes by artful than violent meaſures. To effect this, they earneſtly intreated the Japaneſe, that they would permit them to build a houſe near the ſea-ſide, which, they alledged, would be of the greateſt utility to them in their paſſage to and from Japan. This requeſt was refuſed, which produced a ſecond ſolicitation with equal ſucceſs. Unwilling, however, to give up any endeavours they could project, they again renewed their ſolicitations, and preſſed them to give conſent, aſſuring them, that they deſired no more ground than what might be encompaſſed by the hide of an ox. The modeſty, as well as oddity, of this requeſt, had the wiſhed-for effect, and the Japaneſe at length gave their conſent. The Dutch immediately diſcovered a piece of cunning little thought of by the Japaneſe. They got a large hide, which they cut into a number of ſlips, and faſtening the whole together, covered a very extenſive piece of ground, on which inſtead of a ſingle building, they erected ſeveral ſpacious habitations.

The Japaneſe were at firſt greatly vexed at this ſtratagem, but, from the ſingularity of it, they were at length pacified; and were ſo far from either envying the Dutch, or being any way apprehenſive of danger from them, that they permitted them to do whatever they thought proper; and of this indulgence the Dutch were not backward in taking the greateſt advantages, for they ſoon erected ſeveral ſtrong buildings, particularly a caſtle, which they called Zealand, ſituated on ſo advantageous a ſpot, that it was impoſſible for any ſhip to approach it in a hoſtile manner, of whatever force, without being repulſed. But the Japaneſe, being either offended at the great progreſs the Dutch had made, or not finding the advantages they expected, ſoon quitted the iſland, and left the Dutch in ſole poſſeſſion of it; after which, they erected other fortifications oppoſite to their new fort, and raiſed ſuch other defences, as made them complete maſters of the iſland. They continued here, however, but a few years; for one of the Chineſe generals, a man of an enterprizing genius, being defeated by the Tartars, who were then at war with the Chineſe, fixed his views on Formoſa, formed a reſolution of expelling the Dutch, and eſtabliſhing a new kingdom on the iſland.

Accordingly,

Accordingly, the Chineſe adventurer ſailed from China with a very conſiderable fleet, and arriving near the mouth of the harbour, he landed ſome of his men, and began to attack the fort of Zealand. The Dutch not being apprehenſive of any danger, were ill provided to reſiſt ſo powerful an enemy; they had only four ſhips in the harbour, and not above twenty men in the fort, excluſive of the natives; notwithſtanding which they made ſo gallant an oppoſition, that the ſiege laſted upwards of three months. The Chineſe general was ſo enraged at being thus diſappointed, that he at length had recourſe to a very deſperate effort, which had the deſired effect: he converted ſeveral of his veſſels into fire-ſhips; and the wind happening to be high and favourable, drove them into the harbour, when three of the Dutch ſhips were intirely deſtroyed. Thus ſituated, the Dutch could not make any farther reſiſtance, and the Chineſe general offering them liberty to depart with their effects in caſe they would ſurrender, they readily accepted the offer, and putting all their valuables on board the ſhip that was left, they departed, and left the Chineſe general ſole maſter of the iſland. The conqueror immediately acknowledged ſubmiſſion to the emperor, and ſeveral other towns were ſoon built on different parts of the iſland, the inhabitants of which have ever ſince been ſubject to the government of China, and teſtify their ſubmiſſion by an annual tribute, as we before obſerved.

The iſland of Haynan (the principal part of which alſo belongs to the Chineſe) is of conſiderable extent, and ſome of the towns are very populous. It is ſituated between one hundred and ſeven and one hundred and ten degrees eaſt longitude, and between eighteen and twenty degrees north latitude. It is bounded, on the eaſt, by the Chineſe ſea; on the weſt, by the coaſt of Cochin-China; on the north by part of the province of Quang-tong, to which it belongs; and, on the ſouth, by the channel of Paracel, which joins the eaſtern coaſt of Cochin-China. It is about two hundred miles in length from eaſt to weſt, near one hundred and fifty in breadth, and about four hundred in circumference.

Kian-tcheou is the principal city of Haynan, and is ſo ſituated, that ſhips lie at anchor cloſe to its walls with the greateſt ſecurity. The ſtreets are very uniform, and ſome of them at leaſt a mile in length, but the houſes in general are low mean buildings. There are ſeveral other conſiderable cities in the iſland, beſides the capital, all of which are ſituated near the ſea-ſide, and ſubject to the juriſdiction of Kian-tcheou, which is governed by mandarins of two orders, namely, thoſe of learning, and thoſe of arms.

On the ſouthern part of the iſland there is a fine port, the bay of which is near twenty feet deep. There is alſo another very convenient port on the northern part, the entrance to which is defended by two ſmall forts, though the depth of water does not exceed twelve feet. Here the barks frequently come from Canton with various commodities, in exchange for which they take ſeveral kinds of minerals, the natural produce of the country; for in ſome parts of the iſland there are gold and ſilver mines, as alſo mines that produce the lapis-lazuli, which the natives of Canton uſe in painting the blue porcelain. Between the two forts that defend the entrance of the northern port, is a large plain, on which are ſeveral handſome Chineſe ſepulchres.

With reſpect to the climate of this iſland, it is in general very unhealthy, particularly the northern part, though the ſoil is tolerably fertile. The ſouthern and eaſtern parts are exceedingly mountainous; but the vallies beneath are rich, and produce great plenty of rice. There are likewiſe ſeveral ſorts of very valuable trees, particularly the roſe or violet-tree, which is ſo fragrant in its ſcent, that it is purchaſed at a very high price for the ſole uſe of the emperor. There is alſo another tree little inferior to this: it produces a kind of liquid, which by the natives is called dragons blood, and, if thrown into the fire, diffuſes a moſt agreeable ſcent. Indigo grows very plentifully on this iſland, as alſo ſugar, tobacco, and cotton; and they have a great variety of the moſt delicious fruits, ſome of which we have mentioned before in treating of this iſland.

Horſes, ſheep, cows, and hogs, are the chief animals here. There are prodigious numbers of apes on the mountains and in the woods, ſome of which are very large, of a black colour, and the features of their faces ſo diſtinct, as to reſemble the human ſpecies with greater exactneſs than any others to be found in the univerſe; but theſe are very ſeldom ſeen; and though the natives have often endeavoured to catch them, yet they are ſo cunning and alert, that they have baffled every machination they could project. Theſe apes appear to be of the ſame ſpecies with two ſent ſome years ago in a coaſting veſſel as a preſent from a merchant of the rajah of the Carnatic dominions to the governor of Bombay.

There are various kinds of game in this iſland, particularly deer and horſes; alſo a great plenty of birds, as partridges, wood-cocks, ſnipes, turtle-doves, and moſt ſorts of water-fowls, all which are little inferior to thoſe in Europe. They have likewiſe moſt ſorts of fiſh in great abundance; among theſe is a little blue fiſh found among the rocks, which is ſo beautiful as to be eſteemed of greater value than the golden fiſh; but they will live only a few days out of their natural element.

The natives are ſhort in ſtature, of a reddiſh complexion, and ſome of them greatly deformed. The men wear only a looſe garment, reaching from the waiſt to the knees: it is made of callico, and the colour is either a deep blue, or quite black. The women wear a garment of the ſame ſtuff, though different in form: it ſomewhat reſembles a waiſtcoat, and reaches from the ſhoulders to the knees; and they are farther diſtinguiſhed from the men by ſtreaks made on their faces with indigo. Both ſexes braid their hair, and adorn their ears with rings; their hats are made of ſtraw or rattan, and tie under the chin.

Bows and arrows are their chief weapons, in the uſe of which they are not ſo expert as the inhabitants of Formoſa. They have alſo a kind of hanger faſtened with a girdle to their waiſt, which they generally uſe to clear the way in foreſts or other woody places where they travel.

The natives of this iſland occupy the centre part of it, which is very mountainous; and here they live independent, being ſubject only to their own laws and modes of government. They are ſeldom ſeen by the Chineſe, except when they make an attempt to ſurpriſe any of the neighbouring villages. This, however, ſeldom happens, and, when it does, they are naturally ſuch cowards, that a hundred of them will fly from half a dozen Chineſe. Many of them are in the ſervice of the Chineſe, who employ them to cultivate their lands, and take care of their cattle.

There are a number of ſmall iſlands called the Piſcadores, or Fiſher iſlands, between the iſland of Formoſa and the continent of China; theſe are ſituated in twenty-three degrees north latitude. On the weſt ſide of one of theſe iſlands is a large town, with a fort defended by a garriſon, conſiſting of three hundred Tartars.

A ſet of iſlands are likewiſe ſituated between Formoſa and Luconia. Theſe are called the Five Iſles, the northernmoſt of which lies in twenty degrees twenty minutes north latitude. The largeſt of theſe iſlands is uninhabited, on account of its being a barren country; but the others are very populous, having ſeveral good towns in them. The hills of theſe iſlands are rocky, but the vallies are very fertile, being well watered with running ſtreams. They produce plenty of pine-apples plantains, bananas, ſugar-canes, cottons, pompions, and potatoes; and there are alſo great numbers of goats, horned cattle, and hogs.

The inhabitants are of an olive-colour, and are ſhort in ſtature, with round faces, low foreheads, and thick eye-brows. They have black hair, which they cut ſo ſhort, that it barely touches their ears. The men wear only a cloth about their middle, and have no covering on their heads. The women wear a ſhort petticoat made of coarſe callico, which reaches from the waiſt to the calves of their legs. Both ſexes wear rings in their ears, made of metal reſembling gold, which they dig out of the mountains.

The houſes are built in rows one above another, on the ſides of the rocks, and they aſcend to them by the help of ladders. They are very ſmall, and conſiſt only of a few poſts bound or covered with boughs of trees. The fire-place is at one end, and here they lay boards, on which they ſleep. There is a kind of ſtreet to each row of houſes, which runs parallel with the tops of the buildings in the row beneath.

The natives of theſe iſlands are naturally ingenious: they underſtand the uſe of iron, which they work into various forms, and build very neat boats, that reſemble thoſe with us called yawls. They have likewiſe ſome large veſſels, which they tow with twelve or fourteen oars.

The food of theſe people conſiſts chiefly of vegetables; but they ſometimes make a diſh of locuſts, which at particular ſeaſons of the year come to devour their plants. They catch them with nets, and either broil them on the fire, or bake them in an earthen pan. Their chief drink is water; but they have a liquor that in taſte and colour reſembles Engliſh beer: this is called baſhee, and gives

name

name to one of these islands. It is made with sugar-canes, boiled and mixed with blackberries; after which it is put into jars, and when it has worked five or six days, it becomes very fine, and fit for drinking.

The language of these islanders bears no affinity either to the Chinese or Malayan, but is peculiar to themselves.

The only weapons they use, are lances headed with iron; when they go on the mountains in pursuit of beasts, they wear a kind of armour made of a buffalo's skin, which has sleeves, and reaches down to the calves of the legs. It is wide at the bottom, but close about the shoulders, and is of such solid substance as hardly to be penetrated.

In general, these are a very civil people, and will neither engage in quarrels among themselves, or with strangers. The men are chiefly employed in fishing, and the women in husbandry. Each man is prohibited from having more than one wife, who treats him with great respect. The boys are brought up by their fathers to fishing; and the girls work with their mothers in the plantations, which are in vallies, where every person cultivates and plants as much ground as is sufficient to supply the necessities of the family.

They have not any laws, neither have they occasion for any; every family has one superior, to whom the rest are subservient, and children behave with the greatest respect to their parents. In short, these people appear to enjoy real felicity, by seeking that happiness in their own minds which is not to be found independant of ourselves, as the mistaken part of mankind suppose; they have no ambition, and therefore have no desire to leave their own home to seek after imaginary baubles: they content themselves with the situation in which providence has placed them, and each succeeding day contributes to increase their happiness, while they escape innumerable evils which roving and unsatisfied minds are subject to and experience.

SECT. VII.

Contains a description of the Moluccas or Spice Islands.

THE islands of the Moluccas are sixteen in number, and are situate between five degrees north, and seven degrees south latitude, and from one hundred and twenty-one to one hundred and thirty degrees east longitude. The Banda islands are, 1. Banda; 2. Pulloway; 3. Pulorin; 4. Nera; 5. Gumanapi; 6. Guiliaien: these produce nutmegs, &c. The others are, 1. Ternate; 2. Tidore or Tidor; 3. Motir; 4. Machian; 5. Bachian; 6. Amboyna; 7. Bouro; 8. Ceram; 9. Gilolo; 10. Bouton: the produce of most of these is cloves, &c.

The Portuguese, in 1511, obtained possession of these islands, but were afterwards driven out by the Dutch, who claim an exclusive right to them. Cloves and nutmegs are not produced in any other part of the universe; and the politic Dutch destroy great quantities annually, in order to keep up the price, and not glut the markets. The nutmeg resembles a peach, and the clove a laurel tree, only the leaves are smaller than either, the fruit of the former is both nutmeg and mace, the nutmeg being the kernel, and the mace being a kind of leafy covering that incloses the nutmeg-shell, and the whole is contained in a large coat like that of a walnut: but the cloves appear in clusters; the blossom changes gradually from white to green, red, and brown, which latter is characteristical of its ripeness; but when it is dried in the sun, it receives a blackish hue. The clove is gathered from September to February, and the nutmeg in April, August, and December. The April crop is, however, deemed the best; and in order to prevent the nutmegs from being worm-eaten, they are boiled in lime when gathered.

The Banda, or nutmeg islands, lie near each other. Banda, the principal of them, is about twenty miles long, and ten broad. Besides the large forests of nutmeg and clove-trees which grow spontaneously, and require not the least trouble, the soil is fertile, and produces a variety of delicious fruits. The island is in the shape of a crescent, and the concavity of it forms an excellent bay, near which the principal town stands. Several brooks flow from a small mountain, water the whole country, and render it exceedingly pleasant.

The island is divided into three districts: Mahometanism and Paganism are the religions. The natives have some ships of force, containing a few cannon each, and use bucklers, back and breast plates as defensive, and carbines, darts, lances, scymetars, &c. as offensive weapons. They are strong in their persons, disagreeable in their features, malicious in their tempers, and melancholy in their dispositions. The men are very idle, and oblige the women not only to do all the domestic drudgery, but to cultivate the land. They make fruit a principal part of their diet, though they have three harvests in the year.

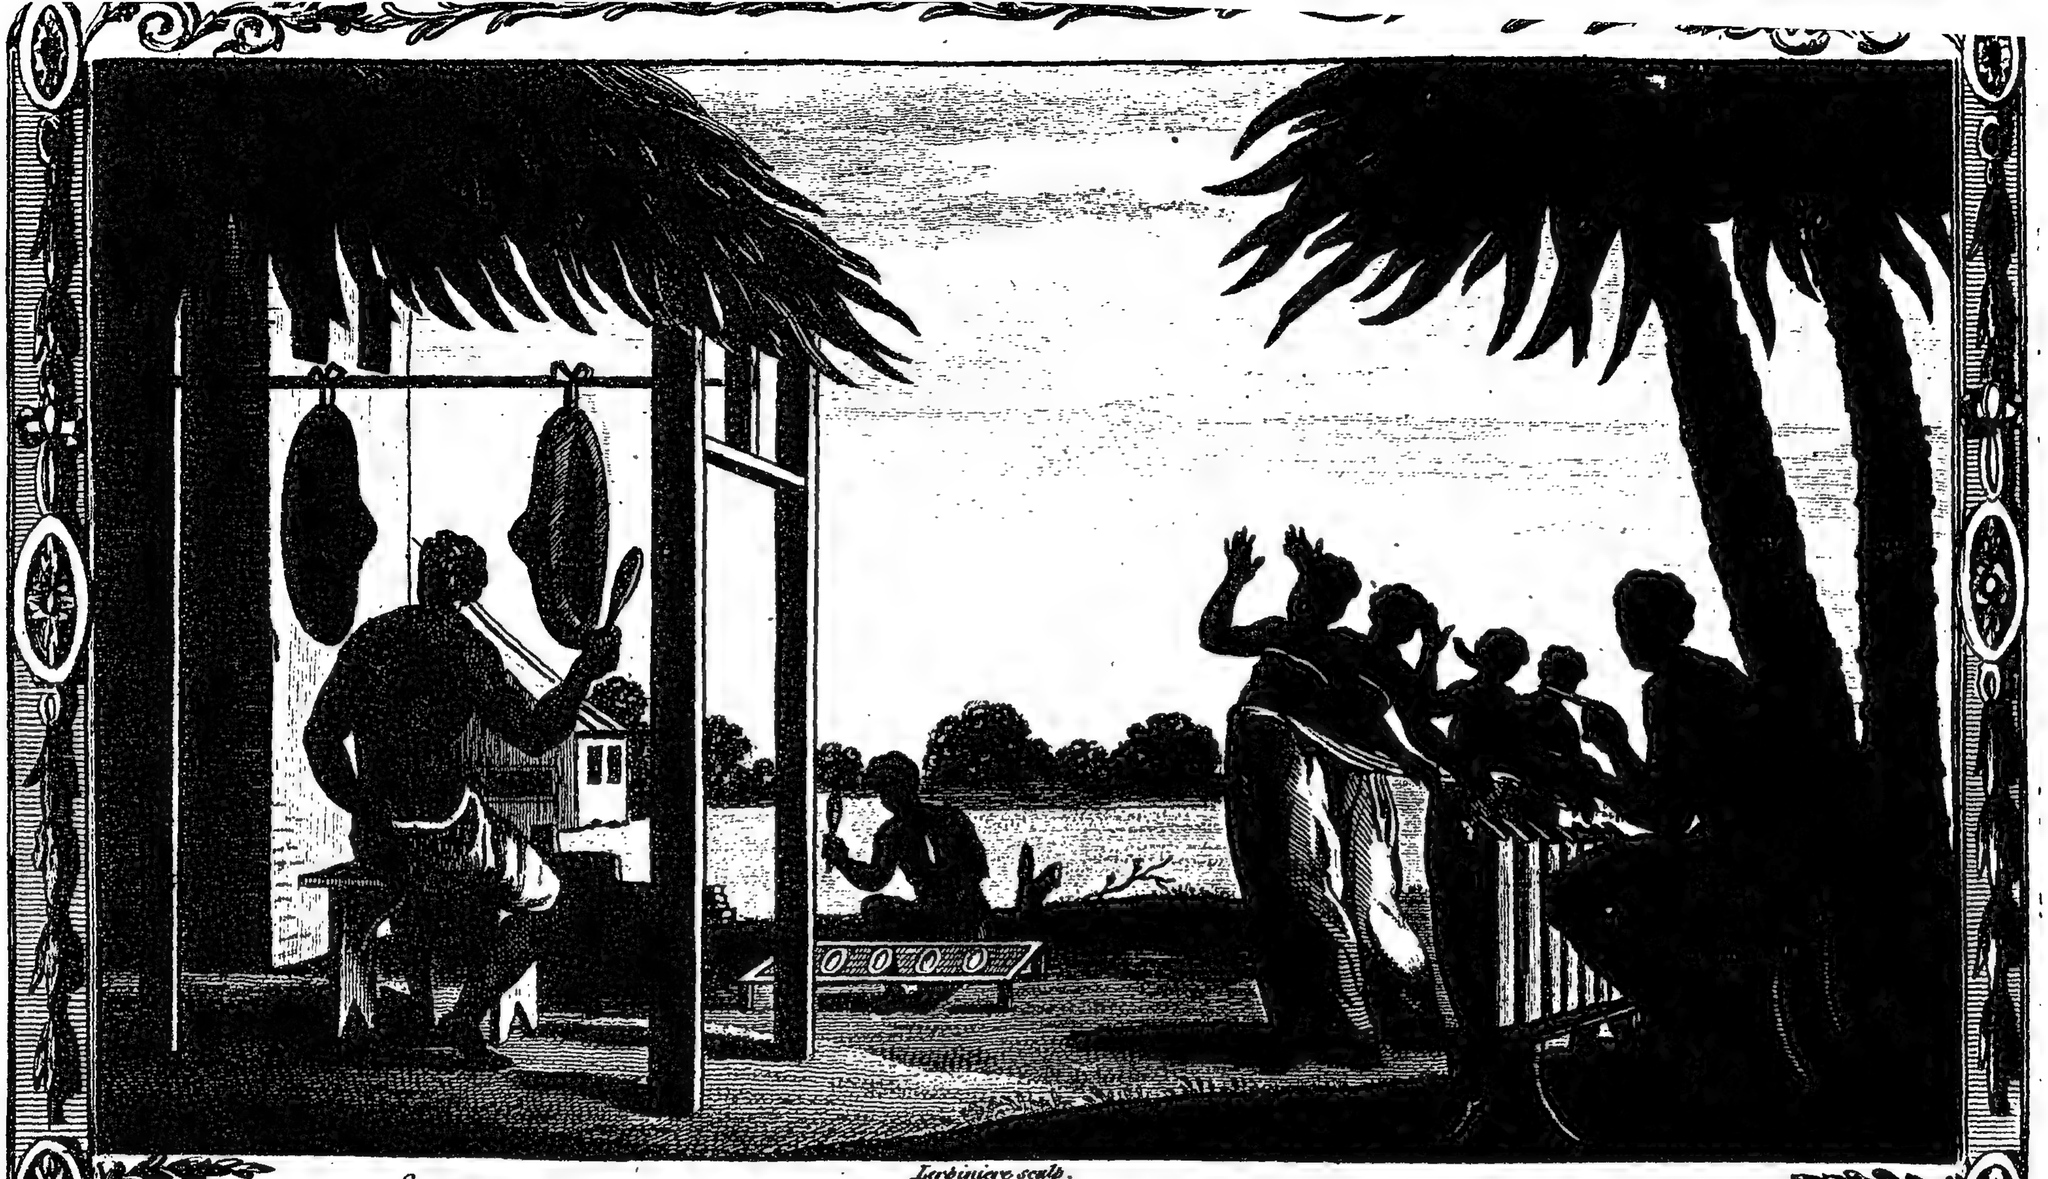
The Dutch have a factory at the western part of the island: it is erected upon the top of a mountain, and is ascended to by three hundred and twenty-four stone steps. At the foot of the mountain stands a negro town, the principal factory of the Dutch being at Nera, which is well fortified, as are all the landing-places in the island; and the whole under the direction and superintendance of a governor and council.

Into this, and the other Banda islands, the following articles are imported, viz. gold chains, gold coins, enamelled and damasked sword-blades, silver cups gilt; guns, china-ware, broad cloath, velvets, damasks, flannels, rice, &c. The exports are fruits and spices.

Pulloway is a most delightful country, the nutmeg and other fruit trees being cut into pleasant walks through the island, and form one beautiful garden; but here are neither springs nor rivulets: the rainy season, which lasts some months every year, supplies them with water, which they preserve in cisterns. The Dutch have a fort on the east side of the island, called the revenge, being one of the strongest fortresses in India.

Pulorin has not much spice upon it, but is fortified to prevent other people settling so near the islands that have fruit.

The other little Banda islands have scarce any thing in them worthy notice, more than what is included in the description of Banda abovementioned.



The island of Ternate is about twenty-four miles in circumference; but though inferior in size to some of the other Moluccas, it is deemed the principal both by the Dutch and natives, as the Dutch make it the head seat of their government, and it is the residence of the chief prince of these islands.

Cloves are produced in great abundance in this island: here are also admirable almonds, delicious fruits; a few goats, and some poultry are to be met with. There is no rice, or any other grain; for the excessive heat, which is requisite to ripen spices, and meliorate fruit, parches the earth, so as to render it incapable of bearing wheat, barley, or rice. The want of the various kinds of grain, however, used in bread, is not felt by the natives; for they have a substitute, which makes the most wholesome and exquisite cakes in the universe, that is, the pith of the tree called sago, whose salubrious qualities are well known in Europe. This excellent tree is not only serviceable with respect to its medicinal virtues, and for yielding them bread; but affords them likewise drink, cloathing, and shelter; for by incision a liquor is drawn from it that exceeds most wines; the leaves being a kind of cotton, the smaller are converted into garments, and the larger used to thatch their houses. Most of the natives live to an hundred years of age, and their longevity is attributed to the salubrious quality of this bread.

Every one of the islands pay tribute to the king, who is the chief of all the Moluccas. The natives struggled for many years against the incroachments of foreigners, but were totally subdued by the Dutch in 1780; and the former do not entertain the least idea of driving the others from their country, because they have so many forts and such strong garrisons in it.

Most of the houses belonging to the natives are built of cane; some few of the wealthier sort, indeed, have wooden ones. A mat serves them instead of bed, chair, and table; for they lie, eat, drink, and sit on it. This, and a pot to dress their victuals in, a hatchet to cut their wood, and a calibash to hold their water, make the whole catalogue of their household furniture: their windows are not glazed, nor are their doors secured by locks. They wear silk or callico, and all persons make their own garments, the king and grandees excepted. Their fuel is odoriferous woods, and even the smiths use nothing in their forges but almond shells. The king resides at Malaya, a little town fortified with a mud-wall; but the suburbs, in which the Dutch factory have a fine garden, is pretty large, and well inhabited by blacks. The palace is but a trivial building; but the gardens belonging to it are very pleasant, and contain an aviary filled with a great variety of beautiful birds, whose harmonious notes are extremely delightful. The prince has a cabinet of Indian rarities and European curiosities: he is attended by a considerable retinue, and wears a sumptuous garment manufactured by the Dutch. In this island, the waters are remarkably clear, and the fish extremely delicious to the taste.

Parrots

Larpiniere sculp.

NATIVES *of the* MOLUCCA ISLANDS *playing on Musical Instruments called the* RABANA.

Parrots are pretty numerous in Ternate; they are handſomer, and ſpeak more diſtinctly, than thoſe in the Weſt-Indies; but the moſt remarkable of the feathered race in this iſland is, the bird of paradiſe which is juſtly deemed the moſt beautiful bird in the univerſe. The head is like that of a ſwallow, but the bill conſiderably longer; the body is ſmall, but the plumage diſplays ſuch admirable colours, as are inconceivably pleaſing to behold.

In this iſland there is a volcano, which caſt out a ſulphureous fire three months in the year, and ſometimes does great miſchief; in the year 1648 it deſtroyed many houſes, and did other conſiderable damage. The annexed recent account of its dreadful devaſtations was tranſmitted to Europe, in a letter from a merchant at Batavia, dated October 18, 1776: "We have the following account of the deplorable ſituation of the iſland of Ternate. On the 4th of July, 1775, there were more than one hundred ſhocks of earthquakes felt here, ſome of which were ſo violent, that they ſeemed to threaten the deſtruction of the whole iſland; about the 20th of Auguſt they were felt again; and the burning mountain, after a dreadful exploſion, threw out hot ſtones, cinders, and lava in abundance: and on the 5th of November the earth was never ſtill for three hours, the mountain ſeemed all on fire, and the moſt dreadful ſtorm of thunder and lightning fell in every part of the iſland, which threw the inhabitants into ſuch a conſternation, that they ran from one part to another for ſhelter; but none was to be found; the ſea was ſo extremely boiſterous, that the deſtruction was inevitable there, and on the land the earth opened and trembled under them, as if the whole iſland was going to be annihilated; but by the providence of the Almighty, a calm was reſtored, and the inhabitants had time to ſee what damage had been done, when it appeared that the Dutch ſettlement had ſuffered but little; but it will be ſome years before the iſlanders recover their loſs. The king has made a report, that a large tract of land on the north ſide of the iſland, in the diſtrict of Xulla Tacory, has been ſwallowed up, by which ſixteen plantations have been totally deſtroyed, and one hundred and forty-one perſons have been either burnt or drowned in the ſea, where many of them took refuge in their boats. This report has been confirmed by about thirty of the unfortunate inhabitants, who are rendered dreadful objects by wounds and burns in this ſhocking event. On the 5th and 6th of November, the earthquakes and effuſions of fire, ſtone, and ſulphureous ſmoke from the mountains began as bad as ever, but no lives were loſt. The horrors of this night are not to be deſcribed, for the thunder, lightning, and moſt ſhocking earthquakes continued without interruption for twelve hours, with the moſt terrible violence; from this ever dreadfully to be remembered night, there were no earthquakes till July, 1, 1776, when they were again felt for two hours, but not violent."

Tidore, or Tidor, is ſituated to the ſouth-eaſt; the capital, which is of the ſame name, has been ſtrongly fortified by the Dutch; ſo that on account of its natural ſtrength, and the important works they have added to it, the place is deemed impregnable; the harbour is, however, but indifferent, being dry at low water, which ſometimes proves very inconvenient to the merchants.

Motir is a very ſmall iſland, about thirty miles north of the line, and ſecured by a ſtrong fortreſs erected by the Dutch.

To the ſouth of Motir is Machian, nearly under the line; it riſes in a conical form to a conſiderable height, and ſeems at a diſtance like a ſingle mountain. The cloves of this iſland and Tidor are ſuperior to thoſe of any other of the Moluccas. The Dutch have ſeveral forts in this iſland, which is only twenty miles in circuit.

Great and Little Bachian are to the ſouthward of the line; the firſt is fertile in fruit, ſago, fiſh, &c. It formerly produced cloves; but the Dutch ordered them to be grubbed up, to prevent their becoming too plentiful. It has a good harbour defended by a ſtrong fort; but there is nothing worthy of mention reſpecting Little Bachian.

Though the above mentioned are the Molucca iſlands; yet thoſe which follow are included under the ſame appellation as they produce the ſame kinds of ſpices.

Amboyna is ſituate in three degrees eight minutes ſouth latitude, and one hundred and twenty-ſeven degrees ten minutes eaſt longitude, lies above ſeventy miles to the northward of Banda, and is about ſeventy-two miles in circumference. It contains at preſent above fifty proteſtant churches; and many of the natives, who have been ſent over to Holland for education, officiate as clergymen and miſſionaries, by which means proſelytes are exceedingly numerous. The ſoil is very fertile, producing great quantities of nutmegs, cloves, oranges, lemons, citrons, potatoes, millet, tobacco, ſugar, bamboos, &c. but the air is unwholſome; there is a good bay, which penetrates very far into the land, and by that means forms a commodious harbour. The people extract a ſpirituous liquor and a kind of green oil from green cloves, which are both good in paralytic caſes. The men wear only a piece of cloth about their waiſts, and are very proud of having large whiſkers: they purchaſe their wives, but in caſe of barrenneſs divorce them. The women are both of a looſe and malicious diſpoſition. On account of the earthquakes, the houſes are built very low. The ſtrong and important fortreſs, called Fort Victory, is the ſtaple of the Dutch Eaſt India company in theſe parts. It is defended by four bulwarks, a broad ditch, and a garriſon of eight hundred men.

The Engliſh had formerly factories here as well as the Dutch; but in 1623 the latter maſſacreed the former, and uſurped the dominion of the Spice Iſlands, which had been ceded to the Engliſh by the natives themſelves. In putting the Engliſh and ſome Japaneſe to death, they exerciſed the moſt horrid cruelties, in order to extort confeſſions concerning a pretended plot, which they accuſed them of having formed; and to the ſhame of king James I. and king Charles I. no ſatisfaction was obtained for the villainous barbarity. Oliver Cromwell was not, however, ſo eaſy about the matter, for he frightened the Dutch into the payment of three hundred thouſand pounds as ſome kind of retribution.

There are ſeveral populous villages in the iſland, in the churches and chapels of which divine ſervice is performed both in the Dutch and Malayan tongues; it contains likewiſe many mountains with ſprings of water on their ſummits.

Bouro is about ſeventy-five miles in length, and thirty in breadth: it is ſituated in two degrees thirty minutes ſouth latitude, and one hundred and twenty-five degrees thirty minutes eaſt longitude. The Dutch have here a ſtrong fort, though the iſland is perfectly ſecure, from the ſingularity of its coaſt, which riſes in a high ridge, and encompaſſes the whole as with a wall. It contains ſome prodigious high mountains, but is nevertheleſs very fertiles, producing cloves, nutmegs, cocoa-trees, bananas, piany, green ebony, beans, peas, potatoes, tobacco, Indian-wheat, lime-trees, herbs, flowers, &c. Among the beaſts, are the civet-cat, and a ſingular kind of roe-buck, whoſe fleſh is very delicate. The natives are black, and go intirely naked till they are twelve years of age; at which period they tie a piece of cloth round their waiſts, and never wear any other garment. They are Mahometans and Pagans, but upon the whole have very little ſenſe of religion. When a relation dies, they appear ſad till the corpſe is in the ground, and then they make merry to an exceſs; but do not forget to provide a kind of ſepulchre or ſtone and clay to cover the grave of the defunct. The next day after the women are delivered of children in this iſland, they go about their ordinary work; while the men indulge themſelves in bed, and pretend to be vaſtly ill. Inſtead of a cradle, they put their infants in a kind of network hammock, which they hang upon a peg whenever they are too buſy to dandle it in their arms.

Ceram is a woody and mountainous iſland: it lies in two degrees thirty minutes ſouth latitude, and in one hundred and thirty-ſeven eaſt longitude, and produces cloves and nutmegs. The Dutch factory called Ambay, is defended by a ſtrong fort and good garriſon; the inhabitants, who are Pagans and Mahometans, have a prince of their own, who reſides at Cambello; notwithſtanding which, they own the king of Ternate as their ſovereign.

Gilolo is one hundred and ninety miles long, and one hundred and ten broad: it extends from one degree ſouth to two degrees north latitude, and from one hundred and twenty-five to one hundred and twenty-eight eaſt longitude; the air is unhealthy, and the ſoil produces rice and ſago, but no ſpices. The inhabitants have an independant ſovereign of their own: they are tall and ſtrong, but ſavage and cruel.

Bouton is ſituated between four and five degrees ſouth latitude, and in one hundred and twenty-one degrees thirty minutes eaſt longitute. It is ſeventy miles in length, thirty in breadth, has a good harbour, and contains a large town with tolerable houſes, built in the manner of thoſe of Mindano: this town is incloſed by a ſtone wall, and ſurrounded by groves of cocoa-trees. The natives are governed by a prince of their own, profeſs the Mahometan religion, and ſpeak the Malayan language.

SECT. VIII.

Treats of Celebes, or the iſland of Macaſſar.

TO the ſouthward of the Philippines lies the iſland of Celebes, or Macaſſar, extending from one degree thirty minutes north latitude, to five degrees thirty minutes ſouth; having the great iſland of Borneo on the weſt, and the Molucca's on the eaſt. The length of it from the ſouth weſt point to the north eaſt is about five hundred miles, and in the broadeſt part of it, it is near two hundred miles over. The ſouth part of the iſland is divided by a bay ſeven or eight leagues wide, which runs forty or fifty leagues up into the country, and on the eaſt ſide of the iſland are ſeveral bays and harbours, and abundance of ſmall iſlands and ſhoals: towards the north there is ſome high land: but on the eaſt the country is low and flat, and watered with many little rivulets.

This iſland is divided into ſix petty kingdoms or provinces, the principal whereof are Celebes, on the north weſt, lying under the equinoctial; and Macaſſar, which takes in all the ſouth part of the iſland: the reſt of the provinces were uſually under the dominion of one of theſe; whereupon the iſland ſometimes receives its name from one, and ſometimes from the other.

The air is hot and moiſt, the whole country lying under or very near the line, ſubject to great rains. It is moſt healthful during the northern monſoons: if they fail of blowing at their accuſtomed time, the iſland grows ſickly, and great numbers of people are ſwept away.

They have mines of copper, tin and gold, but we do not find they are much wrought; the gold they have is found chiefly in the ſands of their rivers, and at the bottom of hills, waſhed down by torrents.

In their woods they have ebony, calambac and ſanders, and ſeveral ſorts of wood proper for dying; and no place, it is ſaid, affords larger bamboos, ſome of them being four or five fathoms long, and above two foot diameter, which they make uſe of in building their houſes and boats.

Their fruits and flowers are much the ſame with thoſe in the Philippines, and therefore we ſhall not tire the reader with a repetition of them, only mention ſome of the principal. They have pepper and ſugar of their own growth, as well as betel and arek, in great plenty; but no nutmegs, mace or cloves; however, of theſe they uſed formerly to import ſuch quantities from the Spice iſlands that they had ſufficient for their own uſe, and ſold great quantities to foreigners. Their rice is ſaid to be better than in other parts of India, it not being overflowed annually as in other countries, but watered from time to time by the huſbandmen as occaſion requires; and from the goodneſs of their rice, the natives are of a ſtronger conſtitution than thoſe of Siam or other parts of India.

Their fruits are alſo held to be of a more delicious taſte than the fruits of other countries which are expoſed to floods: the plains here are covered with the cotton ſhrub which bears a red flower, and when the flower falls, it leaves a head about as big as a walnut, from whence the cotton is drawn; and that which comes from Macaſſar is accounted the fineſt in India.

Of all their plants, opium is what they moſt admire; it is a ſhrub which grows at the bottom of mountains, or in ſtony ground: the branches afford a liquor which is drawn out much after the ſame manner as palm wine; and being ſtopped up cloſe in a pot, comes to a conſiſtency, when they make it up in little pills: they often diſſolve one of theſe pills in water and ſprinkle their tobacco with it; and thoſe who are uſed to take it can never leave it off: they are lulled into a pleaſing dream, and intoxicated as with ſtrong liquor; but it inſenſibly preys upon their ſpirits and ſhortens their lives: they will take the quantity of two pins heads in a pipe of tobacco, when they enter into a battle, and become almoſt inſenſible of wounds or danger till the effect of it is worn off.

The natives of this iſland are famous for the poiſons they compound of the venomous drugs and herbs their country produces; of which, it is ſaid, the very touch or ſmell occaſions preſent death: their young gentlemen are inſtructed how to blow their little poiſoned darts through a tube or hollow cane, about ſix feet in length; with theſe they engage their enemies; and if they make the leaſt wound with theſe darts, it is ſaid to be mortal. Though theſe weapons would not be much dreaded among people that are well cloathed, yet as the natives engage naked, their ſkins are eaſily penetrated, and the poiſon operates ſo ſpeedily, that it is not eaſy to cure them: they will ſtrike a man with theſe darts at near an hundred yards diſtance

Macaſſar, the chief city here, is ſituated on the banks of the river of the ſame name, near the ſouth-weſt corner of the iſland. Here the Dutch have a very ſtrong fort mounted with a great number of cannon; and the garriſon conſiſts of eight hundred men.

The ſtreets of the town are wide and neat, but not paved, and trees are planted on each ſide of them. The palaces, moſque, and great houſes are of ſtone, but the houſes of the meaner ſort of wood of various colours, which make them look very beautiful, but are built on pillars like thoſe of Siam, and the roofs like theirs alſo are covered with palm or cocoa leaves.

There are ſhops along the ſtreets, and large market places, where a market is held twice in twenty-four hours, viz. in the morning before ſun-riſe, and an hour before ſun-ſet, where only women are ſeen; a man would be laughed at to be found amongſt them: from all the villages you ſee the young wenches crowding to market with fleſh, fiſh, rice and fowls; they abſtain only from pork, which their religion forbids.

Upon a computation of the number of inhabitants in this city and the neighbouring villages, ſome years ago, they amounted to one hundred and ſixty thouſand men able to bear arms; but now are not half that number, many of them having forſaken their country ſince the Dutch deprived them of their trade. The reſt of the towns and villages were once equally populous, but are now many of them deſerted.

The people of Macaſſar have excellent memories, and are quick of apprehenſion; they will imitate any thing they ſee, and would probably become good proficients in all arts and ſciences, if they did not want good maſters to improve their talents.

They have alſo ſtrong robuſt bodies, are extremely induſtrious, and as ready to undergo fatigues as any people whatever: nor are any people more addicted to arms and hardy enterpriſes, inſomuch that they may be looked upon as almoſt the only ſoldiers on the other ſide the bay of Bengal; and accordingly are hired into the ſervice of other princes and ſtates on that ſide, as the Swiſs are in this part of the world: even the Europeans frequently employ them in their ſervice, but have ſometimes ſuffered by truſting them too far; or rather, our people being too apt to uſe them like ſlaves, as they do the poor Portugueſe and Muſtees in their ſervice; this is a treatment which the Macaſſarians will not bear, and never fail to revenge whenever it is attempted by our European governors.

The people of Macaſſar are of a moderate ſtature, their complexions ſwarthy, their cheek-bones ſtand high, and their noſes are generally flat; the laſt is eſteemed a beauty, and almoſt as much pains taken to make them ſo in their infancy, as to make the Chineſe ladies have little feet.

They have ſhining black hair, which is tied up and covered with a turbant, or cloth wound about their heads when they are dreſſed, but at other times they wear a kind of hat or cap with little brims.

They continually rub and ſupple the limbs of their infants with oil, to render them nimble and active; and this is thought to be one reaſon there is hardly ever ſeen a lame or crooked perſon among them.

Their male children of the better ſort, it is ſaid, are always taken from their mothers at ſix or ſeven years of age, and committed to the care of ſome remote relation, that they may not be too much indulged and effeminated by the careſſes of the mother; they are ſent to ſchool to their prieſts, who teach them to write and read and caſt accompts, and the precepts of the koran: their characters very much reſemble the Arabic, which is not ſtrange, ſince their anceſtors, many of them, were Arabians.

Beſides their books, every child is bred up to ſome handicraft trade; they are alſo taught ſeveral ſports and martial exerciſes, if they are of quality; but the meaner ſort are employed in huſbandry, fiſhing, and ordinary trades, as in other places.

This people ſeem to be inſpired with juſt notions of honour and friendſhip, and there are inſtances of many of them who have expoſed their lives even in defence of foreigners and Chriſtians; and of others who have generouſly relieved and maintained people in diſtreſs, and even ſuffered them to ſhare their eſtates. They retained that love of liberty, that they were the laſt of the Indian nations that were enſlaved by the Dutch, which did not happen neither till after a long and very expenſive war, wherein almoſt the whole force of the Hollanders in India was employed. The people in general are very much ſubject to paſſion; and they will condemn their own raſhneſs if they are in the wrong.

The

The women are remarkable chaſte and reſerved, at leaſt they cannot help appearing ſo; for the leaſt ſmile or glance on any but their huſbands, is held a ſufficient reaſon for a divorce; nor dare they admit of a viſit even from a brother, but in the preſence of the huſband; and the law indemnifies him for killing any man he ſhall find alone with his wife, or on whom ſhe has conferred any mark of her favour. But the inhabitants of this country are in general ſo little addicted to infamous practices, or litigious diſputes, that they have neither attornies nor bailiffs among them. If any differences ariſe, the parties apply perſonally to the judge, who determines the matter with expedition and equity. In ſome criminal caſes, ſuch as murder, robbery, &c. he has a right to execute juſtice himſelf, by deſtroying the offender.

On the other hand, the man keeps as many wives and concubines as he pleaſes, and nothing can be more ignominious than the want of children, and the having but one wife: the love of women, and the deſire of children is univerſal: and according to the number of women and children the man poſſeſſes his happineſs is rated.

To proceed; though the women of faſhion generally keep cloſe, yet upon certain feſtivals they are ſuffered to come abroad and ſpend their time in public company, in dancing and other diverſions uſed in the country; but the men do not mix with them as in this part of the world, only they have the happineſs to ſee and be ſeen, which makes them wait for this happy time with impatience.

Their princes and great men wear a garment made of ſcarlet cloth or brocaded ſilk, with large buttons of gold, they have likewiſe a very handſome embroidered ſaſh made of ſilk, in which their dagger and purſe are placed, with their knife, crice, and other little trinkets. People of figure dye the nail of the little finger of the left-hand red, and let it grow as long as the finger. The women wear a muſlin ſhift, or rather waiſtcoat, cloſe to their bodies, and a pair of breeches, which reaches down to the middle of the leg, made of ſilk or cotton, and have no other head dreſs than their hair tied up in a roll, with ſome curls hanging down their neck: they throw a looſe piece of linen or muſlin over all when they go abroad; nor have they any ornaments but a gold chain about their necks.

They are fond of a fine equipage and a great number of ſervants to attend them, and if they have not ſo many of their own as their quality requires, they will not ſtir out, till they have got their uſual number, by hiring or borrowing them. The furniture of their houſes conſiſt chiefly of carpets and cuſhions, and the couches they ſleep on. They ſit croſs-legged on mats and carpets, as moſt Aſiatics do.

This iſland produces moſt animals except ſheep. There are monkeys and baboons in abundance, that will ſet upon travellers; ſome of them are quite black, ſome of a ſtraw colour, and others white, the latter of which are generally as big as maſtiffs, and much more miſchievous than the others. Some have long tails, and walk on all-fours; others are without tails, and walk upright, uſing their fore-feet as hands, and in their actions greatly reſemble the human ſpecies. Their going in large companies ſecures them from the more powerful beaſts of the foreſts; but they are ſometimes conquered by the large ſerpents, which purſue them to the tops of trees, and deſtroy them.

The natives do not ſcruple eating any fleſh but pork, this no Mahometan will touch; but their food is chiefly rice, fiſh, herbs, fruit and roots: fleſh they eat but little of. They have but two meals a day, one in the morning and the other about ſun-ſet; but their chief meal is in the evening; they chew betel and areka, or ſmoke tobacco mixed with opium moſt part of the day. Their liquor is tea, coffee, ſherbet, or chocolate, and they have palm wine, arrac, or ſpirits, which they ſometimes indulge in, though it is prohibited by their religion. They loll upon carpets at their meals, and eat off of diſhes made of China, wood, ſilver or copper, which are ſet on little low lacquered tables; and take up the rice with their hands inſtead of ſpoons, which they ſeem not to know the uſe of.

In the celebration of marriage the huſband receives no other portion with his wife than the preſents ſhe received before marriage. As ſoon as the prieſt has performed the ceremony, the new-married couple are confined in an apartment by themſelves for three ſucceſſive days, having only a ſervant to bring them ſuch neceſſaries as they may have occaſion for, during which time their friends and acquaintances are entertained, and great rejoicings made at the houſe of the bride's father. At the expiration of the three days the parties are ſet at liberty, and receive the congratulations of their friends: after which, the bridegroom conducts his wife home, and both apply themſelves to buſineſs, he to his accuſtomed profeſſion, and ſhe to the duties belonging to houſewifery, and the management of a family. When a man has reaſon to ſuſpect his wife of infidelity, he applies to a prieſt for a divorce; and if the complaint appears juſt, there is no difficulty in obtaining it. In this caſe the ſecular judge pronounces the accuſed party guilty, declares her to be divorced, and ſettles the terms; both parties, after this judgment, have liberty to marry again.

The Macaſſarians had originally ſtrange notions of religion: they believed there were no other gods but the ſun and moon; and to them they ſacrificed in the public ſquares, not having materials which they thought ſufficiently valuable to be employed in erecting temples. According to their creed, the ſun and moon were eternal, as well as the heavens, whoſe empire they divided between them. Theſe abſurdities, however, had not ſo laſting an influence either over the nobles or people, as is found from the religious doctrines of other nations; for the Turks and apoſtles of the koran arriving in the country, the ſovereign and his people embraced Mahometaniſm, and the other parts of the iſland ſoon followed their example.

They are great pretenders to magic; and carry charms about them, ſuppoſing theſe will ſecure them from every danger. When any one is ſo ill as to be given over by the phylician, the prieſts are ſent for, who, attributing the violence of their diſeaſe to the influence of ſome evil ſpirit, firſt pray to them, and then write the names of God and Mahomet on ſmall pieces of paper, which are carefully hung about their necks; and if the patient does not ſoon recover, his death is conſidered as inevitable, and every preparation is made for his expected departure.

Theſe people perform their funeral ceremonies with great decency; to ſecure which, the meaneſt perſon makes proviſion while in health, by aſſigning a certain ſum to defray the neceſſary expences attending it. As ſoon as a perſon is dead, the dead body is waſhed, and, being cloathed in a white robe, is placed in a room hung with white, which is ſcented with the ſtrongeſt perfumes. Here it continues for three days, and on the fourth it is carried on a palanquin to the grave, preceded by the friends and relations, and followed by the prieſts, who have attendants that carry incenſe and perfumes, which are burnt all the way from the houſe to the grave. The body is interred without a coffin, there being only a plank at the bottom of the grave for it to lie on, and another to cover it; and when this laſt is placed, the earth is thrown in, and the grave filled up. If the perſon is of any diſtinguiſhed quality, a handſome tomb is immediately placed over the grave, adorned with flowers, and the relations burn incenſe and other perfumes for forty days ſucceſſively.

This iſland was formerly under a monarchical government; and in order to prevent the crown falling to an infant, the eldeſt brother ſucceeded after the death of the king. All places of truſt in the civil government were diſpoſed of by the prime miniſters; but the officers of the revenue and of the houſhold were appointed by the ſovereign. The king's forces, when out of actual ſervice, were not allowed any pay, but only their cloaths, arms, and ammunition. It is ſaid, that in former wars he has brought twelve thouſand horſe, and eight thouſand foot into the field; but the laſt war with the Dutch proved the total deſtruction of both king and country; ſince which this iſland has been under the government of three different princes, who are conſtantly at variance with each other; which is a favourable circumſtance for the Dutch, who might otherwiſe meet with a powerful oppoſition, and be deprived of thoſe advantages they have ſo long poſſeſſed on this ſide the globe. Theſe princes hold aſſemblies at particular times on affairs that concern the general intereſt; and the reſult of their determinations becomes a law to each ſtate.

When any conteſt ariſes, it is decided by the governor of the Dutch colony, who preſides at the above diet. He keeps a watchful eye over theſe different ſovereigns, and holds them in perfect equality with each other, to prevent any of them from aggrandizing themſelves to the prejudice of the company. The Dutch have diſarmed them all, under pretence of hindering them from injuring each other, but in reality only to keep them in a ſtate of ſubjection.

Jampadan is another port-town about fifteen miles ſouth of Macaſſar river, one of the beſt harbours in India, and the firſt town the Dutch took from the natives; here they ſunk or ſeized all the Portugueſe fleet when they were in full peace with that nation. The reſt of the towns and

villages

villages lying in the flat country near the ſea or the mouths of rivers, are for the moſt part built with wood or cane, and ſtand upon high pillars on account of the annual flood, when they have a communication with one another only by boats.

About the Celebes are ſeveral iſlands that go by the ſame name, the principal of which is ſituated about five leagues from the ſouth-eaſt corner. This iſland is about eighty miles long, and thirty broad: on the eaſt-ſide of it is a large town and harbour called Callacaſſong, the ſtreets of which are ſpacious, and incloſed on each ſide with cocoa-trees. The inhabitants are governed by an abſolute prince, ſpeak the Malayan tongue, and are Mahometans. The ſtraights of Patience are on the other ſide of this iſland; they are ſo called from the great difficulty in paſſing them, which ariſes from the violence of the currents, and the contrariety of winds.

SECT. IX.

Treats of the ſituation, trade, and produce of Borneo, Sumatra, and Java, commonly called the Sunda iſlands; and of the manners and cuſtoms of the inhabitants, &c.

THE moſt conſiderable of the Sunda iſlands, called ſo from the ſtraights near which they lie, are Borneo, Sumatra and Java.

Borneo extends from ſeven degrees thirty minutes north latitude to four degrees ſouth latitude, and from the one hundred and ſeventh to the one hundred and ſeventeenth degree of longitude, being about ſeven hundred miles in length and five hundred in breadth, and is computed to be two thouſand five hundred miles in circumference. The figure of this iſland being almoſt round, it probably contains a greater number of acres than any iſland hitherto diſcovered. To the eaſtward of it lies the iſland of Celebes or Macaſſar, to the ſouth of the iſland of Java, to the weſt the iſland of Sumatra, and to the north-eaſt the Philippine iſlands.

The air of this country is not exceſſive hot, conſidering it is ſituated under the equinoctial, being refreſhed almoſt every day with ſhowers and cool breezes, as all other countries that are under the line; but as thoſe parts of the iſland which border on the ſea-coaſt lie upon a flat for ſeveral hundred miles, and are annually flooded; upon the retiring of the waters the whole ſurface of the ground is covered with mud or ſoft ouze, which the ſun darting its rays perpendicularly upon, raiſes thick noiſome fogs, which are not diſperſed till nine or ten in the morning, and render thoſe parts of the iſland very unwholeſome. The multitude of frogs and inſects that the waters leave behind, and are ſoon killed by the heat of the ſun, cauſe an intolerable ſtench alſo at that time of the year, and corrupt the air: add to this the cold chilling winds and damps which ſucceed the hotteſt days; from all which, we may conclude it muſt be very unhealthful at leaſt to European conſtitutions: and the loſs of our countrymen, who yearly travel thither, ſufficiently convinces us of this truth.

As to their monſoons, or periodical winds, they are weſterly from September to April, or thereabouts; during which time is their wet ſeaſon, when heavy rains continually pour down, intermixed with violent ſtorms of thunder and lightning; and at this time it is very rare to have two hours fair weather together on the ſouth coaſt of the iſland, whither the Europeans principally reſort.

The dry ſeaſon begins uſually in April and continues till September, and in this part of the year too, they ſeldom fail of a ſhower every day when the ſea breeze comes in.

The harbours of greateſt note, and to which the Europeans uſually reſort, are Banjar Maſſeen Succadanea and Borneo, but much more to Banjar Maſſeen than either of the other; the greateſt quantities of pepper growing towards the ſource of that river, which falls into the ſea three degrees eighteen minutes ſouth latitude. The town of Banjar formerly ſtood about twelve miles up the river, and was built partly on wooden pillars, and partly on floats of timber in the river; but there is now no ſign of a town there, the inhabitants being removed to Tatas, about ſix miles higher.

The city of Borneo, formerly the reſidence of the principal ſultan or king of the iſland, lies on the north weſt part of the iſland, in four degrees fifty-five minutes north latitude, and is a very commodious harbour. This city is very large, the ſtreets ſpacious, and the houſes well built; they are in general three ſtories high, covered with flat roofs, and the ſultan's palace is a very elegant and extenſive building. It is the chief ſeat of commerce in the iſland, and the port is continually crowded with ſhips from China, Cambodia, Siam, Malacca, &c. The Engliſh and Portugueſe have ſome trade here, though no ſettled factory. The port of Succadanea lies on the weſt ſide of the iſland, in fifteen minutes ſouth latitude, and was heretofore more reſorted to by the Europeans than any other. Over againſt this, on the eaſt ſide of the iſland, ſtands another ſea-port town, called Paſſeir, in fifteen minutes ſouth latitude, but is not a place of any great trade.

One of the moſt conſiderable inland towns is Caytongé, the ſultan whereof is now the moſt potent prince in the iſland: this city lies about one hundred miles up the river Banjar; and about two hundred miles higher ſtands the town of Negaree, the reſidence of another ſultan. The names of the other principal towns are, Tanjongbuoro, Sedang, Tanjongdatoo, Sambas, Landa, Piſagadan, Cotananjang, Sampit, Tanjong, Selatan, Gonwarengen and Pomanoocan.

Their chief rivers are, 1. Banjar. 2. Tatas. 3. Java. 4. Succadanea; and, 5. Borneo.

Banjar is a fine river, riſing in the mountains in the middle of the iſland, and, running ſouth, diſcharges itſelf into a bay on the ſouth-eaſt part of the iſland, being navigable for ſeveral hundred miles: the banks are planted with tall ever-green trees. The river Tatas falls into the mouth of Banjar river, and is frequently called the China river, becauſe the China junks lie in the mouth of it. The rivers Java and Succadanea run from the north-eaſt to the ſouth-weſt, and fall into the bay of Succadanea in the ſouth-weſt part of the iſland.

The river Borneo falls into the bay of Borneo, in the north-weſt part of the iſland. The tides in the river Banjar flow but once in the twenty-four hours, and that in the day-time; they never riſe more than half a foot in the night (unleſs in a very dry ſeaſon) which is occaſioned by the rapid torrents, and the land winds blowing very ſtrong in the night-time. There lie three iſlands within the entrance of the river, the firſt of which is covered with tall trees, that may be ſeen at ſea, and are a good mark for ſailing over the bar. If a ſhip be aground, the ebb is ſo very ſtrong, occaſioned by the land floods, that ſhe will run the hazard of being broke to pieces; and the trees continually driving down the river, render the navigation ſtill more dangerous. The beſt anchoring place is a mile or two within the river; it is beſt to ſail up with the flood, the tide of ebb runs ſo ſtrong. There are a great many fine bays and harbours on the coaſt, but that moſt reſorted to is at the mouth of the river Banjar.

The natives of Borneo conſiſt of two different people, that are of different religions; thoſe upon the ſea coaſt are uſually called Banjareens, from the town of Banjar, to which moſt nations reſort, to trade with them. The Banjareens are of a low ſtature, very ſwarthy, their features bad, reſembling much the negroes of Guinea, though their complexions are not ſo dark; they are well proportioned, their hair is black, and ſhines with the oil with which they perpetually greaſe it. The women are of a low ſtature and ſmall limbs, as the men are, but their features and complexion much better, and they move with a good grace.

The lower claſs of people go almoſt naked; they have only a little bit of a cloth before, and a piece of linen tied about their heads. Their betters, when they are dreſſed on days of ceremony, wear a veſt of red or blue ſilk, and a looſe piece of ſilk or fine linen tied about their loins, and thrown over their left ſhoulder. They wear a pair of drawers, but no ſhirt, and their legs and feet are bare; their hair is bound up in a roll, and a piece of muſlin or callico tied over it; they always carry a crice or dagger in their ſaſh when they go abroad.

The Byaios or mountaineers are much taller and larger bodied men than the Banjareens, and a braver people, which their ſituation and manner of life may account for, being inured to labour, and to follow the chace for their daily food; whereas the Banjareens uſe very little exerciſe, travelling chiefly by water.

The Byaios have ſcarce any cloathing, but, not admiring their tawny ſkins, paint their bodies blue, and, like all other people that live in hot climates, anoint themſelves with oil, which ſmells very ſtrong; and the better ſort, it is ſaid, pull out their fore-teeth, and place artificial ones, made of gold, in their ſtead; but their greateſt ornament conſiſts of a number of tygers teeth, which are ſtrung together, and worn about the neck. Some of them are very fond of having large ears; to obtain which, they

make holes in the ſoft parts of them when young; to theſe holes are faſtened weights about the breadth of a crown piece, which is continually preſſing on the ears, and expand them to ſuch a length, as to cauſe them to reſt upon the ſhoulders,

The Banjareens are an hoſpitable friendly people, where they are not abuſed, or apprehend foreigners have a deſign upon their liberties; they ſeem to be men of good ſenſe, but not being acquainted with the world, are frequently impoſed upon in their traffic with the crafty Chineſe.

The chief part of their food here is rice, as it is in other hot countries, but with it they eat veniſon, fiſh, or fowl, and almoſt all kind of meat, except hogs fleſh; and men of figure are ſerved in gold or ſilver plate; the common people are content with braſs or earthen diſhes, and all ſit croſs-legged upon mats or carpets at their meals, and indeed almoſt all day long, chewing betel and arek, or ſmoaking tobacco, which both ſexes are very fond of when it is mixed with opium. The whole company uſually ſmoke out of one pipe: the maſter of the feaſt having ſmoaked firſt, paſſes it round the company, and they will ſometimes ſit ſmoaking ſo long, that they grow ſtupid. At other times they divert themſelves with comedies, and the Chineſe have taught them to game; their rural ſports are hunting, ſhooting, and fiſhing. They have ſuch plenty of fiſh, that they may take as many as will ſerve them a day at one caſt, from their houſes, which are built upon floats in their rivers.

Their uſual ſalute is the ſalam, lifting up their hands to their heads, and bowing their bodies a little; and before their princes; they throw themſelves proſtrate on the ground: no one preſumes to ſpeak to a great man, till he is firſt ſpoken to, and required to tell his buſineſs: they uſually travel in covered boats upon their rivers; but the great men who live in the inland country ride on elephants or horſes.

Beſides rice, already mentioned, the produce of this country is cocoa-nuts, oranges, citrons, plantains, melons, bananas, pine-apples, mangoes, and all manner of tropical fruits; cotton, canes, rattans, and plenty of very fine timber; gold, precious ſtones, camphire, bezoar, and pepper. There are three ſorts of black pepper; the firſt and beſt is the Molucca, or lout pepper; the ſecond is called Caytonge pepper, and the worſt ſort is the Negaree pepper, of which there is the greateſt plenty. This is ſmall, hollow and light, and commonly full of duſt, and the buyer will be impoſed on if he buys it by meaſure, and does not weigh it. He muſt take care alſo, that the pepper be not mixed with little black ſtones, which are not eaſily ſeen. The white pepper grows on the ſame tree as the black pepper does, and bears twice the price: it is conjectured to be the beſt of the fruit that drops of itſelf, and is gathered up by the poor people in ſmall quantities, before it turns black, and the ſcarcity of it occaſions it to be ſo dear; but we ſeem to want a more ſatisfactory account of this matter.

The animals here are the ſame as on the continent of India, viz. bears, tygers, elephants, buffaloes, deer, &c. but the moſt remarkable animal, and which is almoſt peculiar to this iſland, is that monſtrous monkey called the oran-outang, or man of the woods, near ſix feet high, and walks upon his hinder legs. He has a face like a man, and is not ſo ugly as ſome of the human ſpecies, particularly the Hottentots; he has no tail, or any hair on his body, but where a man has hair. Mr. Beeckman, captain of an Indiaman, purchaſed one of them, who would drink punch, and open his caſe of brandy to get a dram, if he was left alone with it, drink a quantity, and then return the bottle to the caſe. He would lay himſelf down to ſleep as a man does: if the captain appeared angry with him, he would whine and ſigh till he was reconciled. He would wreſtle with the ſeamen, and was ſtronger than any of them, though he was not a year old when he died; for the captain loſt him as ſoon as he came into cold weather, having been bred in the hotteſt climates.

Among their minerals is gold, which the mountaineers get out of the ſands of their rivulets in the dry ſeaſon, and diſpoſe of it to the Banjareens, from whom the Europeans receive it: there are alſo iron mines, and the load-ſtone is found here.

The principal merchandize imported from Borneo by the Europeans is pepper, gold, diamonds, camphire, bezoar, aloes, maſtic and other gums: and the goods proper to be carried thither, beſides bullion and treaſure, are ſmall cannon from one hundred to two hundred weight, lead, callimancoes, cutlery wares, iron bars, ſmall ſteel bars, hangers, the ſmalleſt ſort of ſpike nails, twenty-penny nails, graplings of forty pound weight, red leather boots, ſpectacles, clock-work, ſmall arms with braſs mountings, horſe piſtols, blunderbuſſes, gunpowder and looking-glaſſes. The purchaſing gold is a profitable article; and diamonds may be had reaſonably, though they are generally ſmall ones; they uſually purchaſe gold with dollars, giving a certain number of ſilver dollars for the weight of one dollar in gold.

Their current money is dollars, half and quarter dollars; and for ſmall change they have a ſort of money made of lead in the form of rings, which are ſtrung on a kind of dry leaf.

The language of the inhabitants on the coaſt is the Malayan; but the iſlanders have a language peculiar to themſelves, and both retain the ſuperſtitious cuſtoms of the Chineſe.

They are intirely ignorant of aſtronomy; and when an eclipſe happens, they think the world is going to be deſtroyed. Arithmetic they know but little of; and their only method of calculating, is, by parallel lines and moveable buttons on a board. They have likewiſe little knowledge of phyſic; and the letting of blood, how deſperate ſoever the caſe of the patient may be, is to them a circumſtance of a very alarming nature, as they ſuppoſe, by the operation, we let out our very ſouls and lives. It is their opinion, that moſt of their diſtempers are cauſed through the malice of ſome evil demon; and when a perſon is ſick, inſtead of applying to medicine, they make an entertainment of various kinds of proviſions, which they hold under ſome conſpicuous tree in a field; theſe proviſions, which conſiſt of rice, fowl, fiſh, &c. they offer for the relief of the perſon afflicted; and if he recover, they repeat the offering, by way of returning thanks for the bleſſing received; but if the patient dies, they expreſs their reſentment againſt the ſpirit by whom he is ſuppoſed to have been afflicted.

Pagans and Mahometans both allow a plurality of wives and concubines; and the marriage ceremonies of both are the ſame as in other Mahometan countries. The girls are generally married at the age of ten, and leave childbearing before they are twenty-five. The women are very conſtant after marriage; but are apt to beſtow favours with great freedom when ſingle; and, however indiſcreet they may have been in this point, they are not conſidered the worſe for it by their huſbands, nor dare any one reproach them for what they have committed previous to their marriage. They in general live to an advanced age, which is attributed to their frequent uſe of the water; for both men and women bathe in the rivers once in the day; and from this practice they are very expert ſwimmers.

The Banjareens, in burying their dead, always place the head to the north, and they throw into the grave ſeveral kinds of proviſions, from an abſurd and ſuperſtitious notion that theſe may be uſeful to them in the other world. They fix the place of interment out of the reach of the floods; and the mourners, as in Japan and China, are dreſſed in white, and carry lighted torches in their hands.

There are ſeveral petty kingdoms in the inland part of this country, each of which is governed by a rajah, or king. All the rajahs were formerly ſubject to the rajah of Borneo, who was eſteemed the ſupreme king over the whole iſland; but his authority has been of late years greatly diminiſhed; and there are other kings equal, if not more powerful than himſelf; particularly the king of Caytonge. The town where this prince reſides is ſituated about eighty miles up the Banjar river. His palace is a very elegant building erected on pillars, and is open on all ſides. Before the palace is a large building, conſiſting only of one room, which is ſet apart for holding councils, and entertaining foreigners. In the centre of the room is the throne covered with a rich canopy of gold and ſilver brocade. About the palace are planted ſeveral cannon, which are ſo old, and mounted on ſuch wretched carriages, that they are neither ornamental nor uſeful. This prince is eſteemed the greateſt, on account of the cuſtoms he receives at the port of Banjar Maſſeen, which are eſtimated at eight thouſand pieces of eight per annum.

The king or ſultan of Negaree is the moſt conſiderable prince, next to the above: his palace is ſituated at a place called Metapoora, about ten miles from Caytonge. There is a handſome armoury before the gates of his palace, which contains a great number of fire-arms, and ſeveral cannon. He is always on good terms with his neighbour the prince of Caytonge, and the reſt are ſubordinate to theſe two princes; great homage is paid them by the natives, and it is difficult for a ſtranger to get acceſs to them:

the only means to effect this, is, by complimenting them with ſome valuable preſent, for avarice is their darling paſſion; and the ſtranger will be treated with reſpect in proportion to the preſent he makes.

Sumatra is one of the Sunda iſlands, ſituate in the Indian ocean, between ninety-three and one hundred and four degrees of eaſtern longitude, and between five degrees thirty minutes north latitude, and five degrees thirty minutes ſouth latitude, the equinoctial line running croſs the middle of it; having Malacca on the north, Borneo on the eaſt, Java on the ſouth-eaſt, and the Indian ocean on the weſt, and is eight hundred miles long, and about one hundred and fifty broad. The air is generally unhealthful near the coaſt, the country being very hot, and very moiſt, and changing ſuddenly from ſultry heat in the day-time, to cold chilling winds in the night.

It is the firſt of the remarkable iſlands that form the great Archipelago of the eaſt, the entrance of which is, as it were, blocked up by this iſland and Java, which form a barrier ſeparating the Indian from the Chineſe ocean; except that in the center between the two iſlands there is an opening, which appears as if purpoſely deſigned to admit a free paſſage for the advantages of commerce. This opening is called the ſtraight of Sunda, the ſouth part of which is the north of Java, and called Java Head; and the north point is the ſouth of Sumatra, called Flat Point. Theſe two are about ſix leagues aſunder, between which ſhips paſs from Europe directly to Batavia or China, without touching at the Indies: they ſtretch away eaſt from the Cape of Good Hope, and make no land till having traverſed the whole Indian ſea they arrive at Java Head.

There are no phyſicians in Sumatra, but they rely upon the ſkill and experience of ſome good old women, who are acquainted with the nature of their ſimples. The flux is the diſtemper that uſually carries off foreigners, againſt which the fruit guava and the pomegranate are certain remedies, if taken before the diſtemper becomes violent; but moſt other fruits promote the diſeaſe. Bathing in cold water is eſteemed another remedy for the flux. Their water, unboiled, as well as ſherbet, is very unwholſome: full meals of fleſh ought to be avoided, occaſioning a diſtemper called the Mort Duchin, which is attended with a violent vomiting and purging, and uſually carries off the patient in twenty-four hours. Theſe gentlemen that drink ſtrong liquors to exceſs, uſually avoid the flux, but are carried off by fevers. The cholic and ſmall-pox are often fatal to the natives, as well as foreigners; but they are ſeldom troubled with dropſies, gout, or ſtone.

People that are careful of their health, eat and drink moderately, and boil their water; nor do they avoid wine or arrack punch altogether, for theſe drank moderately in this moiſt air preſerve, rather than deſtroy health.

There is a chain of mountains which runs the whole length of the iſland, from the north-weſt to the ſouth-eaſt, and here the air is ſomething better than on the coaſt; but the European factories are generally ſituated at the mouths of rivers near the ſea, for conveniency of trade; and here three years may be reckoned a long life, the ſalt ſtinking ouſe ſends up ſuch unwholſome vapours as perfectly poiſon foreigners that are ſent thither.

The monſoons, or periodical winds, ſhift here at the equinoxes, as they do in other parts of the Indian ſeas, blowing ſix months in one direction, and ſix months in the oppoſite direction; and near the coaſt there are other periodical winds, which blow the greateſt part of the day from the ſea, and in the night time and part of the morning from the land; but theſe ſcarce extend ſeven miles from the coaſt.

There is alſo a mountain called Single-demond, about forty miles ſouth-eaſt of Bencoolen, which is a mile in height perpendicular; the rocks near the weſt coaſt are generally barren, producing little beſides ſhrubs; but towards the bottom of them grows ſome good timber. The country has a great many ſmall rivers, but none of them navigable much above their mouths, falling from high mountains, and diſcharging themſelves precipitately into the ſea, either on the eaſt or weſt, after a very ſhort courſe; the rains continuing here, as they do in moſt places near the equinoctial, ſix months and upwards, every year, and no where with more violence. The waters of the river Indapoora, during rains, look red for two miles beyond the Mouth out at ſea, occaſioned, it is ſaid, by the great number of oaks that grow in their boggy grounds, and are almoſt covered when the floods are higheſt. The waters of all their rivers, which overflow the low countries, are very unwholeſome, foul, and not fit to be drank till they are ſettled, nor indeed till they have been boiled, and tea or ſome other wholeſome herbs infuſed into them; and this, no doubt, is one cauſe of the unwholeſomeneſs of the air, it being a very juſt obſervation, that wherever the water is bad, the air is ſo too.

The iſland of Sumatra was antiently, and is at preſent, divided into a great many kingdoms and ſtates, of which Achen is the moſt conſiderable, whoſe king is the moſt powerful monarch in the iſland, the north part of it being in a manner ſubject to him. Beſides this prince, there are ſeveral orancayas, or great lords, in this kingdom, who exerciſe ſovereign authority in their reſpective territories; but they all acknowledge the king of Achen their ſuperior, and accept of the great officers in his court.

In former times the kings have exerciſed ſuch deſpotic power as to diſplace ſome of theſe, and depoſe others; and, on the other hand, inſtances have been known where theſe princes have depoſed the king, and placed another on the throne. There have been frequent ſtruggles between the king of Achen and theſe princes for ſovereign power; and if the former has in ſome reigns been abſolute, he has in others had a very limited authority.

The king has the power of diſpoſing of the crown, during his life, to ſuch of his children as he thinks proper, whether born of a wife or a concubine: but if the king does not diſpoſe of it in his life-time, there are ſometimes ſeveral competitors for it; and he who is moſt favoured by the orancayas, or vaſſal princes, uſually carries his point; ſo that the crown is elective in theſe caſes.

Achen, the metropolis of the kingdom of the ſame name, is ſituated at the north-weſt end of Sumatra, in ninety-three degrees thirty minutes eaſt longitude, and in five degrees thirty minutes north latitude, and is much the moſt conſiderable port in the iſland. It ſtands in a plain ſurrounded with woods and marches, about five miles diſtant from the ſea, near a pleaſant rivulet: it is an open town, without wall or moat, and the king's palace ſtands in the middle of it, being of an oval figure, about half a league in circumference, ſurrounded by a moat twenty-five feet broad, and as many deep: and about the palace there are caſt up great banks of earth inſtead of a wall, well planted with reeds and canes, that grow to a prodigious height and thickneſs, inſomuch that they cover the palace, and render it almoſt inacceſſible: theſe reeds alſo are continually green, and not eaſily ſet on fire. There is no ditch or draw-bridge before the gates, but on each ſide a wall of ſtone about ten feet high that ſupports a terrace, on which ſome guns are planted: and a ſmall ſtream runs through the middle of the palace, which is lined with ſtone, and has ſteps down to the bottom of it, for the conveniency of bathing.

There are four gates, and as many courts, to be paſſed before we come to the royal apartments; and in ſome of theſe outward courts are the king's magazines, and the ſtandings of his elephants: as for the inward courts of the palace, foreigners, or even the natives, hardly ever approach them; and therefore a juſt deſcription of theſe is not to be expected. But notwithſtanding the fortifications of this palace or caſtle, as it is ſometimes called, are very mean and inconſiderable, yet the avenues to it are naturally well defended: for the country round about Achen is full of rivulets, marſhes, and thick woods of cane or bamboo, which are almoſt impenetrable, and very hard to cut: there are ſeveral little forts erected alſo at proper diſtances in the marſhes, where guards are planted to prevent any ſurprize. In the king's magazines, ſome authors tell us, are found a numerous artillery, and a good quantity of fire-arms, and that his guards conſiſt of many thouſand men; but that his greateſt ſtrength is in his elephants, who are trained up to trample upon fire, and ſtand unmoved at the report of a cannon; but this we ſhall examine more particularly when we come to ſpeak of the maintenance of the prince, both with reſpect to domeſtic and military ſupplies, for later travellers do not ſeem to admire his power or grandeur.

The city of Achen conſiſts of ſeven or eight thouſand houſes, which take up the more ground becauſe they are not contiguous, every perſon ſurrounding his dwelling with a palliſado pale that ſtands ſome yards diſtant from it; except in two or three of the principal ſtreets where the markets are kept, and where foreigners inhabit, who chuſe to live near one another, to defend themſelves from thieves, robberies being very common here. The harbour, which is ſo large as to be capable of containing any number of the largeſt ſhips, is commanded by a ſpacious fortreſs encompaſſed with a ditch well fortified according to the Italian manner, and mounted with cannon. The

Engliſh,

Engliſh, Dutch, Danes, Portugueſe, Guzarats, and Chineſe, are the chief traders in this city.

The king of Achen has a great number of horſes, which, as well as the elephants, have rich and magnificent trappings. He is at no expence in times of war, for all his ſubjects are obliged to march at their own expence, and carry with them proviſions for three months: he only furniſhes them with arms, powder, lead, and rice, which is very trifling. In peace, it does not coſt him any thing, even for the maintenance of his family, for his ſubjects ſupply him with all kinds of proviſions: they alſo provide him and his concubines with cloaths. He is heir to all his ſubjects who die without iſſue male, and to all foreigners who die within his territories; and ſucceeds to the eſtates of all thoſe who are put to death. From all which it appears, that the revenue of this prince, though not paid in money, is very conſiderable.

The inhabitants of Achen are more vicious than in other places on the coaſt: they are proud, envious, and treacherous; deſpiſe their neighbours, and yet pretend to have more humanity than the inhabitants of any other nation. Some of them are good mechanics, eſpecially in the building of gallies: and they are very dextrous in doing all kinds of ſmiths work: they alſo work well in wood and copper, and ſome of them are ſkilled in making artillery. They live very abſtemiouſly, their chief food being rice, to which ſome of the better ſort add a ſmall quantity of fiſh, and their uſual drink is water. They are very fond of tobacco, though they have but little of their own raiſing; and, for want of pipes, they ſmoke in a bunco, in the ſame manner as the inhabitants on the coaſt of Coromandel. The bunco is the leaf of a tree rolled up with a little tobacco in it, which they light at one end, and draw the ſmoke through the other till it is nearly burnt to the lips. Theſe rolls are very curiouſly formed, and ſold in the public markets in great quantities.

They hold a court of juſtice five times a week, for determining all matters of controverſy, in which one of the chief orankayas preſides as judge. There is alſo a criminal court, where cognizance is taken of all quarrels, robberies, murders, &c. committed in the city: and there is a third court, in which the cadi, or chief prieſt, preſides, who judges concerning all infringements of an eccleſiaſtical nature. Beſides theſe, there is a court for determining diſputes between merchants, whether foreigners or natives. An exact account is kept here of all the cuſtoms, gifts, fines, and commodities belonging to the king, with a liſt of all the perſons who buy of his majeſty, pay the duty, or make preſents to him.

Offenders are brought to a ſpeedy trial, and the puniſhment is inflicted immediately after their conviction. If the offence be of a trifling nature, the puniſhment for the firſt time is the loſs only of a hand or foot, and the ſame for the ſecond; but for the third, or if they rob to a conſiderable amount, they are impaled alive. When the hand or foot is to be cut off, the limb is laid on the edge of a broad hatchet, and the executioner ſtrikes it with a large mallet till the amputation is perfected; and then they put the ſtump into a hollow bamboo ſtuffed with rags or moſs, to prevent the criminal from dying by loſs of blood. After he has thus ſuffered whether by the king's command, or by the ſentence of the judge, all the ignominy of his crime is wiped off; and if any one upbraids him with it, he may kill him with impunity.

Murder and adultery are puniſhed with death; and, in this caſe, the criminal has many executioners, he being placed amidſt a number of people, who ſtab him with their daggers; but female offenders are put to death by ſtrangling. The king is frequently a ſpectator of theſe puniſhments, and ſometimes even acts as executioner: and though ſuch a ſpectacle muſt to a feeling mind, appear extremely ſhocking, yet ſo little does he ſeem affected by it, that inſtances have been known of his executing a criminal, and immediately after entertaining himſelf with cock-fighting; a diverſion which in this country is more univerſally eſteemed than any other.

Having given the ſituation of the moſt conſiderable places on the eaſt ſide of Sumatra, we proceed through the ſtraights of Sunda to the weſt coaſt: and advancing from thence towards the north, the firſt Engliſh ſettlement we meet with is Sillabar, which lies in a bay at the mouth of a large river of the ſame name, in four degrees of ſouth latitude. Here the Engliſh have a reſidence, or a ſmall detachment from Marlborough fort, (erected ſoon after the deſtruction of York fort at Bencoolen) to receive the pepper the natives bring hither.

About ten miles to the northward of Sillabar ſtands the town of Bencoolen, where was the principal ſettlement the Engliſh had upon the iſland Sumatra, from the year 1685 to the year 1719, when there happened a general inſurrection of the natives, who cut off part of the garriſon: the reſt eſcaping in their boats to ſea.

Bencoolen is known at ſea by a high ſlender mountain that riſes twenty miles beyond it in the country, called the Sugar-loaf. Before the town of Bencoolen there lies an iſland, within which the ſhipping uſually ride; and the point of Sillabar extending two or three leagues to the ſouthward of it, makes a large bay: beſides theſe marks the old Engliſh fort, which fronted towards the ſea, might have been diſcerned when a ſhip came within ſeven or eight miles of the place. The town is almoſt two miles in compaſs, and was inhabited chiefly by the natives, who built their houſes upon bamboo pillars, as in other parts of the iſland. The Portugueſe, Chineſe, and Engliſh had each a ſeparate quarter. The Chineſe people built all upon a floor, after the cuſtom of their country. The Engliſh houſes were after their own model: but they found themſelves under a neceſſity of building with timber, (though there was no want of brick or ſtone), upon account of the frequent earthquakes.

The adjacent country is mountainous and woody, and in ſome parts are volcanoes that frequently vomit fire. The air is very unwholſome, and the mountains are generally covered with thick clouds that burſt in ſtorms of thunder, rain, &c. The ſoil is a fertile clay, and the chief produce is graſs; but near the ſea it is all a moraſs. There is a ſmall river on the north-weſt ſide of the town, by which the pepper is brought here from the inland part of the country; but there is a great inconvenience in ſhipping it, on account of a dangerous bar at the mouth of the river. The road is alſo dangerous for ſhips, as it has no other defence from the violence of the ſea during the ſouth-weſt monſoons, than a ſmall place called Rat Iſland, which, with the land-point of Sillabar, makes the haven.

The pepper brought here comes from the territories of the two neighbouring rajahs, one of whom reſides at Sindle-'demond, at the bottom of a bay ten or twelve miles to the north; and the other of Baſar, ten miles to the eaſt. There two rajahs have houſes in the town, whither they come when they have any buſineſs to tranſact with the Engliſh, who pay them half a dollar duty for every five hundred and ſixty pounds weight of pepper; and they alſo pay to the owner for every ſuch quantity ten Spaniſh dollars, weighing each ſeventeen penny weights and twelve grains.

The Engliſh have alſo other ſettlements to the north-weſt of the above, particularly at Cattoun, ſituated about forty miles from Bencoolen; Ippo, about thirty miles farther to the north; Bantall, which is upward of one hundred miles north of Boncoolen; and Mocho, ſituated a little to the ſouth of Indrapour.

There are ſeveral good Dutch ſettlements on this iſland, the moſt conſiderable of which is Pullambam, or Pullamban, ſituated about one hundred and twenty miles north-eaſt of Bencoolen. The chief article of trade here is paper, of which the Dutch have prodigious quantities, being under contract with the king of Pullamban, and other Indian princes, to take it at a certain price, one half of which they pay in money, and the other in cloth. All other nations are prohibited from trading except the Chineſe, by means of whom the Engliſh get a ſhare of their pepper, as our ſhips paſs through the ſtraights of Banca. The Dutch formerly carried on a great trade here in opium; but as that was found to impoveriſh the country, by drawing away its ready caſh, the king, in 1708, ordered only three cheſts of about one hundred and ſixty pounds each, to be imported: and that if any ſhould be detected in acting contrary to this order, they ſhould forfeit not only their goods, but their lives alſo.

Pullambam is a very large town, and pleaſantly ſituated on the banks of a fine river, which divides itſelf into ſeveral branches that run by four channels into the ſea. It continued to be a conſiderable city till the year 1659, when it was deſtroyed by the Dutch, in revenge for ſome injuries they pretended to have received from the natives. About this time the Dutch reduced the chief of the kingdoms in the ſouth part of this iſland; but ſeveral of them were afterwards recovered by the natives, who have ever ſince remained independent. The Dutch have ſeveral other factories here; namely,

1. Bancalis, which is ſituated nearly oppoſite to Malacca, on the banks of a ſpacious river of its own name. The chief articles ſold by the company here are, cloth and opium; in return for which, they receive gold-duſt. The

country is very fertile, and in the woods and mountains are prodigious numbers of wild hogs, whose flesh is exceeding sweet and fat. They have likewise some good poultry, and there are various kinds of fish in the river.

2. Siack, situate on the river Andraghima: this is a very inconsiderable place, on account of the unwholesomeness of the air, which is attributed to the great number of shads caught in the river at a particular season of the year, for the sake of the roes; and the rest of the fish being thrown in heaps, corrupt, and exhale pestilential vapours. These roes the natives pickle, and then dry in smoke; after which they put them in large leaves of trees, and then send them to different countries between Achen and Siam. They call it Turbow, and reckon it a great delicacy.

3. Pedang; which is situated about sixty miles south of the equator, and has a fine river, where large ships may come up, and ride in safety; but it is the most insignificant settlement the Dutch have on this island: it produces but a small quantity of pepper; and the trade in gold is so trifling, as hardly to defray the natural expences attending it.

Many other places on this island are independent of the English and Dutch; the chief of which are the following.

Priaman, it lies nearly opposite to Pedang, about one hundred miles north-west of Indrapour. It is very populous, and plentifully supplied with most kinds of provisions. The natives carry on a considerable trade with the inhabitants of Manimcabo. The Dutch had a factory here for many years, but were at length driven from it by the king of Achen.

Another very considerable place is Ticow, which is situated about seven leagues from Dassaman, in twenty degrees south latitude. The inland part of the country is very high; but that next the sea is low, covered with woods, and watered with several small rivers, which render it marshy. There are, however, many pleasant meadows well stocked with buffaloes and other horned cattle, which are purchased at a very easy price. It likewise affords plenty of rice, poultry, and several sorts of fruits, as durians, ananas, oranges, citrons, pomegranates, melons, mangoes, cucumbers, and potatoes: but its most valuable produce is pepper, with which it abounds, and is in quality esteemed superior to that of any other place on the island. The pepper chiefly grows at the bottom of the mountains; for which reason those parts are exceedingly populous. The city stands about two miles from the sea, opposite to a small island. It is but a little mean place, for the city and suburbs do not contain eight hundred houses, which are chiefly built with reeds, and are neither strong nor commodious. The king is subject to the kings of Achen, who appoints a new governor every three years, and without him the king of Ticow cannot execute any business of importance. The governor, therefore, is the person applied to by foreigners in the transacting of business, and even the natives pay him the most distinguished respect. The inhabitants of the city are Malayans, but the inland parts are possessed by the natives, who disown the king of Achen's authority, and have a peculiar language and king of their own. This part of the country produces great quantities of gold, which the natives exchange with the Dutch, or the inhabitants near the coast, for pepper, salt, iron, cotton, red cloth, and Surat pearls. The air here is very unhealthy, particularly from July to October, and the people are very subject to fevers, which are so violent in their nature, as seldom to admit of a cure; so that were it not for the pepper, no stranger would venture to go near them. Every person who trades to this place, must have a licence for that purpose from the king of Achen; and when that is, obtained, they cannot be interrupted either by the king or governor of Ticow. They sell their pepper by bahars of one hundred and sixteen pounds averdupois: and the king of Achen has fifteen per cent. out of all that is sold, that is seven and a half for the export of the pepper, and seven and a half for the import of the merchandize given in exchange for that commodity.

Barras, which belongs to the king of Achen, is one of the most considerable places on the west coast; it is situated on a fine river near the center between Ticow and Achen, and, like the former, no person must trade here without permission from the king. This place produces great plenty of gold, camphire, and benjamin, the latter of which serves the natives instead of money. The country is very pleasant, and abounds with rice, and several sorts of the most delicious fruits. The Dutch and English, as also the inhabitants of the coast, buy up the camphire here, in order to carry it for Surat, and the straights of Sunda.

The province of Andzigzi is small, but remarkable for producing great quantities of pepper: and gold is cheaper here than in any other part of the island.

Jamly is situated on a river on the east side of the island, about fifty miles from the sea, in two degrees south latitude. Great quantities of pepper are produced in it, which is said to be much superior in quality to that of Andrigri. The Dutch had a factory here, the most considerable of all their settlements on the coast, but they withdrew from it in 1710. The English had likewise a factory near it, which they also quitted on account of the obstructions they met with from the Dutch in their trade.

Pedir is situated about thirty miles east of Achen, and is a large territory: it has the advantage of an excellent river. The soil is very fertile, and the country produces such quantities of rice, that it is called the granary of Achen. It also produces a large quantity of silk, part of which is wove by the natives into stuffs, that are valued in most parts throughout the island, and the rest is sold to the inhabitants of the coast of Coromandel.

Passaiman, almost under the equinoctial, is a large place, situated at the foot of a very high mountain, but is remarkable only for producing pepper, which is both large and excellent in its quality.

Cinquele produces annually a large quantity of camphire, which the inhabitants of Surat, on the coast of Coromandel, purchase for fifteen or sixteen rials the coff, or twenty-eight ounces. Daya abound in rice and cattle.

In the island of Sumatra, they have a small breed of horses; they have also buffaloes, deer, goats, hogs, tygers, hog-deers, monkies, squirrels, guanoes, porcupines, alligators, serpents, scorpions, muskatoes, and other insects: from the hog-deer is obtained a species of the bezoar-stone, which is of a dark brown colour, and has two coats; a small quantity of this stone, dissolved in any liquor, will remove an oppression of the stomach, rectifies foul blood, and restores the appetite: it is also very efficacious in other disorders incident to human nature. Here are also hens, ducks, and other poultry; pigeons, doves, parrots, parakeets, maccaws, and small birds; sea and river fish also are very plentiful, and turtle or sea-tortoise. They have elephants, but they are supposed not to be natives.

Rice is much the greatest part of their food in all their meals; strong soup, made of flesh or fish, and very little meat high seasoned, serves to eat with their rice. The Mahometans that inhabit the coast, abstain from swines flesh, and from strong liquors, as they do in all countries of the same faith. The mountaineers will eat any flesh, except beef, the bull being one of the objects of their worship, and if we could give any credit to their neighbours, the people of Achen, they eat human flesh; but the world is pretty well satisfied by this time that there are few nations of cannibals.

Their common drink is tea, or plain water: but they sometimes use the liquor of young cocoa-nuts, which is very cooling and pleasant. They always sit cross-legged on the floor at their meals. Their salutations are much the same as in other Asiatic countries.

Learning is not to be expected here. The common language is the Malayan tongue, and the koran and religious books of the Mahometans are written in Arabic, which is now a dead language. They have indeed the use of letters here, as they have almost in every other eastern nation except China; but those gentlemen were so self-sufficient, so much above being taught by people they look upon as their inferiors, that they have now the least pretence to learning of any nation on the face of the earth.

The Mahometans of Sumatra speak and write the Malayan language. The Pagan mountaineers have a language peculiar to themselves. As the Malayans write from the right hand to the left, the mountaineers write as we do, from the left hand to the right; and instead of pen, ink, and paper, they write, or rather engrave, with a stile on the outside of a bamboo cane; the Malays, indeed, use ink and a coarse brown paper. Both nations are poor accomptants, and are forced to make use of the Banians that reside amongst them as their clerks, when they have any considerable accounts to make up, the Banians being said to be possessed of great abilities in this particular, and are also some of the sharpest traders in the world.

The inhabitants of this island are in general of a moderate stature, and a very swarthy complexion: they have black eyes, flat faces, and high cheek bones: their hair is long and black, and they take great pains to dye their teeth black: they likewise besmear themselves with oil, as in other hot countries, to prevent being stung by the insects;

ſects, and let their nails grow exceeding long, ſcraping them till they are tranſparent, and dying them with vermillion: the poorer ſort go almoſt naked, having only a ſmall piece of cloth faſtened round the waiſt; and about their heads they wear a piece of linen, or a cap made of leaves, reſembling the crown of a hat; but they have no ſhoes or ſtockings. The better ſort wear drawers or breeches, and a piece of callico or ſilk wrapped about their loins, and thrown over the left ſhoulder, and they wear ſandals on their feet, when in towns.

They are very proud and revengeful in their diſpoſitions; and are ſo indolent, that they will neither endeavour to improve themſelves in arts and ſciences, or in huſbandry, but ſuffer their manufactures to be neglected, and their lands to lie without cultivation. If foreigners, therefore, were not to ſupply their defects, they would in all probability ſuffer themſelves to be reduced to a ſavage ſtate, and only preſerve their exiſtence, like the beaſts of the country, with what the earth ſpontaneouſly produces.

The king has no other ſtanding forces than his guards, but depends on his militia, which, as we hinted above, are as numerous as the people in his kingdom, all who are able to bear arms, are obliged to appear under arms whenever they are ſummoned. They have ſcarce any fortified towns and caſtles, but what are natural; and the country ſeems to be ſo inacceſſible, that the natives boaſt it has never been conquered by any foreign power; but this muſt be a miſtake, for the preſent generation, who are maſters of the north part of the iſland and the ſea coaſt, are not the original inhabitants, but came from Egypt and Arabia, and having driven the Pagans up into the mountains, ſucceeded them on the ſea-coaſts.

The religion of Mahomet is profeſſed at Achen, and upon all the coaſts of Sumatra; but they are not ſuch bigotted zealots as they are in ſome other Mahometan countries. Their temples or moſques are but meanly built, ſome of them no better than cottages. The chief prieſt reſides at Achen, and has a great influence on affairs of ſtate. Their marriage contracts are made before their prieſts, who are judges in caſes of divorce, as well as in civil cauſes. Their prieſts alſo aſſiſt at their celebration of their funeral rites, as in other Mahometan ſtates.

This, as well as the reſt of the Indian iſlands, was, no doubt, firſt peopled from the neighbouring continent. The Phœnicians, Egyptians, and Arabians afterwards trafficked with them; and we find Solomon deſiring Hiram, king of Tyre, to ſend him ſkilful mariners to pilot his fleet into theſe ſeas; and the Ophir mentioned in ſcripture, is ſuppoſed to be this very iſland, from whence he fetched his gold. The Arabians and other nations bordering on the red-ſea, afterwards planted colonies here, and became ſo potent, that they drove the former inhabitants up into the mountains, and poſſeſſed the coaſt. The Portugueſe found the deſcendants of thoſe nations fixed on the ſhores of the Indian continent as well as the iſlands when they arrived there.

The Portugueſe enjoyed the ſole traffic with this and the adjacent iſlands for near one hundred years, viz. from the year 1500 almoſt to the year of our Lord 1600, when other nations followed them round the Cape of Good Hope, and put in for a ſhare of the Indian trade.

Some writers aſſure us, that this kingdom has been ever governed by queens; others affirm that there never was a queen regent here; we may, however, take the middle way, and allow that it has been ſubject both to kings and queens: certain it is, a king was upon the throne when we firſt viſited this iſland, becauſe we have his letter which he wrote to queen Elizabeth, and kings have of late years filled that throne.

The inhabitants of the mountains are governed by the chiefs of their reſpective tribes, who are under a neceſſity of maintaining a good correſpondence among themſelves, in order to defend their country againſt their powerful neighbours; for as they are poſſeſſed of all the gold the iſland produces, there is no doubt but the Mahometan princes that lie round them, would make an effort to ſubdue thoſe golden mountains, if their princes were at variance: or if they did not, the Dutch would find a way to their gold, if they ſhould find their chiefs divided; for the Dutch are poſſeſſed of ſeveral ſtrong places and countries in the iſland, which would be ſupported in ſuch an enterpriſe by fleets and forces from Batavia and Malacca, that lie but a very little diſtance from them.

The coins of the country are, firſt caſh, or pieces of lead, one thouſand five hundred of which make one mas, valued at fifteen pence, which is a gold coin. A pollum or copang is a quarter of a mas, ſixteen mas is one tael, which is an imaginary coin, and equivalent to twenty ſhillings ſterling; dollars and other Spaniſh coins alſo are current here.

With reſpect to their weights, five taels make a buncal, twenty buncals one catty, and one hundred catty one pecul, being one hundred and thirty-two pounds Engliſh; three peculs are a China bahar of three hundred and ninety-ſix pounds China weight; and of Malay weight, at Achen four hundred and twenty-two pounds fifteen ounces, and at Bencoolen, and the reſt of the weſtern coaſt, a bahar is five hundred pounds great weight, or five hundred and ſixty pounds Engliſh. They make their payments at Achen oftener in gold pieces than in coin.

Several other iſlands belong to that of Sumatra, among which is one called by the inhabitants Pulo Lanchakay, and, by the natives of Achen, Pulo Lada, or the iſland of Pepper. This is a large iſland, ſituated in ſix degrees fifteen minutes north latitude. In the centre of it are two high mountains ſeparated from each other by a very narrow valley; and at the foot of theſe mountains is a plain at leaſt twelve miles in length. Pepper is produced in it: but the iſland is very thinly inhabited. The ſoil of the plain is well calculated for all kinds of drugs, fruit, rice, and cattle; and, as it has ſeveral good ſprings and rivers, it might produce excellent paſturage; but the inhabitants only attend to the cultivation of pepper, that being the article which turns out moſt to their advantage. The other parts of the iſland are covered with thick woods, in which are ſome remarkable ſtrait and lofty trees. The winds are weſterly from the beginning of July to the end of October, during which time they have very heavy rains; and the climate, as in other parts of the ſame latitude, is very unwholſome. The iſland at preſent produces five hundred thouſand pounds weight of pepper annually, which is ſaid to be preferable to that of any other place in the Indies. The inhabitants are Malayans, but are naturally better diſpoſed than thoſe of Achen; their habits are much the ſame in make, but not ſo elegant: they are very zealous Mahometans, and in their cuſtoms and ways of living differ little from the inhabitants of Achen.

The iſland of Lingen is ſituated about ſixty miles north-eaſt of Jamby, and about the ſame diſtance to the ſouth-eaſt of Johore. It is fifty miles in length, and ten in breadth: the interior part of it is very mountainous, but that next the ſea lies low, and is very fertile. It produces pepper and canes, and in ſome parts of it are great numbers of porcupines.

The iſland of Banca is very large, being at leaſt one hundred and fifty miles in length, and about twenty in breadth. The natives, like moſt of the Malayans, are treacherous, and very unhoſpitable to ſuch ſtrangers as unfortunately happen to be ſhipwrecked on the coaſt.

At the mouth of the ſtraights of Banca is Lucipara, a ſmall iſland but ſo barren, that it has but few inhabitants, and only produces a ſmall quantity of pepper. There are ſeveral other ſmall iſlands belonging to Sumatra, moſt of which are either uninhabited, or ſo inſignificant as not to merit a particular deſcription.

Java, one of the Sunda iſlands, is ſituate in the Indian ocean, between one hundred and two and one hundred and thirteen degrees of eaſtern longitude, and between five and eight degrees of ſouth latitude, being ſeven hundred miles long, and upwards of one hundred broad; having the iſland of Borneo on the north, the ſtraights of Bally on the eaſt, the Indian ocean on the ſouth, and the ſtraights of Sunda (from whence it is called one of the Sunda iſlands) on the north-weſt.

The air of Java, near the ſea, is generally unhealthful, unleſs where the bogs have been drained, and the lands cultivated; there it is much better, and in the middle of the iſland much more ſo. The worſt weather upon the north coaſt of Java is during the weſterly monſoon, which begins the firſt week in November, when they have ſome rain. In December the rains increaſe, and it blows freſh, and in January it blows ſtill harder, and the rains continue very heavy till the middle of February, when both the wind and rains become more moderate and decreaſe, till the end of March. Their fair ſeaſon commences in April, the winds are then variable, and it is ſometimes calm, only at the change of the moon there are ſudden guſts of wind from the weſt. In the beginning of May the eaſtern monſoon becomes conſtant, and in June and July there is a little rain; but in this monſoon they have generally clear, wholſome weather, until the end of September. In October the eaſterly wind blows faintly, and in November the weſterly monſoon ſets in again: when the weſterly wind and currents are ſtrongeſt here, namely, in December, January

and February, there is no failing againſt them. The eaſterly winds and currents are more moderate; ſhips may ſail againſt this monſoon, and a ſhip may come from the weſtward through the ſtraits of Sunda to Batavia almoſt at any time. There is good anchorage on the Java ſide, in twenty or thirty fathom water: near the coaſt of Java and Borneo, from April to November, they have land and ſea breezes from different points; the wind blows from the land between one and four in the morning, and continues till noon; at one or two in the afternoon it blows freſh from the ſea for five or ſix hours.

A chain of mountains runs through the middle of the iſland from eaſt to weſt, which are covered with fine woods. It is ſaid theſe mountains produce great quantities of gold, but the natives conceal it from the Europeans. The moſt diſtinguiſhed of theſe mountains is called the Blue Mountain.

The low lands are flooded in the time of the rains. Along the north coaſt of Java are fine groves of cocoa-nut trees, and wherever we ſee one of theſe groves, we do not fail to meet with a village of the natives.

The iſland was antiently divided into abundance of petty kingdoms and ſtates, and when admiral Drake viſited this iſland in his voyage round the globe, in the year 1579, he relates there were five kingdoms in it. We may now divide it into two parts, 1. The north coaſt, which is under the dominion of the Dutch; and, 2. The ſouth coaſt, ſubject to the kings of Palamboan and Mataram. Bantam was, till lately, the moſt conſiderable kingdom of Java, but this king is now a vaſſal to the Dutch. We ſhall here give ſome account of the city.

Bantam, once the metropolis of a great kingdom (till the Dutch deſtroyed it, and depoſed the king,) is ſeated in a plain at the foot of a mountain, out of which iſſues three rivers, or rather one river dividing itſelf into three branches, two whereof ſurround the town, and the other runs through the middle of it. The circumference of this city, when in its glory, was not leſs than twelve miles, and very populous. It lay open towards the land; but had a very good wall to the ſea, fortified with baſtions, and defended by a numerous artillery; and the palace, or rather caſtle, where the king reſided, was no mean fortification; beſides which there were ſeveral public buildings and palaces of the great men, which made no ordinary figure in this country. It was alſo one of the greateſt ports in the eaſtern ſeas, to which all nations reſorted, but is now become a wretched poor place, and has neither trade or any thing to render it deſirable. The principal inhabitants are removed, and the buildings ruined, their king deprived of his ſovereignty, and become a vaſſal to the Dutch.

Batavia, by the Indians named Jacatra, and by the natives and Chineſe Calacka, or Calappa, as they call the fruit of the cocoa-trees, (which are very common here, and ſaid to be ſuperior to any in the Indies) lies in ſix degrees ſouth latitude, longitude from London one hundred and ſix, and ſtands about forty miles to the eaſtward of Bantam, it is ſituated at the bottom of a fine bay, in which there are ſeventeen or eighteen ſmall iſlands, which break the violence of the winds and waves; inſomuch that a thouſand ſail may ride here very ſecurely. Two large piers run out half a mile into the ſea, between which an hundred ſlaves are conſtantly employed, in taking up the mud and ſoil which is waſhed out of the town, or the mouth of the river would be ſoon choaked up.

The city of Batavia ſtands in a flat country, and is almoſt ſquare, and about the bigneſs of Briſtol, regularly built like the towns in Holland, but with white ſtone. Their ſtreets are wide and ſtrait, and in twelve or fifteen of the principal are canals, faced with ſtone, and planted with ever-greens: the ſides of the ſtreets alſo are paved, and over their canals are reckoned no leſs than fifty-ſix ſtone bridges: after which deſcription there cannot be much occaſion to tell the reader that the place is extremely pleaſant, and that travellers are ſurprized with its beauty. It is ſurrounded with a good wall, and two and twenty baſtions well furniſhed with cannon, and ſo contrived as to be of equal ſervice againſt an inſurrection in the city, as againſt a foreign enemy; the guns being eaſily brought to point down the principal ſtreets.

The houſes are plain, but very neat, and behind them are large gardens well ſtocked with herbs and vegetables, and moſt kinds of fruit. They have ſeveral handſome public buildings, ſuch as the great church: the ſtadt-houſe, the hoſpitals, the ſpin-houſe or houſe of correction, the peſt-houſe, Chineſe hoſpital, the houſe of artiſans, &c. And there are two churches built for the reformed Portugueſe, and another for the Malays; but they do not allow either the Papiſts or Lutherans the public exerciſe of their religion.

The fort ſtands upon the weſt ſide of the city, and commands both the town and road: it is very large, and has four royal baſtions faced with ſtone, but has no moat except the canals, which lie at ſome diſtance from the rampart, may have been miſtaken for moats: they are about twenty-five feet broad, and fordable in moſt places; the inſide of the fort is crowded with buildings, there being the general's houſe, as well as the houſes of moſt of the principal officers, and companies ſervants: in the middle of the city there is a large ſquare, which ſerves as a parade for the garriſon, on the weſt ſide of which ſtands the great church, on the ſouth the ſtadt-houſe, on the north a fine range of buildings, and on the eaſt is one of their great canals: there are alſo ſeveral ſpacious market-places in the city. The ſuburbs reach almoſt half a league into the country, and form a town larger than the former but not ſo compact: being intermixed with kitchen gardens and orchards. Here the Chineſe chiefly live, and here they have their temples and burying places, and the free exerciſe of their religion, which is denied the Lutheran Proteſtants. In this part of the town alſo live the Malays, and native Javans, and other nations which the Dutch have tranſplanted from Banda, Amboyna, &c. There are ſmall forts erected every way, at two or three leagues diſtance from the town, to defend the avenues; the Dutch being conſcious that the king of Mataran and the natives would lay hold of any opportunity of repoſſeſſing themſelves of their country, and driving the Hollanders from their coaſts, however they may ſeem to acquieſce and tacitly conſent, according to the modern phraſe, to be inſulted and tyrannized over by the Dutch, there is not a nation in India but would gladly throw off the yoke, and declare in behalf of liberty, and for any prince who ſhould come to their relief.

The people who inhabit the city and ſuburbs of Batavia being formed of various nations, who all preſerve the dreſſes, modes, and cuſtoms of their reſpective countries, they conſequently exhibit a very ſtrange appearance; we ſhall therefore, for the information of our readers, give a particular deſcription of them.

The Chineſe do not only drive the greateſt retail trade here, but are many of them good mechanics; they alſo generally farm the fiſhery, exciſe and cuſtoms, and apply themſelves to huſbandry and gardening; to manure and cultivate the rice, cotton and ſugars which grow in the fields, about Batavia and other great towns; and exceeding the Dutch, it is ſaid, in their thriftineſs, as well as in cozening and over-reaching thoſe they deal with.

They dreſs in a veſt and gown of ſilk or callico, after the faſhion of their country, and wear their hair wound up in a roll, on the hinder part of the head, and faſtened with bodkins; for which every one pays a certain tribute to the Dutch.

The Dutch company, however, allow ſome privileges to the Chineſe; for they have not only a governor of their own nation, who manages their affairs, but are alſo allowed a repreſentative in the council. They bring tea and porcelane hither from China; but they who are employed for this purpoſe, muſt not continue on the iſland longer than ſix months. They have ſingular maxims in the interment of their dead; for they will never open the ſame grave where any one has been buried; their burial grounds, therefore, in the neighbourhood of Batavia cover a prodigious ſpace of ground, for which the Dutch make them pay large ſums. In order to preſerve the body they make the coffin of very thick wood, not with planks faſtened together, but cut out of a ſolid piece like a canoe; the coffin, being covered and put into the grave, is ſurrounded with a kind of mortar about eight inches thick, which in time becomes as hard as ſtone. A great number of weeping women, hired on purpoſe, attend the funeral, beſides the relations of the deceaſed. In Batavia, the law requires that every man ſhould be buried according to his rank; ſo that if the deceaſed has not left money ſufficient to pay his funeral expences, an officer takes an inventory of his goods, which are ſold, and out of the produce he buries him in the manner preſcribed.

The greateſt merchants here are the Dutch, who are alſo very good mechanics; they keep the chief inns and moſt places of public entertainment. They pay two reals a month for their licence, and ſeventy for every pipe they ſell of Spaniſh wine: but theſe inn keepers are far from being obliging to their gueſts, and particularly to foreigners.

Here are great numbers of Portugueſe; and in order to diſtinguiſh them from other Europeans, they are called by the natives Oran-ſerante, or Nazarene men. They in general ſpeak the Malayan language, but ſome of them a

A general View of LISBON, the capital City of Portugal.

Sparrow sculp

corrupt dialect of the Portugueſe; and they have all renounced their religion, by profeſſing the principles of Luther. They are chiefly employed in the moſt ſervile offices: ſome of them are handicraftſmen, others get their living by hunting, and the greateſt number by waſhing linen. They have ſo cloſely followed the cuſtoms and manners of the Indians, that they are only diſtinguiſhed from them by their features and complexion, their ſkin being conſiderably lighter, and their noſes not ſo flat; and the manners of adjuſting their hair conſtitutes the only difference in their dreſs.

Moſt of the inhabitants have very tawny complexions. The Malays wear a ſhort coat with ſtrait ſleeves, and a cloth about their loins, binding their temples with a piece of linen, in which they encloſe part of their hair, the reſt hanging down. The women wear a waiſtcoat and a cloth about their waiſt, which reaches half way down their legs, and ſerves inſtead of a petticoat; they wear nothing but their hair on their heads, and go bare-foot. The men get their living by fiſhing, and have ſome retail trade, though not comparable to the Chineſe. They profeſs the Mahometan religion; but are naturally very profligate, and will not ſcruple to commit crimes of the moſt infamous nature.

The Amboyneſe wear veſts, and wrap a piece of callico ſeveral times about their heads, the ends whereof hang down. Their women only wrap a piece of callico about their loins, throwing part of it over their breaſts and ſhoulders, their legs and arms bare; the men are moſt of them carpenters, and ſome of theſe, as well as of the other nations, the Dutch enliſt in their troops, being eſteemed brave bold fellows, but given to mutiny; as the Dutch relate, by which they probably mean, they are not yet reconciled to ſlavery. Their houſes are made of wood, and covered with branches of trees; they are pretty lofty, and the floors are divided into ſeparate apartments, ſo that one houſe will contain ſeveral families.

The native Javaneſe wear a kind of ſcull cap, but their bodies are naked to the middle, wrapping a piece of ſilk or callico about their loins, which reaches below the middle of their legs, which are bare. The women cover their bodies with a piece of ſilk or callico, and have another piece wrapped about their loins, and dreſs in their hair. The men are employed in huſbandry and fiſhing, or in building country boats.

There is a mixed breed, called Topaſſes or Mandikers, conſiſting of ſeveral nations, incorporated with the Dutch, and have greater privileges than the reſt. Many of theſe are merchants, and differ but little in their habits, or way of life from the Dutch; only the men wear large breeches or trowſers, which reach down to their ancles. The women tie up their hair in a roll on their heads, wear a waiſtcoat, and a petticoat of ſilk or callico, which reaches down to their feet. Theſe live both in city and ſuburbs, their houſes are ſeveral ſtories high, built of brick or ſtone, and very neatly furniſhed within.

The Macaſſars, whoſe anceſtors poſſeſſed the iſland of Celebes, and were enſlaved by the Dutch, though they went almoſt naked in their mother-country, wear clothing here.

Several of the Timoreans, inhabitants of an iſland of Eaſt China, having been brought hither by the Dutch, now conſtitute part of the people of Batavia. The habits and cuſtoms of theſe and of the Macaſſars, are nearly the ſame: their chief employment is huſbandry and gardening. As many of them profeſs Chriſtianity, and are conformable to the Dutch in their religion and cuſtoms, it is to be preſumed they clothe themſelves as the Hollanders do.

Some of the negroes here are pedlars, and hawk about the ſtreets glaſs-beads and coral; others follow mechanical trades; but the moſt conſiderable of them deal in free-ſtone, which they bring from the neighbouring iſlands. Theſe people are chiefly Mahometans. All the inhabitants enjoy liberty of conſcience; but they are not allowed to exerciſe their different modes of worſhip. Prieſts and monks are permitted to live here, but they are prohibited from being publicly ſeen in the reſpective habits of their prieſtly orders.

As the women of Java are remarkable for their amorous diſpoſition and conſtancy to the man they eſpouſe, and expect that the man ſhould be equally conſtant, if her lover goes aſtray, ſhe makes no ſcruple to prepare a doſe for him. An old traveller, who ſeems much enamoured with the Javaneſe ladies, gives this deſcription of them; he obſerves that they are much fairer than the men, have good features, little ſwelling breaſts, a ſoft air, ſprightly eyes, a moſt agreeable laugh, and a bewitching mien, eſpecially in dancing: that they expreſs the greateſt ſubmiſſion to their huſband, proſtrating themſelves before him when he enters the houſe. Polygamy prevails here; the Javaneſe have ſeveral wives beſides female ſlaves, of whom they make concubines when they ſee fit.

There being a ſcarcity of European women, the Dutch are allowed to marry a native, provided ſhe will profeſs Chriſtianity, which ſhe is ſeldom averſe to, as it gratifies her pride; a Chriſtian and the wife of a Dutchman taking place of a native Javaneſe, and being allowed a great many privileges, which the natives cannot enjoy; and her huſband is obliged to confine himſelf to her bed; and bring no rivals into the family.

Rice is the principal grain that grows here. They have alſo plantations of ſugar, tobacco and coffee: their kitchen gardens are well repleniſhed with cabbages, purſlain, lettuce, parſley, fennel, melons, pompions, potatoes, cucumbers, and radiſhes. Here are alſo all manner of Indian fruits, ſuch as plantains, bananas, cocoas, ananas, mangoes, mangoſteens, durions, oranges of ſeveral ſorts; limes, lemons, the betel and arek nut; gums of ſeveral kinds, particularly benjamin: in March they plant rice, and their harveſt is in July. In October they have the greateſt plenty of fruit, but they have ſome all the year.

They have good timber, cotton, and other trees proper to the climate, beſides oak, cedar, and ſeveral kinds of red wood. The cocoa tree is very common, which is of univerſal uſe, affording them meat, drink, oil and vinegar; and of the fibres of the bark they make them cordage; the branches cover their houſes, and they write on the leaves with a ſteel ſtile, and with the tree, and the great bamboo cane, they build their houſes, boats and other veſſels.

Here are buffaloes and ſome oxen, and a ſmall breed of horſes. The few ſheep we find here have hair, rather than wool, and their fleſh is dry. Their hogs, wild and tame, are the beſt meat we find there, or in any other countries between the tropics; and their veniſon is good: here are alſo tygers and other wild beaſts, crocodiles, porcupines, ſerpents, ſcorpions, locuſts, and a multitude of inſects. Monkies of various kinds are found here, alſo flying ſquirrels; and a remarkable animal called jackoa; it is almoſt like a lizard, is very malicious, and darts its urine at every thing which offends it: the urine is of ſuch a quality, that it will canker the fleſh, and if the part is not immediately cut out, the object on which it falls muſt immediately periſh. Few accidents, however, happen from this creature, as it always gives notice of its ſituation from the ſingularity of its voice, ſo that the natives, as well as animals, have an opportunity of eſcaping it.

The food, ſalutations and diverſions of the Indians in this iſland, are the ſame as in Borneo and Sumatra, and therefore need not be repeated here. The Dutch travel in coaches, and on horſeback, and ſometimes in pelanquins, or covered couches, carried on men's ſhoulders, as the Indians do, with a grand retinue.

None of the nations of Europe are ſuffered to trade to Java, but from China fourteen or fifteen junks of two hundred or three hundred ton, uſed to come every year in November or December, and return home in June; which furniſhed the Dutch with the merchandize of China upon eaſier terms than they could purchaſe it in that country: and this is the reaſon the Dutch ſo ſeldom viſit that kingdom, and permit other nations to trade thither, which they could prevent if they pleaſed, by ſhutting up the ſtraights of Sunda and Malacca, which the ſquadrons of men of war they always keep in India, enable them to do. Beſides the goods imported to Batavia by the Chineſe, the Dutch themſelves import the produce of Japan, the Spice iſlands, Perſia, Surat, Bengal, the coaſt of Coromandel and Malabar, and all the merchandize of Europe and Africa. Never were ſuch magazines of goods laid up in any city, as are to be found in Batavia, except in Amſterdam itſelf; and as they barter the goods of one country for another, the Indian trade is ſo far from diminiſhing their treaſure, that it brings them in more gold and ſilver than any other traffic.

The Dutch governor of Batavia alſo takes great ſtate upon him, and has in reality the power of a ſovereign prince. A troop of horſe-guards precede his coach when he goes out, halberdiers ſurround the coach, and a company of foot-guards march after it, cloathed in yellow ſattin, enriched with ſilver lace and fringe; and the governor's lady has her guards, and is attended in all reſpects, both within and in public, with a dignity equal to that of a queen.

Next to the governor, the moſt conſiderable officer here is the director-general, whoſe buſineſs is to purchaſe ſuch commodities as are brought to the port, and to diſpoſe of

ſuch as are taken from it. He is ſole maſter of all the magazines, and has the ſupreme direction of every thing that relates to the commercial intereſt of the company.

Batavia being a place of the greateſt trade in India, the cuſtoms muſt be very conſiderable; more eſpecially as the inhabitants are in general wealthy, and almoſt every article is ſubject to a duty. The taxes are paid monthly; and to ſave the charge and trouble of gathering them, on the day they become due a flag is diſplayed on the top of a houſe in the center of the town, and all parties are obliged immediately to pay their money to the proper officers appointed to receive the ſame. The money current here conſiſts of ſeveral ſorts; as ducats, which are valued at one hundred and thirty-two ſtivers; ducatoons, at eighty ſtivers; imperial rix-dollars, at ſixty; rupees of Batavia at thirty; ſchellings, at ſix; double cheys, at two ſtivers and an half; and doits, at one-fourth of a ſtiver. Some of theſe coins are of two ſorts, though of the ſame denomination, namely, milled and unmilled, the former of which is of moſt value; a milled ducatoon is worth eighty ſtivers, but an unmilled one is not worth more than ſeventy two. All accounts are kept in rix-dollars and ſtivers which are here merely nominal coins, like our pounds ſterling.

The Dutch, beſides their land forces, which are very numerous, have men of war ſufficient to engage any fleets they are likely to meet with on the Indian ſeas: and from their great ſtrength and importance in this part of the globe, they aſſume the title of "Sovereigns of all the ſeas, from the Cape of Good Hope eaſtward, to Cape Horn in America."

Cherebon is ſituate about eighty miles eaſt of Batavia: it is a place of conſiderable extent, and where the Dutch have a factory. The country is very fertile, and produces moſt kinds of proviſions, particularly rice. The inhabitants are under the dominion of four great lords, called ſultans, one of whom is particularly attached to the Dutch, and for that reaſon is diſtinguiſhed from the reſt by the name of the company's ſultan. The reſt, indeed, may not be undeſerving of the like epithet, as they are in alliance with the Dutch, whoſe friendſhip they endeavour to preſerve, and whom they conſider as their ſole protectors; for had it not been for them, theſe petty princes would have been reduced to the ſubjection of the king of Bantam, who made inroads on their diſtrict, but was repulſed by the interpoſition of the Dutch. Since this circumſtance, the ſultans have teſtified their gratitude by granting many diſtinguiſhed privileges to their protectors in theſe dominions.

The chief perſon belonging to the Dutch factory here is called the reſident, who correſponds with the governor general of Batavia, but is ſolely independent of any other officer. Here is a good fort, where the Dutch have a garriſon conſiſting of eighty men; about a mile and a half from which is a large temple containing the tombs of ſeveral of the princes of Cherebon. It is a lofty building of variegated ſtones, and very elegantly ornamented within. The generality of their prieſts reſide near this temple, the whole order of whom are treated with the moſt diſtinguiſhed reſpect by the inhabitants.

We ſhall proceed to the deſcription of Palamboan and Mataram, the latter of which is ſubject to the Dutch.

Palamboan, the capital of the kingdom of that name, is ſituate in one hundred and fourteen degrees of eaſtern longitude, and in ſeven degrees thirty minutes ſouth latitude, on the ſtraights of Bally, through which the Eaſt-India ſhips ſometimes paſs, when they are homeward bound from Borneo; ſuch ſhips touch at the town of Palamboan for freſh water and proviſions; but the ſurf often beats with ſuch violence on the ſhore, that makes it difficult watering there.

This kingdom, which is independent of the Dutch, lies at the ſouth-eaſt end of Java, in a pleaſant country watered with ſeveral rivulets, which fall on each ſide of the town into the neighbouring ſtraights. The rajah, or king of this country, generally reſides either at Palamboan, or at a fort fifteen miles from the ſea. His dominion reaches from the eaſt end of Java, eighty miles along the ſouth coaſt, and about ſixty miles from north to ſouth; but its extent up the country is not known. This kingdom is ſaid to produce gold, pepper and cotton, alſo rice, Indian corn, roots, and garden ſtuff. Their animals are, horſes, buffaloes, oxen, deer, and goats, and they have great plenty of ducks, geeſe, and other ſorts of poultry. The ſovereign and his ſubjects are Pagans, but there are ſome Mahometans among them, and a few Chineſe.

Mataram, when in its moſt flouriſhing ſtate, extended its dominion over the whole iſland, and even now takes up a conſiderable part of it: this kingdom was the laſt in the iſland which the Dutch reduced under their government; having continued its ſtruggles for independency till the year 1704, when the Dutch took the advantage of an opportunity that offered in a diſpute relative to the ſucceſſion of the crown, between the ſon and brother of the deceaſed ſovereign. Theſe two rivals produced an univerſal diviſion in the nation. He who was intitled to the crown by order of ſucceſſion had ſo much the advantage over his antagoniſt, that had it not been for the Dutch, who declared in favour of his rival, he would certainly have poſſeſſed himſelf of the ſupreme power. After a ſeries of conteſts, the party eſpouſed by the Dutch at length prevailed: the young prince was deprived of his ſucceſſion, and his uncle, who was unworthy of the character, aſſumed the ſovereignty.

The company, after the death of this prince, placed the legal heir on the throne, and dictated ſuch laws to him as they thought beſt calculated to anſwer their ſiniſter purpoſes. They choſe the place where his court was to be fixed, and ſecured his attachment by erecting a caſtle, in which a guard was kept with no other apparent view than to protect the prince. They employed every artifice to lull his attention by pleaſures, made him valuable preſents, and ſoothed him by pompous embaſſies. From this time the prince and his ſucceſſors have become mere tools of the company. The neceſſary protection allowed them by the company conſiſts of three hundred horſe and four hundred foot; but the expences the company are at on this account are amply repaid by the advantages that accrue to them.

The harbours afford docks for building all the ſmall veſſels employed in the ſervice; and they are ſupplied from hence with the chief part of the timber that is uſed in their reſpective ſettlements. Beſides theſe advantages, they are furniſhed with various productions of the country at ſtipulated prices, which are ſo low as to be extremely profitable to them.

This country is in general very fertile, and produces great quantities of rice, as alſo plenty of fruit. There are alſo various ſorts of animals, particularly horſes, ſheep, goats, and remarkable large oxen. The rivers abound with fiſh, and the woods produce great plenty of game: but the moſt valuable articles in this kingdom are, rice, pepper, cadiang, cotton, yarn, cardamum and indigo; the latter of which is eſteemed to be as good in quality as any found in this part of the world.

The reſidence of the king is uſually at Mataram, the capital of the kingdom. His palace is a very handſome ſpacious building adjoining to which are many good houſes belonging to his nobles, who continually wait on him, and the greateſt homage is paid him by his ſubjects in general; for though theſe princes are vaſſals, yet they are permitted to live in as great ſtate as when they were independent monarchs; and the orders of the Dutch are always executed in their names. They therefore aſſume a dignity not inferior to that of the moſt deſpotic prince, and, when they go abroad, a very diſtinguiſhed mark of loyalty is beſtowed on them.

Japara is the laſt place of importance that remains to be mentioned in this iſland: it is ſituated at the bottom of an eminence called the Invincible Mountain, on the top of which is a fort built of wood. It is a very conſiderable town, and has a good road ſecured by two ſmall iſlands. The Engliſh had once a factory here, but they were driven from it by the Portugueſe, who at that time were maſters of the place. This country produces almoſt every neceſſary of life, eſpecially cattle, hogs, and poultry: they have alſo great plenty of rice, with various ſorts of the moſt delicious fruits; and their waters abound with the beſt of fiſh. But the moſt valuable commodities here are pepper, ginger, cinnamon, and indigo. In the woods and mountains are ſeveral kinds of wild beaſts, as buffaloes, ſtags, tygers, and rhinoceros's: the latter of theſe the natives hunt for the ſake of their horns, which are much admired, becauſe they will not contain poiſon; for they will immediately break to pieces if any ſuch compoſition is put into them.

With reſpect to the natives of this country, they very much reſemble thoſe of other Indian nations, and have the ſame kind of cuſtoms and ceremonies. They are fond of public diverſions, particularly the repreſentation of comedies, which principally conſiſt in ſinging and dancing; and they are ſuch ſlaves to cock-fighting, that by the large ſums they bet, they are frequently reduced to the moſt abject diſtreſs and poverty.

The Japarans are chiefly of the Mahometan religion, as is alſo the king, who generally reſides at a place called Kattafura, where the Dutch have a fort and garriſon,

whose Swords are made of Sandel Wood.

Pollard. sculp.

This prince reigns abſolute among his ſubjects, who are very faithful to him, and pay him the greateſt homage. Like moſt eaſtern monarchs, he is conſtantly attended by women, and takes as many wives and concubines as he thinks proper. When his courtiers obtain an audience, they approach him with the profoundeſt humility; and even his prieſts ſo revere him, that ſome of them go in pilgrimage to Mecca, to make vows, and pray for his proſperity, and that of his family and government.

The iſland of Bally, or the Leſſer Java, is only divided from the larger iſlands by the ſtraights of Bally; and eaſtward of this are the iſlands Lambock, Combava, Flores, Solor, Timor, and ſeveral more, upon which the Dutch have forts and ſettlements, and take the liberty of governing and even tranſplanting the natives whenever they pleaſe: from hence they frequently recruit their troops, and thus make one nation of Indians contribute to keep another in ſubjection.

Timor is the largeſt of theſe iſlands, being about two hundred miles in length, and fifty in breadth, and divided into ſeveral petty ſtates, which the Dutch oppoſe againſt one another, and by that means govern the whole. It has not any navigable rivers or harbours, but there are ſeveral commodious bays. The Portugueſe had formerly colonies here, whoſe deſcendants are now ſo intermixed with the original natives, that they are ſcarce to be diſtinguiſhed from them, eſpecially as they profeſs the ſame religion. The principal kingdoms in this iſland are Namquimal, Lortriby, Pobumby, and Amaby; each of which has an independant and abſolute ſovereign: theſe have ſeveral rajahs and other diſtinguiſhed officers under them: all of whom, with their ſubjects in general, pay them the greateſt homage. Each kingdom has a language peculiar to itſelf, but the manners and cuſtoms of the inhabitants differ but little. There are ſome Pagans and Mahometans ſtill remaining, and the Chineſe come hither to trade once a year: the inhabitants are ſo very ſwarthy, that they are ſometimes taken for blacks, and thoſe that are not under the government of the Portugueſe or the Dutch are repreſented as ſavages: they wear no cloathing but a little piece of cloth about their loins; and the better ſort wear a kind of coronet about their temples, adorned with little thin plates of gold or ſilver; the reſt have caps made with palmetto leaves. Their arms are ſwords, darts, and lances or ſpears, and with theſe they run down and kill their game. Their animals are the ſame as in the iſland of Java, as well as their foreſt and fruit trees. The Dutch do not ſeem to make any great profit of theſe iſlands; the principal deſign of their building forts here is to defend the avenues to the ſpice iſlands, which lie in their neighbourhood.

There is, on this laſt mentioned iſland, a Portugueſe ſettlement called Laphao: it is ſituated by the ſea ſide, about three leagues to the eaſt of the Dutch fort called Concordia. It is a very ſmall place, containing only a few mean houſes, and a church made of boards, covered with palmetto leaves. There is, indeed, a kind of platform here, on which are ſix iron guns; but the whole are ſo much decayed, as to be rendered almoſt uſeleſs. The people in general ſpeak the Portugueſe language; and the natives have been ſo intermixed with the Portugueſe by marriages, that it is difficult to know one from the other. Moſt of them profeſs the Roman catholic religion; but in the other parts of the iſland they are either Mahometans or Pagans. The chief trade is carried on at Porta Nova, ſituated at the eaſt end of the iſland, and where the Portugueſe governor uſually reſides. Some years ago a pirate attacked, plundered, and then deſtroyed ſeveral of the buildings in this town, with that of Concordia belonging to the Dutch.

Mandura is an iſland oppoſite the eaſternmoſt point of Java, the moſt valuable produce of which, for foreign markets, are Deer-ſkins. Its principal town is Arabia, ſituated near a deep bay about eight leagues from the weſternmoſt land of Java. The ſoil of this iſland is very fertile, and produces ſeveral ſorts of grain, particularly rice; alſo ſeveral kinds of the moſt delicious fruits. The chief animals are, buffaloes, horſes, ſheep, and oxen, the latter of which are remarkably large, and the fleſh little inferior to thoſe of Europe. Their buildings, maxims, cuſtoms, &c. reſemble thoſe of other Indian nations: ſome of them are Mahometans, and others Pagans. The men are in general very robuſt and courageous, for which reaſon, when there is any deficiency in the fixed number of the Dutch troops, they recruit from them their forces at Batavia and other ſettlements.

SECT. X.

Treating of the ſeveral Iſlands of NICOBAR, ANDOMAN, and CEYLON.

THE Nicobar iſlands are ſituate in the Indian ſea, between ninety-two and ninety-four degrees of eaſtern longitude, and between ſeven and ten degrees of north latitude, near the entrance of the bay of Bengal, a little north of the iſland of Sumatra. Theſe iſlands form three cluſters: the middle, called Sombrero, are well inhabited, except one: the northern cluſter called Carnicubars, are not ſo populous. The ſouthern cluſter of the Nicobars, are very mountainous, and the people much more ſavage than thoſe of the middle and northern cluſters. The prieſts of Sombrero, are dreſt much in the ſame manner as we paint the devil, by which they keep the inhabitants in awe. The largeſt of theſe iſlands, which lies moſt to the ſouth, is forty miles long, and fifteen broad; the ſouth end is mountainous, and there are ſome ſteep rocks near the ſea; the reſt of the iſland is covered with woods, but not high land. It is a rich ſoil, that would produce almoſt any grain, if it was cultivated. The groves of cocoa-nut trees that ſtand in the flat country near the ſea, are exceeding pleaſant; but I do not find there are any towns, only as we ſail by, we ſee cluſters of five or ſix little houſes in every creek and bay, which are built on bamboo pillars, eight or nine feet above the ſurface of the ground, the roof neatly arched with bended cane, and covered with palm branches.

Theſe iſlanders are moderately tall, their complexion a deep olive, and have long black hair, and black eyes; their women might be eſteemed handſome, if it was not the cuſtom to pull the hair off their eyebrows by the roots.

The men wear no cloaths, but a little linen cloth about their loins; that of the women is deeper, reaching below their knees. The country is ſtill over-run with wood; they neglect to clear it, and cultivate the ground, but live chiefly on fiſh and ſuch fruits as the country produces ſpontaneouſly; they have little trade or commerce with any other people; but as ſhips ſail by in their way to and from the ſtraits of Malacca, they bring off hogs, poultry, and ſuch fruits as the country affords, taking tobacco, linen, and other neceſſaries in return.

The Andoman iſlands lie in the bay of Bengal, north of the Nicobar iſlands, in ninety-two degrees of eaſtern longitude, and between ten and fifteen degrees of north latitude. Theſe iſlands do not ſeem to differ much from thoſe of Nicobar, except in producing rice, which is cultivated here and eaten by the natives as well as fiſh and fruit. The inhabitants are a harmleſs, inoffenſive people, living chiefly on rice, fruit, and herbs.

Here are alſo the cocoa iſlands, ſituated thirty-five leagues weſt-ſouth-weſt of cape Negrais: they produce great abundance of cocoa-trees, but are uninhabited.

The iſland of Ceylon is ſituated between five degrees thirty minutes and ten degrees ſixteen minutes north latitude, and between ſeventy-nine degrees forty minutes and eighty-two degrees forty-five minutes eaſt, at the diſtance of about one hundred and ninety miles from cape Comorin. Ptolemy deſcribed this iſland under the name of Taprobane. It is about nine hundred miles in circumference, being about three hundred in length, and about one hundred and forty in breadth.

It is for the moſt part a mountainous country, covered with wood; but there are ſeveral fruitful plains and vallies, well watered by rivulets. The moſt remarkable mountain, which ſtands on the ſouth-ſide of Conduda, the name of the northern diviſion, is by the natives called Hamalel, and by the Europeans, Adam's Peak, being of a pyramidal form, only on the top is a little rocky plain, with a print of a man's foot on it, near two feet long, to which the natives come in pilgrimage once a year to worſhip the impreſſion, having a tradition, according to ſome, that their god Buddow aſcended to heaven from hence, leaving this print of his foot, which the Portugueſe, when they poſſeſſed this iſland, called Adam's Foot, and the mountain Pico de Adam; others affirm, that it received its name from a tradition of the natives, that Adam was created and buried here. In this mountain riſe the principal rivers, which run into the ſea in different directions. The largeſt of theſe is the Mavillagonga, which runs north-eaſt of the cities of Candy and Alatneur, diſcharging itſelf into the ocean at Trincomale. Theſe rivers run with ſuch rapidity, and are ſo full of rocks, that none of them are navigable: the rains, which happen when the ſun is vertical,

 increaſe

increaſe their waters, and create abundance of torrents, which are not viſible in the dry ſeaſon. The air is for the moſt part healthful, except near the ſea, and the north part of the iſland, where they have no ſprings, or rivers; and if the rain fails them, they are ſure to be afflicted with famine or ſickneſs. The chief towns are theſe,

1. Candy, the capital of the iſland, and ſituate in the middle of it, in ſeventy-nine degrees of eaſt longitude, and eight degrees of north latitude: it is an open town, with fortifications, and yet almoſt inacceſſible, being ſurrounded by rocks and thick woods that are impaſſable, except through ſome lanes, which are fenced with gates of ſtrong thorns; and yet it appears that the Portugueſe made themſelves maſters of Candy, and almoſt demoliſhed it, obliging the king to retire to Digligyneur, five miles ſouth-eaſt of Candy.

2. Columbo, the capital of the Dutch ſettlements, is a great port-town in the ſouth-weſt part of the iſland, in ſeventy-eight degrees eaſt longitude, and ſeven degrees north latitude. It has a good harbour, defended by a caſtle, and ſeveral batteries of guns. In this caſtle reſide the governor, merchants, officers, and ſoldiers belonging to the Eaſt India company; and four thouſand ſlaves have their huts between the caſtle and the ſea. The Dutch have two hoſpitals here: one for the ſick and wounded, and another for the orphans: as the boys grow up, they are entered into the ſea and land-ſervice; and the girls are married at twelve or thirteen years of age; and they have a Malabarian ſchool for teaching the Indian language.

3. Negumbo, which is alſo a port town, lies about twenty-five miles north of Columbo.

4. Chillao, one of the harbours of the coaſt, is ſituate twenty miles north of Negumbo.

5. Jaffnapatan, the capital of the province of Jaffnapatan, the northern diviſion of this iſland, is regularly fortified; for though there is no cinnamon in this part of the iſland, the Dutch have fortified it all round, to prevent any other nation ſending colonies thither.

6. Trincomale is ſituate on the eaſt ſide of the iſland, about eighty miles ſouth of Punta Pedra, the moſt northerly promontory of the iſland.

7. Battadalao is another fortreſs, fifty miles ſouth of the former.

Beſides theſe towns, there are the ſeven little iſlands of Ourature, Xho, Deſerba, Analativa, Caradiva, Pongardiva, and Nainandiva.

The country villages of the natives are very irregular, not laid out into ſtreets, but every man incloſes a ſpot of ground with a bank or pale ſuitable to his circumſtances, and there are frequently twenty or thirty of theſe incloſures pretty near together. The buildings are mean, the houſes of the generality of the people low thatched cottages, conſiſting of one or two ground rooms, the ſides are ſplintered with ratans or cane, which they do not always cover with clay, and if they do, it ſeems, they are not permitted to white-waſh them, this being a royal privilege. The better ſort of people have a ſquare in the middle of their houſes, and as many rooms on the ſides of it as the number of the family requires, with banks of earth raiſed a yard high above this ſquare court, on which they ſit croſs-legged, and eat or converſe with their friends. They have no chimnies, but their meat is dreſſed in their yards or a corner of the room. Their furniture conſiſts only of a mat, a ſtool or two to ſit on, a few china plates, and ſome earthen and brazen veſſels, for their water, and to dreſs their meat in, except one bedſtead which is allowed the maſter of the houſe to ſit or ſleep on, and this is corded, if we may uſe the expreſſion, with rattans or ſmall canes, and has a mat or two and a ſtraw pillow upon it, but no teſter and curtains. The women and children lye on mats by the fire ſide, covering themſelves only with the cloth they wear in the day time, but they will have a fire burning all night at their feet; the pooreſt people never want fuel, wood being ſo plentiful that nobody thinks it worth while to claim any property in it. Their pagodas or temples, which are of any antiquity, are built of hewn ſtone, with numbers of images both on the inſide and out, but no windows in them, and in all other reſpects like thoſe on the neighbouring continent of India: but their temples of a modern date are little low buildings with clay walls, almoſt in the form of a dove-houſe, and beſides their public temples, they have little chapels in their yards, ſometimes not more than two feet ſquare, which they ſet upon a pillar four feet high, and having placed the image in it they reverence moſt, they light candles and lamps before it, and every morning ſtrew flowers about the image, and peform their devotions.

The original inhabitants, of whom the body of the people at preſent conſiſts, are called Chingulays or Cinglaſſes: beſides whom there are a great many Moors, Malabars, Portugueſe, and Dutch in the iſland.

The natives are eſteemed men of good parts and a pretty addreſs, grave, and of an eaſy temper, eat and ſleep moderately, but lazy and indolent, which is the caſe in moſt hot countries. They are not given to thieving, it is ſaid, though addicted to lying, which, to me, ſeems a paradox; for a man that will lye and deceive, would not make much ſcruple to cheat. They are far from being jealous, or reſtraining their women from taking innocent freedoms.

The men are of a moderate ſtature, and well proportioned, wear long beards, and have good features; they have long black hair and black eyes, dark complexions, but not black as the natives upon the neighbouring continent of India are. They ſit on mats and carpets on the floor, but have a ſtool or two for ſtrangers of diſtinction; the vulgar are prohibited to ſit on ſtools.

Young men of figure wear their hair long and combed back; but in a more advanced age, caps in the form of a mitre are worn. Their dreſs is a waiſtcoat of calico, and a piece of the ſame wrapped about their waiſts, in which they put their knife and trinkets, and have a hanger by their ſide, in a ſilver ſcabbard; beſides which they walk with a cane or tuck, and a boy carries a box with their betel and arek nut after them. The betel is a leaf of the ſhape of a laurel leaf, and the arek nut about the bigneſs of a nutmeg, which they cut into thin ſlices, with an inſtrument made on purpoſe for it, and this with a paſte made of lime they chew together almoſt all day long, as moſt other Indians do; this mixture ſeems to be a kind of opiate, and renders them perfectly eaſy while they uſe it.

They have a perſon to carry a covered ſilver pot, or one made of ſome other metal, to ſpit in, for this compoſition has a nauſeous ſmell, and it would be the greateſt affront imaginable to ſpit on the carpets or floors in a friend's houſe; and thoſe that chew it ſpit perpetually. It makes their lips very red, of which they are proud; and this may be one reaſon of their taking it; but there is nothing in the taſte that ſhould invite one to uſe it, though it be univerſally chewed by all degrees of people, and is the firſt thing offered a ſtranger when he makes a viſit.

The women wear their hair long without any covering, and make it ſhine with cocoa-nut oil, as they do on the neighbouring continent; though this oil has a very ſtrong ſmell, perhaps the natives eſteem it a perfume, for cuſtom will bring people to like almoſt any thing. The women are dreſſed in a calico waiſtcoat, which diſcovers their ſhape, and they wrap a piece of calico about them, which falls below their knees, and does the ſervice of a petticoat; theſe are longer or ſhorter, according to the quality of the perſon that wears it; they bore holes in their ears, in which they hang ſuch a weight of jewels, or ſomething that reſembles them, that you may put a half crown through the hole of their ears; they load their necks alſo with weighty necklaces, which fall upon their breaſts, containing a great many ſtrings or rounds of beads, &c. They adorn their arms with bracelets, and wear a great number of rings on their fingers and toes, and a girdle of ſilver wire and plate ſurrounds their waiſts; when they go abroad, they throw a piece of ſtriped ſilk over their heads, which ſometimes reſembles a hood. The people are obliged to go bare-footed, becauſe none but the king is allowed to wear ſhoes and ſtockings.

The uſual ſalutation here, as in other parts of India, is the Salam; (i. e.) the carrying one or both hands to their heads according to the quality of the perſon they ſalute. The neareſt relations and friends do not talk much when they viſit, but ſit ſilent great part of the time. Talkative people are in no eſteem.

Before marriage, the man ſends a friend to purchaſe the woman's cloaths, which ſhe freely ſells for a ſtipulated ſum. In the evening he carries them to her, ſleeps with her all night, and in the morning appoints the day of marriage; on which he provides an entertainment of two courſes for the friends of both parties. The feaſt is held at the bride's houſe, when the young couple eat out of the ſame diſh, ſleep together that night, and on the enſuing morning depart for the bridegroom's habitation. The meaning of making a purchaſe of the bride's cloaths, is, that ſhe and her friends may be ſatisfied with reſpect to the man's circumſtances.

They are permitted to part from each other whenever they pleaſe: but if there are any children, the man is obliged to maintain the boys, and the woman the girls; and

and they are ſo fond of availing themſelves of this liberty, that ſome of them have been known to change a dozen times. The profeſſion of a midwife is unknown, as the women in general are both qualified and willing on that occaſion to aſſiſt each other.

This iſland produces rice, the common food of the inhabitants in all hot countries: of this they have ſeveral kinds: one of them will be ſeven months before it comes to maturity, ſome ſix, and others five between the ſeed time and harveſt; that which grows faſteſt is the beſt taſted, but yields the leaſt increaſe; and as all ſorts of rice grows in water, the inhabitants are at great labour and expence in levelling the ground they deſign for tillage, and making channels from their wells and repoſitories of water, to convey to theſe fields: they cut out the ſides of their hills from top to bottom, into little level plains, one above another, that the water ſhall ſtand in them till the corn is ripe, and theſe levels not being more than ſix or eight feet wide, many of them look like ſtairs to aſcend the mountain at a little diſtance. In the north part of the iſland, where there are few ſprings, they ſave the rain water in great ponds, or tanques, of a mile in compaſs, in the time of the monſoons, as they do on the continent of India, and when their fields are ſown, let it down into them gradually, ſo that it may hold out till harveſt.

They do not thraſh, but tread out their corn with oxen and buffaloes, frequently in the field where it grows: as ſoon as it is reaped they lay out a round ſpot of ground for this purpoſe, about twenty-five feet over, which they dig a foot and a half deep, and the women, whoſe buſineſs it is, bring the corn in bundles on their heads, after which the cattle are driven round the pit till they have trampled it out of the ſtraw; then a new floor is laid, and with half a dozen oxen they will trample out forty or fifty buſhels in a day. Before they begin to tread out the corn they always perform ſome religious ceremony, and apply to their idols for a bleſſing on their labours.

They have ſeveral other kinds of grain, which they eat of the latter end of the year, when rice begins to be ſcarce; and particularly coracan, which is as ſmall as muſtard-ſeed, which they beat or grind into flour and make cakes of. This grain grows on dry ground, and is ripe within three or four months after it is ſown. They have another kind, called tanna, as ſmall as caracan, every ſeed whereof ſhoots out four or five ſtalks, which have each an ear, and are ſaid to multiply a thouſand for one. The women, who do the greateſt part of the harveſt work, cut off only the ears of it when it is ripe, and carry it home in baſkets. This is very dry food, and only eaten when rice is not to be had. They have alſo a ſeed called tolla, of which they make oil, and anoint themſelves with it.

Here are great variety of fruits, but the natives ſeldom eat them ripe, or cultivate any, but thoſe which ſerve to make pickles for their ſoup or curree, and ſauces, when they are green, to eat with their rice. The betel-nut ſo often mentioned, they have great plenty of, which they uſed to export to the coaſt of Cormandel to great advantage, before the Dutch excluded them from all trade with foreigners.

The fruit called jacka is part of their food; they grow upon large trees, are of a round ſhape, and as big as a peck loaf, being covered with a green prickly rind; they have ſeeds or kernels in them as big as a cheſnut, and in colour and taſte like them. They gather theſe jackas before they are ripe, and boil them, and they eat much like cabbage: if they let them grow till they are ripe they are very good to eat raw; they roaſt the kernel in the embers, and carry with them, when they take a journey, for their proviſion.

There is another fruit called jambo, which is very juicy, and taſtes like an apple, it is white, ſtreaked with red, and looks very beautiful; they have alſo ſome fruits which reſemble our plumbs and cherries; nor do they want any of the common Indian fruits, ſuch as mangoes, cocoas, pine-apples, melons, pomegranates, oranges of ſeveral ſorts, citrons, limes, &c. They frequently dedicate their fruit trees to ſome dæmon, to prevent their being ſtolen; after which their neighbours dare not touch them, leſt the dæmon, to which they are devoted, ſhould puniſh them for the theft; and before the owner eats of it himſelf, he offers part of it to the idol.

Their kitchen gardens are well ſtored with roots, plants, and herbs, for the Portugueſe and Dutch have introduced almoſt all manner of European plants that grow in our kitchen gardens. They alſo abound in medicinal herbs, which they know very well how to apply, and with which they perform many notable cures.

Here are alſo flowers of various colours and a delicious ſcent, which grow ſpontaneouſly, but are never cultivated; with theſe, the young people of both ſexes adorn their hair. Among others, they have white and red roſes, as ſweet and beautiful as thoſe of Europe, and a white flower reſembling jaſmine, which the king reſerves for his own uſe, no ſubject being allowed to wear it. There is another flower, which is obſerved to open about four every evening, and cloſe again about four in the morning.

Among their trees the talipot is much taken notice of, which grows very tall and ſtrait, a leaf of which will cover fifteen or twenty men, and will fold up like a fan; they wear a piece of it on their heads on a journey, to ſkreen them from the ſun: theſe leaves are ſo tough, that they make their way with them through the buſhes and thickets without tearing them; they ſerve the ſoldiers for tents to lie under in the field.

There is a tree called kettule, a kind of palm, as high as a cocoa-tree, from whence they draw a pleaſant liquor, but not ſtrong; an ordinary tree yielding three or four gallons a day, and when boiled, makes a kind of brown ſugar, called jaggory; the wood of this tree is black, hard, and very heavy.

The tree of moſt ineſtimable value to the Dutch, as it was formerly to the Arabs and the Portugueſe, is the cinnamon, which is found in no other country, but grows commonly in the woods, on the ſouth weſt part of the iſland. This tree is of a middle ſize, and has a leaf of the form of a laurel leaf. When the leaves firſt appear, they are as red as ſcarlet, and being rubbed between the fingers, ſmell like cloves. It bears a fruit like an acorn, which neither ſmells nor taſtes like the bark; but if boiled in water, an oil ſwims on the top, which ſmells ſweetly, and is uſed in ointment in ſeveral diſtempers; but as they have great plenty of it, they frequently burn it in their lamps. The tree having two barks, they ſtrip off the outſide bark, which is good for little, and then cut the inner bark round the tree with a pruning-knife: after which they cut it long ways in little ſlips, and after they have ſtripped theſe pieces off, lay them in the ſun to dry, and they roll up in the manner we ſee them brought over. The body of the tree is white, and ſerves for building and other uſes, but has not the ſmell or taſte the bark has. When the wind ſets off the iſland, the cinnamon groves perfume the air for many miles out at ſea, of which we have inconteſtable evidence; probably, it is at that time of year, when the cinnamon trees are in bloſſom.

This iſland abounds in elephants of a very large ſize; they have alſo oxen and buffaloes, deer, hogs, and goats, and ſome wild beaſts, with monkies in abundance: but they had neither horſes, aſſes, or ſheep, till they were imported by the Europeans, nor have they any lions or wolves; and here is an animal in all reſpects like a deer, but not bigger than a hare: the wild elephants feed upon the tender twigs of trees, corn and graſs, as it is growing, and do the huſbandmen a great deal of miſchief, by trampling down their corn, as well as eating it, and breaking and ſpoiling their trees. The monkies have black faces, and white beards, very much reſembling old men. Alligators, or crocodiles, abound here, and ſerpents of a monſtrous ſize: but the ſtory of the ſnake that ſwallowed a ſtag with the horns, does not deſerve much credit, eſpecially as Mr. Knox, who relates it, had it by hearſay, and never met with one above the common ſize, though he reſided in the iſland twenty years.

Vermin and inſects are very numerous here, particularly ants, which eat every thing they come at, except iron and other minerals as hard. Their houſes are peſtered with them; if a diſh of meat is ſet down, it is immediately full of ants: in the fields they raiſe hills ſix feet high, of a pure white clay, ſo hard, that a pick-axe will hardly demoliſh them; and of this clay it is that the prieſts frequently form their idols: theſe inſects are not long-lived; when they are full grown they have wings, and fly up in ſuch clouds, that they intercept the light of the ſun; ſoon after which they fall down dead, and are eaten by fowls, who devour them alſo at other times, or there would be no living at quiet for them.

The common ſort of bees build in hollow trees, or in holes of the rocks; but there are much larger bees, of a mere lively colour, which form their combs upon the high boughs of trees, and at the ſeaſon for taking them, the country people go out into the woods and take their honey.

In the ſeaſon when the rains begin to fall, they are troubled with little red leeches, which are not at firſt much bigger than a hair: theſe run up peoples bare legs as they travel, and, fixing themſelves there, are not eaſily removed, till

till the blood runs about their heels. The beſt remedy againſt their bite is, to rub their legs with a compoſition of aſhes, lemon-juice, and ſalt. The bite of theſe creatures is ſo far from being attended with any ill conſequences, that this bleeding is eſteemed very wholeſome.

Their fowls are geeſe, ducks, turkies, hens, woodcocks, partridges, pigeons, ſnipes, wild peacocks, parroquets, and a beautiful ſparrow as white as ſnow, all but his head, which is black, and a plume of feathers ſtanding upright upon it, the tail is a foot long.

The natives of this iſland make ſavoury ſoups of fleſh or fiſh, which they eat with their rice; people of condition will have ſeveral diſhes at their tables; but they conſiſt chiefly of rice, ſoups, herbs, and garden-ſtuff: they eat but little fleſh or fiſh. Their meat is cut into little ſquare pieces, and two or three ounces of it laid on the ſide of the diſh by their rice; and, being ſeaſoned very high, gives a reliſh to the inſipid rice. They uſe no knives or forks, but have ladles and ſpoons, made of the cocoa-nut ſhell; their plates are of braſs or china ware: the poor people have a broad leaf inſtead of a plate; and ſometimes ſeveral leaves ſewed together with bents, where broad ones are not to be had. Water is their uſual drink, which they pour out of a cruce or bottle, holding it more than a foot above their heads: ſome of them will ſwallow near a quart of water in this manner, without gulping once. They draw arrack and ſpirits from rice; but there is neither wine nor beer made in this country. They never eat beef, the bull and cow being objects of adoration here. Neither the people in high, or low ſtation, eat with their wives. The man ſits down by himſelf, and, when he has done, the women and children are allowed to eat.

In this woody and mountainous country there are no wheel carriages, unleſs what belong to the Dutch near the ſea-coaſt. The baggage is uſually carried upon the backs of their ſlaves.

Calico or cotton cloths, which they ſpin or weave, are the chief manufacture here; they make alſo braſs, copper, and earthen veſſels, ſwords, knives, and working-tools uſed by ſmiths, carpenters, and huſbandmen; goldſmiths work, painting, and carving, are alſo performed tolerably well, and they now make pretty good fire-arms.

We may trace their foreign trade up to the earlieſt ages. They ſupplied Perſia, Arabia, Egypt, and Ethiopia, with their ſpices, before Jacob went down into Egypt, which is above three thouſand years ſince, as appears by the hiſtory of Joſeph's being ſold to the Iſhmaelite merchants, who were travelling with a caravan acroſs Arabia to Egypt with the ſpices of India, of which the cinnamon of Ceylon, that lies near the coaſt of Hither India, was no doubt the chief: ſo profitable was this branch of trade, that all the nations above mentioned ſent colonies hither, whoſe deſcendants were planted here when the Portugueſe firſt viſited theſe coaſts.

The Portugueſe language is generally ſpoken upon the coaſt; the natives, however, have a language of their own, which comes neareſt to that ſpoken on the Malabar coaſt; and there is a dead language only ſpoken by their bramins or prieſts, in which the books relating to their religion are written.

They write upon the leaves of the talipot cut into pieces of three fingers broad, and two feet long, with a ſteel ſtyle or bodkin. They have long ſtudied aſtronomy, which they learnt from the Arabian colonies which had ſettled on theſe coaſts, and foretell eclipſes pretty exactly. They are great pretenders alſo to aſtrology, and by the planets calculate nativities, foretell future events, and direct people when will be the moſt lucky days for them to enter upon any affair of moment, or to begin a journey; and they find men weak enough to be impoſed upon, if they have been never ſo often diſappointed. Their year is divided into three hundred and ſixty-five days, and every day into thirty pays or parts, and their night into as many; and they have a little copper diſh, with a hole at the bottom of it, which being put empty into a tub of water, is filled during one of their pays, when it ſinks, and then it is put in the water again to meaſure another pay; for they have neither ſun-dials nor clocks.

Any of the male cinglaſſes may indifferently charge another within hearing (as we do the conſtables) to aid them in execution of their duty, or upon any emergency; but the women are not permitted to mention the king's name, upon the ſevere penalty of having their tongues cut out for the offence.

In Ceylon, the criminals are frequently impaled alive, others have ſtakes driven through their bodies, ſome are hung upon trees, and many are worried by dogs, who are ſo accuſtomed to the horrid butchery, that, on the days appointed for the death of criminals, they, by certain tokens, run to the place of execution. But the moſt remarkable criminal puniſhment is inflicted by the king himſelf, who rides an elephant trained up on purpoſe: the beaſt tramples the unhappy wretch to death, and tears him limb from limb.

Some are puniſhed by fines and impriſonment, at the diſcretion of the judges. When the fine is decreed, the officers ſeize the culprit, wherever they meet him, ſtrip him naked, his cloaths going as part of the payment, and oblige him to carry a large ſtone, the weight being daily increaſed by the addition of others that are ſmaller, till the money is either paid or remitted.

Sometimes a creditor will go to the houſe of the debtor, and very gravely affirm, that if he does not diſcharge the debt he owes him immediately, he will deſtroy himſelf: this ſo terrifies the other, that he inſtantly collects all the money he can, even ſelling his wife and children rather than be deficient, and pays the ſum demanded. This is owing to a law, which ſpecifies, that, if any man deſtroys himſelf on account of a debt not being diſcharged, the debtor ſhall immediately pay the money to the ſurviving relations, and forfeit his own life, unleſs he is able to redeem it by the payment of a very large ſum to the king.

They have two modes of deciding controverſies, the one is by imprecating curſes to fall upon them if they do not ſpeak the truth; and by the other, both perſons are obliged to put their fingers into boiling oil, when the perſon who can bear the pain the longeſt, and with the leaſt appearance of being affected, is deemed innocent. They have, however, methods of evading both theſe laws; the firſt, by uſing ambiguous expreſſions; and the latter, by certain preparations, which prevent the oil from doing them any injury.

It is not lawful to beat a woman without permiſſion from the king; ſo that they may thank his majeſty for all the blows they get. But they may be made to carry heavy baſkets of ſand upon their heads as long as the puniſher pleaſes, which is much more dreadful to them than a hearty drubbing. The circumſtances of the children entirely depend upon thoſe of the mother; for if the mother is a free woman, they are free; but if ſhe is a ſlave, they are always vaſſals.

As to phyſic, every one almoſt underſtands the common remedies, applying herbs or roots, according to the nature of the complaint; and they have an herb which cures the bite of a ſnake: but there are neither phyſicians or ſurgeons amongſt them, who make a profeſſion of this ſcience. As they abound in poiſonous herbs and plants, ſo they have others that are antidotes againſt them. Their diſeaſes are chiefly fevers, fluxes, and the ſmall-pox. They never bleed except when leeches ſeize them in the wet ſeaſon, as has been mentioned already, from which they acknowledge they have ſometimes received great benefit.

The natives worſhip God, but make no image of him; however they have idols, which are the repreſentatives of ſome great men that formerly lived upon earth, and are now, they imagine, mediators for them to the ſupreme God of heaven. The chief of theſe demi-gods is Buddow, who, according to their tradition, originally came from heaven in order to procure the happineſs of men, and aſcended thither again from Adam's mountain already mentioned, leaving the impreſſion of his foot on the rock. They are ſaid likewiſe to worſhip the devil, that he ſhould do them no miſchief: and another of their favourite idols is the tooth of a monkey. They worſhip in like manner the ſun and moon, and other planets. Every town has its tutelar dæmon, and every family their houſhold god beſides, to whom they build chapels in their courts, and ſacrifice and pay their devotions every morning; but to the ſupreme God they erect no temples or altars. There are three claſſes of idols, and as many orders of prieſts, who have their ſeveral temples, and to which eſtates in lands are appropriated. The god Buddow, already mentioned, is the chief of theſe ſubordinate deities, and his prieſts in the greateſt eſteem, being all of the higheſt caſt or tribe in the nation. They wear a yellow veſt and mantle, their heads ſhaved, and their beards grow to a great length. Their diſciples fall down on their faces before them; and they have a ſtool to ſit on wherever they viſit, which is an honour only ſhewn to their princes and magiſtrates.

Theſe prieſts have no commerce with women, drink no ſtrong liquor, and eat only one meal a day; but are debarred from no fleſh except beef. They are ſtiled ſons of the god Buddow, and cannot be called to account by the temporal power, whatever crimes they commit.

There

There is a ſecond order of prieſts that officiate in the temples of other idols; theſe are allowed to profeſs any ſecular employment, and are not diſtinguiſhed from the laity by their habit, but have, however, a certain revenue. Every morning and evening they attend the ſervice of their temples, and when the people ſacrifice rice and fruits, the prieſt preſents them before the idol, and then delivers them to the ſinging men and women, and other ſervants that belong to the temple, and to the poor that come to perform their devotions, who eat the proviſion: no fleſh is ever ſacrificed to the idols of this claſs.

The third order of prieſts have no revenues, but build temples for themſelves, without any election or conſecration, and beg money to maintain themſelves. This begging claſs are mountebanks in their way, ſhewing a variety of whimſical tricks for their bread. They are prohibited by law from touching the waters in wells or ſprings, and muſt not uſe any, but what is procured from rivers or ditches. They are conſidered in ſo deſpicable a light, that it is held diſgraceful to have any connections with them.

Wedneſdays and Saturdays are the times they reſort to the temples; and at the new and full moon they offer ſacrifices to the god Buddow; and on a new-year's day, in the month of March, they offer a ſolemn ſacrifice to him on a high mountain, or under a ſpreading tree which is deemed ſacred. The principal feſtival of the Chingulays is obſerved, in the month of July, in honour of the new moon, when a prieſt goes in pompous proceſſion with a garland of flowers, to which the people preſent their offerings. The ridiculous pageantry attending this feſtival was attempted to be aboliſhed in 1664; but the attempt cauſed an inſurrection, ſo that the kings of Ceylon are obliged to let them continue the ſolemn mummery.

They have alſo idols of monſtrous ſhapes and forms, made of ſilver, braſs, and other metals, and ſometimes of clay; but thoſe in Buddow's temples are the figures of men ſitting croſs-legged in yellow habits, like his prieſts, repreſenting ſome holy men, who, they ſay, are teachers of virtue, and benefactors to mankind.

The iſland of Ceylon was formerly divided into nine monarchies, but at preſent it is under the dominion of one king, whoſe court is kept in the center of the iſland, at a place called Digligy-Neur: the palace is but meanly built, though the gates are large, ſtately, and finely carved; the window-frames are made of ebony, and inlaid with ſilver: the king's elephants, troops, and ſpices are numerous, and his concubines many. The guards are commanded by Dutch and Portugueſe renegado officers. This monarch aſſumes great dignity, and demands much reſpect, which his ſubjects readily pay him, as they imagine that all their kings, immediately on their demiſe, are turned into gods. He expects that Chriſtians ſhould ſalute him kneeling and uncovered, but requires nothing more of them. His title is, Emperor of Ceylon, king of Candy, prince of Onva and the four Corles, great duke of the ſeven Corles, marquis of Duranura, lord of the ſea-ports and fiſheries of pearls and precious ſtones, lord of the golden ſun, &c. His revenue conſiſts in the gifts and offerings of his ſubjects; his palaces are built upon almoſt inacceſſible places for the greater ſecurity; no bridges are permitted to be erected over rivers or ſtreams, or good roads to be made, to render the country as impaſſable as poſſible. None are permitted to approach his palace without a paſſport ſtamped on clay. The troops are hereditary, and their weapons are ſwords, guns, pikes, bows and arrows, &c. They are ſubtle, but not courageous, and will not engage an enemy but by ſurpriſe, and when there is ſome manifeſt advantage in their own favour. It is ſo difficult to penetrate into the inland parts, and all the paſſes are ſo well guarded, that even the Dutch themſelves are unacquainted with the greateſt part of the iſland.

In 1505 the Portugueſe landed in Ceylon, and about twelve years after they eſtabliſhed factories there, the reigning king permitting them to build forts; and upon his demiſe, he declared the king of Portugal his heir; but in proceſs of time the Portugueſe behaving with great cruelty and arrogance, the young king of Candy invited in the Dutch, in 1639, who, after a tedious war, at length, in the year 1655, ſubdued the Portugueſe, and became maſters of the coaſt and trade. They drove the king, their ally, into the mountains, and with their wonted gratitude made him their tributary. The Dutch have in ſubſequent years committed many cruelties, and the natives frequently retaliate by making excurſions among them, or murdering all they meet with at a diſtance from the forts, and the interior part of the iſland.

SECT. X.

Containing a Deſcription of the MALDIVIA ISLANDS BOMBAY, and others in the Indian Seas.

ABOUT five hundred miles ſouth-weſt of Ceylon and cape Comorin, lie the Maldivia iſlands, ſo called from Male the chief of them, which is the reſidence of their king: they extend from four degrees ſouth latitude, to eight degrees north latitude, are about ſix hundred miles in length, and upwards of one hundred in the broadeſt part. They are ſaid to be one thouſand in number, but many of them are only large hillocks of ſand, and from the barrenneſs of the ſoil, are intirely uninhabited. The whole country is divided into thirteen provinces, called Attolons, each of which contains many ſmall iſlands, and is of a circular form, about one hundred miles in circumference. Theſe provinces all lie in a line, and are ſeparated by channels, four of which are navigable for large ſhips, but are very dangerous, on account of the amazing rocks that break the force of the ſea, and raiſe prodigious ſurges. At the bottom of theſe channels is found a ſubſtance like white coral, which when boiled in cocoa-water, greatly reſembles ſugar. The currents run eaſt and weſt alternately ſix months, but the time of the change is uncertain; and ſometimes they ſhift from north to ſouth.

The climate is exceeding ſultry, this country lying near the equinoctial on both ſides: the nights, however, are tolerably cool, and produce heavy dews that are refreſhing to the trees and vegetables. Their winter commences in April, and continues till October, during which they have perpetual rains and ſtrong eaſterly winds; but they never have any froſt. The ſummer begins in October, and continues ſix months, during which time the winds are eaſterly and the heat is ſo exceſſive as ſcarce to be borne, there not being any rain during that ſeaſon.

Theſe iſlands are in general very fertile; and produce great quantities of millet, and another grain much like it, of both which they have two harveſts every year. They have alſo ſeveral kinds of roots that ſerve for food, particularly a ſort of bread-fruit called nell-pou, which grows wild and in great plenty. The woods produce excellent fruits, as cocoas, citrons, pomegranates, and Indian figs. Their only animals for uſe are ſheep and buffaloes, except a few cows and bulls that belong to the king, and are imported from the continent; but theſe are only uſed at particular feſtivals. They have little domeſtic poultry, but are ſupplied with prodigious quantities of wild fowl that are caught in the woods, and ſold at a very low price. They have alſo plenty of wild pigeons, ducks, rails, and birds reſembling ſparrow-hawks. The ſea produces moſt kind of fiſh, great quantities of which are exported from hence to Sumatra. Among the fiſh is one called a cowrie, the ſhells of which (called in England black-amoor's teeth) are uſed in moſt parts of the Indies inſtead of coin.

Snakes are the only poiſonous animals here; there is a dangerous ſort of them that frequent the borders of the ſea; but the inhabitants are greatly infeſted with rats, dormice, piſmires, and other ſorts of vermin, which are very deſtructive to their proviſions, fruit, and other periſhable commodities; for which reaſon they build their granaries on piles in the ſea, at ſome diſtance from the ſhore; and in this manner moſt of the king's granaries are built.

The natives of the Maldives are very robuſt, of an olive complexion, and well-featured. They are naturally ingenious, and apply themſelves with great induſtry to various manufactures, particularly the making of ſilk and cotton. They are cautious and ſharp in trading: and are courageous and well ſkilled in arms. The common people go almoſt naked, having only a piece of cotton faſtened round their waiſt, except on feſtival days, when they wear cotton or ſilk jerkins, with waiſtcoats, the ſleeves of which reach only to the elbows: the wealthier ſort tie a piece of cloth between their legs and round the waiſt, next to which they have a piece of blue or red cotton that reaches to the knees, and to that is joined a large piece of cotton or ſilk, reaching to their ancles, and girded with a ſquare handkerchief embroidered with gold or ſilver; and the whole is ſecured by a large ſilk girdle fringed, the ends of which hang down before; and within this girdle, on the left ſide, they keep their money and betel, and on the right ſide a knife. They ſet a great value on this inſtrument, from its being their only weapon; for none but the king's officers and ſoldiers are permitted to wear any other. The richer ſort wear turbans on their heads made of ſilk richly ornamented, but thoſe of the meaner ſort are made of cotton, and only ornamented with ribbons of various colours.

In theſe iſlands the women are fairer than the men, and in general of a very agreeable diſpoſition. They wear a coat of cotton or ſilk that reaches from the waiſt to the ancles, over which they have a long robe of taffety, or fine cotton, that extends from the ſhoulders to the feet, and is faſtened round the neck by two gilt buttons. Their hair is black, which is eſteemed a great ornament; and to obtain this, they keep their daughters heads ſhaved till they are eight or nine years of age, leaving only a little hair on the forehead to diſtinguiſh them from the boys. They waſh their heads and hair in water, to make the latter thick and long, and let it hang looſe, that the air may dry it, after which they perfume it with an odoriferous oil. When this is done, they ſtroke all the hair backwards from the forehead, and tie it behind in a knot, to which they add a large lock of man's hair; and the whole is curiouſly ornamented with flowers of various colours.

The common people have houſes built of cocoa-wood, and covered with leaves ſewed one within another; but the ſuperior ſort build their houſes of ſtone, which is taken from under the flats and rocks in the following manner: among other trees in this iſland, is one called candou, which is exceedingly ſoft, and, when dry and ſawed into planks is much lighter than cork; the natives, who are excellent ſwimmers, dive under water, and, having fixed upon a ſtone for their purpoſe, they faſten a ſtrong rope to it: after this, they take a plank of the candou wood, which, having a hole bored in it, is put on the rope, and forced down quite to the ſtone: they then run on a number of other boards till the light wood riſes up to the top, dragging the ſtone along with it. By this contrivance the natives weighed up the cannon and anchors of a French ſhip that was caſt away here about a century ago.

The people are in general very polite, particularly thoſe on the iſland of Male, but they are very libidinous, and fornication is not conſidered as any crime: neither muſt any perſon offer inſult to a woman that has been guilty of miſconduct previous to marriage. Every man is permitted to have three wives if he can maintain them, but not more. The girls are marriageable at eight years of age, when they wear an additional covering on their necks: the boys go naked till ſeven, when they are circumciſed, and wear the uſual dreſs of the country afterwards.

The Maldivians are very abſtemious in their diet, their principal food conſiſting of roots made into meal and baked; particularly thoſe called nell-pou and elas, the latter of which they dreſs ſeveral ways; they alſo make a pottage of milk, cocoa, honey, and bread, which they eſteem an excellent diſh; and their common drink is water. They ſit croſs-legged at their meals, in the ſame manner as in other eaſtern countries; the floor on which they ſit is covered with a fine mat, and they uſe banana leaves inſtead of table cloths. Their diſhes are chiefly of china, all veſſels of gold or ſilver being prohibited by law: they are made round with a cover, over which is a piece of ſilk to keep out the ants. They take up their victuals with their fingers, and in ſo careful a manner as not to let any fall; and if they have occaſion to ſpit, they riſe from the table, and walk out. They do not drink till they have finiſhed their meal, for they conſider that as a mark of rudeneſs; and they are very cautious of eating in the preſence of ſtrangers. They have no ſet meals, but eat when the appetite demands, and all their proviſions are dreſſed by the women; for this buſineſs is accounted diſgraceful to a man.

Being naturally very cleanly, as ſoon as they riſe in the morning they waſh themſelves, rub their eyes with oil, and black their eye-brows. They are alſo very careful in waſhing and cleanſing their teeth, that they may the better receive the ſtain of the betel and areka, which is red, and the colour they are particularly fond of. They preſent betel to each other upon occaſional ſalutations, as they always keep ſome about them.

They preſerve many Pagan cuſtoms, though their religion is Mahometaniſm: when meeting with any diſaſter at ſea, they pray to the king of the winds; and there is in every iſland a place, where they who have eſcaped danger make offerings to him of little veſſels made for the purpoſe, in which they put fragrant woods, flowers, and other perfumes, and then turn the veſſel adrift to the mercy of the waves. They dare not ſpit to the windward, for fear of offending this airy deity; and all the veſſels which are devoted to him are kept as clean as their moſques. They impute croſſes, ſickneſs, and death to the devil; and, in order to pacify him, in a certain place, make him banquets and offerings of flower

Each of their moſques is ſituated in the center of a ſquare, and round it they bury their dead: they are very neat buildings, have three doors, each aſcended by a flight of ſteps: the walls within are wainſcotted, and the ceiling is of wood beautifully variegated. The floor is of poliſhed ſtone, covered with mats and tapeſtry; and the ceiling and wainſcotting are firmly joined without either nails or pegs. Each moſque has its prieſt, who, beſides the duties of his office, teaches the children to read and write the Maldivian language, which is a radical tongue; he alſo inſtructs them in the Arabic language, and is rewarded for theſe ſervices by the parents.

Such people here as are very religious go to their moſque five times a day; and, before they enter it, they waſh their feet, hands, ears, eyes, and mouth: this they never neglect to do. They who do not chuſe to go to the moſque, may ſay their prayers at home; but if they are known to omit doing one or the other, they are treated with the greateſt contempt, and every body avoids their company.

Friday is the day on which they keep their ſabbath, which is celebrated with great feſtivity; and the ſame is obſerved on the day of every new moon. They have ſeveral other feſtivals in the courſe of the year; the moſt diſtinguiſhed of which is one called maulude, and is held in the month of October, on the night of which Mahomet died. On this occaſion a large wooden houſe, or hall, is erected on a particular part of the iſland, the inſide of which is lined with the richeſt tapeſtry. In the center of the hall is a table covered with various ſorts of proviſions, and round it are hung a prodigious number of lamps, the ſmoke of which gives a moſt fragrant ſcent. The people aſſemble about eight o'clock in the evening, and are placed by proper officers appointed for that purpoſe, according to their reſpective ſtations. The prieſts and other eccleſiaſtics ſing till midnight, when the whole aſſembly fall proſtrate on the ground, in which poſture they continue till the head prieſt riſes, when the reſt follow his example. The people are then ſerved with betel and drink; and when the ſervice is intirely over, each takes a part of the proviſions on the table, and preſerve, as a ſacred relic, with the utmoſt care.

When two perſons intend to enter into the marriage ſtate, the man gives notice of his deſign to the pandiare, or naybe, who aſks him if he is willing to have the woman propoſed; on his anſwering in the affirmative, the pandiare queſtions the parents as to their conſent: if they approve of it, the woman is brought, and the parties are married in the preſence of their friends and relations. After the ceremony is over, the woman is conducted to her huſband's houſe, where ſhe is viſited by her friends, and a grand entertainment is provided on the occaſion. The bridegroom makes preſents to the king, and the bride equally compliments the queen. The man does not receive any dowry with his wife, and he is not only obliged to pay the expence of the nuptial ceremony, and to maintain her, but he muſt likewiſe ſettle a jointure upon her, though if ſhe thinks proper, ſhe may relinquiſh it after marriage. A woman cannot part from her huſband without his conſent, though a man may divorce his wife; but if ſhe does not aſſent to the ſeparation, ſhe may demand her jointure; yet as this is conſidered as a mean act, it is ſeldom practiſed.

On the death of any perſon the corpſe is waſhed by one of the ſame ſex, of which there are ſeveral in each iſland appointed for that purpoſe. After this, it is wrapped up in cotton, with the right hand placed on the ear, and the left on the thigh. Then it is laid on the right ſide in a coffin of candou wood, and carried to the place of interment by ſix relations or friends, and followed by the neighbours, who attend without being invited. The grave is covered with a large piece of ſilk or cotton, which after the interment, becomes the property of the prieſt. The corpſe is laid in the grave with the face towards Mahomet's tomb; and, after it is depoſited, the grave is filled up with white ſand ſprinkled with water. In the proceſſion both to and from the grave, the relations ſcatter cowries for the benefit of the poor, and give pieces of gold and ſilver to the prieſt, according to the circumſtances of the deceaſed. The prieſt ſings continually during the ceremony; and when the whole is over, the relations invite the company to a feaſt. They incloſe their graves with wooden rails, for they conſider it as a ſin for any perſon to walk over them; and they pay ſuch reſpect to the bones of the dead, that no perſons, not even the prieſts, dare touch them.

In their habit on theſe occaſions they make little difference: the mourners only go bareheaded to the grave, and continue ſo for a few days after the funeral is ſolemnized.

If a perſon dies at ſea, the body, after being waſhed, is put

put into a coffin, with a written paper mentioning his religion, and requeſting thoſe who may meet with the corpſe to give it decent interment. They then ſing over it, and, after having completed their ceremonies, commit it to the waves on a plank of candou wood.

The iſland of Male, where the king reſides, is ſituated in the center of the reſt, and is about five miles in circumference. The palace is built of ſtone, and divided into ſeveral courts and apartments; but it is only one ſtory high, and the architecture very inſignificant: however, it is elegantly furniſhed within, and ſurrounded with gardens, in which are fountains and ciſterns of water. The portal is built like a ſquare tower, and in feſtival days the muſicians ſing and play upon the top of it. The ground floors of the reſpective apartments are raiſed three feet, to avoid the ants, and are covered with ſilk tapeſtry, fringed and flowered with gold. The king's beds are hung like hammocks between two pillars ornamented with gold, and when he lies down, his attendants rock him to ſleep.

The dreſs of the king uſually conſiſts of a coat made of fine white cloth or cotton, with white and blue edgings, faſtened with buttons of ſolid gold: under this is a piece of red embroidered tapeſtry that reaches down to his heels, and is faſtened with a large ſilk girdle fringed, and a great gold chain before, with a locket formed of the moſt precious ſtones. He wears a ſcarlet cap on his head, which is a colour ſo eſteemed, that no other perſon dare preſume to uſe it. This cap is laced with gold, and on the top of it is a large gold button with a precious ſtone. The grandees and ſoldiers wear long hair, but the king's head is ſhaved once a week; he goes bare-legged, but wears ſandals of gilt copper, which are worn only by the royal family.

The dignity of the king, when he goes abroad, is particularly diſtinguiſhed by a white umbrella, which no other perſons, except ſtrangers, are permitted to uſe. He has three pages near his perſon, one of whom carries his fur, another his ſword and buckler, and a third his box of betel and areka, which he almoſt conſtantly chews. He goes to the moſque on Fridays (their ſabbath) in great pomp, his guards dancing, and ſtriking their ſwords on each others targets to the ſound of muſic; and is attended, on his return, by the principal people of the iſland. He either walks, or is carried in a chair by ſlaves, there being no beaſts of burden.

The queen is attended, when ſhe goes abroad, by a great number of female ſlaves, ſome of whom go before, to give notice to the men to keep out of the way; and four ladies carry a veil of white ſilk over her head, that reaches to the ground: on this occaſion, all the women from the ſeveral diſtricts meet her with flowers, fruits, &c. She and her ladies frequently bathe in the ſea for their health, for the convenience of which they have a place on the ſhore cloſe to the water, which is incloſed, and the top of it covered with white cotton. The only light in the chambers of the queen, or thoſe of the ladies of quality, is what lamps afford, which are kept continually burning, it being the cuſtom of the country never to admit day-light. The drawing-room, or that part where they uſually retire, is blocked up with four or five rows of tapeſtry, the innermoſt of which none muſt lift up till they have coughed, and told their names.

The guards appointed to attend on the king's perſon conſiſt of ſix hundred, who are commanded by his grandees; and he has conſiderable magazines of arms, cannon, and ſeveral ſorts of ammunition. His revenues conſiſt chiefly of a number of iſlands appropriated to the crown, with certain taxes on the various production of others; in the money paid to purchaſe titles and offices, and for licences to wear fine cloaths. Beſides theſe, he has a claim to all goods imported by ſhipping; for when a veſſel arrives, the king is acquainted with its contents, out of which he takes what he thinks proper at a low price, and obliges his ſubjects to purchaſe them of him again at what ſum he pleaſes to fix, by way of exchange, for ſuch commodities as beſt ſuit him. All the ambergris found in this country, (which produces more than any other part of the Indies) is alſo the property of the king; and ſo narrowly is it watched, that a perſon would be puniſhed with the loſs of his right hand, if detected in converting it to his own uſe.

Moſt of the nobility and gentry live in the north parts of this iſland, for the convenience of being near the court; and ſo much is this diviſion eſteemed, that when the king baniſhes a criminal, the ſending him to the ſouth is thought to be a ſufficient puniſhment.

Abſolute monarchy prevails in the government here, as every thing depends on the king's pleaſure. Each attolon, or province, has a naybe, or governor, who is both a prieſt and a doctor of the law. He not only preſides over the inferior prieſts, and is veſted with the management of all religious affairs, but he is likewiſe intruſted with the adminiſtration of juſtice, both in civil and criminal caſes. They are in fact ſo many judges, and make four circuits every year throughout their juriſdiction; but they have a ſuperior, called the pandiare, who reſides in the iſle of Male, and is not only the ſupreme judge of all cauſes, but alſo the head of the church. He receives appeals from the governor of each province, but does not paſs ſentence without conſulting ſeveral learned doctors; and from him appeals are carried to the king, who refers the matter to ſix of his privy-council. The pandiare makes a circuit once a year through the iſland of Male, (as every governor in his reſpective province does) and condemns all to be ſcourged, that cannot ſay their creed and prayers in the Arabic tongue, and conſtrue them in the Maldivian. At this time the women muſt not appear in the ſtreet unveiled, on pain of having their hair cut off, and their heads ſhaved, which is deemed very diſgraceful.

They have various modes of puniſhment for crimes. If a man is murdered, the wife cannot proſecute the criminal; but if the deceaſed has left any children, the judge obliges him to maintain them till they are of age, when they may either proſecute or pardon the murderer. The ſtealing any thing valuable is puniſhed with the loſs of a hand, and for trifling matters they are baniſhed to the ſouthern iſlands. An adultereſs is puniſhed by having her hair cut off, and thoſe guilty of perjury pay a pecuniary mulct. Notwithſtanding the law makes homicide death, yet a criminal is never condemned to die, unleſs it is expreſly ordered by the king; in which caſe he orders his own ſoldiers to execute the ſentence.

The chief articles exported from theſe iſlands are, cocoa-nuts, cowries, and tortoiſe-ſhell, the latter of which is exceedingly beautiful, and not to be met with in any other place except the Philippine iſlands. The imported articles are, iron, ſteel, ſpices, china, rice, &c. all which, as we obſerved, are ingroſſed by the king, who ſells them to his ſubjects at his own price.

They have only one ſort of money here, which is ſilver, called lorrins, each of which is about the value of eightpence. It is about two inches in length, and folded, the king's name being ſet upon the folds in Arabic characters. One thouſand two hundred cowries make a lorrin; in their own markets, they frequently barter one thing for another. Their gold and ſilver is all imported from abroad, and is current here as in all other parts of the Indies, by weight.

Theſe iſlands are happily placed, with reſpect to each other, for producing mutual commerce to the reſpective inhabitants, for though the thirteen attolons, or provinces, are in the ſame climate, and all of them very fertile, yet they produce ſuch different commodities, that the people in one cannot live without what is found in another. The inhabitants have likewiſe ſo divided themſelves, as greatly to enhance this commercial advantage; for all the weavers live in one iſland, the goldſmiths in another, and the like of the different manufactures. In order, however, to render the communication eaſy, theſe artificers have ſmall boats, built high on the ſides, in which they work, ſleep, and eat, while ſailing from one iſland to another to expoſe their goods to ſale, and ſometimes they are out a conſiderable time before they return to their fixed habitations.

Bombay is ſituate on an iſland near the weſt coaſt of India, in ſeventy-two degrees eaſtern longitude, and nineteen degrees north latitude. It has an excellent harbour, from whence the Portugueſe were the firſt Europeans that poſſeſſed it, gave it the name of Boonbay, now corruptly called Bombay. The iſland on which it ſtands, is about twenty miles in circumference: the chief town is a mile in length, meanly built: the fort ſtands at a diſtance from it. The iſland is inhabited by Engliſh, Portugueſe, and Moors: there are three or four more ſmall towns on the iſland. The ſoil is barren, and the water bad: they preſerve the rain-water, therefore, in ciſterns, and there is a well of pretty good freſh water about a mile from the town. The king of Portugal transferred this iſland to Charles II. king of Great-Britain, as part of the portion of the infanta Katharine, whom he married, in the year 1662, and the king afterwards gave it to the Eaſt India company. The fort has been beſieged both by the Mogul and the Dutch, but neither of them were able to take it.

Though Bombay lies within the tropics, yet the climate is not diſagreeable to the conſtitution of the Europeans; there

there are but few days in the courſe of the year, in which the weather is very intenſe; the ſhort hot ſeaſon precedes the periodical return of the rains: the night-dews, however, are extremely dangerous, therefore great care ſhould be taken not to be expoſed to them. If people would but live temperately in this place, they need not be afraid of the climate, which is far healthier than in any other of the European ſettlements; and there are now ſome good phyſicians on the iſland. They have wet weather at Bombay about four months in the year, which is commonly introduced by a very violent thunder ſtorm: during this ſeaſon all trading veſſels are laid up. The rains begin about the latter end of May, and continue till September, when the black merchants keep a feſtival, gilding a cocoa-nut, which they conſecrate and commit to the waves.

What they abound in moſt is their groves of cocoa-trees, their rice-fields, and onion-grounds. Their gardens alſo produce mangoes, jacks, and other Indian fruits; and they make large quantities of ſalt, with very little trouble, from the ſea-water, which being let into little pits, extracts the mixture, and the ſalt is left behind.

The town or city of Bombay is a mile long, and ſurrounded by a wall or ditch, it has alſo a pretty good caſtle; ſo that it is well ſecured, and eſteemed one of the ſtrongeſt places belonging to the Eaſt-India company. The houſes of the Engliſh here conſiſt in general of a ground-floor, with a court both before and behind, in which are offices and out-houſes. Moſt of the windows are of tranſparent oyſter-ſhells, which admit a pretty good light; and the flooring of their habitation is a ſort of ſtucco compoſed of ſhells that have been burnt; this they call chunam, which, being well tempered, and becoming hard, has an elegant poliſh on it. The houſes in which the black merchants reſide, are in general ill-contrived, aukward ſtructures.

The Engliſh church is a very neat building, ſituated on a pleaſant green, round which are the houſes of the Engliſh. As to the pagodas of the Gentoos, they are ſuch wretched edifices, as to be unworthy of notice.

The government is entirely Engliſh, ſubordinate to the India company, who appoint by commiſſion a preſident and council: and the marine and military force is under the immediate direction of the preſident, who is ſtiled commander in chief.

The common ſoldiers are of many nations, ſome Portugueſe, ſome Dutch, and others French: what are called topaſſes, are for the moſt part black, or of a mixed breed from the Portugueſe. There are alſo regular companies of the natives, who are called ſeapoys.

Any popiſh prieſt, except a Portugueſe, may officiate in the churches of the three Roman catholic pariſhes, into which Bombay is divided; but the Engliſh formed an objection againſt the Portugueſe, from an apprehenſion that theſe fathers might have rather too cloſe a connection with others of their own country, in the adjacent ſettlements belonging to their maſter. There are no diſputes in this town about profeſſions in religion, all alike are tolerated. Liberty of conſcience, freedom of ſpeech, riches, and honours, diſtinguiſh the people and clime.

The inhabitants of Bombay, are a mixture of ſeveral nations, Engliſh, Portugueſe, and Indians, amounting, as it is ſaid, to fifty or ſixty thouſand. The preſident of Surat is uſually governor of the place, who has a deputy here, and courts of juſtice after the model of England. And the governor, when he is upon the iſland, appears in greater ſtate than the governor of fort St. George, being attended when he goes abroad, by two troops of Moors and Bandarins, with their ſtandards. The natives, and thoſe who are ſeaſoned to the country, enjoy a tolerable ſtate of health, and, if they uſe temperance, live to a good old age; and thoſe who go over young, do pretty well.

Near Bombay are ſeveral iſlands, the chief of which are Butcher's iſland, Elephanta, and Salſette. The firſt is ſo called from great numbers of cattle being kept in it for the uſe of Bombay; and the ſecond has its name from the enormous figure of an elephant cut in ſtone, and which at a diſtance appears as if alive, the ſtone being exactly of the colour of that quadruped. On this iſland, which is nearly one intire hill, and about three miles in circumference, there is a temple hewn from a rock. This real curioſity, which is ſupported by two rows of pillars, is ten feet high; it is an oblong ſquare, about eighty feet in length, and about forty in breadth; and its roof is formed of the rock cut flat. At the farther end of this ſingular ſtructure ſtand the figures of two giants, the faces of which however, have been much mutilated; the Portugueſe, when they became poſſeſſed of this iſland, diſfiguring and injuring thoſe pieces of antiquity as much as poſſible. This curious fabric has two doors, which front each other; near one of them are ſeveral images, much diſfigured: and there is one image ſtanding erect, with a drawn dagger in one hand, and a child in the other. The other door, which opens on the left hand, has an area before it; at the upper end of which is a range of pillars or colonade, adjoining to an apartment ornamented with regular architecture, round the cornices of which are ſome paintings. The whole of this temple differs from any of the moſt antique Gentoo buildings; but with reſpect to the æra when genius and labour produced it, no diſcoveries have yet been made.

To the northward of Bombay lies Salſette, being about twenty-ſix miles in length, and nine or ten broad. Here is a ruinated place called Canara, where are ſeveral caverns in rocks, which conſiderably gratify the curioſity of ſuch Europeans as viſit them. The ſoil of Salſette is extremely fertile, and great plenty of game is found in this iſland, which it muſt be acknowledged is a moſt agreeable ſituation. It was originally comprehended under the regality of Bombay, and of conſequence became the property of the Engliſh crown when Bombay was given to king Charles II. but the Portugueſe defrauded us of it, though it is ſo connected with Bombay, that the people thereof cannot well ſubſiſt without it, having of neceſſity almoſt all their proviſions from it. The Portugueſe, however, loſt this iſland by the invaſion of the Marattas, who inhabit the continent bordering on Bombay: they are a very formidable tribe of Gentoos, who have extended their dominions by dint of arms. Their chief or king reſides generally on the mountains of Decan, at a fort called Raree, reported to be the ſtrongeſt place in the univerſe: it is ſo well and powerfully guarded by nature, that no enemy can approach it, being ſurrounded by ſteep inacceſſible rocks. In this well-defended fort the king, or mar-rajah, holds his court, and lives in great ſplendor. He has long been the avowed foe of the Moguls, Subahs, and Nabobs; making war and concluding treaties juſt as it ſuits his intereſt or ambition.

The Marattas are alike bred to arms and agriculture: they learnt the uſe of the former from the Europeans, though they depend greatly on their targets, which will turn the ball of a piſtol, and even that of a muſket, from ſome diſtance. Their muſkets are very indifferent; but their ſwords are excellent, and they uſe them with great execution. Their targets are quite round, and riſe in the centre nearly to a point. The horſes on which they ride are ſmall, active, and will go through a deal of fatigue.

European arts and manufactures receive little encouragement among theſe people, who prefer thoſe of their own country to the moſt curious that can be ſhewn them from foreign parts.

On an iſland about twelve miles in length, and ſix in breadth, and in fifteen degrees twenty minutes north latitude, and ſeventy-four degrees twenty minutes eaſt longitude from London, ſtands the large and ſtrong town of Goa, which is the principal place belonging to the Portugueſe in India: it was taken by them in 1508. It has the convenience of a fine ſalt water river, capable of receiving ſhips of the greateſt burden, where they lie within a mile of the town. The banks of the river are beautified with a great number of handſome ſtructures, ſuch as churches, caſtles, and gentlemens houſes. The air without the town is very unwholeſome, for which reaſon it is not ſo well inhabited now as formerly. The viceroy's palace is a noble building, and ſtands at a ſmall diſtance from the city, which leads to a ſpacious ſtreet, terminated by a beautiful church.

Goa contains a great number of handſome churches, convents, and cloiſters, with a ſtately large hoſpital, all well endowed, and kept in good repair. The market place takes up an acre of ground; and in the ſhops about it may be had the produce of Europe, China, Bengal, and other countries of leſs note. Every church has a ſet of bells, ſome of which are continually ringing.

Their religion is the Roman catholic, and they have a ſevere inquiſition. There are a great many Indian converts, and they generally retain ſome of their old cuſtoms; particularly they cannot be brought to eat beef. However, there are many Gentoos in the city, who are tolerated, becauſe they are more induſtrious than the Chriſtians, and better artiſts. The clergy are very numerous and illiterate; but the churches are finely embelliſhed, and have great numbers of images. Their houſes, which are of ſtone are ſpacious and handſome, and make a fine ſhew; but within they are poorly furniſhed.

The

The inhabitants are contented with greens, fruits, and roots, which, with a little bread, rice, and fiſh, is their principal diet, though they have hogs and fowls in plenty. However, they are much addicted to women, and are generally weak, lean, and feeble. Captain Hamilton, when he was in this iſland, ſtood on a hill near the city, and counted above eighty churches, convents, and monaſteries; and he was told, that there were about thirty thouſand prieſts and monks. The body of St. Francis Xavier is buried in St. Paul's church, and, as they pretend, performs a great many miracles. None of the churches, except one, have glaſs windows; for they make uſe of oyſter ſhells inſtead of glaſs, and all their fine houſes have the ſame.

The town itſelf has few manufactures or productions, their beſt trade being in arrack, which they diſtil from toddy, the ſap of the cocoa-nut tree. The river's mouth is defended by ſeveral forts and batteries, well planted with large cannon on both ſides; and there are ſeveral other forts in different places. This ſettlement is two hundred and fifty miles north by weſt of Cochin.

The iſland of Diu or Dio, ſituated in ſixty-eight degrees fifty-five minutes eaſt longitude, and twenty-one degrees forty-five minutes north latitude, is three miles long and two broad. The town, which bears the ſame name, is pretty large, and fortified by a high ſtone wall, with baſtions at convenient diſtances, and well furniſhed with cannon. The harbour is ſecured by two caſtles, one of which is made uſe of for powder, and other warlike ſtores. It was one of the beſt places in thoſe parts, the ſtructures being built of free-ſtone and marble. It contains five or ſix fine churches well embelliſhed within with images and painting, built by the Portugueſe; but it is much decayed of late years, not one fourth part of it being inhabited. In 1670 it was taken by the Arabs, who plundered all the churches and other places of their riches, but were driven away with the loſs of one thouſand men. There are not now above two hundred Portugueſe inhabitants, for the reſt are Banians, who may amount to forty thouſand. If this town was in good hands, it would be the beſt place for trade on the coaſt.

The Johor iſlands lie to the north-eaſt of cape Romano, but produce nothing fit for the carrying on commerce. Pulo Aure, one of them, is peopled by Malays, who are ſaid to form a ſort of republic, headed by a chief. In this iſland are ſeveral mountains, on which are many plantations of cocoa-trees. Articles in trade are purchaſed here with iron, and the people have the character of being very honeſt, friendly, and hoſpitable.

The iſland and town of Sincapour, or Sincapora, lie at the ſouthernmoſt point of the peninſula of Malacca, and give name to the ſouth-eaſt part of Malacca ſtraights. Here is a mountain which yields excellent diamonds, and ſugar-canes grow to a great ſize. The ſoil of Sincapour is fruitful, and the woods produce good timber for ſhip building.

There are ſeveral iſlands in the Eaſt Indian ſea, lying off the coaſt of Cambodia, the principal of which, called Pulo-Condore, is the only one inhabited. It is ſituated in one hundred and ſeven degrees forty minutes eaſt longitude, and eight degrees thirty-ſix minutes north latitude. It is about thirteen miles in length, and nine in breadth; but in ſome places not above a mile over.

The inhabitants of this iſland are of a middle ſtature, and well ſhaped, but their complexion is exceedingly ſwarthy. Their hair is ſtrait and black, their eyes are remarkably ſmall, and their noſes high; they have thin lips, ſmall mouths, and white teeth, and in their diſpoſitions are very courteous. They go almoſt naked, except on very particular occaſions, when they are dreſſed in a long garment girded about the waiſt, and ornamented with various coloured ribbands.

Their houſes are built of bamboos, covered with long graſs; but they are very ſmall. They are raiſed ſeveral feet from the earth, on account of the dampneſs of the ground; and they have neither doors or windows; ſo that one ſide is left open as well for convenience of light, as for the entrance of the people. They are very free of their women, and will bring them on board the ſhips, where they are kept by the ſailors while they ſtay.

Theſe people are idolaters, but of what kind is not known; however, they have images of elephants in their temples, as well as horſes. In a ſmall village, on the ſouth ſide of the iſland, is a temple, which is a mean edifice built of wood: within it is the figure of an elephant, and without is that of a horſe.

The ſoil of theſe iſlands is a brackiſh, and pretty deep, but the hills are ſomewhat ſtony. The trees are not very thick, but large, tall, and fit for any uſe. The principal fruits are mangoes, a ſort of grapes, and baſtard nutmegs. The animals are hogs, lizards, and gnanoes; there are fowls of various kinds, as turtle-doves, pigeons, wild cocks and hens, parrots and parroquets, and ſeveral ſorts of birds not known in Europe. The ſea produces great plenty of turtles, limpets, and muſcles; the chief employment of the inhabitants, is, to get tar out of the very large trees that grow here.

In 1702 the Engliſh ſettled on this iſland, after the factory of Chuſan, on the coaſt of China, was broke up. However they continued here but a ſhort time; for, having made an agreement with ſome Macaſſars, natives of the iſland of Celebes, to ſerve for ſoldiers, and aſſiſt in building a fort, and not diſcharging them at the end of three years, (for which term they were engaged) they roſe in the night, and murdered every Engliſhman they could find on the iſland. The Engliſh had purchaſed this iſland of the king of Cambodia, to whom, after this circumſtance, it again reverted. Few remains of the fort are now ſtanding, it having been for the moſt part demoliſhed.

There are ſeveral other ſmall iſlands in theſe ſeas; namely, 1. Pulo-Dinding, near the continent of Malacca, which belongs to the Dutch, where they have a fort. 2. Pulo-Timon, on the eaſtern coaſt of the peninſula of Malacca, in one hundred and five degrees forty minutes eaſt longitude, and three degrees twelve minutes north latitude. It is pretty large, covered with trees, and the vallies are very pleaſant. It is often touched at for wood, water, and other refreſhments; and there is great plenty of green turtles. 3. Pulo-Way, near the iſland of Sumatra: it is ſituated in twenty-one degrees forty-ſeven minutes eaſt longitude, and five degrees forty minutes north latitude, and is the largeſt of all thoſe which form the entrance of the channel of Achem, and is peopled by men baniſhed from Achem. 4. Puna, one hundred and twenty miles north of Patay, one thouſand degrees five minutes weſt longitude, and three degrees fifteen minutes ſouth latitude, it lies at the entrance of the bay of Guiaquil.

SECT. XI.

Treating of the ASIATIC ISLANDS under the Dominion of the Turks.

THE Turks are poſſeſſed of all the iſlands that are diſperſed about the Archipelago; but, from the rigorous government of the Ottomans, they are greatly degenerated from their priſtine opulence and importance.

We ſhall deſcribe them as they lie, beginning with thoſe ſituated to the weſtward; namely, 1. Tenedos; 2. Leſbos; 3. Careeners; 4. Chios; 5. Pſara; 6. Samos; 7. Icaria, or Nicaria; 8. Patmos; 9. Claros; 10. Leros; 11. The Mandria iſles; 12. Coos, or Stanchio; 13. Stampalia; 14. Carpanthus; 15. Iſles in the gulf of Smyrna. Thoſe ſituated to the northward, are, Rhodes and Cyprus.

1. Tenedos. This is one of the ſmalleſt in the Ægean ſea, but was greatly famed among the antients. It lies in forty degrees north latitude and ſixteen degrees eaſt longitude, exactly oppoſite to Troy, from the ſhore of which it is about two leagues diſtant, and indeed formed the Trojan harbour. The Grecians concealed their fleet behind this iſland, in order to delude the Trojans, by making them ſuppoſe that they had raiſed the ſiege, and returned to Greece. The inhabitants of this iſland were reduced to the utmoſt indigence after the fall of Troy, were at length conquered by the Perſians, and afterwards alternately ſubdued by the Lacedæmonians, Romans, and Turks.

This iſland is near twenty miles in circumference, and had formerly a conſiderable city, and two havens: it was likewiſe celebrated for a temple dedicated to Apollo Sminthius. The only antiquities now to be ſeen on this iſland are the ruins of the granaries built by the emperor Juſtinian; they were two hundred and eighty feet in length, and ninety in breadth. In this iſland is produced the beſt and moſt delicious wine in all the Levant, which is called Muſcadine, and is held in the higheſt repute both by Europeans and Aſiatics.

Tenedos is ſurrounded by rocks, and contains ſeveral towns, or rather villages, the principal of which has the ſame name, as the iſland, is inhabited by Greeks, and adorned with many fountains of white marble, being made of ſtones brought from the ruins of Troy. A ſtrong caſtle, flanked with ſquare towers, ſtands on the north of the town, cloſe to the ſea: beſides which, two round

towers, and a battery of twenty cannon, defend the haven. To the ſouth of the port there is another caſtle, which commands the harbour and town, and is conſequently of the utmoſt importance to the place. Here are ſhewn the tomb of Marpeſia queen of the Amazons, and that of the Grecian hero Achilles.

2. Leſbos; which is one of the principal iſlands of the Archipelago, is about ſixty miles from Tenedos, and near eight miles from the continent of Aſia Minor: it lies under the thirty-ninth degree north latitude, and between the twenty-ſixth and twenty-ſeventh degrees eaſt longitude, being about ſeventy miles in length, and one hundred and eighty-ſix in compaſs.

The chief cities of Leſbos were, 1. Ariſba, which was intirely deſtroyed by an earthquake. 2. Pyrrha, on the weſtern coaſt towards Greece, which met with the ſame fate, as the former, as did Hiera and Agamis.

3. Ereſſus; which was ſituated on the ſouthern promontory of the iſland, and only famous for having been the birth-place of the celebrated Theophraſtus, who ſucceeded Ariſtotle in his peripatetic academy. 4. Antiſſa, according to Strabo, was formerly an iſland of itſelf, and was called Antiſſa from being oppoſite to Leſbos, which was then known by the name of Iſſa. This city was deſtroyed by the Romans, on account of its diſſaffection to their government. 5. Methymna was the place of Arion's nativity, and in great repute for the excellent wine which the inhabitants made. 6. Mitylene, the metropolis of Leſbos. This city was not more famed for the fertility of the circumjacent country, and the uncommon magnificence of its buildings, than for the number of conſiderable perſonages to whom it gave birth, among theſe were, Pittacus, one of the ſeven Grecian ſages; Alcæus the Lyric poet; Sappho, the celebrated poeteſs; Terpandor, the muſician; Hellanicus, the hiſtorian; Callias, the critic; beſides many others. Mitylene was deemed ſo much the ſeat of the Muſes, and the centre of politeneſs, that Ariſtotle reſided in it two years, to partake of the elegant converſation of its inhabitants. After having revolted from the Romans, this city was greatly injured by the Peloponneſian war. It was afterwards deſtroyed by the Romans, and at its ſiege the famous Julius Cæſar made his firſt campaign, and greatly ſignalized his courage. Being rebuilt, Pompey reſtored it to its antient franchiſes. The emperor Trajan adorned it with many elegant ſtructures, and from his own name called it Trajanopolis.

This iſland is naturally very fertile, and was celebrated by the antients for producing in great abundance all the neceſſaries and luxuries of life. The wine in particular is excellent, and as much celebrated by phyſicians for its ſalubrity, as admired for its admirable flavour by the voluptuous.

The Leſbians in general bore ſuch an immoral character, as at length to become proverbial; for the Greek ſaying "To live like a Leſbian:" implied to live the moſt abandoned and profligate life that it was poſſible for any perſon to be addicted to.

At preſent Leſbos is but thinly peopled, and ſcarce any thing is to be ſeen but the fragments of its former magnificence: however, travellers tell us, there are ſtill one hundred and thirty ſmall villages, and ſeveral harbours, particularly Caſtri, built on the ruins of the antient Mitylene, which is ſituated on the eaſt ſide of the iſland, has an excellent port, and is defended by a ſtrong caſtle.

There is a town named Cos-dogg, which is built on a ſpot where a city antiently ſtood, called the Mounts of Ida; the inhabitants are principally Greeks; but the neighbouring mountains are infeſted by a great number of Turkiſh robbers, who are ſome of the moſt bloody and mercileſs miſcreants on earth.

The trade of Leſbos conſiſts principally of wine, grain, fruits, cheeſe, butter, pitch, &c. The duties paid to the Ottomans amount to eighteen thouſand piaſtres, and the inhabitants are computed at about twenty thouſand. The houſes at preſent are low, and meanly built, und the people miſerably poor; they are, however, as vicious as when they lived in greater affluence. Magazines are kept here, to furniſh with ſtores the Turkiſh gallies which are employed by the Porte to cruize againſt the pirates that infeſt ſome of theſe iſlands. The governor is a cadi; but the troops on the iſland are commanded by an aga of the janiſaries.

3. The Careeners, or Spalmadori iſlands, are exceedingly ſmall, and, being ſituated to the north of Leſbos, the pirates put in here to careen, the ſituation being extremely convenient for watching the ſhips that go to, or come from Conſtantinople, for the purpoſes of trade.

4. Chios, or Scio, lies in thirty-nine degrees north latitude, and twenty-ſeven eaſt longitude; the Turks call it Sakiſaduci. It is ſituated oppoſite to the coaſt of Ionia, and has a coaſt of about eighty miles in circuit, being divided into upper and lower ground, the former terminating towards the north at cape Apanomeria, and the latter towards the ſouth at cape Malico.

This iſland is mountainous and rocky, yet the plains produce corn, wine, oil, honey, fruit, and gums, though the fertility is much impeded by the great ſcarcity of water. The country is in general fertile and populous, and the inhabitants opulent. The men are well made, the women handſome, and both ſexes ſo much inclined to mirth, that they think all the time loſt that is not employed in ſinging, dancing, feaſting, revelling, gallantry, or ſome kind of merriment.

Commerce is carried on here to a great extent: but the harbour is bad, and indeed dangerous; yet the ſhips going to and coming from Conſtantinople rendezvouſe at this place; and a Turkiſh ſquadron is kept here, to protect the merchant ſhips and chaſtiſe the pirates that infeſt theſe ſeas.

The capital, Scio, is a handſome city. The houſes are elegant, and have grand terraces, and windows glazed with red and green glaſs. This city is two miles in circumference, and environed by ſeveral beautiful gardens. The inhabitants are chiefly of the Greek church, or Roman catholics, and have ſeveral churches and monaſteries, which remain unmoleſted by the Turks, who likewiſe permit them openly to profeſs their religion. The Venetians, in 1694, took Scio, and greatly embelliſhed it, but loſt it the year following.

The port and town are defended by a caſtle, which was built by the Genoeſe: the garriſon conſiſts of one thouſand four hundred men, and both fortreſs and town are not above twelve miles from the continent of Aſia, from whence they are ſupplied with proviſions, ſince the iſland, though tolerably fertile, does not afford a ſufficiency for its numerous inhabitants, and the great number of ſtrangers who are perpetually touching at the port. It is to be obſerved that Scio was one of the ſeven cities that contended for the honour of being the birth-place of Homer, and their coin formerly was ſtamped with the image of that ancient and celebrated bard.

The neighbouring people in general deem the natives of this iſland a very ſtupid and ignorant ſet of people: the Turks call them praſinios, which ſignifies ſhallow wretches; and have a proverb concerning them, which implies, that we may as ſoon expect to meet with a green horſe, as to ſee a wiſe Sciot.

There are, in this iſland, thirty villages, three hundred churches, two thouſand Latins, ten thouſand Turks, and one hundred thouſand Greeks. In time of peace, it is governed by a cadi, with a ſtipend of five hundred aſpers per day; but in war time a baiſa is ſent from Conſtantinople, to take upon him the ſupreme command. The Greek biſhop is immenſely rich, having, beſides the above-mentioned three hundred churches, many chapels and monaſteries under his juriſdiction; the chief of the latter, called Neamoni, or New Solitude, is about five miles from Scio, contains one hundred and fifty monks, and pays to the government five hundred crowns annually, which it can well afford, its yearly revenue being an eighth part of the produce of the whole iſland, amounting to fifty thouſand crowns.

Their ſtaple commodity is gum maſtich, gathered in Auguſt and September; at which ſeaſon the officer who goes to receive the grand Signor's quota, is entertained in a very ſumptuous and feſtive manner by the people.

The moſt conſiderable towns of the iſland, next to the capital, are the following: Callimacha, the chief maſtich town; it contains ſix churches, which have thirty ſubordinate chapels and a nunnery belonging to them. 2. Pergi, which contains a caſtle, thirty churches, and two thouſand inhabitants. 3. Meſta, famous for the nectar wine which its neighbouring vineyards produce. 4. Armolia, a maſtich town, defended by a ſtrong caſtle. 5. Voliſta is famous for its ſilk manufactory; it contains three hundred houſes, one thouſand five hundred inhabitants, and is defended by a caſtle erected by the celebrated Beliſarius, who experienced a moſt aſtoniſhing reverſe of fortune, having been reduced to the condition of a public beggar, from being one of the moſt glorious conquerors. 6. St. Helena is ſituated on a rock, and contains two churches, a chapel, and about two hundred inhabitants. 7. Cambia has a caſtle upon a rock, and is celebrated for its pines, with which the Turks build many gallies, and for a hot medicinal ſpring. 8. Cardamita; ſituated in a very rich territory, which in particular produces annually

one

one hundred and ſeventy tons of excellent wine; many coins of Conſtantine the Great have been dug up in the neighbourhood; and a ſpring of water iſſues from a rock at no great diſtance, which in its fall forms a beautiful caſcade. This town was antiently famed for the temple of Neptune near port Dolphin, the ruins of which are yet to be ſeen.

The natives of this iſland, while under the dominion of the Venetians and Genoeſe, were permitted to be governed by their own laws; but ſince the Turks conquered it, the poor people are both deſpiſed and oppreſſed by them.

5. Pſara is a very ſmall iſland to the weſtward of Chios, and remarkable for nothing but a breed of aſſes, who die immediately after being carried from the iſland, but are exceeding ſtrong, hardy and long-lived, while they remain in their native place. Near this iſland are ſome ſmaller ones, called Careeners, which, like thoſe already mentioned, are frequented by pirates who interrupt the trade.

6. Samos, at the diſtance of forty miles from Chios, and oppoſite to the ſouth coaſt of Ionia, lies in thirty-ſeven degrees north latitude, and twenty-ſeven eaſt longitude. It is about eighty miles in circumference, and the ſee of an archbiſhop; but this prelate is exceedingly poor, for he is obliged annually to pay ſo large a ſtipend to the court of Conſtantinople, that he ſcarce leaves himſelf any thing. It was formerly a commonwealth; and is naturally ſo fertile, that when Greece was at the ſummit of her glory, it was deemed, though leſs than many, of as much importance as any of the iſlands of the Archipelago. The trade at preſent conſiſts of ſeveral ſorts of wines, which are admirable, a ſuperior kind of onions and garlick, fine earthen ware, raw ſilk, oil, honey, ſaffron, fruits, drugs, minerals, emery, oker, and black dye, &c. Notwithſtanding the natural richneſs of this iſland, the natives are ſo much oppreſſed by the Turks, and plundered by the pirates, who infeſt the coaſt, that they are in general very miſerable and indigent.

There are about twelve thouſand inhabitants in this iſland, which are principally Greeks; the capitation tax which they pay amounts to about ſix thouſand four hundred crowns, and the cuſtoms are farmed at ten thouſand more. The governor, who is an aga of the janiſſaries, collects about as much again for himſelf, and makes him likewiſe heir to every Greek who dies without male iſſue, taking money, houſe, goods, and indeed every thing but the garden, which is left to the quiet poſſeſſion of the daughters.

This iſland abounds with wild fowls, ſuch as partridges, woodcocks, ſnipes, thruſhes, wood-pigeons, turtle-doves, and wheat-ears; beſides which, their poultry are excellent; they have iron mines, and moſt of the ſoil is of a ruſty colour: they have alſo emery ſtone, and all the mountains are of white marble.

The Greek monks are two hundred in number: and are ſo extremely ignorant, that their whole knowledge of religion conſiſts in being able to ſay maſs by rote: they have a biſhop who reſides at Cora. The women are very naſty and ugly, and never ſhift above once a month: they are cloathed in the Turkiſh manner, except a red coif, and their hair hanging down their backs, with plates of ſilver, or block tin faſtened to the ends.

Samo, the chief town, which, as well as the iſland itſelf, the Turks call Suſſan, is now reduced to a poor village: and, to add to its wretchedneſs, the pirates frequently plunder it, but the noble fragments of its antient ſplendor, which ſtill remain, excite at once admiration and grief in the ſpectator.

The other towns are, 1. Vati, the reſidence of the French vice conſul; this, though formerly a ſplendid city, is now only a mean village, containing about three hundred miſerable houſes, and a few wretched inhabitants; but though they poſſeſs not worldly wealth, they appear rich in the moſt valuable of all treaſures, contented minds. 2. Cora, which contains about ſix hundred houſes; but, ſince it was plundered by the Venetians, many of them are gone to ruin, and more are uninhabited. A cadi and an aga of the janiſaries are obliged by the porte to reſide here, notwithſtanding the unwholeſomeneſs of the air, occaſioned by the putrid waters that ſurround the place, which are now ſtagnant, though they freely flowed to the ſea in antient times. The reſt of the towns are as much or more miſerable; and, upon the whole, the iſland contains little elſe than ſcenes that are ſhocking to the imagination of the beholder. It was, however, celebrated in hiſtory, for having been the birth place of that admirable philoſopher Pythagoras, who afterwerds removed to Crotona.

Among other things, the city of Samos was remarkable for a noble temple built to the honour of Juno; it was formerly a very magnificent city, as we may judge from its ruins, which are ſtill ſuperb monuments of its ancient grandeur.

7. Nicaria, or Icaria, is about ſeventy miles in circumference, and rocky, mountainous, and barren: it lies in thirty-ſeven degrees thirty minutes north latitude, and twenty-ſix degrees thirty minutes eaſt longitude. It has no harbour for ſhipping, and conſequently muſt be without commerce. The Samians ſay, that when the two iſlands were made, all the good materials were exhauſted in making Samos, and that nothing but the rubbiſh remained for Nicaria. Some negative benefits, however, ariſe to the natives from theſe diſadvantages, for the Turks do not think it worth their while to oppreſs them, nor the pirates to plunder them of their little property.

The inhabitants are about three thouſand in number: they have wine, which is but indifferent; ſheep, goats, and aromatic herbs. They row their boats, and do other work quite naked, for fear of wearing out the few cloaths, they are able to procure. They are of the Greek communion, have a kind of biſhop, twenty-four prieſts, and a few chapels.

A ridge of mountains runs through the whole iſland: they are covered with wood, and ſupply the country with ſprings. The people are ſtrong and well made, but, ill-favoured and naſty; they are exceedingly lazy, of ſavage diſpoſitions, and ſpeak a moſt barbarous dialect of the Greek.

8. Patmos lies between Nicaria and Samos, in thirty-ſeven degrees twenty minutes north latitude, and twenty-ſix degrees forty-five minutes eaſt longitude, and is only about eighteen miles in circumference; nevertheleſs, it has ſeveral convenient harbours, which give it an advantage over many other of the Levant iſlands. De la Scala, its principal port, is deemed the very beſt in the Archipelago. Sapſila and Cricon are likewiſe excellent harbours; but they are all terribly infeſted by pirates, which has obliged the inhabitants of Sapſila to evacuate the town, and retire up a neighbouring hill to the monaſtery of St. John, which is at once a religious houſe and fortreſs, has an annual revenue of ſix thouſand crowns, and maintains one hundred monks. Though the uſe of bells are prohibited in all other parts of the Turkiſh dominions, yet the monks of this monaſtery are permitted to have two large ones.

The whole iſland is very barren, and without wood: however, it abounds with partridges, rabbits, quails, turtles, pigeons, and ſnipes. All their corn does not amount to one thouſand barrels a year. There are ſcarce three hundred men in the iſland; but then there are twenty women to one man, who expect that all ſtrangers, who land here, ſhould carry ſome of them away; theſe latter are good tempered and handſome, but ſpoil their faces by uſing a prodigious quantity of paint.

This is the iſland to which St. John the evangeliſt was baniſhed by the Romans, and where, it is ſuppoſed, he wrote his revelation; and, to his memory, there is an hermitage on the ſide of a mountain, the entrance to which is hewn out of a ſolid rock, and leads to the chapel, which is almoſt forty-four feet long, fifteen broad, and is covered with a gothic roof. Over-head they ſhew ſtrangers a chink in the rock, through which they tell you that the Holy Ghoſt dictated to St. John. The management of the iſland is committed to the care of two Greek officers, as no Turks reſide upon it. The taxes produce about ten thouſand crowns annually. The houſes are neater than thoſe of moſt of the other iſlands; and the chapels are well built arched, and about two hundred and fifty in number.

9. Claros, which is about forty miles in circumference, lies very near Patmos: it is mountainous, has two ſea ports, a town, and a caſtle, to which it gives name, yet was never famous for any thing but a magnificent temple dedicated to Apollo, and was on that account celebrated by the poets.

10. Leros, Lerio, or Oleron, lies to the ſouth of Patmos and north of Claros, is eighteen miles in circumference, and produces abundance of aloes: Greeks and Turks inhabit it, but are not numerous It contains but one ſmall town, a few ſcattered hamlets, and a ſmall number of monaſteries. Upon a hill are ſome noble ruins, in particular about twenty ſuperb marble pillars that remain intire, and which are perhaps the remnants of the temple of Diana, on whoſe account this iſland was famous. This iſland, according to ſome authors, was remarkable for the birth of Patroclus.

11. The Mandria iſlands are to the eaſtward of Leros; the center iſland is by far the largeſt, but none of them are inhabited, except by the pirates that infeſt thoſe parts, who are ſome of the moſt cruel and ſavage wretches exiſting, murdering the crews of all the ſhips that fall into their power.

12. Stanchio.

12. Stanchio, or Coos, lies in thirty-six degrees forty minutes north latitude, and twenty-seven degrees thirty minutes east longitude, is opposite to the coast of Doris, eighty miles from Samos, seventy in circumference, has a fruitful soil, and towards the east gradually rises into mountains; it is rich in pasture, wines, fruit, turpentine, cypress, medicinal and other plants, &c.

The capital, Cos, is spacious, populous, well built, and strongly fortified: it is situated on the eastern coast, and was formerly famous for a superb temple of Æsculapius, as the island itself was for the birth of the celebrated Hippocrates, whose house is still shewn in the town of Harangues; but both these celebrated physicians owed their fame more to their recommending temperance, than to any of the medicines they discovered or prescribed.

This island was celebrated for some light garments manufactured here, and called vestimenta coa: but was still more remarkable for the statue of Venus, made here by Apelles, who was a native of this little island; and hence the notion of Venus's rising out of the sea originated. This admirable piece of workmanship was first lodged in a stately temple, but Augustus carried it to Rome; and to make the superstitious people some amends for its loss, their tribute was intirely remitted. The harbour is good, and well secured from the depredations of the pirates that infest these seas.

13. Stampalia is sixty miles in circumference, and lies about forty miles from the coast of Anatolia, has a town of its own name on the south coast, two harbours, and was antiently celebrated for its temple of Apollo. It is very thinly inhabited; but has a church or two, subject to a bishop.

14. Carpanthus, or Scarpanto, lies on the south coast of Doris, between Corale and Rhodes, in thirty-five degrees forty-five minutes north latitude and twenty-seven degrees forty minutes east longitude, it antiently gave name to the Carpanthian sea. It is near eighty miles in circumference, but is mountainous, barren, and but thinly inhabited. It has no town, except Scarpanto, whose harbour is tolerable, but terribly infested by the pirates.

15. The islands in the gulf of Smyrna, are five in number, small and uninhabited: one is called Long Island, or Isola de Eglere, that is Church Island; it is ten miles long, rather narrow, and contains the ruins of a magnificent temple. Another of them, the Greeks say, formerly contained many elegant buildings, of which no vestiges are at present left, except an apartment supported by four pillars, the whole being cut out of the solid rock; from this island a causeway formerly joined to the main land, but it is now intirely ruined. Some have imagined this to be the Clazomene of the antients, but we cannot determine on the propriety of this conjecture.

16. Rhodes is situated seventy-five miles east from Candia, eight from the Lycian coast, is about one hundred and twenty in circumference, and extends from thirty-five degrees fifty minutes to thirty-six degrees thirty minutes north latitude, and from twenty-eight degrees twenty minutes to twenty-eight degrees forty-four minutes east longitude. It has formerly gone under the names of Asteria, Ethræa, Corymbia, and many others; as for the name of Rhodes, some are of opinion that it was so called by the Grecians from the abundance of roses the soil produces, Rhodes in that language signifying a rose. While the poets feign it received this name from Rhoda, one of the daughters of Apollo by Venus. The chief town is called by the same name, and was always esteemed a place of strength: it is situated on the north-east part of the island, having a tolerable good harbour, and as some say three harbours, but two of them will receive only very small vessels: the city stands part of it on the rising of a hill, and is three miles in circumference, the streets broad, straight and well paved, and the largest is paved in the middle with marble from one end to the other. In this street are still to be seen the apartments of the knights of St. John of Jerusalem, and the palace of the grand master, but very much decayed: for as the Turks did not demolish them upon their taking the place; so neither will they do any thing towards the repairing of the most beautiful buildings whatever: the grand master's palace is seated on the highest part of the hill, now converted into a prison for the chams of Tartary, whom the Grand Signor banishes hither when he depose them, and he has almost always one of the royal family of that prince here to set up against him if he disputes his orders: the church of St. John, which adjoins to that palace, is now a mosque: the city is defended by three walls, and as many ditches, and esteemed one of the strongest fortresses in the Sultan's dominions: the inhabitants consist of Turks, Jews, and Christians, but the Christians have only shops within the walls, and are obliged to have their dwellings without the city, whither they retire every night. Lindus and Camirus were antiently considerable towns in the island; but we do not find there any worth observation at present, except Rhodes. The houses are elegantly built in the Italian taste, and the markets well supplied with all kinds of provisions. This city was formerly celebrated for the learning and politeness of its inhabitants; but at present literature meets here with the same treatment that it does in all other parts of the Turkish dominions.

The air of this island is very healthful, and the country exceeding pleasant, cloathed with trees and herbage always green, and a day scarce ever happens, it is said, wherein the sun does not shine upon them; their wines are much admired, and the country affords such plenty of all things besides, which can render life agreeable, that it gave occasion to the fiction of golden showers. Indeed they do not abound in corn, but then they are well supplied with it from the neighbouring continent of Natolia.

At the mouth of the harbour of Rhodes, which is fifty fathoms wide, it is said, stood that great colossus of brass, esteemed one of the wonders of the world: one foot placed on one side of the harbour, and the other upon the other, so that ships passed in between the legs of it: the face of colossus represented the sun, to whom this image was dedicated; the height of it was seventy cubits, and every part proportionable, the thumb being as thick as a man could grasp in his arms, and every finger of the size of an ordinary statue, and it carried in one hand a lighted house for the direction of vessels into the harbour: this prodigious statue was thrown down by an earthquake, fifty or threescore years after it was erected, and lay there till the Saracens made themselves masters of Rhodes, who having beat it to pieces, fourteen hundred years after the making of it, sold it to a Jew that transported it to Egypt, and there loaded nine hundred camels with the brass. Chares of Lyndus, a town in the island of Rhodes, is reported to have been the statuary who framed this mighty image, which he was twelve years in making.

The principal manufactures are soap, tapestry, and camblets; but the city is a mart for all the commodities and productions of the Levant; yet Rhodes is kept merely in opposition to the Christians, as it does not remit any thing to the Grand Signor, the Turkish bassa being allowed the whole of its revenues to maintain the gallies, the garrison, and himself.

When this island was attacked by the Greeks, the Rhodians called in the Romans to their assistance; who drove away the Rhodians enemies, and, according to their usual custom, repaid themselves for their trouble, by seizing their country, and making bold with the property of the natives; after which it underwent many revolutions, being taken by the Venetians in 1124. The Turks conquered it in 1283, but were driven out of it by the knights of St. John of Jerusalem in 1308; however, Soliman the Magnificent attacked it with an army of two hundred thousand men and three hundred ships, and took it, January 1, 1523, after the Rhodians had lost ninety thousand of their men, and the Turks a much greater number. After this misfortune most of the Rhodians quitted their country, so that the island became in a manner depopulated; the Turks, however, shewed so great respect to the knights of Rhodes, that they suffered them to keep their houses, effects, coats of arms, statues, inscriptions, &c. and granted very considerable privileges to such as would come and settle there, which drew back some of the Rhodians, and many of the Greeks; so that Rhodes at present is as populous and flourishing as Turkish tyranny will permit any place to be that is under the dominion of the Ottomans.

17. The island of Cyprus is situate in the most easterly part of the Levant between the thirty-fourth and thirty-sixth degrees of north latitude, and between thirty-three and thirty-six east longitude, sixty miles south of the coast of Caramania or Cilicia, thirty west of the coast of Syria, and about three hundred miles to the eastward of Candia, and is supposed to have obtained the name of Cyprus, from the great number of cypress trees, which flourish here. The island stretches from the south-west to the north-east, being about an hundred and fifty miles in length, and seventy in breadth in the broadest part, but much wider on the south-west, than on the north-east. The chief town is Nicosia, the capital of the island, being at present the seat of the bassa or viceroy, and formerly the residence of their kings. It stands near the middle of the country, and is about three miles in circumference,

but

but much fallen to decay ſince it has been in the power of the Turks. The cathedral which went by the name of St. Sophia is converted into a Turkiſh moſque; there are however ſeveral churches and chapels in it, which are allowed to the Greeks, Latins, Armenians, Neſtorians, and Maronites. This city is of a circular form, ſurrounded by walls, and is well fortified, and defended by a deep ditch. The Greek archbiſhop reſides in it, whoſe ſuffrages are the biſhops of Famaguſta, Paphos, Larneza, and Cerenes.

Next to the capital, the following are the principal places; namely, 1. Famaguſta, or Arſinoe; which is an elegant city, and good ſea-port, pleaſantly ſituated, and defended by two forts: it is incloſed on two ſides by a ditch, and double wall well fortified; and on the other two by the ſea. The Turks are ſenſible of the importance of this place, and contrary to their uſual cuſtom, keep the fortifications in excellent repair. The governor of this city is accountable only to the Ottoman Porte, not being ſubordinate to the baſſa of the iſlands. The Greeks and other Chriſtians are only permitted to keep ſhops here in the day time, but are not allowed to ſleep in the city. 2. Larneza is a good ſea port town, in which the French and Venetians have a conſul; the houſes are, however, low and mean, and the inhabitants compoſed of Turks, Greeks, and ſome Europeans. The commodities are cotton, cotton yarn, wool, &c. 3. Cerenes, the antient Ceraunia, is almoſt in ruins, though formerly a ſtrong and populous place. People depart from hence to the continent, as the neareſt port. The palace of Peace, a magnificent edifice, formerly belonging to the knights, is near this city; and at about nine miles diſtance there is a Greek monaſtery, the monks of which have cells along the ſea coaſt, where they depoſit the fiſh which they are employed to catch for the uſe of the brotherhood. 4. Limiſſo; this is now nothing but a mere village, though it remains a biſhop's ſee; and the ſituation of the antient city of Amatheus is not at preſent known. 5. Paphos, now called Baffa, is ſituated on the weſtern coaſt of the iſland. Though much decayed from its former glory, it is ſtill a biſhop's ſee, and a good ſea-port town. In antient times it was much celebrated for its magnificent temple dedicated to Venus, from which the goddeſs of love was called the Paphian Venus. In this city St. Paul converted its governor Sergius, and ſtruck the necromancer Barjeſus with blindneſs, Acts xiii. 6.

This iſland was formerly divided into twelve diſtricts, each containing a large city, and the whole including eight hundred villages. It is, as we before obſerved, governed by a baſſa, ſubordinate to whom are five ſangiacs, namely, Itchili, Alaine, Cyprus, Schis, Tarſus; and theſe have again under them forty ziamets and one hundred and ſixty-ſeven timariots. The inhabitants were formerly deemed ſome of the moſt lewd and debauched people in the univerſe; and, according to the moſt authentic accounts, their inclinations are as depraved as ever; but the Turkiſh government compels them to a more reſerved behaviour, and at leaſt obliges them to act with an outward appearance of decency. The preſent inhabitants are chiefly Greeks, who dreſs after the Italian faſhion, but retain their own religion and cuſtoms.

The natives of Cyprus were converted to Chriſtianity by St. Paul and St. Barnabas, the latter of whom was a native of Cyprus. It gave birth to the poet Aſclepiades, Xenophon, Zeno, Apollonius, the famous biſhop of Epiphanius, and ſeveral other great men.

There are no conſiderable rivers in this iſland; but ſome famous mountains, particularly Olympus, which is of an aſtoniſhing height and extent. On this mountain, at the diſtance of every league, there is a Greek monaſtery, and a fountain ſaid to be erected by the empreſs Helena, the mother of Conſtantine the Great. Hardly any veſtiges remain of the antient city of Salamis, formerly celebrated for its temple of Jupiter, who was here repreſented by an image armed with thunder and lightning.

Cyprus was formerly populous and opulent, but at preſent is poor and thinly inhabited, which is chiefly owing to two cauſes, viz. the oppreſſive nature of the Turkiſh government; and the ſwarms of locuſts which for ſome ages paſt have infeſted it, to the frequent deſtruction of the produce of the earth. The ſoil produces all kinds of grains: their wines, oil, ſugar, cotton, honey, ſaffron, wood, metals, minerals, plants, drugs, flowers, &c. are all excellent in their kinds. Their wool and cotton manufactures are the beſt in the eaſt, but the ſilk is very indifferent. All the ſugar canes in the iſland were deſtroyed by one of the Turkiſh baſſas; the people, however, have a great traffic in a delicious bird, which they catch in the month of September and October, and pickle in vaſt quantities to export to Venice, where they are much prized, and purchaſed by the voluptuous at a high price.

This iſland, like moſt others, was at firſt governed by ſeveral petty ſovereigns or heads of families, who were afterwards brought under the dominion of the Egyptians, and next of the Phœnicians their neighbours; at leaſt each of theſe nations had their colonies here upon the ſea coaſt, and kept the inland natives in ſubjection to them: Cyrus the Perſian emperor afterwards invaded the iſland, which he found under the dominion of nine ſeveral ſovereigns, whom he ſuffered after his conqueſt to retain the name and authority of kings, (the firſt of whom was Cinyras, brother of Pygmalion) but obliged them to pay an annual tribute. Alexander the Great, next made a conqueſt of it, and in the diviſion of his empire it fell to the ſhare of Ptolemy king of Egypt, under whoſe ſucceſſors it remained till the Romans caſting an eye on the wealth of the country, without any other colour for invading it, ſent Porcius Cato to reduce it under their power, which he effected, bringing back with him to Rome the ſpoils of the iſland, which amounted to ſeven thouſand talents: the Saracens afterwards plundered it, but it returned to the obedience of the Greek emperors again, to whom it fell on the diviſion of the empire. About the year 1191, Richard I. king of England, putting in here for freſh water in his voyage to the Holy Land, met with a very unhoſpitable reception, whereupon he ſubdued the iſland, and transferred his right to it, to Guy Luſignan the titular king of Jeruſalem, in whoſe family it remained till the year fourteen hundred and twenty-three; when the ſultan of Egypt invaded the iſland, taking John the king priſoner, whom he admitted to ranſom for a great ſum of money, and permitted him to enjoy his kingdom again, under a tribute of forty thouſand crowns per annum, and about the year 1473, one of theſe tributary princes made the ſenate of Venice his heir, who held it about an hundred years, under the like tribute. When Selimis the Turkiſh emperor, as ſovereign of Egypt, claimed a title to Cyprus, and his grand vizier Muſtapha, ſitting down before the city of Famaguſta, then the ſtrongeſt town in the iſland, obliged the governor Seignior Brigandino to ſurrender upon honourable terms in the year 1570.

SECT. XII.

Containing a Deſcription of NEW HOLLAND, NEW GUINEA, and other Iſlands lately diſcovered.

THE iſland of New Holland is ſuppoſed to be the largeſt in the univerſe, being two thouſand miles long, and its ſquare ſurface exceeds that of Europe. The north-weſt and ſouth-weſt coaſts were diſcovered by the Spaniards in the ſeventeenth century, but captain Cook was the firſt who ſaw the eaſt coaſt, which was in 1770. The ſouthern parts are low and level; the northern parts hilly, but diverſified with woods and lawns. There are but two ſorts of timber trees: the largeſt is the gum tree, which grows all over the iſland: it yields a deep red gum, and the wood is heavy, hard, and dark coloured, like the lignum vitæ, with narrow leaves like thoſe of the willow. The other grows tall and upright, reſembling the pine, ſomething like the live-oak of America. The wood alſo of this tree is hard and heavy. Beſides theſe, there are trees having a ſoft bark, eaſily peeled off, the ſame that is uſed for caulking of ſhips in the Eaſt Indies. Here are palms of three ſorts, a kind of cherry-tree, a ſort of fig plum trees, trees with a red apple, margroves, ſhrubs, a ſtrong bearded graſs, plants of various kinds, &c.

There are ſeveral ſorts of quadrupeds, but, as they could not be caught, no deſcription can be given of them. They ſeem to be of the wolf, pole-cat, and weazel kind. There are goats, but no tame animals, except dogs. They have the opoſſum, a creature with a membranous bag near the ſtomach, in which it conceals and carries its young, when apprehenſive of danger. They have alſo a remarkable animal, about the ſize of a ſheep, called a kanguroo, ſome of which weigh upwards of eighty pounds, and are not bad eating, reſembling the fleſh of a hare, but better flavoured. Here are birds of various kinds, innumerable inſects, and abundance of fiſh of various ſorts.

The complexion of the people is chocolate colour, their features tolerable, their teeth white and even, and their hair, though they ſinge it ſhort, is naturally long and black, and generally ſtraight with a ſlight curl at bottom. Their hair is in general matted and ſleek, but without oil

or greaſe; and, though they ſeldom comb it, find a method to keep it free from vermin.

The ſtature of the men is of the middle ſize, but ſlender, and their bones ſo ſmall, that a common hand may ſpan their ancles and their arms above their elbows; and in general they are clean-limbed and remarkably vigorous, active, and nimble. Their beards are of the ſame colour with their hair, and alſo buſhy and thick, it never being ſuffered to grow long.

The people in general go naked, without the leaſt ſenſe of indecency; they are not, however, without their ornaments, the principal of which is a bone five or ſix inches long, and as thick as a man's finger, which they thruſt through the ſeptum of their noſes: it reaches quite acroſs the face, and ſo effectually ſtops up the noſtrils, that the wearer, when he ſpeaks, ſnuffles ſo as ſcarce to be underſtood, and is obliged to keep his mouth conſtantly open, in order to breathe freely: the ſailors, in humour, call it their ſprit ſail yard. They wear alſo necklaces made of ſhells, bracelets of ſmall cord round the upper part of their arms, and a ſtring of human hair plaited and tied round their waiſt; and ſome were ſeen with large gorgets of ſhells hanging on the breaſt, and a few women had feathers on their heads, ſtuck on with gum. They paint themſelves red and white, and duſt their faces with a white powder. The red is generally laid on in broad patches upon the breaſt and ſhoulders, and the white in ſtreaks, one round their thighs, two below their knees, one like a ſaſh over their ſhoulders, and another acroſs their foreheads. They have holes alſo in their ears, but no ornaments were ſeen in them. On their bodies were obſerved large ſcars in irregular lines, apparently made by ſome blunt inſtrument, probably as memorials of grief for the dead.

They have very mean huts, like hovels, ſcarce big enough to hold their families, and here they make fires, with which they are almoſt ſmoke-dried. Their utenſils are a veſſel made of bark, to hold water, and a bag, made like a cabbage-net, to carry their whole property, which conſiſts of paint, fiſhing-hooks, darts, and bracelets. They feed principally on vegetables and fiſh. To produce fire, they take two pieces of ſoft, dry wood, one a round ſtick of about eight or nine inches long, the other piece flat: one end of the round piece they ſhape into an obtuſe point, and make a hole in the flat piece. In this hole they twirl the end of the ſtick between their hands, as we do a chocolate mill, preſſing it down in the hole, till it fires. By this method they get fire in leſs than two minutes, and, from the ſmalleſt ſpark, they encreaſe it with aſtoniſhing ſpeed. They will wrap up a ſpark in a little dry graſs, which, by moving, will be fanned into a flame. Thus a man will run on for miles, and, without any viſible fire in his hands, will at every fifty or a hundred yards, ſtoop down and leave fire behind him. One of their methods of annoying their European viſitors, whom they conſider as enemies, was, by ſetting fire to the high graſs in the neighbourhood of the place where the tents were fixed, which, being dry as ſtubble, burnt with amazing force, and did a great deal of miſchief in its progreſs.

Spears and lances of different kinds, are among their weapons; ſome with four prongs, pointed with bone and barbed; the points of which are covered with a hard reſin, which gives them a poliſh, and facilitates their entrance into the object they ſtrike: others with only one point, and ſome barbed all the way up the ſhaft. They throw theſe with a throwing ſtick. They have likewiſe bows and arrows, an oblong ſhield, and a ſword reſembling a ſcymitar. Some of their weapons had a chiſſel fixed at their ends, but of what ſubſtance they were framed, could not be learnt.

To the ſouthward of New Holland, the canoes are made of one piece of bark, about twelve feet long, tied up at the ends, and ſpread open in the middle by two ſticks. In ſhallow water, they puſh them on by a pole, and in deep water by paddles, two of which they uſe at a time. More to the northward they are made of the trunk of a tree, fourteen feet long, hollowed out by fire. They are in general very narrow, and furniſhed with an outrigger, to prevent their overſetting. Four people are the moſt they will carry.

With reſpect to their tools, the only ones ſeen among them were, an adze made of ſtone, wedges of the ſame, wooden mallets, and a few ſhells and pieces of coral. They make uſe of the rough leaves of a wild fig (which anſwers the purpoſe of ſhave graſs, for poliſhing.

Theſe people have no idea of traffic, nor could any be given them; for all the ſigns made to them, deſcribing a return for things preſented to them, were fruitleſs: they did not ſeem to underſtand them. This indifference with reſpect to buying, kept them honeſt: they never attempted to purloin any thing, but, if refuſed what they wiſhed for, they attempted to take it by force. They ſeemed to ſet no value upon any thing that was given them, for, like play things given to children, they pleaſed only while they were new. Nor do they ſeem to have any curioſity; for though walking on the ſea ſhore, in ſight of the ſhip, a wonderful machine they had never ſeen before, ſcarce one caſt an eye towards it, though numbers trudged along the ſhore. They introduce into company as the Engliſh do, by their names.

We cannot truly aſcertain whether they are brave or not: they made ſome oppoſition to the ſhip's crew on landing, but they were ſoon intimidated by the fire arms, as a few pieces fired with ſmall ſhot preſently diſperſed them, and, after the firſt conteſt, they would never come near enough to parley: ſo that the Europeans could by no means form the leaſt connection with them. How it happens that there are ſo few inhabitants, is not eaſy to deviſe: whether they are deſtroyed by each other in conteſts for food, whether ſwept off by famine, or their increaſe prevented by any particular cauſe, cannot be at preſent determined. That they have wars amongſt them, is evident by their weapons; but what gives riſe to theſe wars, or what is the conſequence of them, we cannot determine.

In confirmation of what has been related above, and for the farther ſatisfaction of our readers, we ſhall add the following remarkable particulars: when captain Cook firſt landed at Botany Bay (thirty-four degrees ſouth, one hundred and fifty-two degrees thirty-ſeven minutes eaſt) ſo called from the great quantity of plants which the gentlemen collected there, two of the natives came down, each armed with a lance about ten feet long, and a ſhort ſtick which appeared to be uſed as a machine to aſſiſt him in throwing it. They ſeemed determined to defend their coaſt, though the party that landed were forty in number. "I could not," ſays captain Cook, "but admire their courage, and being very unwilling that hoſtilities ſhould commence with ſuch inequality of force between us, I ordered the boat to lie upon her oars. We then parlied by ſigns for about a quarter of an hour, and, to beſpeak their good will, I threw them nails, beads, and other trifles, which they took up, and ſeemed to be pleaſed with. I then made ſigns that I wanted water, and, by all the means that I could deviſe, endeavoured to convince them that we would do them no harm. They now waved to us, and I was willing to interpret it as an invitation: but upon our putting the boat in, they came again to oppoſe us. One appeared to be a youth about nineteen or twenty, and the other a middle aged man. As I had no other recourſe, I fired a muſket between them. Upon the report, the youngeſt dropped a bundle of lances upon the rock, but, recollecting himſelf in an inſtant, he ſnatched them up again with great haſte. A ſtone was then thrown at us, upon which I ordered a muſket to be fired with ſmall ſhot, which ſtruck the eldeſt upon the legs, and he immediately ran to one of the houſes, which was diſtant about one hundred yards.

"I now hoped that our conteſt was over, and we immediately landed: but we had ſcarcely left the boat, when he returned; and we then perceived that he had left the rock, only to fetch a ſhield or target for his defence. As ſoon as he came up, he threw a lance at us, and his comrade another, they fell where we ſtood thickeſt, but happily hurt nobody. A third muſket was then fired at them; upon which, one of them threw another lance, and both immediately ran away. If we had purſued, we might probably have taken one of them; but Mr. Banks ſuggeſting that the lances might be poiſoned, I thought it not prudent to venture into the woods. We repaired immediately to the huts, in one of which we found ſome children, who had hidden themſelves behind a ſhield and ſome bark: we peeped at them, but left them in their retreat; without their knowing that they had been diſcovered; and we threw into the houſe, when we went away, ſome beads, ribbons, pieces of cloth, and other preſents, which we hoped would procure us the good will of the inhabitants when they ſhould return: but the lances we found lying about, we took away with us, to the number of about fifty. They were from ſix to fifteen feet long, and all of them had four prongs in the manner of a fiſh-gig, each of which was pointed with fiſh-bones, and very ſharp. We obſerved that they were ſmeared with a viſcous ſubſtance of a green colour, which favoured the opinion of their being poiſoned, though we afterwards diſcovered that it was a miſtake: they appeared, by the ſea-weed that was found

found ſticking to them, to have been uſed in ſtriking fiſh. Upon examining the canoes that lay upon the beach, we found them to have been the worſt we had ever ſeen. They were between twelve and fourteen feet long, and made of the bark of a tree in one piece, which was drawn together, and tied up at one end, the middle being kept open by ſticks, which were placed acroſs them from gunwale to gunwale as thwarts.

" Here was ſeen a tree, the fruit of which in colour and ſhape, reſembled a cherry. There are but two kinds of timber wood here, both of which are as large, or larger than the Engliſh oak, and one of them has not a very different appearance. This is the ſame that yields the reddiſh gum like ſanguis draconis, and the wood is heavy, hard, and dark coloured, like lignum-vitæ. The other grows tall and ſtraight, ſomething like the pine; and the wood of this, which has ſome reſemblance to the live-oak of America, is alſo hard and heavy. There are a few ſhrubs, and ſeveral kinds of the palm; mangroves alſo grow in great plenty near the head of the bay. The country in general, as far as it was obſerved, is level, low, and woody. The woods abound with birds of exquiſite beauty, particularly of the parrot kind: here are alſo crows, exactly the ſame as thoſe in England. About the head of the harbour, where there are large flats of ſand and mud, there is great plenty of water fowl, moſt of which are ſpecies intirely unknown. One of the moſt remarkable was black and white, much larger than a ſwan, and in ſhape ſomewhat reſembling a pelican. On theſe banks of ſand and mud there are great quantities of oyſters, muſcles, cockles, and other ſhell fiſh, which ſeem to be the principal ſubſiſtence of the inhabitants, who go into ſhoal water with their little canoes, and pick them out with their hands. They were not obſerved to eat any of them raw, nor do they always go on ſhore to dreſs them, for they have frequently fires in their canoes for that purpoſe. They do not, however, ſubſiſt wholly upon this food, for they catch variety of other fiſh, ſome of which they ſtrike with gigs, and ſome they take with hook and line.

" All the inhabitants were ſtark naked; they did not appear to be numerous, or to live in ſocieties, but, like other animals, were ſcattered about along the coaſt, and in the woods. Of their manner of life, little is known, as no connection was formed with them, for they never would come near enough for a parley; nor did they touch a ſingle article of all that was left at their huts, and the places they frequented, on purpoſe for them to take away. At the ſight of theſe Indians, Tupia, with an air of ſuperiority and compaſſion, ſhook his head, and ſaid, that they were taata enos, " poor wretches." A midſhipman, who had ſtraggled alone into the country, ſaw an old man and woman, and ſome little children; they were both greyheaded with age; the hair on the man's head was buſhy, and his beard long and rough; the woman's hair was cropped ſhort, and both were ſtark naked.

" More to the northward is Hervey's Bay, in which was found a true mangrove, ſuch as grows in the Weſt Indies, and the firſt of the kind met with in theſe ſeas. In the branches of this mangrove were many neſts of a remarkable kind of ant, as green as graſs. When the branches were diſturbed, they came out in great numbers, and puniſhed the offenders by a much ſharper bite than the ſame kind of animal is elſewhere known to give. Upon theſe mangroves were alſo ſeen ſmall green caterpillars in great numbers: their foreheads were thick ſet with hairs, and they were ranged upon the leaves, ſide by ſide, like a file of ſoldiers, to the number of twenty or thirty together. On touching them, the hair on the bodies was found to have the quality of a nettle, and gave a much more acute, though a leſs durable pain. More northwardly was found a ſpecies of the buſtard, as large as a turkey, one of which weighed ſeventeen pounds and an half. It was generally agreed by the gentlemen who eat of it, to be the beſt bird they had taſted ſince they left England, and in honour of it they called the inlet Buſtard Bay: it lies in latitude twenty-four degrees four minutes one hundred and fifty-one degrees forty-two minutes eaſt. Here are oyſters in great numbers, and of various kinds; among others, the hammer-oyſter, and abundance of ſmall pearl-oyſters.

" Thirſty Sound, twenty-two degrees ten minutes ſouth, one hundred and fifty degrees eighteen minutes eaſt. Upon the branches of gum-trees here, were found ants neſts, made of clay, as big as a buſhel, ſomething like thoſe deſcribed in Sir Hans Sloane's natural hiſtory of Jamaica, vol. ii. page 221. tab. 258, but not ſo ſmooth. The ants which inhabited theſe neſts were ſmall, and their bodies white. On another ſpecies of the tree was found a ſmall black ant, which perforated all the twigs, and having worked out the pith, occupied the pipe which had contained it; yet the parts in which this inſect had thus formed a lodgment, and in which they ſwarmed in amazing numbers, bear leaves and flowers, and appeared to be in as flouriſhing a ſtate, as thoſe that were found. Here was alſo ſuch a ſwarm of butterflies, that for the ſpace of three or four acres the air was ſo crouded with them, that millions were to be ſeen in every direction; at the ſame time that every branch and twig was covered with others that were not upon the wing. Here was alſo found a ſmall-fiſh of a ſingular kind; it was about the ſize of a minnow; and had two very ſtrong breaſt-fins. It was found in places quite dry, but did not ſeem to become languid by the want of water, for when it was approached it leaped away, by the help of the breaſt fins, as nimbly as a frog; and when it was found in the water, it frequently leaped out, and purſued its way upon dry ground. From the great difference in the needle when brought on ſhore, captain Cook thinks there is iron ore in the hills.

" Along the coaſt of New South Wales, the ſea in all parts conceals ſhoals, that ſuddenly project from the ſhore, and rocks that riſe abruptly like a pyramid from the bottom, for an extent of twenty-two degrees of latitude more than one thouſand three hundred miles. Off cape Tribulation, which lies ſixteen degrees ſix minutes eaſt longitude, our intrepid, and hitherto proſperous adventures very nearly eſcaped the miſeries of ſhip wreck. On the 10th of June 1770, at eleven o'clock at night, the ſhip ſuddenly ſtruck againſt a coral rock, and became immoveable, except by the heaving of the ſurge, which beat her againſt the crags of the rock upon which ſhe lay, and cauſed ſo violent a concuſſion, that it was with the utmoſt difficulty any one on board could ſtand on his legs, at the dawn of the day land appeared at eight leagues diſtance, without any iſland in the intermediate ſpace, upon which they might be ſet on ſhore by the boats, and afterwards proceed to the main, if the ſhip ſhould go to pieces; the wind, however, died away, till it became a dead calm, by which the ſhip eſcaped inſtant and inevitable deſtruction." After relating ſeveral other circumſtances reſpecting the perilous ſituation the ſhip's company were in, and the hardſhips and diſtreſſes they underwent in endeavouring to ſave the veſſel from ſinking, captain Cook ſums up the narrative as follows: " But the full danger which they had eſcaped, was not known till the veſſel arrived at Batavia, and was hove down; for, on examining her bottom, it was found to be in a worſe condition than was apprehended. The falſe keel was all gone to within twenty feet of the ſtern poſt; the main keel was conſiderably injured in many places; a great quantity of ſheathing was torn off, and ſeveral planks were much damaged: two of them, and the half of a third, under the main channel, near the keel, were, for the length of ſix feet, ſo worn that they were not above the eighth part of an inch thick, and here the worms had made their way quite into the timbers: yet in this condition ſhe had ſailed many hundred leagues, where navigation is as dangerous as in any part of the world. How much miſery did thoſe on board eſcape, by being ignorant that ſo conſiderable a part of the bottom of the ſhip was thinner than the ſole of a ſhoe, and that every life on board depended upon ſo ſlight and fragil a barrier between them and the unfathomable ocean!"——*** *For further particulars, and a more full deſcription of theſe Iſlands, the reader is referred to the* Folio Edition of CAPTAIN COOK'S VOYAGES.

New Guinea reaches from the equator to the twelfth degree of ſouth latitude, and from one hundred and thirty-one to one hundred and fifty degrees eaſt longitude, in one part it does not appear to be above fifty miles broad. It was firſt viſited by an European ſhip in 1529. Saavedra, a Portugueſe, who made the diſcovery of the north weſt part of this country, called it Terra de Papuas. Van Schouten, a Dutch diſcoverer, gave the name of New Guinea to its ſouth-weſtern part. Roggewein alſo touched here; and before him, Dampier, January 1, 1700. Captain Cook made the coaſt of New Guinea, in latitude ſix degrees fifteen minutes, and one hundred and thirty-eight degrees eaſt longitude, on the 3d of September, and landed from the pinnace, accompanied by Mr. Banks, doctor Solander, nine of the ſhips crew, and ſervants well armed, and, leaving two ſeamen to take care of the boat, advanced ſome little way up the country; but coming to the ſkirts of a thick wood, they judged it prudent to proceed no further, leſt they ſhould fall into an ambuſcade of the natives, and their retreat to the boat be cut off. Having advanced about a quarter of a mile from the boat, three Indians ruſhed out of the wood with a hideous ſhout; they threw their darts, and ſhewed ſuch a hoſtile diſpoſition, that the party,

party, to prevent the deſtruction of theſe people, returned to the boat, as they had no intention forcibly to invade their country, either to gratify their appetites or curioſity, and it was evident nothing could be done upon friendly terms. When they got on board the boat, they rowed along the ſhore. The people were ſtark naked, and their hair cropped ſhort, and in general made much the ſame appearance as the New Hollanders.

New Britain, or Solomon's Iſlands, conſiſt of three large, and ſeveral ſmaller ones. The large, are, New Britain, New Ireland, and New Hanover. They were merely coaſted, and are therefore but imperfectly known. They are mountainous, but have a romantic pleaſant appearance, and are ſituated in five degrees ſouth latitude, and two hundred and ten degrees weſt longitude. From the people ſeen on the beach, they are ſuppoſed to be populous. The inhabitants are black, and woolly-headed; they go almoſt naked, ornament themſelves with ſhell bracelets, wear ear rings in their ears, which are very long, chew betel to make their teeth red, and powder their hair and beards white. They have ſometimes feathers on their heads, ſhells about their neck, and rings through their noſes. They live chiefly on vegetables, and are idolaters in their worſhip. Their canoes are long and narrow, ſome reach to ninety feet in length, and yet are formed of a ſingle tree. The head and ſtern are very much raiſed, to ſhelter the people within from arrows, which is done by turning either end of the boat towards the enemy. Their canoes are decorated with carved work, and thirty or forty rowers are employed to paddle them on the water.

Theſe people have lances, bows and arrows, ſlings, and long ſticks and poles, like the quarter ſtaff, for their offenſive weapons: they have ſhields to defend themſelves with. Theſe offenſive and defenſive weapons, their dextrous management of them, and their boldneſs in attacking, is a convincing proof that they are always at war with ſome of their neighbours.

We ſhall now proceed to give a deſcription of the New Hebrides, which are eleven in number, and received their name from captain Cook, in 1774, and are as follows:

Terra del Eſpiritu Santo (the firſt of them) was diſcovered by De Quiros, in 1606: it lies in fifteen degrees thirty-nine minutes ſouth latitude, and one hundred and ſixty-ſix degrees fifty minutes eaſt longitude from Greenwich. It is the weſternmoſt, and lies fartheſt north of all the Hebrides; is the largeſt of the whole, being twenty-two leagues long, twelve broad, and ſixty round. The land to the weſt is very mountainous, the hills frequently riſing immediately from the ſea. Every part of it except the cliffs and beaches, is covered with trees and plantations, and every valley watered with a ſtream. It has a remarkable fine bay on the north ſide, called, by De Quiros, St. Philip and St. Jago, it being St. Philip and St. James's day when he arrived here. It has twenty leagues of ſea ſhore, is eight leagues at the mouth, and cannot be fathomed. There is a fine anchorage place in this bay, from two to forty fathoms, called Vera Cruz, and capacious enough to hold one thouſand ſhips with clear ſoundings.

This iſland is fertile, and likewiſe contains hogs, fowls, birds, bees, &c. The natives are tall, ſtout, and have black hair: they go naked, except two long ſlips of matting hanging down before and behind, from the waiſt to the knees.

St. Bartholomew's Iſle (the ſecond) was ſo called by captain Cook, becauſe he diſcovered it on St. Bartholomew's day. It is between ſix and ſeven leagues in circumference, and is ſituated in fifteen degrees forty minutes north latitude, and in one hundred and ſixty-ſeven degrees twenty-ſeven minutes eaſt longitude.

Mallicolo (the third) is eight leagues long, and ſituated n ſixteen degrees twenty-five minutes ſouth latitude, and one hundred and ſixty-ſeven degrees fifty-ſeven minutes aſt longitude. It was touched at by captain Cook, in uly 1774. This iſland is mountainous and woody, but he ſoil is rich and fertile. Here are plenty of ſugar-canes, ams, cocoa-nuts, bread-fruit, turmeric, oranges, hogs, oultry, and various birds. It is a warm and populous ountry, but the people are remarkably ugly, dark, and l-made; yet ſprightly, and quick of apprehenſion. They ave flat noſes and foreheads, woolly hair, and ſhort beards. hey tie a cord uncommonly tight about their waiſts, and ear a piece of cloth or leaves before them. They wear racelets of ſhells on their arms, a piece of white carved one in the noſtrils, round the right wriſt hogs tuſks bent rcular, and round the left a round piece of wood to ward f the ſtring of the bow; ſome wear tortiſe-ſhell earrings, and other rings of ſhells. On their breaſt they hang a ſhell ſuſpended by a ſtring round their neck. Wearing of ornaments ſeems to be the privilege only of the men.

With reſpect to the women, they are not leſs ugly than the men; for they paint their heads and faces red and yellow, and alſo their ſhoulders, over which ſome wear a kind of petticoat, others a bag made of a kind of cloth, in which they carry their children. Full grown women wear ſhort pieces of cloth or matting round their waiſts, reaching nearly to their knees, others have only a ſtring round their middle with a whiſp of ſtraw between the legs; and girls, as do the boys, go quite naked.

Clubs and ſpears made of a hard wood, and bows and arrows, are their weapons. Their bows are about four feet long, made of a dark-brown ſtick like mahogany, ſpilt through the middle, are ſtrong, elaſtic, and nicely poliſhed; and their arrows are a kind of reed, pointed with hard wood, or bone dipped in poiſon, which they keep in a ſort of quiver made of leaves.

They have ſmall wretched hovels for their dwellings, ſo low, that they can hardly ſtand upright in them, and conſiſt merely of a roof, reſting on a few poſts, and thatched with palm leaves. Some few are incloſed with boards, and the entrance is by a ſquare hole at one end. Their canoes are like thoſe of the neighbouring iſles.

Theſe people ſeem to be of a cheerful diſpoſition, and paſs great part of their time in muſic and dancing. Their inſtruments, we may ſuppoſe, are very ſimple; for none were ſeen but drums and pipes, which are readily made. Their drums alſo, in caſes of danger, ſerve to ſound an alarm.

Sandwich iſle (the fourth) is ten leagues long in the direction of north-weſt by weſt and ſouth-eaſt by eaſt, twenty-two leagues ſouth-ſouth-eaſt half eaſt from Mallicolo, and is twenty-five leagues round: it was ſo called in compliment to Lord Sandwich. The hills gently ſloping to the ſea, and diverſified with woods and lawns, exhibit a delightful view.

Erromango (the fifth) is twenty-four leagues in circuit, and lies eighteen leagues from Sandwich iſland; the middle of it is in eighteen degrees fifty-four minutes ſouth latitude, and one hundred and ſixty-nine degrees nineteen minutes eaſt longitude. Theſe iſlanders ſeem to be of a different race from thoſe of Mallicolo, and ſpeak a different language. They are of the middle ſize, have a good ſhape, and tolerable features; their colour is very dark, and they paint their faces, ſome with black, and others with red pigment; their hair is very curly and criſp, and ſomewhat woolly. The few women which were ſeen, were ugly; they wore a petticoat made of the leaves of ſome plant. The men, like thoſe of Mallicolo, were in a manner naked, having only the belt about the waiſt, and the piece of cloth or leaf uſed for a wrapper. No canoes were ſeen in any part of the iſland. Their plantations are laid out by line, and fenced round: they live in houſes, covered with thatch.

Tanna (the ſixth) is about eight leagues long, and three or four broad, in nineteen degrees thirteen minutes ſouth, one hundred and ſixty-nine degrees thirty-eight minutes eaſt, and about twenty-four in circuit: it lies ſix leagues on the ſouth ſide of Erromango. Its name, in the Malay language, ſignifies "earth." The ſoil, in ſome parts, is a rich black mould; in other parts, it ſeemed to be compoſed of decayed vegetables, and the aſhes of a volcano, which was ſeen about eleven miles to the weſt of the ſhip, burning with great fury. The country is in general ſo covered with trees, ſhrubs, and plants, as to choak up the bread-fruit, and cocoa-nuts. The houſes and inhabitants are thinly ſcattered. Several ponds of ſtagnant water were ſeen, in which the natives had planted great quantities of eddoes. During the ſixteen days that captain Cook continued here, the volcano vomited up, at different times, vaſt quantities of fire and ſmoke, accompanied with an explotion about once in five minutes: ſome of theſe exploſions reſembled violent claps of thunder, and a rumbling noiſe continued for about half a minute: the whole air was filled with ſmoky particles and aſhes, which occaſioned much pain when they fell into the eye; at one time great ſtones were ſeen thrown up high in the air, ſome of which were at leaſt as large as the hull of a ſhip's long boat: its fires preſented a moſt pleaſing and magnificent ſight: the ſmoke, which rolled up, from time to time, in thick and heavy columns, was coloured with all the various hues of yellow, orange, crimſon, and purple, which died away into a reddiſh grey and brown: as often as a new exploſion happened, the whole country, with its ſhaggy

ſhaggy foreſts, were tinged with the ſame orange and purple, according to its diſtance, or particular expoſure to the volcanic light. It ſometimes continued quite ſilent for five or ſix days together. It was remarked, that the exploſions of the volcano recommenced after ſhowers of rain; ſo that it ſhould ſeem that rain excites them by promoting or increaſing the formation of the various mineral ſubſtances which the mountain contains in its bowels.

With reſpect to their perſons, they are of a middle ſize, ſtronger and better proportioned than the Mallicoleſe; their colour is a dark cheſnut brown, with a very ſwarthy mixture: like the natives of Mallicolo, they go naked, having only a ſtring round the belly, which did not, however, cut their body in ſo ſhocking a manner as that at the other iſland. Their hair is generally black or brown, growing to a tolerable length, and very criſp and curly; they ſeparate it into ſmall locks, which they woold or cue round with the rind of a ſlender plant, down to an inch of the ends; and as the hair grows the woold is continued; each of theſe cues or locks, is ſomewhat thicker than common whip cord, and they look like a parcel of ſmall ſtrings hanging down the crown of their heads; their beards, which are ſtrong and buſhy, are generally ſhort. The women do not wear their hair ſo, but cropped; nor do the boys till they approach manhood. They make uſe of a cylindrical piece of alabaſter, two inches long, which they wear in the cartilaginous part between the noſtrils as a noſe jewel, in the ſame manner as is practiſed at Mallicolo. Their features are large, the noſe broad, but the eyes full, and, in general, agreeable. Not one ſingle corpulent man was ſeen here; all are active, and full of ſpirit. Their ears are hung full of tortoiſe-ſhell rings, and necklaces of ſhells fall on their boſom.

Some of the elderly women had caps made of a green plantain leaf, or of matted work; but this head-dreſs was rather uncommon. But the number of ornaments conſiderably increaſed with age, the eldeſt and uglieſt being loaded with necklaces, ear-rings, noſe-jewels, and bracelets. The women here are expert cooks; they roaſt and broil the yams and bananas, they ſtew the green leaves of a kind of fig, they bake puddings made of a paſte of bananas and eddoes, containing a mixture of cocoa-nut kernels and leaves.

Apee (the ſeventh) is not leſs than two hundred leagues round, and is diſtant from Ambrym about five leagues: its longeſt direction is about eight leagues north-weſt and ſouth-eaſt. It is very high land richly diverſified with woods and lawns. This and the former were diſcovered by captain Cook in 1774.

Ambrym (the eighth) is ſituated in ſixteen degrees fifteen minutes ſouth latitude, and one hundred and ſixty-eight degrees twenty minutes eaſt longitude, is about ſeven leagues in the longeſt part, and has a volcano in it; but is very fertile and rich.

Whitſunday iſle (the ninth) is of the ſame length, lies about four miles to the ſouth, and runs in the ſame direction; having more ſloping expoſures than Aurora, it appears to contain more plantations, and to be better inhabited.

Aurora (the tenth) is about twelve leagues long, but not above five miles broad in any part, lying nearly north and ſouth; the middle is fifteen degrees ſix minutes ſouth latitude, and one hundred and ſixty-eight degrees twenty-four minutes eaſt longitude. Mr. Forſter ſuppoſes the Etoile of M. de Bougainville to be ſituated on this iſland. Inhabitants were ſeen here, and canoes, but none came off to the ſhip. A fine beach, and moſt luxuriant of vegetation, preſented themſelves; the whole country was woody, and a beautiful caſcade poured through a foreſt. This iſland is divided by a channel from which

The Iſle of Lepers (the eleventh and laſt) lies between Eſpiritu Sante and Aurora iſland, eight leagues from the former and three from the latter, in latitude fifteen degrees twenty-two minutes ſouth, and one hundred and ſixty-eight degrees three minutes eaſt longitude. It was firſt diſcovered by M. de Bougainville in 1768, who gave it the above appellation, from its leprous inhabitants. This iſland is in form like an egg, very high land, and about twenty leagues round. Some of the ſhip's crew went on ſhore, and were approached by a numerous troop of the natives, armed with bows and arrows, and ſtones ready to caſt. They began hoſtilities; but were ſoon quieted by a diſcharge or two from the muſquetry.

The people are of two colours, black and mulattoes; they have thick lips; and their hair is woolly, which they powder with turmeric, that gives it a yellow caſt; but they do not wear a beard. They are ſhort, ugly, ill-made and in general infected with leproſy. They wear an ornament in the noſes like the Mallicoleſe, and the ſame kind of bracelets and necklaces. The men go naked. The women are not leſs diſagreeable than the men, and wear bandages on their backs, by which they carry their children. On their cloth they paint many pretty deſigns with a fine crimſon.

They uſe, for their arms, bows and arrows, and clubs of hard wood, like thoſe at Mallicolo; ſtones alſo are among their weapons of defence, but they caſt them without ſlings: they have alſo ſabres of hard wood. Their canoes reſemble thoſe of their neighbours.

This iſland is covered throughout with trees: the ſoil is very light, and of no great depth. There are many paths through the woods, and places incloſed three feet high with reed fences. Their huts are low, and could not be entered but by creeping. They have a particular ſpecies of figs here, and other productions in common with the neighbouring iſlands.

New Caledonia extends from ſouth latitude nineteen degrees thirty-ſeven minutes, and from eaſt longitude one hundred and ſixty-three degrees thirty-ſeven minutes to one hundred and ſixty-ſeven degrees fourteen minutes. This iſland was diſcovered by captain Cook in 1774. It is hilly, but contains ſeveral fruitful vallies, has many fine ſtreams to water it, and appears delightfully pleaſant. The productions are bread-fruit, figs, ſugar-canes, plantains, yams, and cocoa-nuts.

There are no quadrupeds of any kind in this iſland, but a variety of the feathered tribe, large tame fowls with bright plumage, ducks, a ſort of ſmall crow tinged with blue, a beautiful ſpecies of parrot, turtle-doves, fly-catchers, a kind of hawk, boobies, man of war, tropic birds, and others unknown to Europe. Turtles and fiſh abound here, particularly a poiſonous fiſh, ſomething like a ſun-fiſh, with a large, long, ugly head, and which brings on an extraordinary numbneſs and giddineſs to thoſe who eat it. They have alſo beatles, ants, ſpiders, lizards, ſcorpions, &c. and a flat-tailed water-ſnake. Captain Cook left with them an O-Taheite dog and bitch.

The inhabitants are not very numerous. They are all ſtout, well featured, and of a mahogany colour. Their hair is black, ſtrong and frizzled. To comb their hair, or rather ſcratch their heads, they have an excellent inſtrument, a kind of comb, made of ſticks or hard wood, from ſeven to ten inches long, and about the thickneſs of knitting needles; about twenty of theſe are faſtened together at one end, parallel to each other, and about the tenth of an inch aſunder. Theſe combs they wear conſtantly in their hair, on one ſide of their heads. They cut their hair with a piece of mineral, ſharpened like a flint. Some few indeed of the men wear it long and tie it upon the crown of the head; others ſuffer only a large lock to grow on each ſide, which they tie up in clubs.

In this iſland, the men go quite naked, except a wrapper over their privities, which they faſten up to their girdle, as they do at Mallicolo, or up to the neck by a ſtring, and ornament that ſtring with ſmall round beads, of a pale-green nephritic ſtone. They wear on their heads black cylindrical caps, made of ſtiff coarſe matting, open at top, very much like a huſſar's cap. The chiefs ornament their heads with feathers. They ſtretch the flaps of their ears to a great length, cut out the whole cartilage or griſtle, as at Eaſter iſland, and hang great numbers of tortoiſeſhell rings in them, as they at Tatna do.

The women's dreſs gives them a thick ſquat ſhape, and conſiſts of a petticoat reſembling fringe, about eight inches long, juſt dropping below the waiſt: it is made of filaments, or ſmall cords, laid thick over one another, and faſtened to a long ſtring that is wound ſeveral times round the body. The outward filaments of this fringe they die black; the under ones are of a pale yellow. By way of ornament, they fix on one ſide of the petticoat a few pearl oyſter-ſhells. Both ſexes wear tortoiſeſhell ear-rings, necklaces, and bracelets, above the elbow. The women tattow or puncture themſelves a little in the face, generally in three black ſtraight lines, from the under lip downwards to the chin; and they carry their infants in a kind of ſatchel on their backs.

The houſes of theſe people are like thoſe in Friendly Iſles, which we ſhall deſcribe hereafter. Their chief utenſils are made of red clay: they ſubſiſt on roots, fiſh, and the bark of trees. They are well provided with weapons of offence, as of courſe they muſt ſometimes have wars among themſelves, or with their neighbours: theſe weapons are, clubs, ſpears, darts, and ſlings for caſting ſtones. Their clubs are about two feet and a half long, and of different forms; ſome like a ſcythe; others like a mattock; ſome have a head like a hawk, and others have knobs at

the end; but they are all neatly made, and well polished. Their darts and ſpears are ornamented with carved work; but their ſlings are perfectly ſimple, being no other than a ſlender round cord, no thicker than pack thread, with a taſſel at one end, a loop at the other, and in the middle. The ſtones they throw are of a ſoft ſoap rock, rubbed into the form of an egg. They exactly fit the loop in the middle of the ſling, and are kept in a pocket of matting, tied round the waiſt for the purpoſe. They caſt their darts alſo with a ſhort ſtring knotted at one end, and looped at the other, as they do at Tanna, called by the ſeamen a Becket, and are very dextrous in throwing them. Their ſpears are fifteen or twenty feet long, blackened over, and have a prominence near the middle, carved ſo as to reſemble a human face.

Their canoes are heavy and clumſy. They are, as it were, double, conſiſting of two hulls, made out of two large trees hollowed out, the gunnel raiſed about two inches high, and cloſed at each end with a kind of bulk-head of the ſame height. The two hulls are ſecured to each other about three feet aſunder, by ſeveral croſs ſpars.

Their language differs from thoſe of the other iſlands in the ſouth ſeas, and their pronunciation is indiſtinct. They are good ſwimmers, and fond of ſinging and dancing. The only muſical inſtrument obſerved among them was a whiſtle, made of a poliſhed piece of brown wood ſhaped like a bell, though apparently ſolid, with a rope fixed at a ſmall end. The holes were made in it near the baſe, and another near the inſertion of the rope, all which had ſome communication with each other. The inhabitants are ſtrictly honeſt, and not the leaſt addicted to pilfering: they may in general be deemed a friendly, inoffenſive people: they gave captain Cook and his ſhip-mates a very welcome and peaceable reception, addreſſing him firſt in a ſhort ſet ſpeech, and then inviting him aſhore. But they are indolent, and deſtitute of curioſity; the greater part of them did not move from their ſeats when the Europeans paſſed them for the firſt time: they are remarkably grave, ſpeak always in a ſerious tone; and laughter ſeems to be a ſtranger among them.

Many of the natives were ſeen with prodigious legs and arms, which ſeemed to be affected with a kind of leproſy; the ſwelling was found to be extremely hard, but the ſkin not alike harſh and ſcaly in all the ſick perſons; the preternatural expanſion of the leg and arm did not appear to be a great inconvenience to thoſe who ſuffered it, and they ſeemed to ſay that they felt pain very rarely in them; but in ſome the diſorder began to form blotches, which were marks of a great degree of virulence.

They depoſit their dead under ground, which ſeems to be a more judicious manner of diſpoſing of them than that uſed at O-Taheitee, where they expoſe them above ground till all the fleſh is entirely putrified: if the mortality was more conſiderable in that iſland than it is ſuppoſed to be, ſuch a cuſtom might have the moſt pernicious conſequences, and produce a dreadful epidemical diſtemper: ſuch a diſeaſe as the ſmall-pox, for example, if introduced, would go near to depopulate the whole country. The grave of a chief, who had been ſlain in battle, here reſembled a large mole-hill, and was decorated with ſpears, darts, paddles, &c. all ſtuck upright in the ground round about it. Lieutenant Pickerſkill was ſhewed a chief, whom they named Tea-booma, and ſtiled their areekee, or king; but nothing further is known of their government, and very little of their religion.

Captain Cook when he firſt landed here, was accompanied by a native, who appeared to be a man of ſome conſequence, and who had come on board the ſhip before ſhe came to an anchor. The natives aſſembled in great numbers on the beach, led merely by curioſity, for many had not ſo much as a ſtick in their hands. The party, on landing, were received with great courteſy, and with ſurprize natural for people to expreſs at ſeeing men and things ſo new and wonderful. The captain made preſents to all thoſe whom his companion pointed out: but, on his going to give a few beads and medals to ſome women who ſtood behind the croud, the chief held his hand, and would not ſuffer him to do it. As they proceeded up a creek, Mr. Forſter ſhot a duck that flew near them, which was the firſt uſe which theſe people ſaw made of fire-arms. The friendly natives begged to have it; and when he landed, he told his countrymen in what manner it was killed.

From this excurſion, they learnt, that they were to expect nothing from theſe people but the privilege of viſiting their country undiſturbed, for they had little elſe than good nature to beſtow; and "in this" ſays captain Cook, "they exceeded all the natives we had yet met with; and although it did not ſatisfy the demands of nature, it at once pleaſed and left our minds at eaſe." A hatchet was not quite ſo valuable as a large ſpike nail; ſmall nails were of little or no value; and beads, looking glaſſes, &c. they did not admire. Many of the natives came on board the ſhip with perfect confidence, and one of them exchanged a yam for a piece of red cloth: they admired every thing that had a red colour, particularly red cloth or baize, but did not chuſe to give any thing in exchange. Captain Cook ſent the king Tea-booma a dog and bitch, both young, but nearly full grown, which may be the means of ſtocking the country with that ſpecies of animals; and to Hebai, the friendly chief before ſpoken of, he gave a ſow and boar pig, in order to provide, if poſſible, a ſtock of domeſtic animals, for a nation whoſe inoffenſive character ſeemed highly deſerving of ſuch a preſent. To enhance their value with the Indians, and thereby induce them to be more careful of their ſtock of hogs, the captain explained to them how many young ones the female would have at one time, and how ſoon this would multiply to ſome hundreds.

No one of the natives attempted to take the leaſt trifle by ſtealth, but all behaved with the ſtricteſt honeſty. Some of them ſpoke of a great land to the northward, which they called Mingha, the inhabitants of which were their enemies, and very warlike. They likewiſe pointed to a ſepulchral mount, where one of their chiefs lay buried, who had been killed fighting in defence of his country, by a native of Mingha. The appearance of a large beef bone, which an officer began to pick towards the concluſion of the ſupper, interrupted this converſation; the natives talked very loud and earneſtly to each other, looked with great ſurprize, and ſome marks of diſguſt at the ſtranger, and at laſt went away altogether, expreſſing, by ſigns, that they ſuppoſed it to be the limb of a man. The officer endeavoured to free himſelf and his ſhipmates from this ſuſpicion, but two inſurmountable impediments lay in his way, viz. the want of language, and that the natives had never ſeen a quadruped in their lives. At another time a native, who was in a boat with captain Cook and Mr. Wales, acquainted them that they had enemies who feaſted upon human fleſh, which doubtleſs had contributed to make them impute the ſame practice to their new friends. This iſland, the largeſt diſcovered in the ſouth-ſea between the tropics, remains intirely unexplored on its ſouth ſide; its minerals and vegetables ſtill remain untouched; animals it ſhould ſeem to have none, from the ignorance which the natives to the northward diſcovered of ſuch as they ſaw.

New Zealand is ſituated between one hundred and eighty degrees forty-five minutes, and one hundred and ninety-three degrees fifteen minutes weſt longitude, and thirty-four degrees twenty-four minutes and forty-ſeven degrees twenty-four minutes ſouth latitude, and about two thouſand miles difference from O-Taheitee. It conſiſts of two large iſlands, divided by a ſtraight four or five leagues broad, and lying nearly north and ſouth of each other. The northern iſland is called by the natives Eahie-nonauwe, and that to the ſouth Tavai Poenammoo; they are much the ſize of each other, and together are as large as the iſland of Great Britain, having many ſmall iſlands about them. They were firſt diſcovered by Abel Janſen Taſman, a Dutchman, on the 13th of December, 1642. He coaſted the eaſtern part, from latitude thirty-four degrees to forty-three degrees, and entered the ſtraight which divides the two iſlands; but, meeting with a diſagreeable reception from the natives, as ſoon as he dropped his anchor, he thought proper to weigh it again without landing. Captain Cook was ſix months in coaſting this country, viz. in the latter end of 1769, and beginning of 1770. He viſited it again in 1773, and a third time in 1774.

This iſland, in the ſouthern part of it, is rather barren, but the other is tolerably fertile, and the latter contains a mountain as high as the Peak of Teneriff. The productions are ſuch as are common to the ſouth ſea iſlands, but, among other productions, the trees claim no ſmall conſideration. Here are forests of great extent crowded with trees, the ſtraiteſt, cleaneſt, and largeſt ever ſeen. They are rather too hard and heavy for maſts; but if they could be lightened by tapping, as it is probable they might, they would make the fineſt maſts for ſhipping in the world: they are not unlike the pitch-pine. There are ſome with a ſcarlet flower, well adapted to the mill-wright. There are many other ſorts of trees, one like the maple, yielding a whitiſh gum, and another giving a deep yellow ſubſtance fit for dying. They have plenty of mangrove trees; and a kind

a kind of tree that grows ſo large and lofty, that they will meaſure, at ſixteen inches above the ground, full nineteen feet in girth, and are as ſtraight as an arrow, from the root to the firſt branches; many of them will yield three hundred and fifty-ſix feet of ſolid timber, excluſive of the branches. It bears a narrow leaf like the juniper, is generally found in low land, and has a dark-coloured appearance. Of this tree the natives make their canoes.

Though there are, in this iſland, many trees and ſhrubs, which bear beautiful flowers, and are highly aromatic, yet there is not one that produces fruit; but there is a plant worth them all, ſerving the natives inſtead of hemp, and flax. Of this plant there are two ſpecies; one bearing a deep red flower, the other a yellow. The leaves of both reſemble flags, but the bloſſoms are not ſo large, and their cluſters are more in number. They make all their cloaths of the leaves of this plant, and alſo all their ſtrings and cordage, which are at once gloſſy, elaſtic, and ſo ſtrong, that nothing made of hemp can equal them. From the ſame, by another proceſs, they draw out long, ſlender, ſtrong fibres, white as ſnow, and ſhining as ſilk; of theſe they make their better cloth; and by ſlitting the leaves in proper breadths, and tying them together, they make their fiſhing-nets. This plant ſeems to grow beſt in boggy grounds; there is every reaſon to believe that it would thrive well in England; and, could we tranſport it hither, it would be a valuable acquiſition to this country.

Dogs and rats are the only quadrupeds here; but they have a great variety of birds, ſome of which are exquiſitely beautiful.

There are but few inhabitants, in proportion to the extent of country. Tavai Poenammoo is, as we obſerved before, very thinly peopled, conſiſting chiefly of wanderers; but Eahie-monauwe is better peopled. The weſtern ſide of this iſland is quite a deſert; and the interior parts being ſo mountainous, ſcarce any place is inhabited but the ſea-coaſts, which, on an extent of four hundred leagues, is ſuppoſed to contain only about one hundred thouſand people.

The men in general, are equal in ſtature to the largeſt Europeans, being tall but thin, yet exceedingly ſtrong, fleſhy and well made, and they are particularly active and vigorous, with an uncommon adroitneſs in every thing they do; but moſt of their legs are ſlender and bandy, with large knees, owing to the little exerciſe they take, and their continually ſitting croſs-legged in confined canoes. Their complexion is a clear mahogany brown, though they are rather darker in the ſouthern iſland. Their hair is black and curling, and their teeth extremely regular and white. They have good faces, like Europeans, dark eyes, lips rather thick, and aquiline noſes. Their voice is rough, they talk loud, and, in general, are more rude and unpoliſhed than the natives of O-Taheitee, of whom we ſhall ſhortly treat. The women are plain, and have no great female delicacy; but their voices are remarkably ſoft and harmonious, and by this they are chiefly diſtinguiſhed, the dreſs of both ſexes being nearly the ſame. They have, like the women of other countries, a chearfulneſs ſuperior to the men, and a greater flow of animal ſpirits. Both ſexes have the practice of tattowing.

With reſpect to the dreſs of the people of this country; that of the men is merely a wrapper round the body, kept from falling below the waiſt by two ſlips over the ſhoulders, faſtened before and behind with bone bodkins. It is made of flag leaves, and reſembles a ſhaggy door mat. Some men on particular occaſions, wear another piece of this matting round the waiſt, which reaches almoſt to the ground.

The dreſs of the women is a cloak and petticoat of matting, and a bunch of aromatic leaves hanging from a girdle between the legs. Some of them wear their hair cropped ſhort, others have it flowing about their ſhoulders; but the men tie theirs up in a bunch on the crown of the head, decorate that bunch with feathers, and a ſtick comb behind it. They wear their beards cut ſhort. Both men and women greaſe their hair, and frequently wear upon the crown of their heads, a large bunch of black feathers, tied up round ſo as to raiſe their head twice its natural height, and almoſt to cover it.

A variety of ornaments is worn by both ſexes, ſuch as ear-rings, necklaces, anelets, &c. Both men and women bore their ears, and ſtretch the holes till they will admit a finger; in theſe they wear cloth, feathers, bones of large birds, and ſometimes ſtick pieces of wood through them. The women frequently ſtuff in the white down of the albatroſs, ſtained with ruddle or oker, which ſpreads before and behind, as large as one's fiſt; and, though ſingular, has a very good effect. Sometimes they hang to their ears, by ſtrings, chiſſels, or bodkins, made of tale, and often the nails or teeth of their deceaſed relations: bracelets and anclets are made of birds, bones, ſhells, or any other ſubſtance they can drill a hole through. The men ſometimes wear round the neck, ſuſpended by a ſtring, a piece of round green tranſparent tale, or whalebone ſhaped like a laurel leaf, and with the rude figure of a man carved upon it; and ſome wear a feather through their noſtrils.

Theſe people live upon fiſh, birds, and vegetables. Water is their only liquor; and, having nothing that will intoxicate, they are in this reſpect the happieſt perſons in the world; but, on the other hand, ſhould their plantations fail, or an unfavourable ſeaſon happen, and they happen not to be provided with a ſufficient dry ſtock, the diſtreſs to ſuch as inhabit the interior parts of the country muſt be dreadful. This will, in ſome meaſure, account for the fear theſe people live in of each other, for the care they take to fortify their villages, and for the horrid cuſtom of eating thoſe whom they kill in battle. The head is the only part they do not eat: they ſuck the brains, and frequently convert the ſkull to domeſtic purpoſes, ſuch as to hold water, &c. The way they diſpatch their priſoners, is, by knocking them down with their patta-pattoos, and then ripping them up.

The hippahs, or towns of theſe people, are all fortified. Many are built upon eminences near the ſea, and ſecured on the land ſide by a bank or ditch, and a high paling within the ditch; and ſome have outworks; their houſes are built on a riſing ground, under a tuft of trees, but are little better than dog-kennels, ſeldom more than twenty feet long, ten broad, and ſix high; their furniture and utenſils are trifling. Their amuſements are ſinging and dancing: they have two muſical inſtruments, a trumpet made of a ſhell, and a wooden pipe, which yields a noiſe like a child's whiſtle. A top was ſeen here, ſhaped like the gigs in England, and, like them, made to ſpin by whipping.

In theſe iſlands, two or three ſorts of cloth are made: the ſhaggy ſort, reſembling a thrummed door mat; one as coarſe as our coarſeſt canvas, though ten times as ſtrong; and another as gloſſy as ſilk. The ſhaggy ſort is made of flag-leaves, ſplit into three or more ſlips, and interwoven with dry, leaving a number of ends hanging to it on the outſide, eight or nine inches long; and the gloſſy ſort is formed by many threads lying very cloſe one way, and a few croſſing them the other; but theſe are about half an inch aſunder, ſomewhat like the round pieces of cane matting that are by ſome perſons placed under the diſhes upon tables to ſave the cloth; this ſtuff is prepared ſo as to ſhine like ſilk, and is often ſtriped. It is made in a frame of the ſize of the cloth, about five feet long, and four broad. They have adzes and axes made of black ſtone, and chiſſels of bone, or pieces of jaſper: they have likewiſe an inſtrument made of a ſharp ſtake, which ſerves at once for plough and ſpade. Their fiſhing-nets are made of a kind of graſs, very ſtrong in its nature; and their principal nets are ſo large, that they ſeem to be the joint work and joint property of a whole town; they are generally about five fathom deep: they make alſo a circular net, extended by two or three hoops, ſeven or eight feet in diameter, which they bait at the bottom, and leave open at the top.

The natives have a particular and ſingular taſte for carving: they attempt not to imitate any thing in nature, but confine themſelves to a volute or ſpiral, which they vary many ways, ſingle, double, and triple, and with as much regularity, as if done from mathematical draughts. They thus ornament their boats, paddles, arms, tools, and almoſt every thing they make, though they have very aukward tools to do it with.

Hoſtilities, among them, are declared with a war ſong and a dance, in which the women join and attack, with diſtorted features, hideous ſhouts, rolling eyes, and tongues lolling out of their mouths. The heads of their chiefs are curiouſly tattowed, and ſometimes adorned with a wooden comb and feathers. Captain Cook, having expreſſed a deſire to ſee their mode of attack and defence, one young man mounted a fighting ſtage, which is a platform raiſed from the ground and ſurrounded with a ditch, of which they have many large ones on the ſides of hills; and another went into the ditch; both he that was to defend the place, and he that was to attack it, ſung the war ſong, and danced in a frightful manner, working themſelves up to a degree of mechanical rage: this done they attacked each other with uncommon fury.

As theſe people live in perpetual hoſtility with each other, there is therefore little land in a ſtate of cultivation, and

and every village is made a fort: they ſeem to have ſtudied leſs the inſtruments of peace, than thoſe of war.

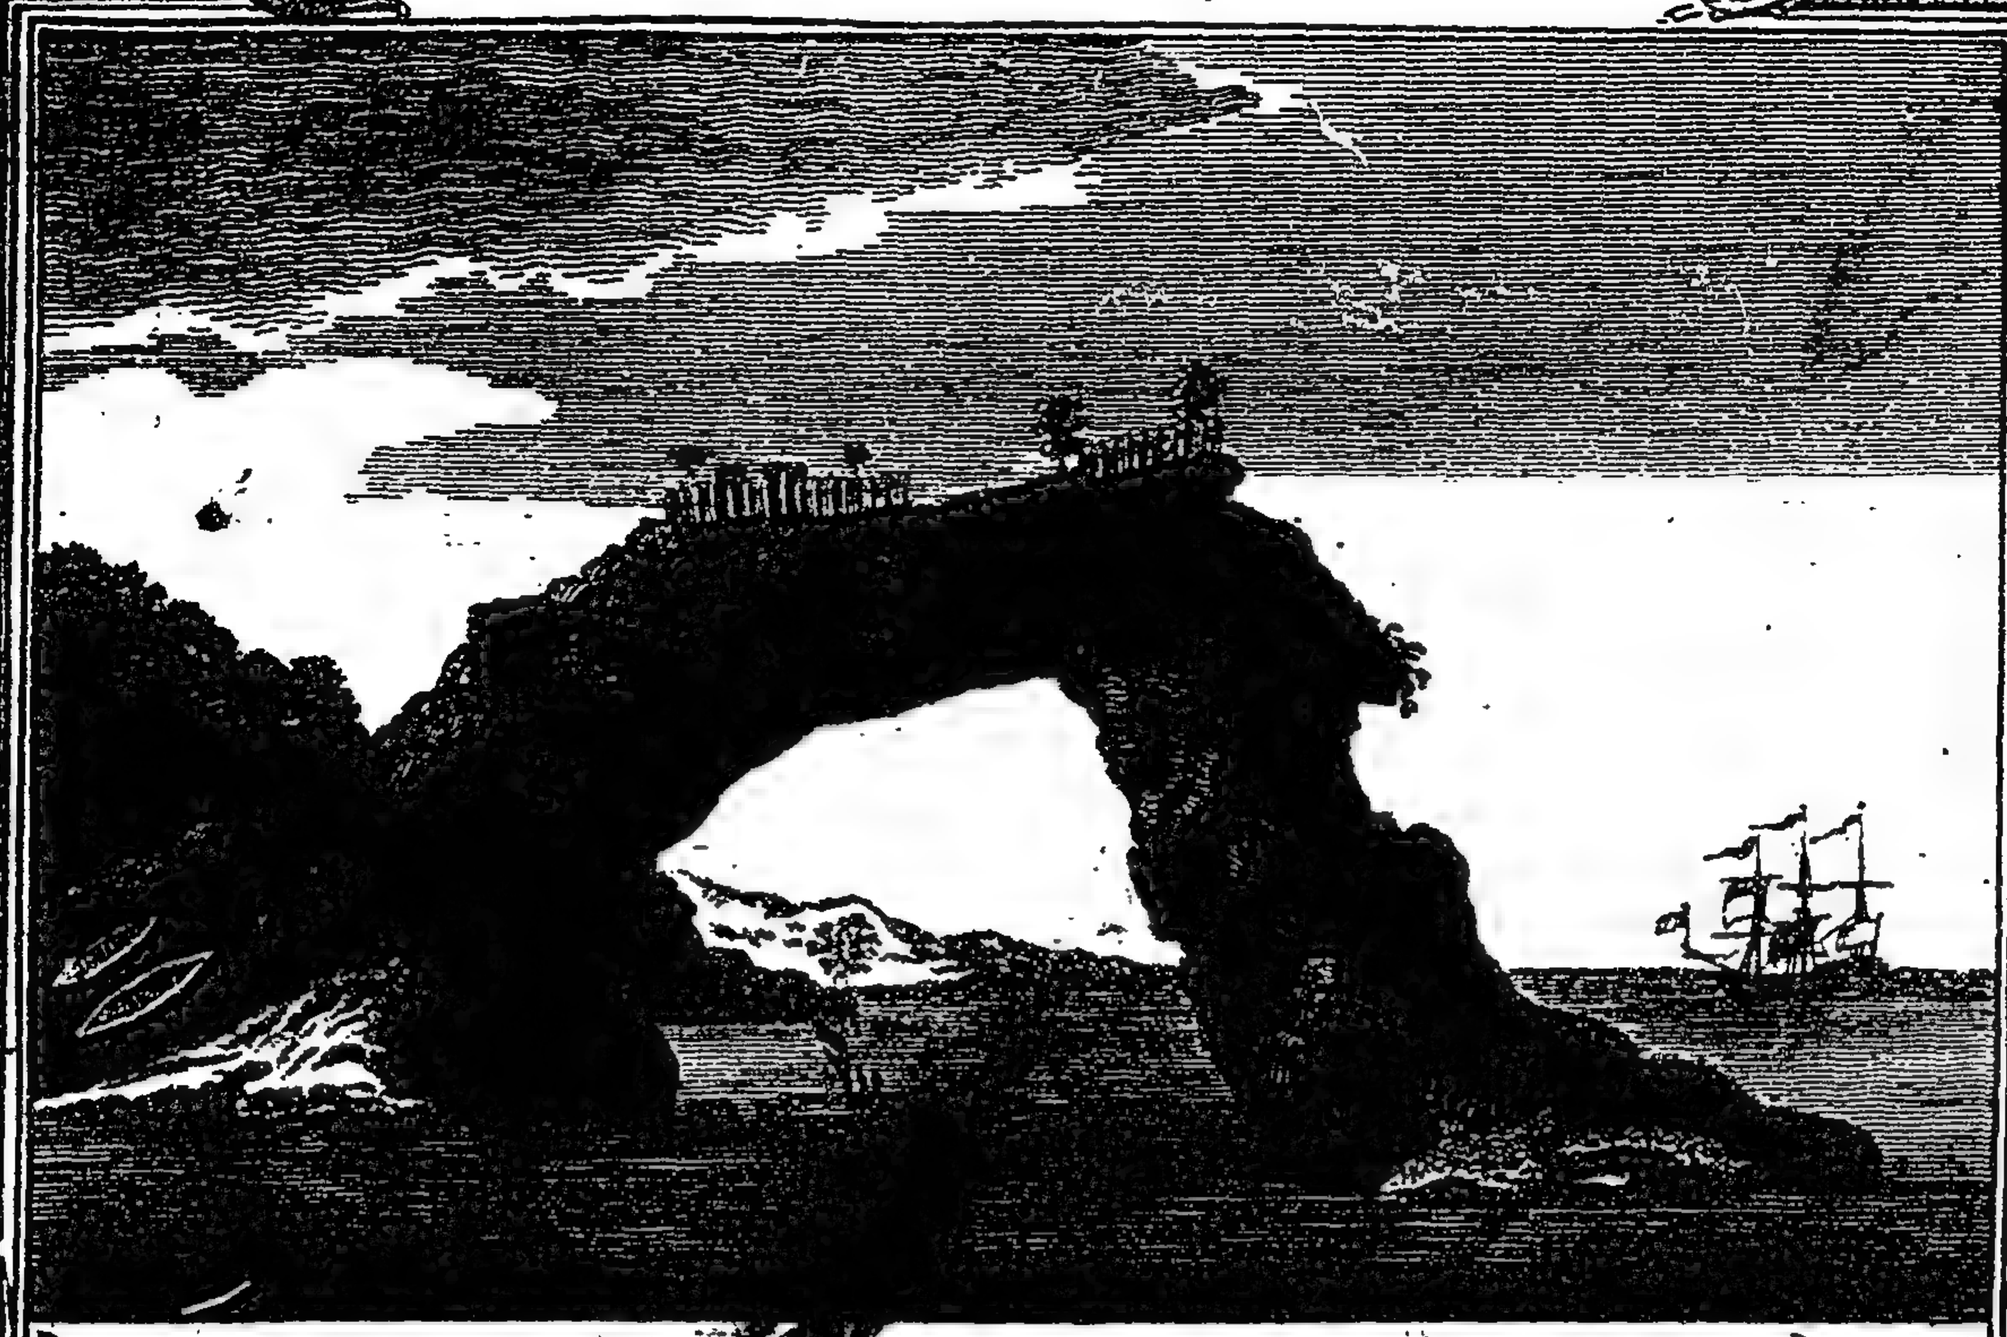
A lance painted and barbed is their miſſile weapon: this is held like a quarter ſtaff, in the middle, and thrown with great fury: they likewiſe ſometimes fight with ſhort darts and arrows, and with ſtones, but have neither beams to convey the former, or ſlings to throw the latter: their other weapons are battle-axes, and the patta-pattoo, which is made of green talc about a foot long, and thick enough to weigh four or five pounds. It is formed like a pointed battledore, with a ſhort handle and ſharp edges, and deſigned for cloſe fighting: through the handle there is a ſtring to twiſt round the hand when the weapon is uſed: the patta-pattoo is worn in the girdle, as a conſiderable military ornament. Their chiefs carry about them a ſtaff of diſtinction, generally the rib of a whale, white as ſnow, ornamented round the top with carving, dog-ſkin and feathers, like our ſheriff's halberts; but ſometimes this ſtaff is merely a ſtick about ſix feet long, adorned in the ſame manner, and inlaid with a ſhell reſembling mother of pearl.

The canoes uſed by theſe people afford a ſtriking proof of their ingenuity: they are of different ſizes, narrow and long, and reſemble very much the New-England whale-boat. Some of the larger ſort ſeem to be built chiefly for war, and will contain from forty to near one hundred armed men, being near ſeventy feet long, though not more than five feet broad, and about three feet and a half in depth. The ſides are made ſtraight, of three intire planks, one above another, which reach from end to end, and are ſewed together by a ſtring, made of the flax plant and caulked with the woolly ſubſtance of the reed mace. The ſides being ſtraight, and the bottom ſharp, they are in form of a wedge. A conſiderable number of thwarts or ſeats are laid from gunwale to gunwale, in order to ſtrengthen them, and a profuſion of carved ornaments decorate the head and ſtern, which project beyond the body, riſing almoſt perpendicularly five or ſix feet above it, are pierced through and through in ſpirals, like fillagree work, and adorned with ſtreamers hanging from them. The gunwales of their beſt boats are alſo carved in a groteſque taſte, and ornamented with tufts of white feathers placed upon a black ground. Theſe boats are worked by eighteen or twenty ſmall light paddles, about ſix feet long, neatly made, having an oval blade, pointed at the bottom, and gradually loſing its oval form in the handle; and the Indians have ſuch an adroitneſs and manual dexterity in uſing theſe paddles, that thirty of them together will keep time ſo exactly, that one would think the rowers were actuated by one common ſoul. They frequently ſing when rowing, and beat time with their paddles. Sails of matting fixed upright, between two poles, are ſometimes made uſe of; but they can make no way with theſe, except right before the wind.

The New Zealand language and that of O-Taheitee are radically the ſame, the difference being only provincial. They worſhip a Supreme Being, but believe in ſubordinate deities, and make offerings of proviſion, fruit, &c.

The Europeans could not diſcover how they bury the dead: the natives in the northern parts informed them, that they bury them in the ground; but in the ſouthern parts they ſaid they threw them into the ſea, tied to a ſtone, in order to ſink them: this, however, is certain, that when any die, the neareſt ſurviving relations, by way of ſhewing reſpect to the deceaſed, ſcarify themſelves in a terrible manner.

Thoſe who inhabit T'avai Poenammoo, which is the ſouthern iſle, live a wandering life, and ſeem to be under no regular kind of government: the head of each tribe, indeed, is reſpected, and, on ſome occaſions, commands obedience; but thoſe of Eahie-monauwe acknowledge a ſovereign, under whom are ſeveral ſubordinate chiefs, to whom great reſpect is paid, and by whom juſtice is probably adminiſtered; and it was learnt that they poſſeſſed their authority by inheritance. The ſmaller ſocieties in the ſouthern iſland have ſeveral things in common, particularly their fine cloaths and fiſhing-nets. Their fine cloaths are preſerved in a place by themſelves, in the middle of their towns, and part of their nets are found in almoſt every houſe; for they collect theſe parts, and join them together, when they go out to fiſh.



The New Zealanders, though more iraſcible than the other ſouth-ſea iſlanders in general, are, however, leſs immodeſt, having ſome idea of indecency. They are as decent and reſerved in their behaviour as the politeſt perſons in Europe. When an overture is made to any young woman, the party is given to underſtand, that the conſent of friends is neceſſary; that a ſuitable preſent muſt be made; that the conſenting female muſt be treated with good manners and delicacy; that no unbecoming liberties muſt be taken, and that the day-light muſt not be a witneſs of what paſſes between them. An agreement thus made is conſidered by them as regular and binding as a marriage ceremonial in European countries.

The two following inſtances will ſerve to ſhew the ferocity of theſe people, ſeveral of whom were killed, and great pains taken to conciliate their affections, before captain Cook, who was here in 1769, could effect or bring them to trade with integrity. Monſieur Marion, who commanded two French ſhips, was, in 1772, with twenty-eight of his men murdered here. The carpenters belonging to this officer's ſhips were encamped in the woods, under the protection of a M. Crozet, with a ſmall party, for the purpoſe of making new maſts, &c. Upon the news, therefore, of captain Marion and his men being cut off, a corporal and four marines were diſpatched to M. Crozet, to acquaint him with his danger, while ſeveral boats waited to receive him. M. Crozet immediately diſpoſed every thing, as well as he could, to effect a retreat; but ſoon found himſelf in ſight of a prodigious crowd of natives, led on by ſeveral chiefs. He directed the four marines to be ready to fire at ſuch perſons as he ſhould point out, if neceſſity required it, and then ordered all his party to ſtrike their tents, and retire with their tools to the boats, while he advanced up to one of the chiefs. This man told him, that M. Marion was killed by another chief, whom he named. At this, M. Crozet fixed a ſtake in the ground, juſt before the feet of the chief, and bid him advance no further. The boldneſs of the action ſtartled the ſavage, which being obſerved by M. Crozet, he inſiſted on his commanding the croud to ſit down; which was accordingly complied with. He now walked up and down before the natives, till all his men were in the boat: his ſoldiers were ordered to follow, and himſelf was the laſt who embarked. Scarce was the boat put off from the ſhore, but the ſavages began their ſong of defiance, and threw ſtones at him; however, by the exertion of his people, he got ſafe on board. This, however, did not intimidate M. Crozet; for finding himſelf under a neceſſity of procuring new maſts, he landed again with a party, attacked one of their fortifications, and cut a breach in it; an armed chief inſtantly ſtepped into it, and was ſhot dead; another ſtepped on the dead body, and occupied his place, he likewiſe fell a victim to M. Crozet's heroiſm; and in like manner fell eight chiefs, who ſucceſſively defended, and bravely fell upon this poſt of honour. The reſt, ſeeing their leaders dead, fled, and many were purſued and killed. In ſhort, after this enterprize, M. Crozet completed the repairs of his ſhip without interruption, and, after a ſtay of ſixty-four days, proſecuted his voyage.

The other inſtance relates to the dreadful cataſtrophe of ſome of captain Furneaux's crew: the two ſhips commanded by the captains Cook and Furneaux having parted company off the eaſtern coaſt of Eahie-monauwe, and not happening to join again, captain Furneaux, ſome time after the departure of captain Cook, arrived in Queen Charlotte's ſound, in December, 1773. While he lay there, the cutter, in which were the two midſhipmen and eight ſeamen, was ſent up a creek, to procure wood and water; which not returning, occaſioned ſome anxiety about their ſafety. The next day an officer was ſent in another boat, in ſearch of them. The firſt intimations which they received of the fate of their comrades, was, the ſight of the rullock parts of the cutter, and ſome ſhoes, one of which was known to have belonged to a midſhipman who was of the party; preſently a piece of meat was found, which was at firſt ſuppoſed to be ſome of the ſalted meat belonging to the cutter's crew, but, on a cloſer examination, it was found to be freſh. Several baſkets lay on the beach tied up, which they eagerly cut open, and found them to contain roaſted fleſh, and fern roots, which ſerved them for bread; on further ſearch, many ſhoes were found, and a hand, which was immediately known to belong to a forecaſtle-man, it being marked with the initial letters of his name by an O-Taheitan tattow inſtrument. Proceeding onward to the next bay, a great many people appeared on the beach, and three or four canoes; on the approach of the boat, they retreated to a ſmall iſland; on the beach were two bundles of celery, which had been gathered for loading the cutter; a broken oar was ſtuck upright in the ground, to which the natives had tied their canoes. They ſearched in vain every part of the beach for the cutter, but a ſhocking ſpectacle ſuddenly opened upon them. Here were ſcattered the heads, hearts, and lungs of ſeveral of

A Chief and other Natives of O-Taheitee, visiting Capt. Cook in his second Voyage to the Southern Hemisphere.

the unhappy men who had been murdered by the natives; and dogs were ſeen devouring their entrails. Horror chilled the ſailors blood at the ſight, which urged them to a fierce deſire of revenge. They fired and killed ſeveral of the ſavages, and deſtroyed all the canoes that lay on the beach.

Mr. Banks and Dr. Solander, going on ſhore, at Queen Charlotte's Sound, in ſearch of the natural productions of the country, by accident fell in with a very agreeable Indian family, which afforded them a better opportunity of remarking the perſonal ſubordination of theſe people, than had before offered. The principal perſons were a widow, and a pretty boy about ten years old. The widow, was mourning for her huſband with tears of blood, according to their cuſtom: and the child, by the death of its father was become proprietor of a diſtrict of land. The mother and the ſon were ſitting upon mats: and the reſt of the family, to the number of ſixteen or ſeventeen, of both ſexes, ſat round them in the open air, for they did not appear to have any houſe, or other ſhelter from the weather, the inclemencies of which, cuſtom had probably enabled them to endure without any laſting inconvenience. Their whole behaviour was affable, obliging, and unſuſpicious. They preſented each perſon with fiſh, and a brand of fire to dreſs it, and preſſed them many times to ſtay till the morning; which they would have done, had they not expected the ſhip to ſail.

A man and two women were the firſt inhabitants ſeen in Duſky Bay, the man ſtood with a battle ax or club in his hand, on the rocky point of an iſland, and called to captain Cook and ſome more who were paſſing near him in a boat. The women were behind him, each with a long ſpear in her hand. His ſalutation was anſwered in the language of O-Taheitee; Tayo barre mai, Friend, come hither; he did not, however, ſtir from his poſt, but held a long ſpeech, frequently ſwinging round his club, on which he leaned at other times. The captain landed on the rock alone; great ſigns of fear were conſpicuous in the poor native: however, he ſtood firm on the ſame ſpot. The captain went up to him, and embraced him according to the cuſtom of the country, by joining noſes, by which token of amity all apprehenſions on the part of the natives were diſpelled. The man received the preſents that were made him, and the two women joined company; one of them had a prodigious excreſcence on the upper lip, and was in every reſpect remarkably ugly. An hour was ſpent in converſation, which was very little underſtood by either party, and in which the youngeſt woman bore by far the greateſt ſhare. The next day the gentlemen renewed their viſit. The natives received all the articles that were offered them, with great indifference, except hatchets and ſpike-nails, in return for which they parted with ſeveral of their ornaments and weapons, but did not chuſe to part with their ſpears. A perfect good underſtanding being now eſtabliſhed, the next time the captain viſited them, he found them dreſſed out in the higheſt taſte of the country; their hair was combed, tied to the crown of their head, and anointed with ſome oil or greaſe; white feathers were ſtuck in at the top: ſome had fillets of white feathers all round the head, and others wore pieces of an albatro's ſkin, with its fine white down in their ears. A cloak of red baize was preſented to the chief, in return for which he gave the captain a patta-pattoo, which he drew from his ſide; it was a ſhort club made of a fiſh-bone. A few days after they were prevailed upon to enter on board the ſhip, which they promiſed to do the next morning.

When the Reſolution lay in Queen Charlotte's Sound, a New Zealander, with his ſon and daughter, came on board. They were introduced into the cabin, when captain Cook gave him many little preſents, and dreſſed the boy in one of his own white ſhirts: the boy was ſo overjoyed at his finery, that nothing could confine him to the cabin, he muſt diſplay it to his countrymen on the deck; this puerile vanity ſerved, however, for the firſt time perhaps to make him acquainted with misfortune. An old he-goat that walked the decks, to the great terror of all the New-Zealanders, conceived a capricious kind of diſlike to the ludicrous figure of poor Khoaa, which was the boy's name, who was loſt in the ample folds of his ſhirt, and awkwardly trotted about with perfect ſelf-complacency. The ſturdy mountaineer aſſailed the youth, and raiſing himſelf on his hind legs, with one butt of his head made the beau meaſure his length on the deck: the boy bellowed out his tribulations ſo loudly, that his exulting conqueror was proceeding to further chaſtiſement, when the people who were ſpectators interpoſed, and put an end to the unequal conflict. The unhappy Khoaa's pride was now humbled in the dirt; his ſhirt was beſmeared with dirt, and in this woful plight he ſlunk into the cabin, feelingly telling his misfortune by his tears: the ſtern father unuſed to the melting mood, was enraged to ſee the ineſtimable preſent begrimed with filth, and in the ungovernable ſally of his anger, beſtowed many hearty blows on the poor ſufferer.

The diſpoſition to ſteal and ſecrete every thing they could lay their hands on, was prevalent in all that came on board the ſhip in Queen Charlotte's Sound; ſeveral of them were diſcovered in conveying away a variety of things that lay conveniently for their purpoſe, upon which they were ignominiouſly turned out of the ſloop. One time a woman ſtole a jacket from one of the ſailors, and conveyed it to a young Zealander. The owner, finding the ſtolen goods upon him, took away his property without ceremony, for which he received ſeveral blows with the fiſt, which the ſailor with great goodnature paſſed by, imputing them to jocularity; but as he was advancing to his boat, he was ſaluted with ſeveral large ſtones thrown at him by the New Zealander. This was more than the ſpirit of the ſeaman could brook, he therefore returned, and began to attack the aggreſſor in the Engliſh manner of boxing, and preſently obliged him to ſheer off with a black eye and bloody noſe. A boy about fourteen years of age was prevailed on to drink about a glaſs of Madeira wine, at which he made a great many wry faces at firſt; a bottle of very ſweet Cape wine being brought upon the table, a glaſs was filled out to him; which he reliſhed ſo well, that he was continually licking his lips, and deſired to have another, which he likewiſe drank off; theſe potations began to elevate his ſpirits, and his tongue ran with great volubility: he capered about the cabin, inſiſted on having the captain's boat cloak which lay on a chair, and was much piqued at a refuſal: he next deſired one of the empty bottles, and this requeſt likewiſe proving fruitleſs, he went out of the cabin highly offended. On deck he ſaw ſome of the ſervants folding up linen which had been hung out to dry, and immediately ſeized on a table cloth; but this being taken from him, his paſſion roſe very high; he ſtamped, threatened, then grumbled, or rather grunted awhile, and at laſt became ſo ſullen, that he would not ſpeak a word. This boy was a very juſt ſample of the impatient temper of theſe people.

SECT. XIII.

Treating of the Iſland of O-TAHEITEE, SOCIETY ISLES, EASTER ISLE, the MARQUESAS, FRIENDLY ISLES, and QUEEN CHARLOTTE'S ISLANDS, &c. lately diſcovered.

THE iſland of O-Taheitee, called alſo king George the Third's iſland, was firſt diſcovered, by Captain Wallis, in the Dolphin, on June 19, 1767, who made ſome ſtay in this iſland: it has alſo been viſited by ſeveral navigators, but laſt by captain Cook in the Endeavour, in April 1769. It is ſituated in ſeventeen degrees, thirty minutes ſouth latitude, and one hundred and fifty degrees weſt longitude, conſiſts of two circular peninſulas, one of which is near as large again as the other; the biggeſt is therefore termed Great O-Taheitee, and the other Little O-Taheitee: the iſthmus that joins them is two miles broad. The whole iſland is thirty miles long, and one hundred and twenty in compaſs; is ſurrounded by coral rocks, and internally mountainous.

The ſoil, except at the very ſummit of the hills, is rich, woody, well watered, and verdant: from various appearances, however, it ſeems to have undergone many changes, by ſubterraneous fires. The inhabitants only dwell in the vallies, or in the flat lands near the ſea. The houſes are built without order, and ſcattered up and down with a plantation to each. The productions are bread-fruit, plantains, cocoa-nuts, yams, cuſtard apple, ſugar canes, wild indigo, ginger, turmeric, &c. but neither fruits, vegetables, or grain, reſembling thoſe of Europe.

When M. de Bougainville was there in 1768, he perſuaded one of the chiefs to incloſe a piece of ground for a garden, had it dug, ſowed it with wheat, barley, oats, rice, maize, onions, and pot-herbs of all kinds, and gave him to underſtand of what great uſe they would be to the inhabitants if they were properly attended to; but they did not thrive, or were neglected, for captain Cook, in 1773, neither ſaw nor heard of any of their product. In May 1769 captain Cook ſowed ſome melon ſeed, and the ſeed of other plants; but they did not come up; this might indeed have been the fate of the ſeeds which M. de Bougainville ſowed. No European ſeeds ſeem to ſucceed here but thoſe of pumkins, which the natives diſlike. M. de Bougainville left a cock and hen turkey, and ſome ducks and drakes. The turkies, it is ſuppoſed died, as there were none in 1774; but it is

presumed the ducks bred and increased, there being plenty of them at present in the island. In August, 1773, captain Cook left a couple of goats, male and female; and, on his return the April following he found that the she goat had two kids, and was with kid again, that they looked sleek and well, and that their hair was as soft and fine as silk. The domestic animals here are little hogs, and small slothful dogs. There are likewise ducks, green doves, blue pigeons, cuckoos, kingfishers, herons, paroquets, turtles, ants, &c.

The natives of this island are a stout, well-made people; both men and women are remarkably handsome, and beautifully made, those of distinction rather taller than the English; those of an inferior class rather below us in height. Their natural complexion is a clear brunette; their features do not differ from those of the Europeans, except that their noses are rather flat, being purposely flattened in their infancy; their skin is delicately soft and smooth; their eyes are black, sparkling, and full of expression; though they have no crimson in their cheeks, they are delicately clear; their teeth are beautifully white and regular, and continue so to old age; and their breath without the least degree of taint; some are of a pale white complexion, with white hair, eye-brows, and eye-lashes. The hair of the people in general, however, is black. They oil it with cocoa-nut oil, perfume it with a certain root, and dress it neatly without combs. The men wear whiskers, and their beards in many shapes; cleanliness is their chief characteristic. Both men and women regularly bathe themselves in running water thrice a-day; as soon as they rise, at noon, and before they go to rest. They wash their mouth at every meal, and not only their mouths but their hands, and this five or six times in the course of the meal, and they keep their cloaths without either spot or stain upon them.

The lower class of inhabitants are frequently seen without any other covering than a sash or mantle round their waist; but the principal people have an additional garment: they wrap themselves gracefully in a piece of cloth containing many yards, which hangs down as low as the knees. Some of the women wear a piece of cloth, with a hole in the middle through which they put their head, so that it hangs down before and behind and below their knees; over this they throw a fine white cloth, like a mantle, which is wound several times over the body, in elegant turns, below the breast, forming a kind of tunic. The cloth is made like paper, of macerated bark, spread out and beaten together. Girls, under four, and boys under seven years of age, go naked. On the head they wear a bonnet made of matting or cocoa-nut leaves, and the women sometimes decorate themselves with small turbans, and, plaiting their hair, twine it round their heads. Sometimes they stick flowers and feathers in their hair, and both sexes wear ear-rings of shells, berries, or small pearls, in one ear only. They let the finger-nails grow, except that of the middle finger on the right hand.

In 1606, when De Quiros saw this island, the men were quite naked, and the women covered only from the waist downwards with a garment made of the palm-tree: he indeed saw one man, who seemed to be a chief, who had on his head a kind of coronet made of small black feathers, so fine and soft that they resembled silk, and behind hung down a bunch of red hair somewhat curled, as low as the middle of his back; by which we learn that a century and half will make some alterations in the customs of the natives of the South Seas, as well as in those of the Europeans. These people mark their loins and back part of their thighs with black or blue lines, in a variety of forms, which they call tattowing. They stain themselves in this manner, by puncturing or pricking the skin till it just bleeds, with a sharp instrument something like a comb, and then rubbing upon the part a grease made of soot and oil, which continues through life: such as are marked with deep blue punctures, have the parts rubbed with the juice of a plant that gives that colour. They do not mark their children till they are about thirteen years old; and though it is a painful operation, and several days before the part is healed, they bear it with great resolution; considering it as the highest ornament.

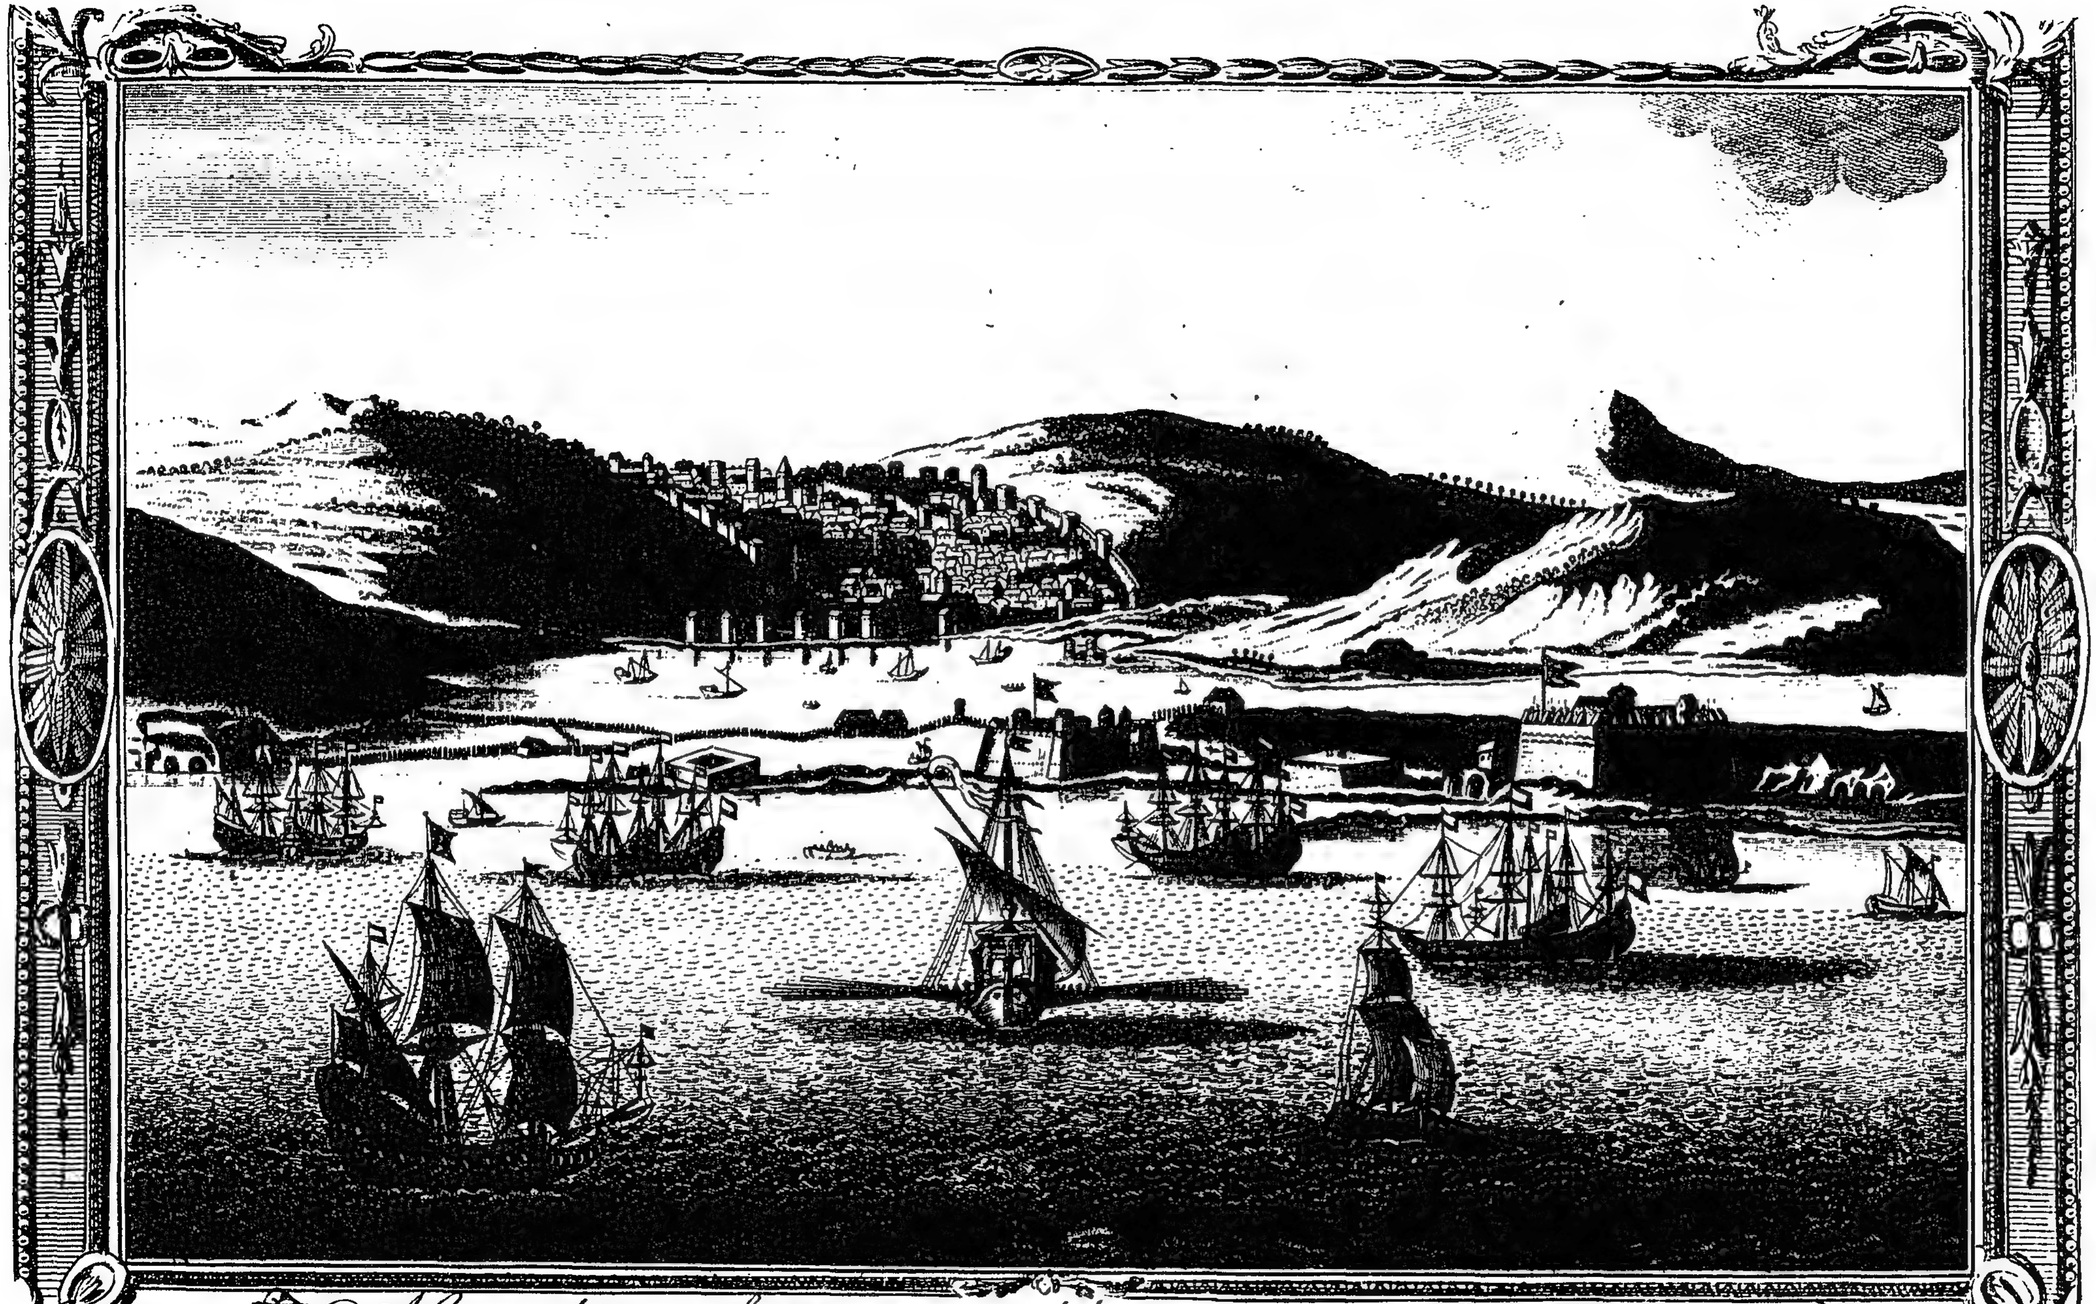
The diet of these people is vegetables, fish, poultry, pork, and dogs-flesh; and their manner of dressing their food is very singular. Having procured fire by making a grove in one stick, and rubbing another in that grove, in the same manner as carpenters whet their chissels, till the small dust kindles, they dig a hole in the ground about six inches deep, and eight or nine in circuit: this done they pave the bottom with pebbles, and make a fire in it: they then sweep off the ashes, and lay their food upon it, first covering it with plantain leaves, and then heaping over it the hot embers. Here it lies till it is sufficiently baked; and when taken out, it is tender, juicy, and full of gravy. Their chief drink is water: but they sometimes drink the juice of the cocoa-nut. They have an intoxicating juice, which they press out from the root of a plant, yet they seldom are inebriated. They sit on the ground at meals, with leaves spread out by way of table-cloth. Their provisions are brought in baskets, their salt and water are kept in cocoa-shells; none eat without washing their hands and mouths; they carve with shells, feed with their fingers, and eat immoderately. They are silent during the whole repast, and eat separately with their faces turned from each other.

The huts of these islanders consist merely of a roof, supported on three rows of pillars, one on each side, and one in the middle, and thatched with the leaves of the palm-tree; their houses are formed like our hay-ricks, with the roofs sloping both ways, the eaves of the roof about three or four feet from the ground; they have seldom any walls, but are open at the sides and ends, some few are inclosed with reeds, having only a hole to enter in at, which can be shut up with a board; but these are the habitations of the principal people. Within, they are very neatly bedded with a kind of straw or hay, on which they lay mats to sleep on; resting their head on a block, or four-legged stool, by way of pillow. When dark, they burn a kind of candle, made of the kernels of an oily nut, many of which they stick upon a small piece of wood like a skewer, one over another; when the first is burnt down, the one below it takes fire, and so to the bottom. After meals, and during the heat of the day, elderly persons of the better sort lie down to sleep: indeed eating and sleeping, is their general way of passing time, for they have little to do but procure themselves food, and are very indolent people; so indolent, as sometimes even not to feed themselves. If they plant a few trees in the course of their lives, it is all that is expected from them. They are not, however, without the more sprightly amusements; such as music, dancing, wrestling, swimming, and diving, which they do wonderfully (not only men and women, but children of six years old), throwing a lance, and shooting with a bow. In throwing a lance, their ambition is, to hit a mark, at about twenty yards distance; and in using the bow, he is the best archer that conveys the arrow farthest: and as their arrows are not feathered, will often send them two hundred and eighty yards. They kneel when they draw the bow, which as soon as the arrow is delivered, they drop.

Flutes and drums are their only musical instruments; the flutes are made of the bamboo cane about twelve inches long, with two holes only, which they stop with the first finger of the left hand, and the middle one of the right. Thus they have only four notes, and of these they seem to have but one tune; and, what is more remarkable, they sound this instrument by blowing through their nostrils. The drum is cylindrical, and formed of a hollow block of wood, solid at one end, and covered with the skin of a shark at the other. These they beat with their hands, and can tune them; they have a contrivance also to tune the flute, which they do by the ear with great exactness.

They sometimes sing, and sometimes dance, to the sound of these instruments. Their songs are in couplets, and frequently extemporaneous, and, from their repeating them, seem to be metre, though without rhime. At other times they dance, and their way of dancing is not less singular than their music; for they twist and writhe their bodies into many extravagancies.

Dramatic entertainments, or regular interludes, divided into three acts, are here performed by men and women. These dramatic interludes are called by the islanders Heava, and they consist of dancing and comedy, and last near two hours. Their language is soft and melodious, and abounds with vowels.



Cloth is their principal manufacture, which is made of bark of different degrees of fineness; blanched, and dyed red or yellow. They are likewise very ready in making baskets and wicker-work, which they do very expeditiously: they will make baskets of the cocoa-nut leaves in a few minutes, and also bonnets to shade their faces from the sun; not such bonnets as cover the head, but merely a shade over the eyes, which they tie round the head. They make ropes and lines of the bark of another tree, from the size of a packthread to that of an inch in diameter. Of these they form their fishing-nets and tackle, and of the fibres of the cocoa-nut they make thread. The fish-

fish-hooks are made of mother of pearl: and they make a harpoon of cane, pointing it with hard wood, for they have no metal of any sort.

The tools used by these people are in general made of shells and stone, and with these they will erect houses, build canoes, and after their manner carve images. They make an adze with stone, a chissel of human bone, a rasp of coral, and for files and polishers they use coral sand.

These islanders carry on their trifling navigation in canoes, which are of various sizes, and designed, according to their construction for fighting, fishing, making voyages, &c. the length is from ten to seventy-two feet, the sides are perpendicular, and the bottoms flat. Two fighting canoes are always lashed together, and upon the forepart of these a stage is erected like a quarter-deck for the warriors to stand on. From hence they throw their lances, which are their military weapons, as their bows and arrows are only used by way of amusement. They also make use of slings. Below these stages, which sometimes cover the whole canoe, sit the rowers, sixteen or seventeen in number, who paddle on with oars resembling a bakers peal; and the spare men (when any are wounded on the platform above change places with them. The fishing canoe is from ten to forty feet in length, and sometimes carries a sail; and the travelling canoes are always used in pairs, and have generally a small house six or seven feet square, but on a stage in the forepart of them, and sometimes only an awning; for in fine weather they go in companies a pleasuring in these boats, and make a good appearance. At these times the vessels are decorated with streamers, and the people on board are dressed; they who row and steer are dressed in white; they who sit upon and under the awning, in white and red; and two men, in red only, are placed on the prow of each canoe.

The year is divided here by the moon, which they call Malama, and measure the day by the sun. They measure distances by the time they pass them, and count by their fingers. Their language is soft and harmonious, and abounds with vowels, like the Spanish and Italian, which they can readily pronounce; but they find a difficulty in pronouncing English.

The priests are physicians and surgeons. They use bleeding, which is performed with a sharp wooden instrument. The principal diseases are ulcers, leprous and cutaneous eruptions.

This people have two kinds of deposit for the dead, one called a tupapow, which is little less than a shed, under which the flesh is suffered to putrify; and the other called a morai, a kind of inclosure, with pyramidical erections of stone, where the bones are afterwards interred; and in the magnificence of the latter one, their chief ambition seems to consist. The morai is not only a place of burial, but a place of worship.

When any person dies, the house of the deceased is crouded with relations. Such as are nearest of kin, and are truly affected by the loss, are silent; the rest are clamorous, and at one moment with lamentations, and the next with laughing and vociferous talking; for true grief always ties the tongue. Thus is the remainder of the day and the succeeding night spent, and in the morning the body is wrapt in a cloth, and conveyed on a bier to the sea-side, attended by a priest. The latter prays and sprinkles the corpse till the morai is constructed, when the body is deposited therein, and left to putrefy. The nearest female relation then wounds herself on the head with the tooth of a shark, and the blood is thrown on the bier. The other women follow her example, the ceremony continuing three days. On these occasions they likewise wipe their tears with pieces of cloth, and throw them on the bier, and some even tear off their hair for that purpose.

As soon as the women have performed their part, the men begin. Every relation in turn, beginning with him who is the nearest of kin, assumes the office of chief mourner: he dresses himself in a fantastic dress, such an one as in England would convey the idea which nurses affix to a ghost or goblin; it consists of drapery, shells, and feathers, which cover the whole body, even the face. At the death of a man, the woman wears this dress; and at the death of a woman, the man. The chief mourner, at the head of the rest (who are naked to the waist, and their bodies smeared with charcoal and water as low as the shoulders) marches in procession to a great distance, round the corpse; and as he carries in his hand a long stick, the end of which is set with shark's teeth, and affects a kind of phrenzy, occasioned by grief, the people fly before him, lest he should strike and wound them with it, which, had they been within his reach, he certainly would have done. These processions are not dropped till near the expiration of five months, when the remains of the dead body are taken down, and the bones scraped, washed, and buried in the place of interment.

When the people mourn, they have a vail over their face, and a certain head-dress of feathers; and the wealthier sort are preceded by a slave, who beats castanets before them, to give notice to all who approach; that the way may be cleared for the mourners.

Little can be said of the religion of these people, as their religious language differs from the common; and the Europeans, who visited them, were not even such sufficient judges of the latter, as to comprehend their ecclesiastical mysteries. The priesthood is hereditary, and the superior knowledge of the priests consists chiefly in understanding their traditions better than other people; and they only are allowed to tattow and circumcise.

Marriage here is but a mutual contract to be continued at the pleasure of the parties, the priest having nothing to do with the affair.

In this country, the feudal government seems to subsist. Each of the peninsulas has a chief; and each of the districts, which are forty-three in number, a subordinate chief. The chiefs have a kind of court, and a council. Each district, in case of an attack, furnishes a certain number of fighting men, and the sovereign commands the whole. The weapons are slings, pikes, and clubs. They give no quarter, but kill men, women, and children, and carry off the jaw bones as trophies.

The O-Taheitans are much addicted to theft: but it seems to arise rather from not having any notions of private property than from any criminal inclination. They are amorous and unchaste before marriage, but in general very faithful afterwards. There is a society, however, called the arreoy, in which indiscriminate concubinage is permitted. Polygamy is allowed to the principal people of the island. Love is the ruling passion; but a submissive obedience is paid by the wives to their husbands.

When a dispute arises at any time between two chiefs, it is settled among themselves. Captain Cook was once present at a naval review, and found it consisted of upwards of three hundred large canoes completely equipped, and manned with near eight thousand men; the chiefs, and all those on the fighting platforms, were habited in their war accoutrements, which consisted of a great quantity of cloth, turbans; breast-plates, and unwieldy helmets. The canoes were dressed with flags and streamers. This fleet was designed to attack a neighbouring island that had thrown off its dependency on O-Taheitee. Some of the troops, at captain Cook's request, went through their exercise on shore. Two parties first began with clubs; the blows of the clubs were aimed at the legs and head; those at the legs were evaded by jumping; and those at the head by stooping or leaning aside: when they proceeded to use the spears or darts, they parried the push or dart by fixing the point of a spear in the ground before them, and directing the other end of it, as they foresaw the aim was made at the other party.

When captain Wallis (who not long since sailed to this island) brought his ship close under the land, he was surrounded by some hundreds of canoes, with several persons in each. When they came within pistol shot, they gazed, and seemed to hold a council how to act; at last they paddled round the vessel, exhibiting signals of friendship, and one of them made a speech. Soon after this, some few came on board, but one of them being butted by a goat then on deck, and on turning round seeing the goat rise on his legs, they all jumped over the sides of the vessel in the greatest fright, but soon swam round her and returned on board again, and the crew had enough to do to prevent their stealing sundry things that lay in their way; one of them snatched off a gold-laced hat from an officer's head, leaped overboard and swam off with it. Upon the captain's sending out a boat to sound the depth of water, the Indians to prevent their coming on shore, threw stones into her, and wounded some of the men, which made an officer in the boat fire his musket, loaded with buck shot, at the Indian who threw the first stone, and wounded him on the shoulder. This was an alarm sufficient: it brought together three or four hundred canoes, with upwards of two thousand men, armed with slings and stones, of two pounds weight, who attacked the ship, and hurt some of the crew; but they were soon quieted and dispersed by firing a few great guns at them, with the loss only of a few Indians. They prepared for a second attack, but found it in vain; in short they became so afraid of a gun, that a musket being pointed at them, thousands would fly before it, like a flock of

of ſheep. So great indeed was their dread, that when a party of Indians once attempted to attack an officer, then ſtrolling about on ſhore by himſelf, he put them all to flight, by preſenting his tooth-pick caſe at them, which they conceived to be a little gun. After this, the ſhip's boat went peaceably on ſhore; and upon ſignals of friendſhip made on both ſides, a trade was opened with the iſlanders, which improved every day. The things they valued moſt were nails and hatchets, they having no iron; and the rates of trafficking were, a ſpike for a ſmall pig, a ſmaller for a fowl, a hatchet for a hog, and middling ſized nail for twenty cocoa-nuts or bread-fruit. Nay, they trafficked with the ſhip's crew for the perſonal favours of their daughters and ſiſters, whom fathers and brothers brought down to the ſea on purpoſe: a nail was generally the price of theſe favours; but, to ſhew that they were not inſenſible of the ſuperiority of charms in one female more than another, the ſize of the nail demanded roſe always in proportion to the beauty of the lady; but no nail under the ſize of a forty-penny were current at O-Taheitee.

With reſpect to the general character of theſe people, we muſt obſerve, that they are hoſpitable, unambitious, and far from revengeful. They probably are not ſo ſincere in their profeſſions of friendſhip as from appearances might be expected; for they weep upon every little occaſion, and ſeem to have tears at will; like children, they cry for trifles, and, like them, their ſorrows are ſoon forgotten: but when we reflect that they have never been taught either to diſguiſe or ſuppreſs their paſſions, and are not accuſtomed to thought, which alone can recall the paſt, and anticipate the future, it is no wonder that their ſorrows ſhould be tranſient; they are affected only with the occurrence of the paſſing minute; and yet they are of a benevolent diſpoſition. Though they have no trade, they have plenty of amuſements and employments: manufacturing of their dreſs is an agreeable employ to the women; and building houſes and canoes, with making of tools and arms, ſufficient occupations for the men. Moſt of their days are ſpent in a country where nature has been laviſh of her gifts; where the temperature of the air is warm, but continually refreſhed by wholeſome breezes; where the atmoſphere is conſtantly clear and ſerene, and where the climate and fruits of the land contribute to the ſtrength, pleaſure, and elegance of the natives. In ſhort, their tempers are unruffled by violent paſſions; they live a life of eaſe, equanimity, and content, and are ſituated in a delightful country, free from care, and happy in their ignorance.

M. de Bougainville, when at O-Taheitee, met with a native of that iſland, about thirty years of age, very deſirous of accompanying him to France, and his countrymen ſeemed to approve the ſtep. He happened, however, to be a ſtupid fellow, and in two years ſtay at Paris could never be brought to ſpeak or even pronounce the language, poſſibly from ſome impediment in his ſpeech; yet ſtill he would go out into the ſtreets by himſelf, and was well acquainted with the town. He frequently made a purchaſe, and ſeldom paid more for it than its value. The principal exhibition that pleaſed him was the opera, and particularly the dancing; he conſtantly went there by himſelf, paid for his admiſſion, his favourite place was in the ſeats behind the boxes. Among the great number deſirous of ſeeing him, he knew how to diſtinguiſh thoſe who were moſt civil, and his grateful heart never forgot them. The miniſtry ſent him, in March 1770, to the Iſle of France, that he might be thence conveyed home; but he never lived to reach his native iſle, for having caught the ſmall pox, it proved fatal to him.

The Society iſles are ſix in number: viz. Huaheine, Ulietea, Bolabola, Otaha, Fubai, and Marua.

1. Huaheine was diſcovered the 11th of July, 1769, by captain Cook. It is ſituated in ſixteen degrees forty-three minutes ſouth latitude, and one hundred and fifty degrees fifty-two minutes weſt longitude, is upwards of twenty miles in circumference, has a hilly ſurface, and a commodious harbour on the weſt ſide.

This iſland is divided into two peninſulas joined by an iſthmus, which at high water is overflowed. It ſeems to have been diſturbed by volcanos, and the face of the country is ſomewhat ſimilar to that of O-Taheitee.

The ſame language is ſpoken here as at O-Taheitee; the natives alſo wear the ſame kind of habits, and are the ſame as the O-Taheitans, except that they are not ſo dark coloured. The women in general are handſome, and both women and men rather ſtouter, larger made, and leſs timid; but they are more indolent and lazy. The productions likewiſe of this iſland are the ſame as thoſe of the laſt mentioned, but are about a month forwarder in their growth. They have here indeed mulberry-trees, which are not to be met with at O-Taheitee. The amuſements are ſimilar; they are likewiſe governed by chiefs, and their religious notions are much the ſame. Captain Furneaux, in 1773, brought from this iſland a young man, named Omai, who, however, was not a native of this place, but of Ulietea, having been driven from his home by the inhabitants of Bolabola. He was but of the middle claſs of people, and but an ugly ſpecimen of the natives of theſe iſlands. While in England, he was introduced to the beſt company, and taken uncommon notice of by his preſent Majeſty. Great pains were taken, while here, to feaſt his eyes with wonders. During his ſtay here, he was inoculated for the ſmall pox; and, when captain Cook ſailed for O-Taheitee again in July 1776, Omai voluntarily went with him, though with manifeſt regret at leaving England. He carried with him a great variety of dreſſes and other ornaments, a portable hand-organ, a puppet-ſhow, a coat of mail, a ſuit of armour, and an electrical machine which he was taught to uſe. Though at years of maturity, his judgment was ſtill in its infant ſtate, and, like children, he coveted every thing he ſaw: he did not carry with him any inſtruments of real uſe in life; but a variety of domeſtic animals, male and female, were put on board, as a preſent from captain Cook to the inhabitants of O-Taheitee, and the other South Sea iſlands. Omai, however, dying in his paſſage home, never again ſaw his native country.

2. Ulietea was firſt diſcovered by captain Cook in July 1769. It lies ſouth-weſt and by weſt, about ſeven or eight leagues from Huaheine, and is about three times as large, has much broader plains, and much higher hills, but is not ſo fertile or populous; the ſoil, at the top, is a kind of ſtone marle. Here are plantains, cocoa-nuts, yams, hogs, and fowls. It is governed by a viceroy, deputed from Bolabola. Their burial places here are incloſed with ſtone walls, made with coral ſtones. The principal people, when they receive a viſit of ceremony, are ſeated within their habitations, at the end of a long mat, and the party introduced by four or five old women weeping, and, as it were, bitterly lamenting, and cutting their heads with inſtruments made of the teeth of a ſhark, till the blood runs plentifully down their faces and ſhoulders; before the viſitor enters, theſe women embrace him, and thus frequently beſmear him with their blood. This ceremony ended, they go and waſh themſelves, and immediately reſume their former cheerfulneſs.

In this iſland, the dances and dramatic entertainments are very ſingular; in one houſe, where Dr. Solander, and Mr. Banks paid a viſit, by order of the maſter, a man with a large cylindrical piece of wicker work upon his head, about four feet long and eight inches in diameter, faced with feathers placed perpendicular and edged round with ſharks teeth, began to dance. In dancing, he often twiſted his head in ſuch a manner, that the top of the head-dreſs deſcribed a large circle, and was frequently ſtriking the by-ſtanders, which never failed to produce a laugh; at the expence of the perſon who had been ſtruck by him.

3. Bolabola lies north-weſt and by weſt, and is diſtant about four leagues from Otaha. It is made up of one high forked peak of land, and is ſurrounded by a reef of rocks and ſeveral ſmall iſlands, all of which are only eight leagues in compaſs.

4. Otaha lies within about two miles of Ulietea, and is divided from it by a ſtraight; both iſlands are incloſed in one reef of coral rocks, ſo that there is no paſſage for ſhipping between them. This iſland is not populous; nor has it any thing to diſtinguiſh it from the other iſlands. The natives received the boat that landed on this coaſt, in the moſt courteous manner, and were particularly attentive to pay Mr. Banks and Dr. Solander, who went in her, the ſame compliments that they paid to their kings, uncovering their ſhoulders, and wrapping their garments round their breaſts.

5. Fubai: which produces nothing but cocoa-nuts, and is ſaid to be inhabited only by three families. The coaſt abounds with fiſh, which occaſions the ſhore to be frequently viſited by the natives of the neighbouring iſlands.

6. Marua is a ſmall iſland intirely ſurrounded with a reef of rocks, and without any harbour for ſhipping: a high hill riſes in the middle of it, which may be ſeen at the diſtance of ten leagues. It is inhabited, and its productions are the ſame as the iſland bordering upon it.

Eaſter Iſle, or Davis' Land, is ſituated in twenty-ſeven degrees

degrees five minutes ſouth latitude, and one hundred and nine degrees forty-ſix minutes weſt longitude. It is hilly and ſtony, and affords neither fuel, water, or anchorage for ſhipping. It is not certainly known who firſt diſcovered this iſland; but Captain Cook viſited it in March, 1774. The only productions are, plantains, nuts, potatoes, ſugar-canes, yams, and gourds. The animals are fowls, a few land, and ſome ſea-birds; alſo rats, which they eat, as well as the former. The people are frugal livers, and good ſwimmers.

The natives, with reſpect to their perſons, are lively and ſtrong, of a middling ſtature, ſlender, but hard-featured. Their looks are mild, pleaſing, modeſt, and ſubmiſſive. Their complexion, in general, is a cheſnut brown; but ſome few are darker, and ſome are quite white, and the bodies of the men are very hairy. Their beards are black and ſtrong, and they wear them clipped ſhort. The noſes, both of men and women, are not very broad, but rather flat between the eyes; their lips, though not ſo thick as that of the negro, are ſtrong, and their hair is black and curling. Their eyes are dark brown, and rather ſmall, and the whites of them not ſo clear as in other iſlands of the South Seas. The women wear their hair long, and ſometimes tie it upon the crown of the head; but the men never ſuffer theirs to grow more than three inches in length. Both men and women are remarkable for the great length of their ears. They pierce the flaps of them, and ſtretch the holes, by wearing a leaf in them, rolled up tight like a ſcroll, till they become two or three inches long, and reach the ſhoulders. They ſometimes turn this ſlit over the upper part of the ear, and it then looks as if the flap was cut off.

Theſe iſlanders have the practice of painting and tattowing. The men cover their heads either with a round fillet, feathers, a ſtraw bonnet, or with a buſhy cap. The cloathing of the women conſiſts of a piece of red and white quilted cloth, or a mat, one part wrapped round the loins, and the other thrown over the ſhoulders; but the men go almoſt naked, except a ſlip of cloth between the legs, both ends of which are faſtened to a belt round the waiſt. Both ſexes wear on the breaſt, ſuſpended by the neck, a flat piece of bone, ſhaped like a laurel-leaf; and occaſionally, by way of amulet or charm, necklaces and earrings made of ſhells.

As to their huts, they reſemble a canoe lying upon the ground, with the keel upwards: they are about fifty or ſixty feet long, and built in the following manner: the foundations are laid with ſtone, by paving the ground in two curve lines, converging at the extremities to each other: the diſtance, from line to line, in the middle, is about ſix feet, and at the ends not more than a foot. In every ſtone of this line or foundation is made a hole, into which they fix a ſtake, ſix feet high in the middle, and diminiſhing proportionably to two feet at the ends: theſe ſtakes are drawn together, and faſtened at the top, and the whole is covered to the ground with matting of ſugar-cane leaves.

They have but few working tools, and thoſe are very mean, being made of ſtone, bone, or ſhells; but yet they are very ingenious at carving, and ſhew a taſte for the arts. They carve and very highly poliſh, human figures about eighteen inches long: which they perform with great neatneſs and proportion.

Clubs, ſpears and battle axes are their weapons; their canoes are very badly contrived. Very little that may be depended on, can be ſaid of their religion, language, or government.

There is a number of gigantic ſtone ſtatues in ſeveral places on the coaſt of this iſland, ſome erected in groves, in platforms of maſonry, and others ſingle, fixed only in the earth. They reſemble a human figure to the waiſt, are thirty feet high, more than eight feet acroſs the ſhoulders, and ſeemed to be formed each of one ſingle ſtone. The workmanſhip is rude; and the eyes and noſe, are ſcarce marked on an ill-ſhaped head; but the ears quite long, in the preſent faſhion of the country. On the heads of theſe ſtatues are placed huge round cylinders of ſtone, five feet in height, and five in diameter, ſet upright. They ſeem to have been erected over the graves of ſome chiefs, in former days, not being the workmanſhip of the preſent inhabitants, but preſerved now as monuments of antiquity. How theſe ſtones were thus raiſed one upon another, is as little to be accounted for as the manner in which thoſe at Stonehenge on Saliſbury-plain were erected. The iſlanders do not pay any adoration to them, but hold them in a kind of veneration, and will not ſuffer any one to tread upon the platforms. They probably may have ſome tradition concerning them, but as the Europeans who viſited the iſland did not continue long enough to learn the language, nothing could be collected with certainty; except only that they were the burial-place of ſome former chiefs.

Though theſe iſlanders have weapons of defence, they are cowardly and timorous: they ſtand in great awe of a muſquet, and probably from the deſtruction that was made among them by Roggerwein and his people, who, without any provocation, wantonly fired upon the natives, and made a great ſlaughter among them; but they are harmleſs and friendly: having a natural mildneſs, fellow-feeling, and good-nature in their diſpoſition, which prompt them to treat their viſitors kindly, and as hoſpitably as their wretched country will admit.

The Marqueſas were diſcovered in 1595, by Alvara Mendana, a Spaniard, who gave them their preſent name, La Marqueſas de Mendoça, in honour of the marquis of Cannete, viceroy of Peru; he alſo gave to four of the different iſles their reſpective names. The Marqueſas are five in number: La Magdalena, St. Pedro, La Dominica, Santa Chriſtina, and Hood's Iſland, which laſt was a diſcovery of captain Cook, in April 1774; Mendana having only ſeen the firſt four. They occupy one degree in latitude, and near half a degree in longitude.

La Magdalena, is ſituated in ten degrees twenty-five minutes ſouth latitude, and one hundred and thirty-eight degrees fifty minutes weſt longitude. It is ſix leagues in circuit, and is in general mountainous, but contains ſome vallies where the people dwell. The inhabitants are handſome, of white complexions, ſtout, and portly.

St. Pedro, ſeems barren, by the diſtant appearance; but it is uncertain whether it is inhabited, not having been touched at.

La Dominica, is mountainous, woody, and in ſome meaſure fertile; but is inhabited. It is about ſixteen leagues in compaſs.

Santa Chriſtina, lies about a league ſouth of La Dominica, and is eight leagues in circumference. It has fertile vallies abounding with fruit, trees, and vegetables, is in ſome places hilly, but well watered.

The natives are a well-made people, of a tawny or yellowiſh complexion: but look almoſt black, by being punctured over the whole body. The men wear long beards, which ſome tie in two brooches under the chin, and others plait. The women reſemble thoſe of O-Taheitee; their cloathing is alſo the ſame, and made of the ſame materials. The men in general go almoſt naked, having only a ſlip of cloth paſſed round the waiſt and between the legs. The dreſs of the women is a piece of cloth wrapped round the waiſt like a petticoat, hanging down below the middle of the leg, and a looſe mantle or tunic thrown over the ſhoulders. But, to be more particular,

This iſland though high and ſteep, has many vallies which widen towards the ſea, and are covered with fine foreſts, to the ſummits of the interior mountains. On the ſouth ſide riſes a peak, which is very craggy and inacceſſible. All the north ſide is a black burnt hill, of which the rock is vaulted along the ſea-ſhore, and the top clad to the ſummit with a ſhrubbery of caſuarinas. The products of this iſland are, bread-fruit, bananas, plantains, cocoa-nuts, ſcarlet-beans, paper-mulberries, of the bark of which their cloth is made, caſuarinas, with other tropical plants and trees. They have hogs and fowls and plenty of fiſh. Mr. Forſter ſays, he never ſaw a ſingle deformed or even ill proportioned man among the natives; all were ſtrong, tall, well limbed and active in the higheſt degree.

Their arms are clubs and ſpears, like thoſe of O-Taheitee, but neater. They have alſo ſlings, with which they throw ſtones with great velocity, and to a great diſtance: but not with a good aim. In times of danger, they beat an alarm with drums of the ſame kind with thoſe of the Society Iſles; and, like them, are under a monarchical government; but they are not quite ſo cleanly as that people, who ſurpaſs, in that reſpect, perhaps, any other in the world. Their canoes are from ſixteen to twenty feet long, and about fifteen inches broad, being very ſimilar to, though not quite ſo large as thoſe of O-Taheitee. Their drink is purely water, cocoa-nuts being rather ſcarce. They are much given to pilfering, like the lower ſort among the O-Taheitans.

Hood's Iſland was diſcovered by captain Cook, in 1774, who gave it that name from a perſon on board his ſhip, who firſt ſaw the land. It lies in two degrees twenty-ſix minutes ſouth latitude, and one hundred and thirty-nine degrees thirteen minutes weſt longitude; is five leagues and a half diſtant from the eaſt end of La Dominica, and the moſt northernly of the cluſter.

The Friendly Iſlands are ſituated between nineteen degrees forty-four minutes and twenty-one degrees thirty-two minutes ſouth latitude, and one hundred and ſeventy-four degrees and one hundred and ſeventy-five degrees fourteen minutes weſt longitude. The three moſt conſiderable of them were firſt diſcovered in 1643, by Faſman, a Dutchman; they are ſeven in number excluſive of ſome leſſer and very inconſiderable iſlands.

Amſterdam Iſle, or, as the natives call it, Tongatabu, lies in twenty-one degrees ſeven minutes ſouth latitude, and one hundred and ſeventy-five degrees weſt longitude, is to the northward of Middleburgh, and about five leagues from it; it is ſomething in the form of an iſoſceles triangle, the longeſt ſides of which are ſeven leagues, the ſhorteſt about four: its direction is nearly eaſt-ſouth-eaſt and weſt-north-weſt.

Middleburgh, called by the natives Eaoowe, lies in twenty-one degrees ſeventeen minutes ſouth latitude, and one hundred and ſeventy-four degrees forty-four minutes weſt longitude, is about ten leagues in compaſs, and may be ſeen at the diſtance of twelve leagues.

The general ſtature of the men in the iſlands of Amſterdam and Middleburgh is equal to our middle ſize, from five feet three to five feet ten inches; the proportions of the body are very fine, and the contours of the limbs extremely elegant, though ſomething more muſcular than at O-Taheitee, which may be owing to a greater and more conſtant exertion of ſtrength in their agriculture and domeſtic œconomy. Their complexion is a clear mahogany or cheſnut brown, with black hair, in ſhort frizzled curls which ſeem to be burnt at the tips; their beards are cut or ſhaven. Their features are extremely mild and pleaſing, and they practiſe tattowing, or puncturing the ſkin. They have a practice likewiſe of powdering their hair; ſome with a white powder made of lime, which burns; others with blue, and ſome with orange colour, made of turmeric.

Both men and women have, for their dreſs, only a piece of cloth or matting tied round the waiſt. The men frequently wear a ſtring of leaves round their necks; and the women, looſe necklaces made of ſhell fiſh, teeth, and ſeeds intermixed. Ther utenſils, animals, habitations, &c. nearly reſemble thoſe in the Society Iſlands. Their manufactures are like thoſe of O-Taheitee, only of an inferior ſort.

Their weapons are clubs highly poliſhed, ſharp pointed ſpears barbed, and bows and arrows. The bow is ſix feet long, and, when ſlack, forms a curve; the convex part has a groove that holds a ſtring. In drawing the bow, inſtead of pulling it, ſo as to increaſe the natural curvature, they draw it the reverſe way, ſo that the ſpring, to recover its former poſition, gives greater velocity to the arrow, and the recoil never hurts the arm of the perſon who diſcharges the bow.

In point of neatneſs and workmanſhip, their canoes exceed every thing of the kind met with in the South Seas. They are conſtructed of ſeveral planks ſewed together ſo neatly, that the joints on the outſide are ſcarcely to be ſeen. Some of their canoes are double, and ſome ſingle; the ſingle ones are from twenty to thirty feet long, about twenty inches wide in the middle, terminating at each end in a point. At the ends are a kind of deck, about ten feet long, ſo that the canoe is open in the middle; and they frequently decorate the decks with rows of white ſhells. Some of them have ſails, and ſome are worked on with paddles. The double canoes are formed of two, faſtened together by ſtrong beams, and a boarded platform is raiſed upon ſtaunchions over them. They are ſo contrived, that they can be ſunk under water quite to the platform, without being in any danger of filling; nor can they ſink while they hold together. They are in general ſixty or ſeventy feet long, and four or five broad. They have one ſail made of matting, and one maſt in the middle.

Their religious opinions are little known; and what reſpects their amuſements and government ſtands in the ſame predicament. The prevailing diſeaſe is the leproſy; to cure which, they bliſter the cheek bone. The common mode of ſalutation is by putting noſe to noſe, a more cordial one is kiſſing hands: the token of peace is a white flag, and the greateſt teſtimony of friendſhip is an exchange of names: but their moſt ſingular cuſtom is, the cutting off the joints of the little fingers at the death of parents and relations, one joint for each, till they have left none remaining.

Theſe iſlanders are in general, brave, friendly, and courteous; the women are modeſt; but both ſexes are given to pilfering, like thoſe in the neighbouring iſlands.

Rotterdam Iſland, or Anamocka has a great number of ſmall inconſiderable iſlands in its neighbourhood: it is ſituated in twenty degrees fifteen minutes ſouth latitude, and one hundred and ſeventy-four degrees thirty-ſix minutes weſt longitude. The inhabitants, productions, languages, &c. are ſimilar to thoſe of Amſterdam iſland: but the former ſeem more leprous than any of thoſe deſcribed above.

In this iſland, the houſes are different from any thing above cited: they are an oblong ſquare, about thirty feet long, eight feet wide, and they are built about nine feet in height: their walls and ſides are about four feet high, and made of reeds fixed up, not perpendicularly, but converging from the eaves of the roof to the bottom. The roof is ridged at the top, ſo that a ſection of the whole would reſemble a pentagon. It is thatched, and the roof ſpreads a good way beyond the ſloping walls. In one of the long ſides there is an opening like a window, which is the only entrance into it. Within are ſtored quantities of yams, which are probably the chief ſupport of the natives; on theſe they ſleep, covered only with a little matting: they reſt their heads on narrow ſtools, as the O-Taheitans do. In the day-time they lie under ſheds, the floors of which are covered with mats; and they have a variety of large wooden diſhes, bowls, and earthen pots, as houſehold utenſils.

The iſle of Handſome People was diſcovered by De Quiros in 1606. It is eighteen miles in circumference, and ſituated in ten degrees ſouth latitude, and one hundred and eighty-five eaſt longitude. Notwithſtanding the exceſſive heat of the climate, the natives are remarkably fair and handſome, from which circumſtance the iſland had its name. The natives are covered only from the waiſt downwards with mats made of palm, and wear a mantle of the ſame upon their ſhoulders.

Their canoes are trees hollowed out; and their houſes, which are thatched, ſtand in cluſters.

Cocos and Traitors Iſlands are ſituated in fifteen degrees fifteen minutes ſouth latitude and one hundred and ſeventy-five degrees thirteen minutes weſt longitude. They were diſcovered in 1616, by Schouten, and afterwards viſited by captain Wallis, in July 1767.

Cocos, called alſo Boſcawen's Iſland, is a high mountain, in appearance like a ſugar-loaf. Traitors iſland is three miles and an half long, two broad, and leſs elevated than Cocos iſle. Traitors iſle was ſo called from at attempt made by ſome of the natives to ſeize Schouten's boat, when he was here.

The inhabitants of both theſe iſlands are a ſavage people, cloathed with ruſhes or mats: they are, however, well made, and robuſt; have their hair in different forms. The flaps of their ears are ſlit, and hang down almoſt as low as their ſhoulders; they wear whiſkers, and a little beard under the chin, the reſt being all ſhaven: and their bodies are marked or punctured like thoſe of the O-Taheitans.

When Schouten was here in 1616, a chief put off from the ſhore, in a canoe covered with a mat in form of a tent, and accompanied with a number of people in forty-five canoes; as they approached the ſhip, the chief cried out three times with a loud voice: and at the fourth, all his company joined in the cry. He preſented the captain with a paper dreſs, and a fine mat; and he was entertained and received preſents in return. Theſe people certainly had no idea of property, attempting to ſteal every thing they could lay their hands upon; nay, they tried to draw out the nails from the ſhip's ſide with their teeth, and ſome ſwam under the keel, and attempted to draw the nails from thence; but being fired at, they deſiſted. The next day, however, they put off from ſhore to the number of one thouſand, with hogs, bananas, fowls, and cocoa-nuts, of which they have plenty, under a pretence of trading; and the chief, or Latou, as he is there called, in a double canoe, giving a ſignal, they all ſhouted, and at that inſtant threw a volley of ſtones on board the ſhip, and the chief was abſurd enough to ſuppoſe that he could run down the ſhip by ſailing againſt it with his canoe: he made the ridiculous attempt, and beat the head of his canoe to pieces; this exaſperated the Indians, and they reiterated their attack; but on a diſcharge of ſome muſquets, and a few great guns, they were ſoon put to flight, with the ſlaughter of a very ſmall number of them.

Their canoes are made of one piece of red wood; flat before, and pointed behind; they dart along very faſt in them, ſteering them and putting them on with two oars aſtern. They have other canoes that carry a ſail, in the middle of which is generally drawn a grey and red cock;

and

and a large piece of wood on the left ſide, with which they keep the veſſel upright: on this wood there is always ready for uſe a fiſh-gig, and a kind of prong for ſtriking fiſh.

Horn or Hoorn Iſland was alſo diſcovered by Schouten, in 1616: it is ſituated in fourteen degrees fifty-ſix minutes ſouth latitude and one hundred and ſeventy-nine degrees eaſt longitude.

The complexion of the people of this iſland is a yellow brown. The men are tall, large, well made, and ſtrong bodied: they are faſt runners, expert ſwimmers, and good divers. They do not ſuffer their beards to grow, but take great pleaſure in dreſſing their hair, which is black. Some tie it, others frize it, and others curl it; ſome let it grow down the waiſt, and tie it in five or ſix tails, and others dreſs it right an end, ſtanding up like hog's briſtles.

Both men and women go naked, except a piece of covering between their legs: the women are very much deformed both in face and body, and are very ſhort: they rub their heads and cheeks with ſomething red. Their breaſts are long, and hang down to their bellies like leathern bags, ſo that they make a very diſagreeable appearance: they are beſides very immodeſt, performing the rites of Venus in the preſence of every one, only under a mat.

The ſoil produces ſpontaneouſly a great variety of fruits, ſuch as cocoes, bananas, yams, &c. for they know nothing of cultivation. They have ſome hogs, which they cook wretchedly. At low water the women catch fiſh, which is eaten raw.

Queen Charlotte's Iſlands were viſited by captain Carteret in 1767. They conſiſt principally of eight iſlands, namely, Egmont's Iſle, or New Guernſey; Howe's Iſle, or New Jerſey; Edgecumb's Iſle, or New Sark; Ourry's Iſle, or New Alderney; Swallow, Carteret, Simpſon, and Gover's Iſlands. The following is the beſt account we could procure of Egmont's Iſle, the reſt being only ſeen at diſtance.

Mendana firſt diſcovered this iſland in 1595. He would fain have fixed a colony here; but found it impracticable, as the natives continually maintained hoſtilities againſt him. Captain Carteret's attempt in 1767 was equally unſucceſsful; for on the firſt attempt to land, a ſkirmiſh enſued, in which four people loſt their lives. We perceived, however, that the iſland abounds in hogs, fowls, ring-doves, turtle-doves, partridges, geeſe, herons, ſwallows, and black lizards. It likewiſe produces plantains, ſugar-canes, two or three kinds of bread-fruit, beetle, two kinds of good almonds, Spaniſh pumpkins, cheſnuts, and nuts, cocoa-nuts, large pine-apples with kernels in them, and apples reſembling pearmains; ſago, ſweet baſit, ginger, a kind of indigo, &c.

Their towns conſiſt of about twenty houſes each, they are built round and of plank, and thatched with palm-leaves; every houſe has two ſtories, to which they go up by land-ladders; each ſtory is incloſed breaſt high, the part above being left open to give light and air. Their houſes are ſurrounded by a wall of looſe ſtones, open at the entrance, inſtead of a gate; and the ſides and ſtones within are lined with fine matting. There is in each town a large houſe, probably a temple; and another long houſe, apparently belonging to the community, in which are hung bundles of arrows, in great quantity, ready for uſe; and alſo a well or two curiouſly made, with ſteps to go down, and covered with plank. Some of their towns are ſurrounded with breaſt-work of ſtone, reſembling a fortification, and gives reaſon to ſuppoſe that the natives are often troubled with civil wars; ſome fiſhing wiers fenced with ſtone are found cloſe to the ſea.

The inhabitants at preſent go naked and unadorned, though when Mendana was there they had cloathing and ornaments. They live principally on fiſh, and a vegetable called brete; their chief diverſion is dancing. Their manufactures, beſides fiſhing-tackle and weapons, are ropes of oziers, and cordage of tattans, bags and pockets of palm, and curious and large mats for ſails. They weave alſo, in ſmall looms, a kind of cloth, which ſerves as a covering for the women.

Their arms and offenſive weapons are bows and arrows, darts with three rows of barbs, a kind of wooden ſword, and ſtones: the bows are ſix feet five inches long, and their arrows four feet four inches, pointed with flint: and with theſe miſſile weapons they do execution at a conſiderable diſtance. One of their arrows wounded a man in the thigh, after going through the boats waſh-board.

Some of their canoes are double, like thoſe at O-Taheitee. The common ones, for daily uſe, are ſmall, and of rude workmanſhip: they are all formed from the trunk of a tree hollowed out, with an out rigger, but no ſails. Some of them will carry a dozen men. Their voyage canoes, which will hold thirty men, are more beautiful than the others.

There is an iſland about ten leagues north of Egmont's iſle, which is near four leagues round, of a conical figure, and contains a volcano.

Captain Carteret had only an opportunity of ſeeing at a diſtance the other iſlands, of which Queen Charlotte's iſles conſiſt; but had reaſon to believe them all to be inhabited. As he paſſed the iſland that bears his name, which is about two days ſail from Egmont's iſle, is near ſix leagues long, and lies in eight degrees twenty-ſix minutes ſouth latitude, and one hundred and fifty-nine degrees fourteen minutes eaſt longitude, he met with ſome of the inhabitants fiſhing. He ſent out a boat, and ſeized one of the canoes, which was large enough to contain eight or ten men, was very neatly built with planks well jointed, ornamented with ſhell-work, and figures rudely painted, and the ſeams were covered with ſomething like black putty, but of better conſiſtence. The people were armed with bows, arrows, and ſpears pointed with flint, as at Egmont iſle. They ſeemed to be the ſame kind of people as the natives of that iſland, and were quite naked.

Beſides thoſe above deſcribed, there are ſeveral ſcattered iſlands between the equator and the ſouthern tropic; viz. 1. Eimeo, or York iſland; 2. O-Heteroa; 3. Hervey iſland; 4. Palmerſton iſland; 5. Savage iſland; 6. Iſlands of Danger; 7. Duke of York's iſland; 8. Turtle iſland; 9. Byron's iſland.

Eimeo, or York iſland, was firſt diſcovered by captain Wallis in July, 1767. It is about twenty leagues diſtant from O-Taheitee, weſt-north-weſt.

O-Heteroa is ſituated in twenty-two degrees twenty-ſeven minutes ſouth; one hundred and fifty degrees forty-ſeven minutes weſt, and is thirteen miles in circumference. It does not ſhoot out in high peaks like the other iſlands; but is more uniform and even, being divided into ſmall hillocks. It is neither populous nor fertile. The natives are hoſtile, armed with lances, dreſſed in ſtriped cloth, their heads decorated with feathers, and their habit a ſhort jacket reaching to their knees. The whole is girded with a yellow ſaſh, which paſſes round the neck, is croſſed upon the breaſt, and is gathered about the middle.

Hervey iſland lies low, in nineteen degrees eighteen minutes ſouth latitude, and one hundred and fifty-eight degrees and fifty-four minutes weſt longitude. It was diſcovered by captain Cook on September 23, 1773, who gave it the above name in honour of the earl of Briſtol.

Palmerſton iſland is ſituated in one hundred and ſixty-three degrees ten minutes weſt longitude, and eighteen degrees four minutes ſouth latitude.

Savage iſland lies in nineteen degrees one minute ſouth latitude, and one hundred and ſixty-nine degrees thirty-ſeven minutes weſt longitude. On captain Cook's landing here, June 1774, the natives attacked his party with great fury: every poſſible intimation of good will was given them, but without any effect: a dart or ſpear was thrown by one of the natives, which grazed captain Cook's ſhoulder; a party which had been poſted on a rock, to ſecure a retreat in caſe of an attack, ſaw it abſolutely neceſſary to fire on the natives, to reſcue their commander, and thoſe who were with him, from deſtruction. This prevented others coming down from the heights, and abated the ardour of thoſe who were engaged: whether any of the Indians were hurt, could not be perceived. This diſpoſition of the natives, as well as the iſland furniſhing no port, determined captain Cook to leave it. The name of Savage Iſland was given by him to this ſpot, from the conduct and aſpect of the natives who thus came down upon them with the fury of wild beaſts.

Iſlands of Danger; a name given by commodore Byron to three iſlands which had rocks and broken ground between them, and were ſo low, that a ſhip may be cloſe in with them before they are ſeen. Their ſituation is differently laid down by commodore Byron and captain Cook; the former placing them in latitude twelve degrees thirteen minutes ſouth; longitude one hundred ſixty-ſeven degrees forty-ſeven minutes weſt; and the latter in ten degrees fifty-one minutes and one hundred and ſixty-three degrees forty-three minutes. The ſouth eaſternmoſt of theſe iſlands is about three leagues in length between the extreme points, from both which a reef runs out, upon which the ſea breaks to a tremendous height: upon the north-weſt and weſt ſides innumerable rocks and ſhoals ſtretch

near

near two leagues into the sea, and was extremely dangerous. The islands have a fertile and beautiful appearance, and swarm with people. No farther discovery concerning these secluded spots could be made by the commodore, as the great danger to which the ships were exposed, prevented his going on shore.

Duke of York's island was first discovered by commodore Byron, June 21, 1765, and, according to all probability, never received a human footstep before that time. The boats landed with great difficulty, and procured about two hundred co oa-nuts, which, circumstanced as the crews were, was an inestimable treasure. This island lies in latitude eight degrees forty-one minutes south; and in one hundred and seventy-three degrees three minutes west longitude; a dreadful sea breaks upon almost every part of the coast, and no soundings could be found.

Turtle Island lies in nineteen degrees forty-eight minutes south latitude, and one hundred and seventy-eight degrees two minutes west longitude. It was so called by captain Cook, who first visited it, on account of the great number of turtles that were seen here.

Byron's Island was first discovered by commodore Byron, July 3, 1765; but he could not go ashore, or procure any refreshments, there being no part favourable for a ship to anchor. This island lies in one degree eighteen minutes south latitude, and one hundred and seventy degrees fifty-three minutes east longitude, and is supposed to be about four leagues in length. It was very populous; for as soon as the ship came in sight, the natives to the number of above one thousand, assembled on the beach, and more than sixty canoes, or proas, put off from the shore, and made towards it, and ranged themselves in a circle round it; after having gazed for some time, one of the Indians suddenly jumped out of his proa, swam to the ship, and ran up the side like a cat. As soon as he had stepped over the gunwale, he sat down upon it, and burst into a violent fit of laughter, then started up and ran all over the ship, attempting to steal whatever he could lay his hands on, but without success, for being stark naked, it was impossible to secrete his booty. The seamen put him on a jacket and trowsers, which produced great merriment, for he had all the gestures of a monkey newly dressed. Bread was given him, which he ate with a voracious appetite; and, after having played a thousand antic tricks he leaped overboard clad in his new apparel, and swam back to his proa.

These people are tall, well proportioned, and clean limbed; their skin is a bright copper colour; their features good, and their countenances exhibited a mixture of intrepidity and cheerfulness that is very striking. They have long black hair; some have long beards, some only whiskers, and others nothing more than a small tuft at the point of the chin. All their ears were bored, but they had no ornaments in them. They were all stark naked except their ornaments, which consisted of shells very prettily disposed and strung together; these they wear round their neck, wrists, and waists.

SECT. XIV.

Containing a Journal of Captain COOK's Three Years Voyage round the World.

WE shall conclude our account of this quarter of the globe with some few particulars relative to the important expedition made by captain Cook, &c. for the discovery of a southern continent, which object has greatly attracted the notice of the learned and curious.

On July 13, 1772, the Resolution and Adventure (the former commanded by captain Cook, and the latter by captain Furneaux) sailed from Plymouth Sound, having on board Mr. William Hodges, landscape painter; Dr. John Reinhold Forster, Mr. George Forster his son, and Mr. Sparman, naturalists; together with Mr. William Wales, and Mr. William Bayley, astronomers; and arrived at the Cape of Good Hope, on the 30th of October following. On the 10th of the next December they saw the first ice, in latitude fifty degrees forty minutes. This first ice was a very large mass, but they afterwards saw another much larger: this prodigious body was two thousand feet long, four hundred broad, and about two hundred in height. On December 12, they passed by six more ice islands, some of them near two miles in circuit, and sixty feet high. Here the elder Mr. Forster and Mr. Wales had nearly perished by cold and famine, having gone with some others, in the ship's boat, to make some experiments of the temperature of the sea at a certain depth, but were at length saved by the Adventure. On December 26, the ships passed through a great quantity of packed or broken ice, some of which looked dirty or decaying. Islands of ice still surrounded them; and in the evening, the sun setting just behind one of them, tinged its edges with gold, and brought upon the whole mass a beautiful suffusion of purple: they had no thaw during the continuance of the whole summer.

On the 2d of January 1773, captain Cook searched for Cape Circumcision, which is laid down by Bouvette in fifty-eight degrees fifty-three minutes south latitude, and ten degrees six minutes east longitude. January 9, three boats were hoisted out, and in about five or six hours took up as much ice as yielded fifteen tons of good fresh water. It is remarked, that here was a discovery made important to science; that nature forms great masses of ice in the midst of the wide ocean, which are destitute of any saline particles, but have all the useful and salubrious qualities of the pure element. On January 16, they crossed the antarctic circle in longitude thirty-nine degrees thirty-five minutes east, which had till then remained impenetrable to all former navigators. The next day thirty-eight ice islands, great and small, were seen, besides loose ice in abundance. After having reached sixty-seven degrees fifteen minutes south, captain Cook ordered the ships to put about, and stood north-east by north, an immense field of solid ice extending to the southward, as far as the eye could reach from the mast head, which rendered it impossible to advance farther that way. Here were seen many whales playing about the ice, and for two days before several flocks of brown and white pintadoes were seen, which they named antarctic petercls, because they seemed to be natives of that region. January 31, they passed near two islands of ice, sixty degrees fifty minutes south, fifty-six degrees forty-eight minutes east, one of which appeared to be breaking or falling to pieces, by the crackling noise it made, said to be equal to the report of a four pounder. This was the last ice seen till they returned again to the southward.

On February 8, the Resolution lost sight of the Adventure, and the two sloops continued separated for the rest of the cruize, but afterwards met in Queen Charlotte's sound, in Zealand; then sailing together for O-Taheitee and other islands within the tropics, in coming round the same coasts near to Cook's straights they again separated and never more joined during the voyage. Captain Furneaux seeing no probability of forming a junction with his consort, returned to England, and reached Spithead in July 1774.

On February 28, the Resolution, in sixty-two degrees south, fell in once more with a solid piece of ice, which obstructed their further progress in that course. In latitude fifty-nine degrees fifty-eight minutes south, longitude one hundred and eighteen degrees thirty-nine minutes east, three islands of ice were in sight, all of them large, especially one, which was larger than any that had been before seen: the side opposite to the ship seemed to be a mile in extent, and the whole mass seemed to be three in circuit. It was supposed to be one hundred feet high; yet such was the impetuous force and height of the waves which broke against it, by meeting with such a sudden resistance, that they rose considerably higher. On March 26, they made the coast of New Zealand, and anchored in Dusky Bay, after having been one hundred and seventeen days at sea, in which time they had sailed three thousand six hundred and sixty leagues, without having had sight of any land. The Resolution left Dusky Bay on May 11, 1773, and, casting anchor in Queen Charlotte's Sound on the 17th of the same month, continued till the 7th of June.

Having now lost the Adventure, captain Cook, determined on fully exploring the southern parts of the Pacific ocean, began his second course alone, on the 27th of November; and on the 6th of December they were in latitude fifty-one degrees thirty-three minutes south, and longitude one hundred and eighty degrees, consequently just at the point of the antipodes of London, being the first Europeans, and most probably the first human beings, who had reached that point, and perhaps will be the last. The first ice was seen December 12, in sixty-two degrees, ten minutes south, one hundred and seventy-two east, which is eleven and a half degrees more to the southward than the first ice seen the preceding year in the Atlantic ocean. On December 15, in sixty-six degrees south, one hundred and fifty-nine west, the further course to the southward was interrupted on account of the ice,

The **DEATH**

of **CAPT.N COOK,** *at*

O-why-hee, near Kamschatka, whose **discoveries** *in his* **Last Voyage** *, as well as those of his* **First** *and* **Second**, *will be included in this New & Improved System of Geography.*

among which they were in a manner embayed, which obliged them to tack to the northward; and ſoon after they got clear of all the looſe ice, but not without receiving ſeveral hard knocks from the larger pieces. The weather remained foggy, and ſeveral ice-iſlands ſtill lay in their way, one of which they were near falling aboard of, and if that had happened, none would have ſurvived to relate the circumſtance. The ſhip paſſed with her own length to the windward of this huge maſs, ſo that every one on board was in the moſt dreadful ſuſpenſe for a few minutes. Several penguins were ſeen on ſome little ice-iſlands, and a few antarctic peterels on the wing. We doubt not but the following account and deſcription of theſe birds will prove acceptable to our readers.

Captain Cook relates, that having continued during the whole ſummer in the frigid zone, their chaſe of penguins proved very unſucceſsful, though it afforded great ſport; theſe birds dived ſo frequently, continued ſo long under water, and at times ſkipped continually into and out of it, making way with ſuch amazing velocity in a ſtraight line, that the fowlers were obliged to give over the purſuit; but not before they had come near enough to wound one of them; but though they followed it cloſely, and fired above ten times with ſmall ſhot, which was obſerved to hit, yet they were at laſt obliged to kill it with ball. When they took it up, they perceived its hard gloſſy plumage had conſtantly turned the ſhot aſide: this plumage is extremely thick, and conſiſts of long narrow feathers which lie above each other as cloſely as ſcales, and ſecure theſe amphibious birds againſt the wet, in which they almoſt conſtantly live. Their very thick ſkin, and their fat, ſeem wiſely appropriated to them by nature to reſiſt the perpetual winter of theſe inhoſpitable climes. Their broad belly, the ſituation of their feet far behind, and fins which ſupply the place of wings, are conſtructed with equal wiſdom to facilitate the progreſs of their otherwiſe lumpiſh bodies through the water. That which was ſhot weighed eleven pounds and a half. The blue peterels which every where abound in this immenſe ocean, ſettled in flocks of ſeveral hundreds on the ſmooth ſurface of the water: theſe were not worſe fitted out againſt the cold than the penguins. Their plumage was amazingly abundant, and increaſed their bulk in a great proportion; and two feathers, inſtead of one, proceeded out of every root, lying within each other, and formed a very warm covering. As they are almoſt continually in the air, their wings are very ſtrong, and of great length to ſupport them in flying.

They croſſed the antarctic circle a ſecond time on December 20, in one hundred and forty-ſeven degrees forty-ſix minutes weſt longitude. The next morning ice-iſlands were ſeen very high and rugged, forming at their tops many peaks, whereas thoſe that had been ſeen before were flat at top, and not ſo high; many of theſe were between two and three hundred feet in height, and between two and three miles in circuit, with perpendicular cliffs or ſides, aſtoniſhing to behold.
